2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Turn ON the ignition. Did the DTC P0602 reset?	--	Go to Step 3	Go to Diagnostic Aids

3	Perform the Transmission Control Module Programming Procedure. Refer to Control Module References . Is the action complete?	--	Go to Step 5	Go to Step 4
4	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn OFF the ignition for at least 30 seconds. 4. Turn ON the ignition. 5. Select Specific DTC. 6. Enter DTC P0602. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0603

Circuit Description

A normal function of the transmission control module (TCM) is to perform an internal test that verifies the integrity of the non-volatile random access memory (NVRAM) allocation. This diagnostic detects faults in the allocation of NVRAM that contain the transmission adaptive pressure memory cells by comparing a calculated checksum with a stored checksum. When the TCM detects that the calculated checksum is different from the stored checksum, DTC P0603 sets. DTC P0603 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0603 Transmission Control Module (TCM) Long Term Memory Reset

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The TCM NVRAM checksums do not match.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM turns off power to all solenoids.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The High Side Driver 1 is commanded OFF.
- The ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0603 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power

down the TCM.

Diagnostic Aids

DTC P0603 may set as result of TCM reprogramming.

Test Description

The number below refers to the step number on the diagnostic table.

3. This step eliminates the TCM software as a possible cause of the DTC. If the DTC continues to set after reprogramming, the fault is in the TCM hardware.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Turn ON the ignition. Did the DTC P0603 reset?	--	Go to Step 3	Go to Diagnostic Aids
3	Perform the Transmission Control Module Programming Procedure. Refer to Control Module References . Is the action complete?	--	Go to Step 5	Go to Step 4
	Replace the TCM. Refer to Diagnostic System Check - Vehicle for			

4	replacement, set-up and programming. Is the action complete?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn OFF the ignition for at least 30 seconds. 4. Turn ON the ignition. 5. Select Specific DTC. 6. Enter DTC P0603. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0604

Circuit Description

A normal function of the transmission control module (TCM) is to perform an internal test that verifies the read and write capability of the random access memory (RAM). This diagnostic detects faults in the RAM by writing test data to the RAM, reading back the same data, and then comparing the two data sets. When the TCM detects that the data that was read from the RAM is different from the test data that was written to the RAM, DTC P0604 sets. DTC P0604 is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0604 Transmission Control Module (TCM) Random Access Memory (RAM)

Conditions for Running The DTC

The ignition is ON.

Conditions for Setting The DTC

The data read from RAM does not match the test data written to the RAM.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The TCC commands maximum line pressure.
- The TCC freezes transmission adaptive functions.
- The TCC is disabled.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0604 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.

- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

DTC P0604 may set as a result of TCM reprogramming.

Test Description

The number below refers to the step number on the diagnostic table.

3. This step eliminates the TCM software as a possible cause of the DTC. If the DTC continues to set after reprogramming, the fault is in the TCM hardware.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Turn ON the ignition. Did the DTC P0604 reset?	--	Go to Step 3	Go to Diagnostic Aids
3	Perform the Transmission Control Module Programming Procedure. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming.	--		

	Is the action complete?		Go to Step 5	Go to Step 4
4	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn OFF the ignition for at least 30 seconds. 4. Turn ON the ignition. 5. Select Specific DTC. 6. Enter DTC P0604. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P062F

Circuit Description

While the vehicle is being driven, engine and transmission data accumulates in a random access memory (RAM) device, which cannot store data reliably when the transmission control module (TCM) powers down. Before the TCM powers down, the data is copied from RAM to an electrically-erasable programmable read-only memory (EEPROM) device, sometime referred to as non-volatile memory (NVM). Both the RAM and the EEPROM are inside the TCM. A normal function of the TCM programming is to test the EEPROM at TCM power-down by copying test data from RAM to the EEPROM and then comparing the two copies. If they do not match, DTC P062F will set. DTC P062F is a type A DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P062F Transmission Control Module (TCM) Long Term Memory Performance

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The TCM detects a checksum error when the RAM and EEPROM test data are compared.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) when the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P062F in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to

power down the TCM.

Diagnostic Aids

TCM reprogramming may cause P062F to set.

Test Description

The number below refers to the step number on the diagnostic table.

2. Performing this step helps verify that an external anomaly, such as Electromagnetic Interference (EMI), did not cause the code to set originally.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** - Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Turn ON the ignition with the engine OFF. Did the DTC P062F reset?	--	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections
3	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 4	--
	Perform the following procedures in order to verify the repair:			

4	1. Select DTC. 2. Select Clear Info. 3. Turn ON the ignition with the engine OFF for more than 2 seconds. 4. Select Specific DTC. 5. Enter DTC P062F. Has the test run and passed?		Go to Step 5	Go to Step 2
5	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0658 or P0659

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0658: Solenoid High Control Circuit Group 1 Low Voltage

DTC P0659: Solenoid High Control Circuit Group 1 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
High Side Driver 1	P0658	P0658	P0659

Circuit/System Description

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the TCC PWM solenoid through two separate solid-state devices called high side drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to ensure that it is functioning properly.

Conditions for Running the DTC

P0658

The engine run time is greater than 5 seconds.

P0659

The ignition is ON.

Conditions for Setting the DTC

P0658

The TCM detects a short to ground on the HSD1 circuit when the HSD1 is commanded ON.

P0659

The TCM detects greater than 6.4 volts at the HSD1 terminal prior to commanding the HSD1 ON.

Action Taken When the DTC Sets

- DTC P0658 and P0659 are Type C DTCs.
- The TCM commands HSD1 OFF.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- SERVICE VEHICLE SOON displays on the driver information center (DIC).

Conditions for Clearing the DTC

DTC P0658 and P0659 are Type C DTCs.

Diagnostic Aids

1. Electrical Faults P0658 and P0659 only set on the PC Solenoid Valve High Control side (HSD1) of the PC Solenoid Valve. Electrical faults on the PC Solenoid Valve Low Control side (ground side) of the shift solenoids will set P0748.
2. An open on the PC Solenoid Valve High Control side (HSD1) of the PC Solenoid Valve will set P0748.

- *J 45681* Jumper Harness

Circuit/System Verification

Ignition ON, engine OFF. With a scan tool, observe the High Side Driver 1 parameter status for:

- Short to Ground
- Open
- Short to Volts

Circuit/System Testing

1. Ignition OFF, disconnect the X121 harness connector.
2. Ignition ON, Engine OFF. Test for 4.0-6.4 volts between the Pressure Control (PC) Solenoid Valve High Control circuit terminal 13 and a good ground.

   If less than the specified value, test the PC Solenoid Valve High Control circuit for a short to ground or an open/high resistance. If circuits test normal, replace the TCM.

   If greater than the specified value, test the PC Solenoid Valve High Control circuit for a short to voltage. If circuits test normal, replace the TCM.
3. Install the *J 45681* harness on the transmission pass-thru connector.
4. Using the brown J35616-6 test probes from the most current *J 35616* kit , test for 3.5-5.5 ohms between the PC Solenoid Valve High Control circuit, terminal 13, and the PC Solenoid Valve Low Control circuit, terminal 8.

   If less than the specified value, test the PC Solenoid High Control circuit and the PC Solenoid Low Control circuit for a short together condition. If circuits test normal, replace the PC Solenoid Valve.

   If greater than the specified value, test the PC Solenoid Valve High Control circuit and the PC Solenoid Low Control circuit for an open. If circuits test normal, replace the PC Solenoid Valve.
5. Test for greater than 10 K ohms between the PC Solenoid High Control circuit, terminal 13, and all other circuits of the *J 45681* harness , except the PC Solenoid Low Control circuit, terminal 8.

   If less than the specified value, the affected circuits are shorted together. Replace the transmissions internal wire harness.
6. Test for the greater than 10 K ohms between the PC Solenoid Low Control circuit, terminal 8, and all other circuits of the *J 45681* harness , except the PC Solenoid High Control circuit, terminal 13.
7. Test for greater than 50 K ohms from the PC Solenoid High Control circuit, terminal 13, and the PC Solenoid Low Control circuit, terminal 8, to the transmission case.

   If less than the specified value, test the affected circuit for a short to the transmission case. If both circuits test normal, replace the PC Solenoid Valve.

Component Testing

1. Ignition OFF, disconnect the X121 harness connector. Install the *J 45681* harness on the transmission pass-thru connector.
2. Using the brown J35616-4 test probes form the most current *J 35616* kit , test for 3.5-5.5 ohms between the PC Solenoid Valve High Control circuit, terminal 13, and the PC Solenoid Valve Low Control circuit, terminal 8.

    If less than the specified value, test the PC Solenoid Valve High Control circuit and the PC Solenoid Low Control circuit for a short together condition. If circuits test normal, replace the PC Solenoid Valve.

    If greater than the specified value, test the PC Solenoid Valve High Control circuit and the PC Solenoid Low circuit for an open. If circuits test normal, replace the PC Solenoid Valve.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Pressure Control Solenoid Valve Replacement
- Transmission Internal Electrical Harness Replacement
- Refer to Control Module References for replacement, setup, and programming.

The automatic transmission fluid temperature (TFT) sensor is a negative coefficient thermistor. When the transmission fluid is cold, the sensor resistance is high. As the transmission fluid warms up, the sensor resistance decreases. This diagnostic monitors the TFT circuit. The circuit may be functional, but not in the normal operating range. This diagnostic indicates stuck, erratic, intermittent, skewed, or inaccurate values, indicating poor system performance. The TFT range is -40 to +151°C (-40 to +305°F).

If the TCM detects rapid or no voltage changes in the TFT sensor circuit, then DTC P0711 sets. DTC P0711 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0711 Transmission Fluid Temperature (TFT) Sensor Performance

Conditions for Running the DTC

- No ECT DTC P0115.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- DTC P0711 has not passed in the current ignition cycle.
- The engine run time is greater than 5 seconds.
- The transmission fluid temperature is -39 to +149°C (-38 to +300°F).
- For conditions 1 and 2 below, the engine coolant temperature is greater than 70°C (158°F) and has changed by at least 50°C (90°F) since startup.
- For conditions 1 and 2 below, the TCC slip speed is 120 RPM or greater for 600 seconds (10 minutes) cumulatively.

Conditions for Setting the DTC

One of the following conditions occurs:

Condition 1

- The transmission fluid temperature at startup is -40 to +21°C (-40 to +70°F).
- The vehicle speed is greater than 8 km/h (5 mph) for 900 seconds (15 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C (4°F) since startup for 100 seconds (1 minute and 40 seconds).

Condition 2

- The transmission fluid temperature at startup is 129-150°C (264-302°F).
- The vehicle speed is greater than 8 km/h (5 mph) for 600 seconds (10 minutes) cumulatively.
- The transmission fluid temperature has not changed by more than 2°C (4°F) since startup for 100 seconds (1 minute and 40 seconds).

Condition 3

The transmission fluid temperature has changed by 20°C (36°F) or greater within 250 milliseconds; 14 times within 7 seconds.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0711 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. This step tests for an intermittent short or open condition in the engine wiring harness. The test light is used as a resistor in the circuit.

6. This step determines if the TCM or the TFT, sensor is causing a steady, unchanging TFT, reading.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Did you perform the Transmission Fluid Checking Procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Select Trans. Fluid Temp. on the scan tool. 6. Drive the vehicle and observe the scan tool for either of the following conditions:	--		

	- The TFT does not change greater than 2°C (4°F) in 1 minute and 40 seconds since startup. - The TFT changes by 20°C (36°F) or greater in 0.250 second, 14 times within 7 seconds, unrealistic change. Did either of the conditions occur?		Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did the scan tool display a condition in which the Trans. Fluid Temp. does not change by greater than the specified value in 1 minute and 40 seconds since startup?	2°C (4°F)	Go to Step 6	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the Automatic Transmission inline 20-way connector. Additional DTCs may set. 3. Install the J 45681 on the engine side of the Automatic transmission inline 20-way connector. 4. Using the connector test adapter kit, connect a test light between the TFT sensor signal and low reference circuits of the J 45681 . 5. Turn ON the ignition, with the engine OFF. 6. While observing the scan tool display, move or wiggle the engine wiring harness from the TCM connector to the Automatic transmission inline 20-way connector. Does the Trans. Fluid Temp. change by greater than the specified value?	20°C (36°F)	Go to Step 7	Go to Step 8
6	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. 3. Turn ON the ignition, with the engine OFF. Did the scan tool display a condition in which the Trans. Fluid Temp. does not change by greater than the specified value in 1 minute and 40 seconds since startup?	2°C (4°F)	Go to Step 9	Go to Step 8
	1. Test the TFT signal circuit for an intermittent open or short condition between the TCM connector and the Automatic transmission inline 20-way connector. 2. Test the TFT low reference circuit for			

7	an intermittent open or short condition between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Testing for Short to Ground . Did you find and correct a condition?	--	Go to Step 10	Go to Step 8
8	Replace the automatic transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement . Did you complete the replacement?	--	Go to Step 10	--
9	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Did you complete the replacement?	--	Go to Step 10	--
10	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle and make sure the following conditions are met: • The TFT is -39°C to +149°C (-38°F to +300°F). • The TFT changes by greater than 2°C (4°F) since startup. • The TFT does not change by 20°C (36°F) or greater within 0.250 second. 4. Select Specific DTC. 5. Enter DTC P0711. Has the test run and passed?	--	Go to Step 11	Go to Step 2
11	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Transmission Control Module (TCM)
Low Reference
TFT Sensor Signal
5V

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission internal wiring harness assembly. The TFT sensor is a thermistor, or a resistor that changes value when the temperature changes. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The transmission control module (TCM) supplies a 5 volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

If the TCM detects a short to ground in the TFT sensor or signal circuit, then DTC P0712 sets. DTC P0712 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0712 Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage

Conditions for Running The DTC

The engine run time is greater than 5 seconds.

Conditions for Setting The DTC

The TCM detects a transmission fluid temperature of 150° C (302° F) or more for 10 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0712 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step tests the ability of the TCM to detect an open circuit. If the TCM recognizes the open, this eliminates the TCM and the wiring up to the transmission connector. The fault must be internal to the transmission.

5. Because the TFT is an integral part of the transmission wiring, the entire harness must be replaced.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use			

2	the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the Failure Records. 4. Clear the DTCs. 5. Select Trans. Fluid Temp. on the scan tool. Does the scan tool display transmission fluid temperature equal to or greater than the specified value?	150°C (302° F)	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections
3	1. Turn OFF the ignition. 2. Disconnect the transmission 20-way harness connector. Additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. Does the scan tool display transmission fluid temperature equal to the specified value?	-40°C (-40° F)	Go to Step 5	Go to Step 4
4	Test the TFT signal circuit from the transmission 20-way harness to the TCM for a short to ground. Refer to Testing for Short to Ground . Did you find and correct the condition?	--	Go to Step 7	Go to Step 6
5	Replace the automatic transmission internal wiring harness assembly. Refer to Transmission Internal Electrical Harness Replacement . Is the action complete?	--	Go to Step 7	--
6	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 7	--
	Perform the following procedure in order to verify the repair:			

7	1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Turn ON the ignition, with the engine OFF. • The Trans. Fluid Temp. must be 150°C (302°F) or less for 2 seconds. 4. Select Specific DTC. 5. Enter DTC P0712. Has the test run and passed?	150°C (302°F)	Go to Step 8	Go to Step 2
8	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Transmission Control Module (TCM)
Low Reference
TFT Sensor Signal
5V

The automatic transmission fluid temperature (TFT) sensor is part of the automatic transmission internal wiring harness assembly. The TFT sensor is a thermistor, or a resistor that changes value when the temperature changes. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases, the resistance increases. The transmission control module (TCM) supplies a 5 volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold, the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature increases, the resistance of the sensor decreases, which lowers the signal voltage.

If the TCM detects an open or short to voltage in the TFT sensor or signal circuit, then DTC P0713 sets. DTC P0713 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0713 Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage

Conditions for Running The DTC

- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- The output shaft speed is greater than 200 RPM for 200 seconds (3 minutes and 20 seconds) cumulative.
- The TCC slip speed is greater than 120 RPM for 200 seconds (3 minutes and 20 seconds) cumulative.
- The engine run time is greater than 5 seconds.

Conditions for Setting The DTC

The TCM detects a transmission fluid temperature of -39° C (-38° F) or less for 25 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM freezes transmission adaptive functions.
- The TCM calculates a default transmission fluid temperature based on engine coolant temperature, intake air temperature and engine run time.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0713 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and	-39°C (-		

2	TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Select Trans. Fluid Temp. on the scan tool. Does the scan tool display a Trans. Fluid Temp. less than the specified value?	38°F)	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Install the J 45681 on the transmission side of the Automatic transmission inline 20-way connector. 4. Using the DMM and the J 45681 , measure the resistance between the TFT sensor signal and low reference circuit of the J 45681 . Is the resistance less than the specified value?	100 K Ω	Go to Step 5	Go to Step 4
4	1. Test the TFT signal circuit for a short to voltage between the TCM connector and the TFT sensor. Refer to Testing for a Short to Voltage . 2. Repair the wiring as necessary. 3. Replace the automatic transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement . Is the repair complete?	--	Go to Step 7	--
5	1. Test the TFT signal circuit for an open between the TCM connector and the Automatic transmission inline 20-way connector. 2. Test the TFT low reference circuit for an open between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity . Did you find and correct an open condition?	--	Go to Step 7	Go to Step 6
	Replace the TCM.			

6	Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Did you complete the replacement?	--	Go to Step 7	--
7	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Turn ON the ignition, with the engine OFF. • The Trans. Fluid Temp. must be greater than -40°C (-40°F) for 12.5 seconds. 4. Select Specific DTC. 5. Enter DTC P0713. Has the test run and passed?	--	Go to Step 8	Go to Step 2
8	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

ISS Low Signal
ISS High Signal
Transmission Control Module (TCM)

The input shaft speed (ISS) sensor is a permanent magnet generator. The ISS sensor mounts in the transmission case in front of the valve body assembly. The sensor faces the reverse clutch housing machined teeth surface. As the reverse clutch housing rotates, an Alternating Current (AC) voltage is induced and transmitted to the transmission control module (TCM). The AC voltage level and the number of pulses increase as the speed of the reverse clutch housing increases. The TCM converts the AC voltage into a digital signal. The TCM uses the input shaft speed signal to help determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

If the TCM detects an unrealistic drop in input shaft speed, DTC P0716 sets. DTC P0716 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0716 Input Speed Sensor Performance

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No engine torque DTC P2637.
- No 1-2 Shift Solenoid Performance DTC P0752.
- No 1-2 Shift Solenoid Electrical DTCs P0973 or P0974.
- The engine run time is greater than 5 seconds.
- The vehicle speed is at least 16 km/h (10 mph).
- The transmission input shaft speed is greater than 1,050 RPM for 2 seconds.
- The throttle position is greater than 12 percent.
- One of the following conditions exist:
  - The transmission input shaft speed has not changed for at least 2 seconds.
  - The transmission input shaft speed has increased by greater than 500 RPM within 2 seconds.

Conditions for Setting the DTC

The transmission input shaft speed drops more than 1,000 RPM for at least 4 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates input speed from the automatic transmission output shaft speed sensor and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0716 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

Ensure the ISS is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. The resistance measurement will not change if either the ISS high signal circuit or the ISS low signal circuit, but not both, is shorted to ground. The vehicle speed detector in the TCM and the ISS are matched in such a way that an open or a short to ground in the ISS low signal circuit will not usually cause a loss of speed signal or a DTC P0716 to set.
6. This step isolates the short between the ISS and the wiring.
11. Refer to Diagnostic System Check - Vehicle for the latest procedures for TCM reprogramming.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Start the engine. 6. Select Transmission ISS on the scan tool. Does the scan tool display input shaft speed above the specified value?	500 RPM	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
	1. Turn OFF the ignition. 2. Disconnect the TCM.			

3	3. Using the DMM and the J 35616 Holden-terminal test kit, measure the resistance between the ISS high signal and low signal circuits at the TCM connector. Is the resistance within the specified range?	325-575 Ω	Go to Step 5	Go to Step 4
4	Test the ISS high signal circuit and ISS low signal circuit for the following conditions: • An open circuit or high resistance condition. • ISS high signal circuit and ISS low signal circuit shorted together. Refer to Testing for Continuity . Did you find and correct a condition?	--	Go to Step 12	Go to Step 9
5	Measure the resistance between ISS high signal circuit at the TCM connector and ground. Is the resistance greater than the specified value?	50K Ω	Go to Step 8	Go to Step 6
6	1. Leave the DMM connected between the ISS signal circuit and ground. 2. Disconnect the ISS. 3. Measure the resistance. Is the resistance greater than the specified value?	50K Ω	Go to Step 9	Go to Step 7
7	Repair the short to ground in the ISS high signal circuit. Refer to Wiring Repairs . Did you complete the repair?	--	Go to Step 12	--
8	1. Connect the DMM between the ISS high signal and low signal circuits. 2. Place the transmission in Park. 3. Start the engine. Is the AC voltage equal to or greater than the specified value?	0.5 V	Go to Step 11	Go to Step 9
	1. Remove the ISS. Refer to Input Speed Sensor Replacement . 2. Inspect the ISS and the ISS rotor for the following conditions: • ISS damage. • ISS rotor damage. • Excessive air gap between the reverse clutch input housing			

9	assembly (401) rotor and the ISS. - Incorrect alignment between the ISS and the reverse clutch input housing assembly (401) rotor. 3. Repair or replace any of the above items as necessary. Did you find and correct a condition?	--	Go to Step 12	Go to Step 10
10	Replace the ISS. Refer to Wiring Repairs . Did you complete the repair?	--	Go to Step 12	--
11	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 12	--
12	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start and idle the engine. 4. Observe Transmission ISS on the scan tool. Input speed must be greater than 550 RPM for 4 seconds. 5. Select Specific DTC. 6. Enter DTC P0716. Has the test run and passed?	--	Go to Step 13	Go to Step 2
13	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

The input shaft sensor (ISS) is a permanent magnet generator. The ISS sensor mounts in the transmission case in front of the valve body assembly. The sensor faces the reverse clutch housing machined teeth surface. As the reverse clutch housing rotates, an AC voltage is induced and transmitted to the transmission control module (TCM). The AC voltage level and the number of pulses increase as the speed of the reverse clutch housing increases. The TCM converts the AC voltage into a digital signal. The TCM uses the input shaft speed signal to help determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

If the TCM detects no input shaft speed when there is vehicle speed in a drive gear range, then DTC P0717 sets. DTC P0717 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0717 Input Speed Sensor Circuit Low Voltage

Conditions for Running the DTC

- No OSS DTCs P0722 or P0723.
- No ISS DTC P0717.
- No engine torque DTC P2637.
- The engine run time is greater than 5 seconds.
- The vehicle speed is at least 16 km/h (10 mph).

Conditions for Setting the DTC

The transmission input shaft speed is less than 100 RPM for 5 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM calculates input shaft speed from the output shaft speed sensor and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0717 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

Ensure the ISS is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. The resistance measurement will not change if either the ISS high signal circuit or the ISS low signal circuit, but not both, is shorted to ground. The vehicle speed detector in the TCM and the ISS are matched in such a way that an open or a short to ground in the ISS low signal circuit will not usually cause a loss of speed signal or a DTC P0717 to set.

6. This step isolates the short between the ISS and the wiring.

Transmission Control Module (TCM)

The output speed sensor (OSS) assembly provides vehicle speed information to the transmission control module (TCM). The OSS sensor assembly is a permanent magnet generator. The sensor is mounted in the transmission case facing the rear internal gear which is splined to the output shaft assembly. As the output shaft and internal gear rotate, the toothed rotor of the internal gear produces Alternating Current (AC) voltage as the rotor teeth pass through the magnetic field of the sensor. The AC voltage level and the number of pulses increase as the speed of the vehicle increases. The TCM converts the voltage to vehicle speed. The TCM uses the output shaft speed signal to determine shift timing and torque converter clutch (TCC) scheduling.

If the TCM detects no vehicle speed when there is engine speed in a drive gear range, then DTC P0722 sets. DTC P0722 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0722 Output Speed Sensor Circuit Low Voltage

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTC P0722 or P0723.
- No engine torque DTC P2637.
- The engine run time is greater than 5 seconds.
- The throttle position is greater than 12 percent.
- The engine torque is greater than 70 N·m (52 lb. ft).
- The transmission input shaft speed is 1,500-6,800 RPM.

Conditions for Setting the DTC

The transmission output shaft speed is 100 RPM or less for 3 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits Autograde.
- The TCM calculates vehicle speed from the automatic transmission input shaft speed sensor and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0722 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

Ensure the OSS sensor is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. The resistance measurement will not change if either the OSS high signal circuit or the OSS low signal circuit, but not both, is shorted to ground. The vehicle speed detector in the TCM and the OSS are matched in such a way that an open or a short to ground in the OSS low signal circuit will not usually cause a loss of speed signal or a DTC P0722 to set.
6. This step isolates the short between the OSS and the wiring.
8. The DMM will detect AC voltage if the OSS high signal circuit is shorted to ground.
11. Refer to Diagnostic System Check - Vehicle for the latest procedures for TCM reprogramming.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	**Notice:** In order to avoid damage to the drive axles, support the lower control arms in the normal horizontal position. Do not run the vehicle in gear with the wheels hanging down at full travel. 1. Install a scan tool. 2. DTC P0723 Output Speed Sensor Circuit Intermittent

Conditions for Running the DTC

- No ISS DTCs P0716 or P0717.
- No 1-2 Shift Solenoid Electrical DTC P0974.
- The engine run time is greater than 5 seconds.
- The transmission output speed is greater than 1,400 RPM for 2 seconds or greater.
- One of the following conditions exist:
  - The transmission input shaft speed has not changed less than 500 RPM for at least 2 seconds.
  - The transmission output shaft speed has not increased greater than 1400 RPM for at least 2 seconds.

Conditions for Setting the DTC

The transmission output shaft speed drops at least 1,300 RPM for at least 3 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes adaptive transmission functions.
- The TCM inhibits Autograde.
- The TCM calculates vehicle speed from the automatic transmission input shaft speed sensor and commanded gear.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0723 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

Ensure the OSS sensor is properly torqued to the transmission housing.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. The resistance measurement will not change if either the OSS high signal circuit or the OSS low signal circuit, but not both, is shorted to ground. The vehicle speed detector in the TCM and the OSS are matched in such a way that an open or a short to ground in the OSS low signal circuit will not usually cause a loss of speed signal or a DTC P0723 to set.
6. This step isolates the short between the OSS and the wiring.
8. The DMM will detect AC voltage if the OSS high signal circuit is shorted to ground.
11. Refer to Diagnostic System Check - Vehicle for the latest procedures for TCM reprogramming.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	**Notice:** In order to avoid damage to the drive axles, support the lower control arms in the normal horizontal position. Do not run the vehicle in gear with the wheels hanging down at full travel. 1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Raise the drive wheels. 6. Support the lower control arms so that the drive axles are in a horizontal, straight, position. 7. Start the engine.	100 RPM		

	8. Shift the transmission into D5. 9. Select Transmission OSS on the scan tool. Does the scan tool display transmission output speed above the specified value?		Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the TCM. 3. Measure the resistance between the OSS high signal and the OSS low signal circuits at the TCM connector. Is the resistance within the specified range?	325-575 Ω	Go to Step 5	Go to Step 4
4	Test the OSS high signal circuit and the OSS low signal circuit for the following conditions: - An open circuit or high resistance condition - OSS high signal and OSS low signal circuits shorted together Refer to Testing for Continuity . Did you find and correct a condition?	--	Go to Step 12	Go to Step 9
5	Measure the resistance between the OSS high signal circuit at the TCM connector and ground. Is the resistance greater than the specified value?	50K Ω	Go to Step 8	Go to Step 6
6	1. Leave the DMM connected between the OSS high signal circuit and ground. 2. Disconnect the OSS. 3. Measure the resistance. Is the resistance greater than the specified value?	50K Ω	Go to Step 9	Go to Step 7
7	Repair the short to ground in the OSS high signal circuit. Refer to Wiring Repairs . Did you complete the repair?	--	Go to Step 12	--
8	1. Connect the DMM between the OSS high signal and the OSS low signal circuits at the TCM connector. 2. Measure the AC voltage with the DMM while rotating the drive wheels by hand. Is the AC voltage equal to or greater than	0.5 V		

	the specified value?		Go to Step 11	Go to Step 9
9	1. Remove the OSS. Refer to Output Speed Sensor Replacement . 2. Inspect the OSS and the OSS rotor for the following conditions: • OSS damage • OSS rotor damage • Excessive air gap between the OSS rotor and the OSS • Incorrect alignment between the OSS and the OSS rotor • Damaged or missing OSS sensor spacer 3. Repair or replace any of the above items as necessary. Did you find and correct a condition?	--	Go to Step 12	Go to Step 10
10	Replace the OSS. Refer to Output Speed Sensor Replacement . Did you complete the repair?	--	Go to Step 12	--
11	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 12	--
12	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Drive the vehicle in D5 and observe Transmission OSS on the scan tool. 4. Ensure the Transmission OSS is greater than 750 RPM and does not drop more than 650 RPM for at least 2 seconds. 5. Select Specific DTC. 6. Enter DTC P0723. Has the test run and passed?	--	Go to Step 13	Go to Step 2
13	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0727

Circuit Description

Engine speed information is sent to the transmission control module (TCM) by the engine control module (ECM) through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P0727 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P0727.

When the ECM sends the TCM an invalid engine speed, then DTC P0727 will set. DTC P0727 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0727 Engine Speed No Signal

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The engine speed is invalid for 2.0 seconds.

Action Taken When the DTC Sets

- The TCM illuminates the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0727 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.

- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	Did you record a TCM Failure Record for DTC U0100?	--	Go to DTC U0100	Go to Step 4
4	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start and idle the engine. 4. Observe the Engine Speed on the scan tool. Is the Engine Speed within the specified range?	500-1,000 RPM	Go to Step 5	Go to Step 6
5	Road test the vehicle using various engine speeds. Did DTC P0727 reset?	--	Go to Step 7	Go to Testing for Intermittent Conditions and Poor Connections
6	1. Select Engine Data on the scan tool. 2. Observe the scan tool Engine Speed parameter. Is the Engine Speed value within the specified range?	500-1,000 RPM	Go to Step 7	Go to Step 8

7	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 8
8	Replace the TCM. Refer to Diagnostic System Check - Vehicle for replacement, set-up and programming. Is the action complete?	--	Go to Step 9	--
9	Perform the following procedure to verify the repair: 1. Select DTC on the scan tool. 2. Select Clear Info. 3. Turn ON the ignition, with the engine OFF. 4. Operate the engine at varying speeds. 5. Select Specific DTC. 6. Enter DTC P0727. Has the test run and passed?	--	Go to Step 10	Go to Step 2
10	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

TCC SIGNAL

The transmission control module (TCM) controls the torque converter clutch (TCC) solenoid valve pulse width modulation (PWM). The solenoid directs the hydraulic fluid for TCC apply and release. When the TCC is applied, the engine is coupled directly to the transmission through the TCC. The TCC slip speed should be near 0.

If the TCM detects high torque converter slip when the TCC is commanded ON, then DTC P0741 sets. DTC P0741 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0741 Torque Converter Clutch (TCC) System - Stuck Off

Conditions for Running the DTC

- No throttle system DTC P0120.

- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No TCC performance DTC P0742.
- No Internal Mode Switch (IMS) DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine torque signal circuit DTC P2637.
- No TCC solenoid electrical DTCs P2764 or P2763.
- The engine run time is greater than 5 seconds.
- The IMS range is D2, D3, D4, or D5.
- The elapsed time since the most recent range change is greater than 6 seconds.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The engine torque is greater than 55 N·m (41 lb. ft).
- The throttle position is 10-90 percent.
- The gear ratio is within the following ranges:
  - 1.56:1 to 1.64:1 - 3rd gear
  - 0.98:1 to 1.03:1 - 4th gear
  - 0.73:1 to 0.77:1 - 5th gear
- The TCC apply pressure is greater than 200 kPa (22 psi) for more than 2 seconds.
- The TCC duty cycle is greater than 80 percent for more than 2 seconds.

Conditions for Setting the DTC

The TCM commands the TCC ON, and the TCC slip is between 150-250 RPM for greater than 8 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM inhibits 5th gear if the transmission is in Hot Mode.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0741 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.

- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

Inspect the transmission fluid lines to the radiator. The lines may be pinched, plugged or twisted.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step inspects the transmission fluid to make sure that it is at the proper level.

3. This step verifies that the TCC engages when commanded ON by the scan tool.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Did you perform the Transmission Fluid Checking Procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Operate the vehicle in D5 at 72 km/h (45 mph). 6. Using the scan tool, command the TCC PWM solenoid valve ON.	-20 to +75 RPM		

	7. Monitor the TCC slip speed on the scan tool. Is the slip speed within the specified range?		Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 4
4	- Inspect the front control valve body assembly (311) for the following conditions: - TCC PWM solenoid valve (352) mechanically stuck off or leaking - TCC regulator apply valve (348) stuck. Refer to Torque Converter Clutch Solenoid Replacement . - Inspect the rear control valve body assembly (310) for the control valve body ball check valve #2 stuck or missing. Refer to Control Valve Body Accumulator Assembly Replacement . - Inspect the fluid pump assembly (202) for the following conditions: - TCC control valve (235) stuck in the off position - TCC enable valve (237) stuck in the off position. Refer to Transmission Fluid Pump Disassemble and Transmission Fluid Pump Assemble . - Inspect the forward clutch input housing assembly (433) for the input shaft fluid seal ring (432) leaking or worn. Refer to Forward and Coast Clutch Disassemble . Did you find and correct any of the above conditions?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - The TFT is 20-130°C (68-266°F). - The engine torque is greater than 55 N·m (41 lb. ft). - Drive the vehicle in D5 with the throttle position at 12-	--		

	90 percent. - Ensure that the TCC applies and the slip speed is -20 to +75 RPM for 4 seconds. 4. Select Specific DTC. 5. Enter DTC P0741. Has the test run and passed?		Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

TCC SIGNAL

The transmission control module (TCM) controls the torque converter clutch (TCC) solenoid valve pulse width modulation (PWM). The solenoid directs the hydraulic fluid for TCC apply and release. When the TCC is released, the engine is coupled by fluid to the transmission and TCC slip speeds of -300 RPM to +1,500 RPM, during heavy acceleration, are normal.

If the TCM detects low torque converter slip when the TCC is commanded OFF, then DTC P0742 sets. DTC P0742 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0742 Torque Converter Clutch (TCC) System - Stuck On

Conditions for Running the DTC

- No throttle system DTC P0120.

- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No TCC performance DTC P0741.
- No Internal Mode Switch (IMS) DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine torque signal circuit DTC P2637.
- No TCC solenoid electrical DTCs P2764 or P2763.
- The engine run time is greater than 5 seconds.
- The IMS range is D5.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The engine torque is greater than 80 N·m (59 lb. ft).
- The throttle position is 12-90 percent.
- The transmission is not in 1st gear and the gear ratio is 0.73:1 to 2.27:1.
- The vehicle speed is greater than 15 km/h (9 mph).

Conditions for Setting the DTC

The following conditions occur 3 times in 1 ignition cycle:

- The TCM commands the TCC OFF.
- The TCC slip is between -20 to +20 RPM for greater than 3.5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0742 in TCM history.

Conditions for Clearing the DTC

- The ECM turns off the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- Rapid fluctuation in line pressure may set DTC P0742. Refer to Line Pressure .
- The customer may notice an engine stalling condition.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step verifies that the ECM commanded the TCC PWM solenoid valve OFF and the slip speed is -20 to +150 RPM.

3. This step inspects and repairs the components that caused the DTC to set.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Select TCC Duty Cycle and TCC Slip Speed on the scan tool. 6. Drive the vehicle in D5, with the throttle position angle greater than 15 percent. Allow the transmission shift to 5th gear. While the TCC duty cycle is 0 percent, does the scan tool display a TCC slip speed within the specified range?	-20 to +20 RPM	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections
	1. Inspect for the following conditions: • The TCC PWM solenoid valve (352) is stuck ON due to sediment.			

3	• The TCC regulator apply valve (348) is stuck due to sediment. Refer to Torque Converter Clutch Solenoid Replacement . 2. Repair or replace components as necessary. Did you find and correct a condition?	--	Go to Step 4	--
4	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Drive the vehicle in D5 with the throttle position angle of 12-90 percent and a vehicle speed greater than 15 km/h (9 mph). • The TFT is 20-130°C (68-266°F). • The engine torque is greater than 80 N·m (59 lb. ft). • The TCC slip speed must be 130-1,500 RPM for 2.5 seconds. • Stop the vehicle. • Drive the vehicle, as noted in Steps 1-3 above, in order to cycle the TCC a second time. 4. Select Specific DTC. 5. Enter DTC P0742. Has the test run and passed?	--	Go to Step 5	Go to Step 2
5	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Transmission Control Module (TCM)
Feedback
PC Solenoid Valve Low Control

The pressure control (PC) solenoid valve regulates actuator feed fluid passing through the solenoid into torque signal pressure. The TCM uses a pulse width modulated signal in order to control the torque signal pressure. The TCM compares various inputs in order to determine the appropriate pressure for a given load. The TCM varies the current to the PC solenoid from 0.1 amps, for maximum line pressure to 1.1 amps, for minimum line pressure. An internal current monitor within the TCM provides feedback in order to determine actual PC solenoid valve current draw.

If the TCM detects a continuous open, short to voltage or short to ground in the PC solenoid circuit, then DTC P0748 sets. DTC P0748 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0748 Pressure Control (PC) Solenoid Control Circuit

Conditions for Running the DTC

The engine is running.

Conditions for Setting the DTC

The PC solenoid valve feedback circuit indicates a continuous open or short to ground for greater than 1.2 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- SERVICE VEHICLE SOON displays on the driver information centre (DIC).
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P0748 in TCM history.

Conditions for Clearing the DIC/DTC

- The TCM clears the DIC when the condition no longer exists.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step verifies the ability of the TCM to command the PC solenoid valve.

3. This step verifies that the automatic transmission wiring harness and the PC solenoid have correct resistance.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition, with the

1-2 SHIFT VALVE (387)
1-2 SHIFT CONTROL VALVE (366)

The 1-2 shift solenoid (SS) valve is a normally closed exhaust valve that, in conjunction with the 2-3 (SS) valve, allows 4 different shifting combinations. The 1-2 SS valve is attached to the control valve body, within the transmission.

The Transmission Control Module (TCM) monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0751 sets under two conditions:

- A stuck ON 1-2 SS valve
- A stuck ON 1-2 shift valve

If the TCM detects a 2-2-3-3-3 shift pattern, then DTC P0751 sets. DTC P0751 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0751 1-2 Shift Solenoid (SS) Valve Performance - No First, Fourth or Fifth Gear

Conditions for Running the DTC

- No throttle system DTC P0120.
- No Input Speed Sensor (ISS) DTCs P0716 or P0717.
- No Output Speed Sensor (OSS) DTCs P0722 or P0723.
- No Torque Converter Clutch (TCC) stuck ON DTC P0742.

- No shift solenoid electrical DTCs P0973, P0974, P0976, P0977, P0979, or P0980.
- No Internal Mode Switch (IMS) DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine torque delivered signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is 10 percent or more.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- The TCM commands 1st gear when the engine torque is greater than 40 N·m (30 lb. ft) and the resulting gear ratio is 2.16:1-2.27:1 for 1.25 seconds.
- The TCM commands 4th or 5th gear when the engine torque is greater than 36 N·m (27 lb. ft) and the resulting gear ratio is 1.56:1-1.64:1 for 5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits Autograde.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0751 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0751, and then cannot reset DTC P0751, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 2-2-3-3-3 shift pattern.

4. This step tests for a mechanical or hydraulic condition causing the 1-2 SS valve to be stuck ON, or the circuit to be released.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Did you perform the Transmission Fluid Checking Procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool snapshot mode in order to record commanded gear and gear ratio. 6. Drive the vehicle in D5, in order to	1st 2.16:1-2.27:1 4th/5th 1.56:1-1.64:1		

	obtain 1-2, 2-3, 3-4, and 4-5 shifts with a throttle position angle of 10 percent or greater. Are the commanded gear and gear ratio within the specified range?		Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	1. Inspect the 1-2 shift circuit for the following conditions: • 1-2 SS valve mechanically stuck ON • Refer to Shift Solenoid Leak Test . • 1-2 SS valve O-ring worn or damaged • 1-2 shift valve stuck in the released position. Refer to 1-2 Shift Solenoid Valve Replacement . 2. Repair the circuit as necessary. Did you complete the repair?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Drive the vehicle in D5 with a throttle angle of 10 percent or greater. • Allow the transmission to shift through all the gears 2 times. • Monitor the commanded gear and gear ratios. The actual gear ratios must match the commanded gears for 1 second, for all gears. 4. Select Specific DTC. 5. Enter DTC P0751. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

The 1-2 shift solenoid (SS) valve is a normally-closed exhaust valve that, in conjunction with the 2-3 shift solenoid (SS) valve, allows 4 different shifting combinations. The 1-2 SS valve is attached to the control valve body, within the transmission.

The TCM monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0752 sets under two conditions:

- A stuck OFF 1-2 SS valve
- A stuck OFF 1-2 shift valve

If the TCM detects a 1-1-4-4-5 shift pattern, then DTC P0752 sets. DTC P0752 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0752 1-2 Shift Solenoid (SS) Valve Performance - No Second or Third Gear

Conditions for Running the DTC

- No throttle system DTCs P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No TCC stuck ON DTC P0742.

- No shift solenoid electrical DTCs P0973, P0974, P0976, P0977, P0979, or P0980.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine delivered torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is 10 percent or more.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur twice during the same trip:

- The TCM commands 2nd gear when the engine torque is greater than 32 N·m (24 lb. ft) and the resulting gear ratio is 3.33:1-3.50:1 for 2 seconds.
- The TCM commands 3rd gear when the engine torque is greater than 32 N·m (24 lb. ft) and the resulting gear ratio is 0.98:1-1.03:1 for 5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 3-2 downshifts if the vehicle speed is greater than 8 km/h (5 mph).
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0752 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0752, and then cannot reset DTC P0752, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 1-1-4-4-5 shift pattern.

4. This step tests for a mechanical or hydraulic condition causing the 1-2 SS valve to be stuck OFF, or the circuit to be applied.

The 2-3 shift solenoid (SS) valve is a normally-closed exhaust valve that, in conjunction with the 1-2 shift solenoid (SS) valve, allows 4 different shifting combinations. The 2-3 SS valve is attached to the control valve body, within the transmission.

The TCM monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0756 sets under two conditions:

- A stuck OFF 2-3 SS valve
- A stuck OFF 2-3 shift valve

If the TCM detects a 5-3-4-4-5 shift pattern, then DTC P0756 sets. DTC P0756 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0756 2-3 Shift Solenoid (SS) Valve Performance - No First or Second Gear

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No TCC stuck ON DTC P0742.

- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine delivered torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is 10 percent or more.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 200 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur during the same trip:

- The TCM commands 1st gear when the output shaft speed is 200 RPM or greater, the engine torque is greater than 40 N·m (30 lb. ft), and the resulting gear ratio is 0.73:1-0.77:1 for 2.8 seconds.
- The TCM commands 2nd gear when the engine torque is greater than 36 N·m (27 lb. ft) and the resulting gear ratio is 1.56:1-1.64:1 for 1 second.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM inhibits 1st gear.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0756 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0756, and then cannot reset DTC P0756, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 5-3-4-4-5 shift pattern.

The 2-3 shift solenoid (SS) valve is a normally-closed exhaust valve that, in conjunction with the 1-2 shift solenoid (SS) valve, allows 4 different shifting combinations. The 2-3 SS valve is attached to the control valve body, within the transmission.

The TCM monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0757 sets under two conditions:

- A stuck ON 2-3 SS valve
- A stuck ON 2-3 shift valve

If the TCM detects a 1-2-2-1-1 shift pattern, then DTC P0757 sets. DTC P0757 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0757 2-3 Shift Solenoid (SS) Valve Performance - No Third, Fourth or Fifth Gear

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.
- No TCC stuck ON DTC P0742.

- No shift solenoid electrical DTCs P0973, P0974, P0976, P0977, P0979, or P0980.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine delivered torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is 10 percent or more.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

Both of the following conditions must occur once during the same trip:

- The TCM commands 3rd gear when the output shaft speed is 200 RPM or greater, the engine torque is greater than 20 N·m (15 lb. ft), and the resulting gear ratio is 2.16:1-2.27:1 for 2 seconds.
- The TCM commands 4th or 5th gear when the engine torque is greater than 12 N·m (9 lb. ft) and the resulting gear ratio is 3.33:1-3.50:1 for 2 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits 4th and 5th gears.
- The TCM inhibits TCC.
- The TCM inhibits Autograde.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0757 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0757, and then cannot reset DTC P0757, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 1-2-2-1-1 shift pattern.

4. This step tests for a mechanical or hydraulic condition causing the 2-3 SS valve to be stuck ON, or the circuit to be released.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Did you perform the Transmission Fluid Checking Procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC.	3rd 2.16:1-2.27:1 4th/5th 3.33:1-3.50:1		

	5. Use the scan tool snapshot mode in order to record commanded gear and gear ratio. 6. Drive the vehicle in D5, in order to obtain 1-2, 2-3, 3-4, and 4-5 shifts with a throttle position angle of 10 percent or greater. Are the commanded gear and gear ratio within the specified range?		Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	1. Inspect the 2-3 shift circuit for the following conditions: - 2-3 SS valve mechanically stuck ON - Refer to Shift Solenoid Leak Test . - 2-3 SS valve O-ring worn or damaged - 2-3 shift valve stuck in the released position 2. Repair the circuit as necessary. Refer to 2-3 Shift Solenoid Valve Replacement . Did you complete the repair?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - Drive the vehicle in D5 with a throttle angle of 10 percent or greater. - Allow the transmission to shift through all the gears. - Monitor the commanded gear and gear ratios. The actual gear ratios must match the commanded gears for 1 second, for all gears. 4. Select Specific DTC. 5. Enter DTC P0757. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

The 4-5 shift solenoid (SS) valve is a normally-closed exhaust valve. When the 1-2 and the 2-3 SS valves are both OFF, the 4-5 SS valve turns off to shift the transmission into 5th gear. When either of the other two shift solenoids are ON, the 4-5 SS allows powertrain braking. The 4-5 SS valve is attached to the control valve body, within the transmission.

The transmission control module (TCM) monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0761 sets under two conditions:

- A stuck OFF 4-5 SS valve
- A stuck OFF 4-5 shift valve

If the TCM detects a 1-2-3-5-5 shift pattern, then DTC P0761 sets. DTC P0761 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0761 4-5 Shift Solenoid (SS) Valve Performance - No Fourth Gear

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.

- No TCC stuck ON DTC P0742.
- No shift solenoid electrical DTCs P0973, P0974, P0976, P0977, P0979, or P0980.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine delivered torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is 10 percent or more.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

The following conditions must occur twice during the same trip:

- The TCM commands 4th gear for 1 second.
- The engine torque is greater than 36 N·m (27 lb. ft).
- The resulting gear ratio is 0.73:1-0.77:1 for 4 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits powertrain braking.
- The TCM inhibits Autograde.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0761 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0761, and then cannot reset DTC P0761, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 1-2-3-5-5 shift pattern.

4. This step tests for a mechanical or hydraulic condition causing the 4-5 SS valve to be stuck OFF, or the circuit to be applied.

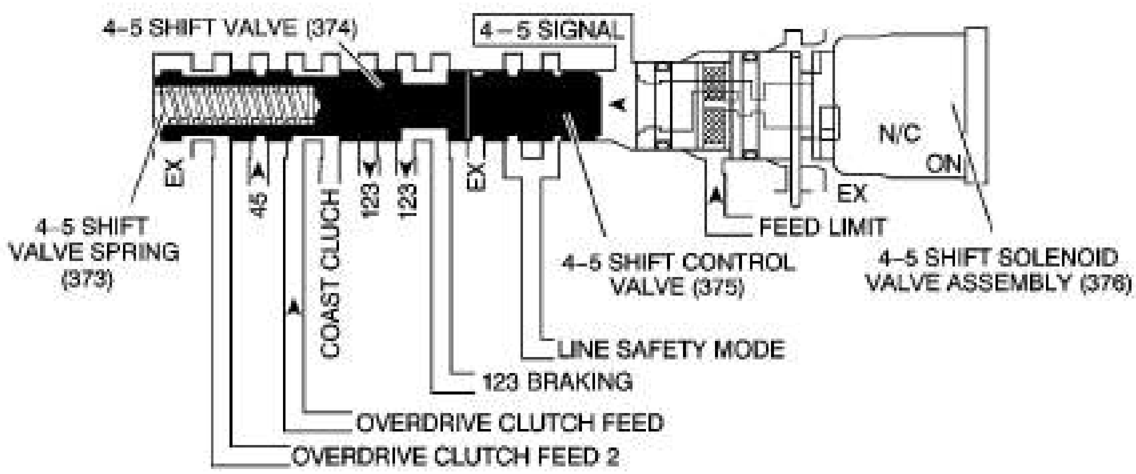
Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	Perform the Transmission Fluid Checking Procedure. Refer to Transmission Fluid Check . Did you perform the Transmission Fluid Checking Procedure?	--	Go to Step 3	Go to Transmission Fluid Check .
3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool snapshot mode in order to record commanded gear and gear ratio.	4th 0.73:1-0.77:1		

	6. Drive the vehicle in D5, in order to obtain 1-2, 2-3, 3-4, and 4-5 shifts with a throttle position angle of 10 percent or greater. Are the commanded gear and gear ratio within the specified range?		Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	1. Inspect the 4-5 shift circuit for the following conditions: • 4-5 SS valve mechanically stuck OFF • Refer to Shift Solenoid Leak Test . • 4-5 SS valve O-ring worn or damaged • 4-5 shift valve stuck in the applied position 2. Repair the circuit as necessary. Refer to 4-5 Shift Solenoid Valve Replacement . Did you complete the repair?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Drive the vehicle in D5 with a throttle angle of 10 percent or greater. • Allow the transmission to shift through all the gears 2 times. • Monitor the commanded gear and gear ratios. The actual gear ratios must match the commanded gears for 1 second, for all gears. 4. Select Specific DTC. 5. Enter DTC P0761. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1997453**

DTC P0762

Circuit Description



4-5 SHIFT VALVE (374)

OVERDRIVE CLUTCH FEED
OVERDRIVE CLUTCH FEED 2

The 4-5 shift solenoid (SS) valve is a normally-closed exhaust valve. When the 1-2 and the 2-3 SS valves are both OFF, the 4-5 SS valve turns OFF to shift the transmission into 5th gear. When either of the other two shift solenoids are ON, the 4-5 SS turn OFF in order to enable powertrain braking. The 4-5 SS valve is attached to the control valve body, within the transmission.

The transmission control module (TCM) monitors the actual gear ratio, and compares the actual gear ratio with the commanded gear ratio. DTC P0762 sets under two conditions:

- A stuck ON 4-5 SS valve
- A stuck ON 4-5 shift valve

If the TCM detects a 1-2-3-4-4 shift pattern, then DTC P0762 sets. DTC P0762 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0762 4-5 Shift Solenoid (SS) Valve Performance - No Fifth Gear

Conditions for Running the DTC

- No throttle system DTC P0120.
- No ISS DTCs P0716 or P0717.
- No OSS DTCs P0722 or P0723.

- No TCC stuck ON DTC P0742.
- No shift solenoid electrical DTCs P0973, P0974, P0976, P0977, P0979, or P0980.
- No IMS DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- No engine delivered torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The IMS does not indicate PARK, NEUTRAL or REVERSE.
- The transmission fluid temperature is 20-130°C (68-266°F).
- The throttle position is greater than 10 percent.
- The input shaft speed is 200-6,800 RPM.
- The output shaft speed is greater than 100 RPM.

Conditions for Setting the DTC

The following conditions must occur twice during the same trip:

- The TCM has commanded either 2nd or 3rd gear for 3 seconds or greater.
- The TCM commands 5th gear for 1 second.
- The engine torque is greater than 36 N·m (27 lb. ft).
- The resulting gear ratio is 0.98:1-1.03:1 for 3.5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits powertrain braking.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0762 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Diagnostic Aids

- If you clear DTC P0762, and then cannot reset DTC P0762, the following conditions may exist:
  - Fluid contamination
  - Plugged fluid circuits
  - Restricted fluid circuits
- Refer to Shift Solenoid Valve State and Gear Ratio .

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step verifies a 1-2-3-4-4 shift pattern.

4. This step tests for a mechanical or hydraulic condition causing the 4-5 SS valve to be stuck ON, or the circuit to be released.

Step	Action	Value (s)	Yes	No

3	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool snapshot mode in order to record commanded gear and gear ratio.	4th 0.98:1-1.03:1		

	6. Drive the vehicle in D5, in order to obtain 1-2, 2-3, 3-4, and 4-5 shifts with a throttle position angle of 10 percent or greater. Are the commanded gear and gear ratio within the specified range?		Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	1. Inspect the 4-5 shift circuit for the following conditions: - 4-5 SS valve mechanically stuck ON - Refer to Shift Solenoid Leak Test . - 4-5 SS valve O-ring worn or damaged - 4-5 shift valve stuck in the released position 2. Repair the circuit as necessary. Refer to 4-5 Shift Solenoid Valve Replacement . Did you complete the repair?	--	Go to Step 5	--
5	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - Drive the vehicle in D5 with a throttle angle of 10 percent or greater. - Allow the transmission to shift through all the gears. - Monitor the commanded gear and gear ratios. The actual gear ratios must match the commanded gears for 1 second, for all gears. 4. Select Specific DTC. 5. Enter DTC P0762. Has the test run and passed?	--	Go to Step 6	Go to Step 2
6	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0850

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0850: Park/Neutral Position (PNP) Switch Circuit

Circuit/System Description

The engine control module (ECM) provides 12 volts to the park/neutral switch of the manual shift shaft position switch. The manual shift shaft position switch is a sliding contact assembly that attaches to the manual shift shaft inside the transmission. The switch consists of five separate circuits, four of which indicate gear selector position to the transmission control module (TCM), and one that indicates park/neutral position to the ECM. When the transmission is in PARK or NEUTRAL, the switch closes and pulls the ECM voltage low, 0 volts. When the transmission is not in PARK or NEUTRAL, the ECM voltage is high, 12 volts. The ECM uses the switch in order to enable starter operation.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

DTC P0850 sets when either of the following conditions are true:

Condition 1

The park/neutral switch circuit is low, 0 volts, for 100 seconds while the TCM is reporting the gear selector is in REVERSE or any forward range.

Condition 2

The park/neutral switch circuit is high, 12 volts, for 200 seconds while the TCM is reporting the gear selector is in PARK or NEUTRAL.

Action Taken When the DTC Sets

- DTC P0850 is a Type C DTC.
- The ECM uses the transmission range data to enable engine cranking.

Conditions for Clearing the DTC

DTC P0850 is a Type C DTC.

DTC Type Reference

Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Transmission Control Module Scan Tool Information

Circuit/System Verification

If there are any other engine or transmission related DTCs set, diagnose those DTCs first. With a scan tool observe the Park/Neutral switch parameter in the engine controls data list and move the gear shift lever from Park, to Reverse and through all the ranges and observe the parameter as you move the shift lever. The parameter should display Park/Neutral when in Park or Neutral and In-Gear when in Reverse, Drive or Drive Low. Close observation of the Park and Neutral to Drive transitional positions while moving the shift lever and observing for possible misalignment or slack in the shifter mechanism is especially important.

If any concerns are found proceed to Testing.

Circuit/System Testing

Disconnect the transmission 20-way connector and observe the Park/Neutral scan tool parameter in the engine controls data list. The parameter should display In-Gear.

If the Park/Neutral parameter does not display In-Gear test the Park/Neutral signal circuit between the engine side of the transmission 20-way connector and the ECM connector for a short to ground.

If the Park/Neutral parameter displays In-Gear test the transmission IMS for a shorted P/N circuit to ground. Inspect the harness for damage or chaffing.

If the IMS was not shorted to ground, test the IMS Park/Neutral signal circuit form the IMS connector on the TCM side of the 20-way connector for an open or short to ground.

If no concerns are found, replace the ECM. Refer to Control Module References for replacement, setup, and programming.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Refer to Control Module References for replacement, setup, and programming.
- Manual Shift Shaft Position Switch Replacement
- Transmission Internal Electrical Harness Replacement

DTC P0897

Circuit Description

Transmission fluid life is determined by monitoring transmission fluid temperature over a period of time. The transmission control module (TCM) calculates transmission fluid life based on a set of temperature ranges stored in TCM memory. As the vehicle is driven, a counter increments. The rate at which the counter increments depends on the temperature range in which the transmission is currently operating. The higher the temperature range, the faster the counter increments. As the counts increment, the TCM will begin to decrease the fluid life percentage from 100, high fluid life, to 0, low fluid life.

If the TCM detects a calculated transmission oil life of 10 percent or less, then DTC P0897 sets. DTC P0897 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0897 Transmission Fluid Life

Conditions for Running the DTC

- No Transmission Fluid Overtemperature DTC P0218.
- No TFT DTCs P0711, P0712, or P0713.

Conditions for Setting the DTC

The calculated transmission oil life remaining is 10 percent or less.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- CHANGE TRANSMISSION FLUID displays on the driver information centre (DIC).
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The ECM stores DTC P0897 in TCM history.

Conditions for Clearing the DIC/DTC

- The TCM clears the DIC when the condition no longer exits.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the fault no longer exists and the DTC passes.

Diagnostic Aids

Inspect the transmission cooling system for possible blockage and restrictions.

Test Description

The number below refers to the step number on the diagnostic table.

2. This step changes the Automatic transmission fluid and filter. It is important to reset the oil life monitor after the fluid and filter are replaced.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Replace the transmission fluid and filter. Refer to Automatic Transmission Fluid and Filter Replacement . 6. Use the scan tool in order to reset the transmission oil life. Is the action complete?	--	Go to Step 3	--
3	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Ensure that the transmission oil life monitor displays 99 percent or greater. 4. Select Specific DTC. 5. Enter DTC P0897.	--		

	Has the test run and passed?		Go to Step 4	Go to Step 2
4	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

4-5 Shift Solenoid Valve Control
1-2 Shift Solenoid Valve Control
TCC Solenoid Valve Control

The 1-2 shift solenoid valve is located in the control valve body of the transmission. The transmission control module (TCM) selects the required gear by turning the appropriate solenoid ON or OFF, enabling the transmission to shift. Refer to Shift Solenoid Valve State and Gear Ratio .

The TCM provides voltage to the solenoid through High Side Driver 2 (HSD2). The TCM uses a second driver to control the solenoid ground circuit. The controlled ground driver reports feedback voltage to the TCM. When the TCM commands the 1-2 shift solenoid valve ON, the voltage of the control circuit should be approximately 0 volts. When the TCM commands the 1-2 shift solenoid valve OFF, the voltage of the control circuit should be approximately system voltage.

When the TCM detects a continuous open or short to ground in the 1-2 shift solenoid valve circuit, then DTC P0973 sets. DTC P0973 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0973 1-2 Shift Solenoid (SS) Control Circuit Low Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P0973 sets when either of the following conditions occurs:

- The TCM detects an open in the 1-2 shift solenoid valve circuit when HSD2 is commanded ON.
- The TCM detects a short to ground in the 1-2 shift solenoid valve circuit when HSD2 is commanded OFF.

Action Taken When the DTC Sets

- Powertrain braking is disabled at the time that the TCM first detects the failure, before the DTC sets.
- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids. When the solenoids are off:
  - The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear. If the transmission is operating in fifth gear, fourth gear may be obtained if the engine is stopped briefly and started again.
  - The line pressure is at maximum.
- The TCM freezes transmission adaptive functions.
- Torque management is inhibited.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0973 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.

- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

5. Listen for an audible click when the solenoid energizes.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Freeze Frame and Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from both the ECM and the TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. Is DTC P0976, P0979 or P2764 also set?	--	Go to Step 3	Go to Step 5
3	Test the ignition 1 voltage circuit of the 1-2 SS valve for an open or a short to ground between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 4
4	**Important:** The condition that affects this circuit may exist in other connecting branches of the circuit. Refer to Power Distribution Schematics for complete circuit distribution. Test the ignition 1 voltage circuit of the 1-2 SS valve for an open or a short to ground between the Automatic transmission inline 20-way connector and the 1-2 SS valve. Refer to Circuit Testing .	--		--

	Did you find the condition?		Go to Step 16	
5	1. Use the scan tool in order to command the 1-2 SS valve ON and OFF 3 times. 2. Listen at the transmission bottom pan. Does the solenoid click when commanded ON and OFF?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 6
6	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Install the J 45681 jumper harness on the engine side of the Automatic transmission inline 20-way connector. 4. Using the J 35616 , connect a test lamp between the ignition 1 voltage and the 1-2 SS valve control circuits of the J 35616 . Refer to Component Connector End Views . 5. Turn ON the ignition, with the engine OFF. 6. Command the 1-2 SS valve ON and OFF three times. Is the test lamp ON when you command the solenoid ON, and OFF when you command the solenoid OFF?	--	Go to Step 10	Go to Step 7
7	Is the test lamp always ON?	--	Go to Step 8	Go to Step 9
8	Test the control circuit of the 1-2 SS valve for a short to ground between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
9	Test the control circuit of the 1-2 SS valve for an open between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
10	1. Turn OFF the ignition. 2. Disconnect the J 45681 from the engine side of the Automatic transmission inline 20-way connector. 3. Install the J 45681 on the transmission side of the Automatic transmission in line 20-way connector. 4. Using the DMM and the J 35616 , measure the resistance between the ignition 1 voltage and the 1-2 SS valve	19-31 Ω		

	control circuits of the J 45681 . Refer to Component Connector End Views . Is the resistance within the specified range?		Go to Step 13	Go to Step 11
11	Is the resistance greater than the specified value?	31 Ω	Go to Step 12	Go to Step 13
12	1. Test the control circuit of the 1-2 SS valve for an open between the Automatic transmission inline 20-way connector and the 1-2 SS valve. 2. Test the ignition 1 voltage circuit of the 1-2 SS valve for an open between the Automatic transmission inline 20-way connector and the 1-2 SS valve. Refer to Testing for Continuity . Did you find a condition?	--	Go to Step 16	Go to Step 17
13	Measure the resistance from the 1-2 SS valve control circuits of the J 45681 to ground. Refer to Component Connector End Views . Is the resistance less than the specified value?	100 Ω	Go to Step 14	Go to Step 15
14	Test the control circuit of the 1-2 SS valve for a short to ground between the Automatic transmission inline 20-way connector and the 1-2 SS valve. Refer to Testing for Short to Ground . Did you find the condition?	--	Go to Step 16	--
15	Measure the resistance between the 1-2 SS valve control circuits and all other terminals, except the 2-3 SS valve control circuit, the TCC PWM solenoid valve control circuit, and the ignition 1 voltage circuit of the J 45681 . Refer to Component Connector End Views . Is the resistance less than the specified value?	100 Ω	Go to Step 16	Go to Step 17
16	Replace the automatic transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement . Did you complete the replacement?	--	Go to Step 19	--
17	Replace the 1-2 SS valve. Refer to 1-2 Shift Solenoid Valve Replacement . Did you complete the replacement?	--	Go to Step 19	--
18	Replace the TCM. Refer to Control Module References for replacement, setup, and programming.	--		--

	Did you complete the replacement?		Go to Step 19	
19	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: - Drive the vehicle in D. - Allow the transmission to obtain a 1-2 upshift. 4. Select Specific DTC. 5. Enter DTC P0973. Has the test run and passed?	--	Go to Step 20	Go to Step 2
20	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

TCC Solenoid Valve Control

The 1-2 shift solenoid valve is located in the control valve body of the transmission. The transmission control module (TCM) selects the required gear by turning the appropriate solenoid ON or OFF, enabling the transmission to shift. Refer to Shift Solenoid Valve State and Gear Ratio .

The TCM provides voltage to the solenoid through High Side Driver 2 (HSD2). The TCM uses a second driver to control the solenoid ground circuit. The controlled ground driver reports feedback voltage to the TCM. When the TCM commands the 1-2 shift solenoid valve ON, the voltage of the control circuit should be approximately 0 volts. When the TCM commands the 1-2 shift solenoid valve OFF, the voltage of the control circuit should be approximately system voltage.

When the TCM detects a continuous short to voltage in the 1-2 shift solenoid valve circuit, then DTC P0974 sets. DTC P0974 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0974 1-2 Shift Solenoid (SS) Control Circuit High Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P0974 sets when the TCM detects a short to voltage in the 1-2 shift solenoid valve circuit.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM inhibits 3-2 downshifts if the vehicle speed is greater than 8 km/h (5 mph).
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0974 in TCM history.

Diagnostic Aids

DTC P 0974 may set when a communication fault exists between the ECM and TCM. Inspect for DTCs U 2100, U 2104, U 2105 and U 2106. If any of these DTCs are present, diagnose them first.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

2. Listen for an audible click when the solenoid energizes.

Step	Action	Value (s)	Yes	No
	Did you perform the Diagnostic System Check -			Go to

1	Vehicle?	--	Go to Step 2	Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** - Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool in order to command the 1-2 shift solenoid ON. Does the solenoid operate?	--	Go to Step 8	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission 20-way inline harness connector. 3. Install the J 45681 jumper harness to the TCM side of the 20-way connector. 4. Turn ON the ignition with the engine OFF. 5. With the test lamp connected to ground, probe the HSD2 circuit, terminal 17, of the J 45681 . Does the test lamp illuminate?	--	Go to Step 4	Go to Step 6
4	1. Turn OFF the ignition. 2. Install the J 45681 to the transmission side of the 20-way connector. 3. Using the DMM, measure the resistance between terminal 17 and 14 of the J 45681 . Refer to Component Resistance . Is the resistance within the specified range?	15.0-20.3Ω	Go to Step 5	Go to Step 7
5	1. Disconnect the TCM. 2. Test the 1-2 solenoid valve control circuit for a short to voltage. Refer to Testing for a Short to Voltage . Did you find a condition?	--	Go to Step 9	Go to Step 8

6	1. Turn OFF the ignition. 2. Disconnect the TCM. 3. Test the HSD2 circuit from the TCM to the 1-2 solenoid for an open circuit. Refer to Testing for Continuity . Did you find a condition?	--	Go to Step 9	Go to Step 8
7	1. Remove the transmission oil pan. 2. Test the 1-2 shift solenoid wiring from the 20-way connector to the 1-2 shift solenoid connector for a short to voltage. Refer to Testing for Short to Ground . Did you find a condition?	--	Go to Step 10	Go to Step 11
8	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 12	--
9	Perform the necessary wiring repairs. Refer to Wiring Repairs . Is the action complete?	--	Go to Step 12	--
10	Replace the Automatic transmission internal transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement . Is the action complete?	--	Go to Step 12	--
11	Replace the 1-2 shift solenoid valve. Refer to 1-2 Shift Solenoid Valve Replacement . Is the action complete?	--	Go to Step 12	--
12	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn ON the ignition, with the engine OFF. 4. Select Specific DTC. 5. Enter DTC P0974. Has the test run and passed?	--	Go to Step 13	Go to Step 2

TCC Solenoid Valve Control

The 2-3 shift solenoid valve is located in the control valve body of the transmission. The transmission control module (TCM) selects the required gear by turning the appropriate solenoid ON or OFF, enabling the transmission to shift. Refer to Shift Solenoid Valve State and Gear Ratio .

The TCM provides voltage to the solenoid through High Side Driver 2 (HSD2). The TCM uses a second driver to control the solenoid ground circuit. The controlled ground driver reports feedback voltage to the TCM. When the TCM commands the 2-3 shift solenoid valve ON, the voltage of the control circuit should be approximately 0 volts. When the TCM commands the 2-3 shift solenoid valve OFF, the voltage of the control circuit should be approximately system voltage.

When the TCM detects a continuous open or short to ground in the 2-3 shift solenoid valve circuit, then DTC P0976 sets. DTC P0976 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0976 2-3 Shift Solenoid (SS) Control Circuit Low Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P0976 sets when either of the following conditions occurs:

- The TCM detects an open in the 2-3 shift solenoid valve circuit when HSD2 is commanded ON.
- The TCM detects a short to ground in the 2-3 shift solenoid valve circuit when HSD2 is commanded OFF.

Action Taken When the DTC Sets

- Powertrain braking is disabled at the time that the TCM first detects the failure, before the DTC sets.
- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids. When the solenoids are off:
  - The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear. If the transmission is operating in fifth gear, fourth gear may be obtained if the engine is stopped briefly and re-started.
  - The TCM commands maximum line pressure.
  - The TCM freezes transmission adaptive functions.
- Torque management is inhibited.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0976 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The 4-5 shift solenoid valve is located in the control valve body of the transmission. The transmission control module (TCM) selects the required gear by turning the appropriate solenoid ON or OFF, enabling the transmission to shift. Refer to Shift Solenoid Valve State and Gear Ratio .

The TCM provides voltage to the solenoid through High Side Driver 2 (HSD2). The TCM uses a second driver to control the solenoid ground circuit. The controlled ground driver reports feedback voltage to the TCM. When the TCM commands the 4-5 shift solenoid valve ON, the voltage of the control circuit should be approximately 0 volts. When the TCM commands the 4-5 shift solenoid valve OFF, the voltage of the control circuit should be approximately system voltage.

When the TCM detects a continuous open or short to ground in the 4-5 shift solenoid valve circuit, then DTC P0979 sets. DTC P0979 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P0979 4-5 Shift Solenoid (SS) Control Circuit Low Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P0979 sets when one of the following conditions occurs:

- The TCM detects an open in the 4-5 shift solenoid valve circuit when HSD2 is commanded ON.
- The TCM detects a short to ground in the 4-5 shift solenoid valve circuit when HSD2 is commanded OFF.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids. When the solenoids are off:
  - The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear. If the transmission is operating in fifth gear, fourth gear may be obtained if the engine is stopped briefly and started again.
  - The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P0979 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

2. Listen for an audible click when the solenoid energizes.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool in order to command the 4-5 shift solenoid ON. Does the solenoid operate?	--	Go to Step 9	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission 20-way inline harness connector. 3. Install the J 45681 to the TCM side of the 20-way connector. 4. Turn ON the ignition with the engine OFF. 5. With the test lamp connected to ground, probe the HSD2 circuit, terminal 17, of the J 45681 . Does the test lamp illuminate?	--	Go to Step 4	Go to Step 7
4	1. Turn OFF the ignition. 2. Install the J 45681 to the transmission side of the 20-way connector. 3. Using the DMM, measure the resistance between terminal 17 and 5 of the J 45681 . Refer to Component Resistance . Is the resistance within the specified range?	15.0-20.3Ω	Go to Step 5	Go to Step 8

5	Using the DMM, measure the resistance between terminal 17 of the J 45681 and ground. Is the resistance greater than the specified value?	50K Ω	Go to Step 6	Go to Step 8
6	1. Disconnect the TCM. 2. Test the 4-5 solenoid valve control circuit for the following conditions: • Open circuit • Short to ground • Refer to Testing for Continuity and Testing for Short to Ground . Did you find a condition?	--	Go to Step 10	Go to Step 9
7	1. Turn OFF the ignition. 2. Disconnect the TCM. 3. Test the HSD2 circuit from the TCM to the 4-5 solenoid for an open circuit. Refer to Testing for Continuity . Did you find a condition?	--	Go to Step 10	Go to Step 9
8	1. Remove the transmission oil pan. 2. Test the 4-5 shift solenoid wiring from the 20-way connector to the 4-5 shift solenoid connector for the following conditions: • Open circuit • Short to ground • Refer to Testing for Continuity and Testing for Short to Ground . Did you find a condition?	--	Go to Step 11	Go to Step 12
9	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 13	--
10	Perform the necessary wiring repairs. Refer to Wiring Repairs . Is the action complete?	--	Go to Step 13	--
11	Replace the Automatic transmission internal transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement .	--		--

	Is the action complete?		Go to Step 13	
12	Replace the 4-5 shift solenoid valve. Refer to 4-5 Shift Solenoid Valve Replacement . Is the action complete?	--	Go to Step 13	--
13	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn ON the ignition, with the engine OFF. 4. Select Specific DTC. 5. Enter DTC P0979. Has the test run and passed?	--	Go to Step 14	Go to Step 2
14	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P0980

DTC Descriptor

DTC B0980 00: Transmission Sports Switch Circuit Short to Ground

Circuit/System Description

The body control module (BCM) controls the.

Conditions for Running the DTC

The DTC can only set only when the output is actively being requested by the BCM.

Conditions for Setting the DTC

The BCM detects a short to ground, open, or short to voltage in the horn relay control circuit for approximately 125 milliseconds.

Action Taken When the DTC Sets

The BCM disables the output to the horn relay until the next ignition cycle.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

Reference Information

Electrical Information Reference

- Circuit Testing
- Wiring Repairs

Scan Tool Reference

Control Module References

Circuit/System Testing

1. Ignition OFF, disconnect the A15 harness connector at the S73 Power/Economy Switch.
2. Ignition ON, test for 12 volts between circuit terminal J-220 and ground.

If less than the specified range, test the reference circuit for a short to ground. If the circuit tests normal, replace the S73 Power/Economy Switch.

If greater than the specified range, test the reference circuit for a short to voltage. If the circuit tests normal, replace the A15 Body Control Module.

3. If all circuits test normal, test the S73 Power/Economy Switch.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 2034987**

DTC P1793

Circuit Description

The engine control module (ECM) sends wheel speed data to the transmission control module (TCM). The data is sent to the TCM through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P1793 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P1793.

When the TCM receives invalid wheel speed data from the ECM, then DTC P1793 will set.
DTC P1793 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1793 Wheel Speed Signal

Conditions for Running the DTC

- The engine run time is at least 6 seconds.
- No other GMLAN errors are present.

Conditions for Setting the DTC

The TCM receives no valid wheel speed data from the ECM for 2 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM inhibits Autograde braking.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P1793 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No

1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** Record all Failure Records before clearing the DTC. Using Clear Info erases the Failure Records from the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 3
3	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start, and allow the engine to idle. Did DTC P1793 reset?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 5
5	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 6	--
6	Perform the following operation to verify the repair: 1. Select DTC on the scan tool. 2. Select Clear Info. 3. Start, and allow the engine to idle. 4. Select Specific DTC. 5. Enter DTC P1793. Has the test run and passed?	--	Go to Step 7	Go to Step 2
7	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P1815

Engine Control Module (ECM)

The transmission manual shift shaft switch assembly is a sliding contact switch attached to the control valve body within the transmission. The four inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission selector lever. This information is used for engine controls as well as determining the transmission shift patterns. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The IMS input parameters represented are transmission range Signal A , Signal B, Signal C and Signal P (Parity).

If the TCM detects an invalid switch state while the engine is being started, then DTC P1815 sets. DTC P1815 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1815 Transmission Fluid Pressure (TFP) Valve Position Switch - Start in Wrong Range

Conditions for Running the DTC

- No OSS DTC P0722 or P0723.
- The transmission output shaft speed is less than 100 RPM.

Conditions for Setting the DTC

The manual shift shaft switch assembly indicates a transitional state during the following sequence:

- The engine speed is less than 60 RPM for more than 0.25 second, then,
- The engine speed is 81-625 RPM for more than 0.15 seconds, then,
- The engine speed is greater than 651 RPM for more than 1.5 seconds, then,
- The transmission input shaft speed is greater than 200 RPM for more than 1.5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM assumes a D5 shift pattern.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1815 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without

a non emission related diagnostic fault occurring.

- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. All HI values, in both Park and Drive 5, indicate the ground circuit is OPEN.

5. With the transmission 20-way connector disconnected, all IMS values should indicate HI.

7. If one circuit affects the other, this indicates a short between the two circuits.

13. This step tests the internal transmission harness. If no fault is found in the harness, the fault will be in the switch.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Select Transmission Data on the scan tool. 6. Select IMS range on the scan tool. 7. Place the gear select lever in PARK, then move to NEUTRAL. Does each range selected match the scan tool IMS range display?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3

3	1. Select IMS A/B/C/P on the scan tool. 2. Place the gear select lever in PARK, then move to D5. Does the scan tool IMS A/B/C/P display indicate the specified value for each range?	HI/HI/HI/HI	Go to Step 14	Go to Step 4
4	1. Inspect the transmission linkage from the range selector to the manual shift shaft for proper adjustment. 2. Adjust the linkage as necessary. Refer to Manual Shift Shaft Position Switch Replacement . Did the linkage require adjustment?	--	Go to Step 19	Go to Step 5
5	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. 4. Select IMS A/B/C/P on the scan tool. Does the scan tool IMS A/B/C/P display all HI?	--	Go to Step 6	Go to Step 10
6	1. Turn OFF the ignition. 2. Install the J 45681 jumper harness on the TCM side of the Automatic transmission inline 20-way connector. 3. Turn ON the ignition, with the engine OFF. 4. Using the DMM and the J 35616 Holden terminal test kit, measure the voltage at the Transmission Range (TR) signal A circuit of the J 45681 . Refer to Component Connector End Views. 5. Measure the voltage at the TR signal B circuit of the J 45681 . 6. Measure the voltage at the TR signal C circuit of the J 45681 . 7. Measure the voltage at the TR signal P circuit of the J 45681 .	--		

	Did you measure ignition voltage at all four terminals?		Go to Step 7	Go to Step 11
7	Install a fused jumper wire from the TR signal A circuit of the J 45681 to ground while monitoring the scan tool IMS A/B/C/P display. Refer to Component Connector End Views. When the TR signal A circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 8
8	Install a fused jumper wire from the TR signal B circuit of the J 45681 to ground while monitoring the scan tool IMS A/B/C/P display. Refer to Component Connector End Views. When the TR signal B circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 9
9	Install a fused jumper wire from the TR signal C circuit of the J 45681 to ground while monitoring the scan tool IMS A/B/C/P display. Refer to Component Connector End Views. When the TR signal C circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 13
10	Test the TR signal circuits of the transmission manual shift shaft switch assembly that did not indicate HI for a short to ground between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
11	Test the TR signal circuits of the transmission manual shift shaft switch assembly that did not indicate ignition voltage for an open between the TCM and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Wiring Repairs.	--		

	Did you find and correct the condition?		Go to Step 19	Go to Step 18
12	Test the affected TR signal circuits of the transmission manual shift shaft switch assembly for a shorted together condition between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
13	Test the TR signal circuits of the transmission manual shift shaft switch assembly for an open or shorted condition between the Automatic transmission inline 20-way connector and the switch. Refer to Testing for Continuity. Did you find the condition?	--	Go to Step 16	Go to Step 17
14	Test the ground circuit of the transmission manual shift shaft switch assembly for an open between the Automatic transmission inline 20-way connector and the chassis. Refer to Testing for Continuity and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 19	Go to Step 15
15	Test the ground circuit of the transmission manual shift shaft switch assembly for an open between the Automatic transmission inline 20-way connector and the switch. Refer to Testing for Continuity. Did you find the condition?	--	Go to Step 16	Go to Step 17
16	Replace the automatic transmission wiring harness assembly. Refer to Transmission Internal Electrical Harness Replacement. Did you complete the replacement?	--	Go to Step 19	--
	Replace the transmission manual shift shaft switch assembly.			

17	Refer to Manual Shift Shaft Position Switch Replacement. Is the action complete?	--	Go to Step 19	--
18	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 19	--
19	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start the engine in PARK. 4. Turn OFF the ignition. 5. Start the engine in NEUTRAL. 6. Select Specific DTC. 7. Enter DTC P1815. Has the test run and passed?	--	Go to Step 20	Go to Step 2
20	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Engine Control Module (ECM)

The transmission manual shift shaft switch assembly is a sliding contact switch attached to the lower control valve body within the transmission. The 4 inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission selector lever. This information is used for engine controls as well as determining the transmission shift patterns. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The 4 IMS input parameters represented are Signal A , Signal B, Signal C and Signal P (Parity).

If the TCM detects a short to ground on the IMS Signal A, then DTC P1820 sets. DTC P1820 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1820 Internal Mode Switch A Circuit Low Voltage

Conditions for Running the DTC

- No engine torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The engine torque is greater than 55 N·m (41 lb. ft).

Conditions for Setting the DTC

- The switch indicates PARK for 1 second, then;
- The switch indicates a transitional state between D4 and D3 for at least 4 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM assumes a D5 shift pattern.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1820 in TCM history during the second consecutive trip in which the Conditions for Setting the DTC are met.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step determines if the fault is internal or external to the transmission.
4. This step determines if the engine wiring harness circuit or the TCM is at fault.
5. This step determines if the automatic transmission wiring harness or the IMS is at fault.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Select Transmission Data on the scan tool. 6. Select IMS range on the scan tool. 7. Place the gear select lever in D5. Does the scan tool IMS range display Drive 5?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. 4. Select IMS A/B/C/P on the scan tool. Does the scan tool IMS Signal A display LOW?	--	Go to Step 4	Go to Step 5
4	Test the TR signal A circuit of the switch for a short to ground between the TCM connector and the Automatic transmission inline 20-way connector.	--		

	Refer to Testing for Short to Ground and Wiring Repairs. Did you find and correct the condition?		Go to Step 9	Go to Step 8
5	1. Turn OFF the ignition. 2. Connect the Automatic transmission inline 20-way connector. 3. Disconnect the automatic transmission wiring harness at the transmission manual shift shaft switch assembly. 4. Turn ON the ignition, with the engine OFF. 5. Select IMS A/B/C/P on the scan tool. Is the IMS Signal A displaying LOW?	--	Go to Step 6	Go to Step 7
6	Replace the automatic transmission internal wiring harness. Refer to Transmission Internal Electrical Harness Replacement. Is the action complete?	--	Go to Step 9	--
7	Replace the transmission manual shift shaft switch assembly. Refer to Manual Shift Shaft Position Switch Replacement. Is the action complete?	--	Go to Step 9	--
8	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 9	--
9	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Drive the vehicle in D4. • The engine torque is greater than 55 N·m (41 lb. ft). • IMS Signal A must be HI for 0.025 second. 4. Select Specific DTC. 5. Enter DTC P1820.	--		

	Has the test run and passed?		Go to Step 10	Go to Step 2
10	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Engine Control Module (ECM)

The transmission manual shift shaft switch assembly is a sliding contact switch attached to the control valve body, within the transmission. The 4 inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission selector lever. This information is used for engine controls as well as determining the transmission shift patterns. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The 4 IMS input parameters represented are Signal A , Signal B, Signal C and Signal P (Parity).

If the TCM detects an open in the TR signal B circuit, DTC P1822 sets. DTC P1822 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1822 Internal Mode Switch B Circuit High Voltage

Conditions for Running the DTC

- No engine torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The engine torque is greater than 55 N·m (41 lb. ft).

Conditions for Setting the DTC

- The switch indicates PARK for 1 second, then;
- The switch indicates a transitional state between D2 and D3 for 4 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM assumes a D5 shift pattern.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1822 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step determines if the fault is internal or external to the transmission.

4. This step determines if the engine wiring harness circuit is at fault or the TCM.

5. This step determines if the automatic transmission wiring harness or transmission manual shift shaft switch assembly is at fault.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Select Transmission Data on the scan tool. 6. Select IMS range on the scan tool. 7. Place the gear select lever in D5. Does the scan tool IMS range display Drive 5?	--	Go to Testing for Intermittent Conditions and Poor Connections.	Go to Step 3
	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Install the J 45681 jumper harness on the TCM side of the Automatic transmission inline 20-way connector. 4. Using the J 35616 Holden-terminal test			

3	kit, connect a fused jumper wire from the TR signal B circuit of the J 45681 to ground. Refer to Component Connector End Views. 5. Turn ON the ignition, with the engine OFF. 6. Select IMS A/B/C/P on the scan tool. Is IMS Signal B displaying LOW?	--	Go to Step 5	Go to Step 4
4	Test the TR signal B circuit of the switch for an open between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Wiring Repairs. Did you find and correct the condition?	--	Go to Step 9	Go to Step 8
5	Test the TR signal B circuit of the switch for an open between the Automatic transmission inline 20-way connector and the transmission manual shift shaft switch assembly. Refer to Testing for Continuity. Did you find the condition?	--	Go to Step 6	Go to Step 7
6	Replace the automatic transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement. Is the action complete?	--	Go to Step 9	--
7	Replace the transmission manual shift shaft switch assembly. Refer to Manual Shift Shaft Position Switch Replacement. Is the action complete?	--	Go to Step 9	--
8	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 9	--
	Perform the following procedure in order to verify the repair:			

9	1. Select DTC. 2. Select Clear Info. 3. Operate the vehicle under the following conditions: • Drive the vehicle in D5. • The engine torque is greater than 55 N·m (41 lb. ft). • IMS Signal B must be LOW for 0.025 second. 4. Select Specific DTC. 5. Enter DTC P1822. Has the test run and passed?	--	Go to Step 10	Go to Step 2
10	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

Engine Control Module (ECM)

The transmission manual shift shaft switch assembly is a sliding contact switch attached to the control valve body within the transmission. The 4 inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission selector lever. This information is used for engine controls as well as determining the transmission shift patterns. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The 4 IMS input parameters represented are Signal A , Signal B, Signal C and Signal P (Parity).

If the TCM detects a short to ground on the TR signal P circuit, DTC P1823 sets. DTC P1823 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1823 Internal Mode Switch P Circuit Low Voltage

Conditions for Running the DTC

- No engine torque signal DTC P2637.
- The engine run time is greater than 5 seconds.
- The engine torque is greater than 55 N·m (41 lb. ft).

Conditions for Setting the DTC

- The switch indicates PARK for 1 second, then;
- The switch indicates a transitional state between Neutral and D5 for 5 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM assumes a D5 shift pattern.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1823 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step determines if the fault is internal or external to the transmission.

4. This step determines if the engine wiring harness circuit or the TCM is at fault.
5. This step determines if the automatic transmission wiring harness or the transmission manual shift shaft switch assembly is at fault.

Transmission Range Switch Signal P	LOW	LOW	HI	HI
HI = 12 volts				

LOW = 0 volts

Circuit / System Description

The internal mode switch (IMS) assembly is a sliding contact switch attached to the control valve body within the transmission. The four inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission manual shaft. The input voltage at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The IMS input parameters represented are transmission range signal A, Signal B, signal C, and signal P.

Conditions for Running the DTC

No OSS DTCs P0722 or P0723.

DTC P1825

VSS is greater than 16 km/h (10 mph)

DTC P1915

The transmission output shaft speed is less than 90 RPM.

Conditions for Setting the DTC

DTC P1825

Any one or more of the following conditions:

- The IMS signal circuit A, B, or P are Low in Park for greater than 1 second.
- The IMS signal circuit A is Low in D6 for 8 seconds.
- The IMS signal circuit C is High in D6 for 8 seconds.
- The TCM detects an invalid range from the IMS for 3.25 seconds.
- The IMS signal circuit C is high in D6 for greater than 8 seconds and the engine torque is greater than 20 N·m (15 lb ft).
- Park/Neutral Switch equals P/N and the IMS state is not Park or Neutral, or the Park/Neutral switch is not Park or Neutral and the IMS state equals Park or Neutral for 4 seconds.

DTC P1915

The manual shift shaft switch assembly indicates a transitional state during the following sequence:

- The engine speed is less than 50 RPM for more than 0.25 seconds.
- The engine speed is 50-480 RPM for more than 0.07 seconds.
- The engine speed is greater than 525 RPM for more than 3.25 seconds.
- The transmission input shaft speed is greater than 250 RPM.

Action Taken When the DTC Sets

- DTCs P1825 and P1915 are Type A DTCs.
- The TCM commands maximum line pressure.
- The TCM turns OFF all solenoids.
- The TCM freezes transmission adaptive functions.
- The TCM defaults the transmission to third gear if the current gear is 1st, 2nd, or 3rd; or fifth gear if the current gear is 4th, 5th, or 6th gear.

Conditions for Clearing the DTC

DTCs P1825 and P1915 are Type A DTCs.

Diagnostic Aids

The IMS is part of a wire harness, which connects electrically to the control solenoid (w/body and TCM) valve assembly and is serviced separately from the control solenoid (w/body and TCM) valve assembly. Inspect the IMS, harness, connector, and control solenoid (w/body and TCM) valve assembly pins for metallic debris. Use the J 35616 for any test that requires probing the control solenoid (w/body and TCM) valve assembly harness connector or a component harness connector.

Circuit/System Verification

Test for the correct operation of the IMS. Refer to Transmission Internal Mode Switch Logic .

If the IMS operation matches the IMS logic table, the system is functioning normally.

Circuit/System Testing

1. Disconnect the IMS connector at the control solenoid (w/body and TCM) valve assembly. Ignition ON. The scan tool IMS A/B/C/P parameter should display HI for all four signal circuits.

   If a signal circuit displays LOW, the control solenoid (w/body and TCM) valve assembly is faulty.
2. Connect a 3-amp fused jumper wire between each transmission range signal circuit at the control solenoid (w/body and TCM) valve assembly and ground ensuring that the signal circuit displays LOW when connected to ground.

   If a signal circuit remains HI when connected to ground, the control solenoid (w/body and TCM) valve assembly is faulty.

   If the above two tests indicate correct TCM functions, the IMS is faulty.

Component Testing

Internal Mode Switch Logic Table

Gear Selector Position	A	B	C	P
Park	LOW	HI	HI	LOW
Park/Reverse	LOW	LOW	HI	LOW
Reverse	LOW	LOW	HI	HI
Reverse/Neutral	HI	LOW	HI	HI
Neutral	HI	LOW	HI	LOW

Invalid	HI	HI	HI	HI
	LOW	HI	HI	HI
	HI	HI	HI	LOW

HI = Ignition voltage

LOW = 0 voltage

Repair Instructions

Important: Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Important: Perform the Control Solenoid Valve and Transmission Control Module Assembly Inspection for the following components before replacing the components.

- Internal Mode Switch (IMS) Replacement. Refer to Manual Shift Shaft Position Switch Replacement .
- Control Solenoid (w/Body and TCM) Valve Assembly Replacement. Refer to Control Module References for replacement, setup, and programming.
- Perform the Service Fast Learn Adapts .

Engine Control Module (ECM)

The transmission manual shift shaft switch assembly is a sliding contact switch attached to the control valve body within the transmission. The 4 inputs to the transmission control module (TCM) from the switch indicate which position is selected by the transmission selector lever. This information is used for engine controls as well as determining the transmission shift patterns. The input voltage level at the TCM is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as IMS. The 4 IMS input parameters represented are Signal A, Signal B, Signal C and Signal P (Parity).

If the TCM detects switch Signal C is high while the vehicle is being driven in a forward gear, then DTC P1826 sets. DTC P1826 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1826 Internal Mode Switch C Circuit High Voltage

Conditions for Running the DTC

- No OSS DTCs P0722 or P0723.
- No engine torque signal DTC P2637.
- Vehicle speed is greater than 8 km/h (5 mph).
- Engine torque is greater than 20 N·m (15 lb. ft).
- DTC P1826 has not passed during the current ignition cycle.
- The gear ratio is within one of the following ranges:
  - 3.33:1 to 3.50:1 for first gear
  - 2.16:1 to 2.27:1 for second gear
  - 1.56:1 to 1.64:1 for third gear
  - 0.98:1 to 1.03:1 for fourth gear
  - 0.73:1 to 0.77:1 for fifth gear

Conditions for Setting the DTC

The TCM detects Signal C is high, while the gear ratio indicates first, second, third, fourth, or fifth gear for 3 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM assumes a D5 shift pattern.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1826 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

3. This step tests the integrity of the engine harness and TCM by checking for the Signal C state change from HI to LOW. A LOW signal indicates the fault is in the internal transmission harness or the switch. A HI signal indicates the fault is in the engine harness or the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** - Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Select Transmission Data on the scan tool. 6. Select IMS range on the scan tool. 7. Place the range selector in D5. Does the scan tool IMS range indicate	--	Go to Testing for Intermittent Conditions and	

	Drive 5?		Poor Connections	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. Additional DTCs may set. 3. Install the J 45681 jumper harness on the TCM side of the Automatic transmission inline 20-way connector. 4. Using the J 35616 Holden-terminal test kit, connect a fused jumper wire from terminal 19 of the J 45681 to ground. Refer to Component Connector End Views . 5. Turn ON the ignition, with the engine OFF. 6. Select IMS A/B/C/P on the scan tool. Does IMS Signal C indicate LOW?	--	Go to Step 5	Go to Step 4
4	Test the TR signal C circuit of the transmission manual shift shaft switch assembly for an open between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Wiring Repairs. Did you find and correct a condition?	--	Go to Step 9	Go to Step 8
5	Test the TR signal C circuit of the transmission manual shift shaft switch assembly for an open between the Automatic transmission inline 20-way connector and the switch. Refer to Testing for Continuity. Did you find the condition?	--	Go to Step 6	Go to Step 7
6	Replace the automatic transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement. Is the action complete?	--	Go to Step 9	--
7	Replace the transmission manual shift shaft switch assembly. Refer to Manual Shift Shaft Position Switch Replacement.	--		--

	Is the action complete?		Go to Step 9	
8	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 9	--
9	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start and idle the engine in PARK. 4. Observe IMS A/B/C/P on the scan tool. 5. Move the range selector to D2, D3, D4 and D5 positions. Ensure that IMS Signal C indicates LOW for each range. 6. Operate the vehicle to greater than 8 km/h (5 mph). 7. Select Specific DTC. 8. Enter DTC P1826. Has the test run and passed?	--	Go to Step 10	Go to Step 2
10	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

PC Solenoid Valve Low Control

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the TCC PWM solenoid through two separate solid-state devices called High Side Drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to make sure that it is functioning properly.

When the TCM detects a short to ground on HSD1, then DTC P1831 sets. DTC P1831 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1831 Pressure Control (PC)/Shift Lock Solenoid Control Circuit Low Voltage

Conditions for Running the DTC

The engine run time is greater than 5 seconds.

Conditions for Setting the DTC

The TCM detects a short to ground on the HSD1 circuit when the HSD1 is commanded ON.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- SERVICE VEHICLE SOON displays on the driver information centre (DIC).
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P1831 in TCM history.

Conditions for Clearing the DTC/DIC

- The TCM clears the DIC when the condition no longer exists.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM and the TCM Failure Records. Using the Clear Info function erases the Failure Records from the ECM and TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds.	--		Go to Testing for

	6. Start the engine. Did DTC P1831 reset?		Go to Step 3	Intermittent Conditions and Poor Connections
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission inline 20-way connector. 3. Turn ON the ignition with the engine OFF. 4. Clear the DTC. 5. Turn OFF the ignition for at least 30 seconds. 6. Start the engine. Additional DTCs may set. Did DTC P1831 reset?	--	Go to Step 4	Go to Step 5
4	1. Disconnect the TCM. 2. Test the HSD1 circuit between the Automatic transmission inline 20-way connector and the TCM for a short to ground. Refer to Testing for Short to Ground. Did you find a condition?	--	Go to Step 8	Go to Step 7
5	Test the HSD1 circuit between the Automatic transmission inline 20-way connector and the pressure control solenoid for a short to ground. Refer to Testing for Short to Ground. Did you find a condition?	--	Go to Step 9	Go to Step 6
6	Replace the shorted pressure control solenoid. Refer to Pressure Control Solenoid Valve Replacement. Is the action complete?	--	Go to Step 10	--
7	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 10	--
8	Repair the short to ground on the HSD1 circuit. Refer to Wiring Repairs. Is the action complete?	--	Go to Step 10	--
	Replace the internal transmission electrical harness.			

9	Refer to Transmission Internal Electrical Harness Replacement. Is the action complete?	--	Go to Step 10	--
10	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start the engine. 4. Select Specific DTC. 5. Enter DTC P1831. Has the test run and passed?	--	Go to Step 11	Go to Step 2
11	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

PC Solenoid Valve Low Control

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the TCC PWM solenoid through two separate solid-state devices called High Side Drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to make sure that it is functioning properly.

When the TCM detects a short to voltage on HSD1, then DTC P1832 sets. DTC P1832 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1832 Pressure Control (PC)/Shift Lock Solenoid Control Circuit High Voltage

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The TCM detects at least 6.4 volts at the HSD1 terminal prior to commanding the HSD1 ON.

Action Taken When the DTC Sets

- The TCM does not request the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL).
- SERVICE VEHICLE SOON displays on the driver information centre (DIC).
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- The TCM stores DTC P1832 in TCM history.

Conditions for Clearing the DTC/DIC

- The TCM clears the DIC when the condition no longer exists.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non-emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

TCC Solenoid Valve Control

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the TCC PWM solenoid through two separate solid-state devices called High Side Drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to make sure that it is functioning properly.

When the TCM detects a short to ground on HSD2, then DTC P1833 sets. DTC P1833 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1833 Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit Low Voltage

Conditions for Running the DTC

The engine run time is greater than 5 seconds.

Conditions for Setting the DTC

The TCM detects a short to ground on the HSD2 circuit when the HSD2 is commanded ON.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The TCM commands maximum line pressure.
- The TCC is disabled.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1833 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle

TCC Solenoid Valve Control

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the TCC PWM solenoid through two separate solid-state devices called High Side Drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to make sure that it is functioning properly.

When the TCM detects a short to voltage on HSD2, then DTC P1834 sets. DTC P1834 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1834 Torque Converter Clutch (TCC)/Shift Solenoid (SS) Control Circuit High Voltage

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The TCM detects at least 6.4 volts at the HSD2 terminal prior to commanding the HSD2 ON.

Action Taken When the DTC Sets

- The TCM requests the engine control module (ECM) to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The TCM commands maximum line pressure.
- The TCC is disabled.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P1834 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

DTC P1876

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

Circuit Description

The TAP Shift system allows the driver to manually shift gears by using the Upshift and Downshift positions located on the automatic transmission shift Lever. Pushing the lever to the Upshift position will command an upshift and pushing the lever to the Downshift position will command a downshift. The TAP Shift system is activated when the gear selector is in the manual, M, position and is deactivated in all other positions.

If the TCM detects TAP enable switch Active and the IMS does not indicate D5, DTC P1876 sets. DTC P1876 is a type C DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P1876 Up and Down Shift Switch Performance - Range Switch Not in D3

Conditions for Running the DTC

- No TAP system DTCs P0815, P0816 or P0826.
- No IMS range DTCs P1815, P1820, P1822, P1823, P1825 or P1826.
- The engine run time is greater than 5 seconds.
- No GMLAN errors present.

Conditions for Setting the DTC

The TCM detects the TAP enable switch is Active and the IMS range is not D for 5 seconds.

Action Taken When the DTC Sets

- The TCM does not request the ECM to illuminate the malfunction indicator lamp (MIL).
- The TCM disables TAP Shift operation.
- The TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information a Failure Record.
- The TCM stores DTC P1876 in TCM history.

Conditions for Clearing the DTC

- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value(s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. **Important:** Before clearing the DTC, use the scan tool in order to record the Failure Records. Using the Clear DTC Information function erases the Failure Records from the TCM. 3. Record the DTC Failure Records. 4. Clear the DTC. 5. Start the engine. 6. Move the A/T shift lever to the Manual position. 7. Select IMS on the scan tool. Does the scan tool IMS parameter display Drive 5?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	1. Select IMS A/B/C/P on the scan tool. 2. Place the gear select lever in the Manual position. Does the scan tool IMS A/B/C/P display indicate the specified value for each range?	HI/HI/HI/HI	Go to Step 14	Go to Step 4
4	1. Inspect the transmission linkage from the range selector to the manual shift shaft for proper adjustment. 2. Adjust the linkage as necessary. Refer to Manual Shift Shaft Position Switch Replacement . Did the linkage require adjustment?	--	Go to Step 19	Go to Step 5
	1. Turn OFF the ignition. 2. Disconnect the Automatic			

5	transmission inline 20-way connector. Additional DTCs may set. 3. Turn ON the ignition, with the engine OFF. 4. Select IMS A/B/C/P on the scan tool. Does the scan tool IMS A/B/C/P display all HI?	--	Go to Step 6	Go to Step 10
6	1. Turn OFF the ignition. 2. Install the J 45681 jumper harness on the TCM side of the Automatic transmission inline 20-way connector. 3. Turn ON the ignition, with the engine OFF. 4. Using the DMM and the J 35616 Holden terminal test kit, measure the voltage at the transmission range (TR) signal A circuit of the J 45681 . Refer to Component Connector End Views . 5. Measure the voltage at the TR signal B of the J 45681 . 6. Measure the voltage at the TR signal C of the J 45681 . 7. Measure the voltage at the TR signal P of the J 45681 . Did you measure ignition voltage at all four terminals?	--	Go to Step 7	Go to Step 11
7	Install a fused jumper wire from the TR signal A circuit of the J 45681 to ground while monitoring the scan tool IMS A/B/C/P display. Refer to Component Connector End Views . When the TR signal A circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 8
8	Install a fused jumper wire from the TR signal B circuit of the J 45681 to ground while monitoring the scan tool IMS A/B/C/P display. Refer to Component Connector End Views . When the TR signal B circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 9
	Install a fused jumper wire from the TR signal C circuit of the J 45681 to ground while monitoring the scan tool IMS			

9	A/B/C/P display. Refer to Component Connector End Views . When the TR signal C circuit is grounded, do any other circuits indicate LOW?	--	Go to Step 12	Go to Step 13
10	Test the TR signal circuits of the transmission manual shift shaft switch assembly that did not indicate HI for a short to ground between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Short to Ground and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
11	Test the TR signal circuits of the transmission manual shift shaft switch assembly that did not indicate ignition voltage for an open between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Testing for Continuity and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
12	Test the affected signal circuits of the transmission manual shift shaft switch assembly for a shorted together condition between the TCM connector and the Automatic transmission inline 20-way connector. Refer to Circuit Testing and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 18
13	Test the TR signal circuits of the transmission manual shift shaft switch assembly for an open or shorted condition between the Automatic transmission inline 20-way connector and the switch. Refer to Testing for Continuity . Did you find and correct the condition?	--	Go to Step 16	Go to Step 17
	Test the ground circuit of the transmission manual shift shaft switch assembly for an open between the Automatic transmission			

14	inline 20-way connector and the chassis. Refer to Testing for Continuity and Wiring Repairs . Did you find and correct the condition?	--	Go to Step 19	Go to Step 15
15	Test the ground circuit of the transmission manual shift shaft switch assembly for an open between the Automatic transmission inline 20-way connector and the switch. Refer to Testing for Continuity . Did you find and correct the condition?	--	Go to Step 16	Go to Step 17
16	Replace the automatic transmission wiring harness assembly. Refer to Transmission Internal Electrical Harness Replacement . Did you complete the replacement?	--	Go to Step 19	--
17	Replace the transmission manual shift shaft switch assembly. Refer to Manual Shift Shaft Position Switch Replacement . Is the action complete?	--	Go to Step 19	--
18	Replace the TCM. Refer to Control Module References for replacement, setup and programming. Is the action complete?	--	Go to Step 19	--
19	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Start the engine. 4. Place the A/T Shift Lever in the Manual position. 5. Select Specific DTC. 6. Enter DTC P1876. Has the test run and passed?	--	Go to Step 20	Go to Step 2
20	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P2534

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category

DTC Descriptor

DTC P2534: Ignition 1 Switch Circuit Low Voltage

Circuit/System Description

The transmission control module (TCM) samples the system voltage on the Ignition 1 voltage circuit every 0.1 seconds. Lower than normal voltage may be inadequate to operate the transmission control solenoids properly. Improper solenoid operation may cause erratic transmission operation, which may result in internal damage.

Conditions for Running the DTC

- The engine speed is greater than 500 RPM.
- Ignition voltage is between 8-18 volts.

Conditions for Setting the DTC

The TCM detects 2 volts or less on the ignition 1 voltage circuit at the TCM for 10 seconds or more.

Action Taken When the DTC Sets

- DTC P2534 is a Type A DTC.
- The TCM turns OFF all high side drivers.
- The TCM turns OFF all solenoids.
- The TCM commands maximum line pressure.
- the TCM freezes transmission adaptive functions.
- The TCM commands the TCC OFF.
- The TCM allows the vehicle to operate in transmission protection mode.

Conditions for Clearing the DTC

DTC P2534 is a Type A DTC.

Diagnostic Aids

If all circuit tests are OK, make sure the transmission pass through connector and harness terminals are clean and not damaged, and the charging system is functioning correctly.

Reference Information

Schematic Reference

Automatic Transmission Controls Schematics .

Connector End View Reference

Component Connector End Views

DTC Type Reference

- Diagnostic Trouble Code (DTC) Type Definitions .
- Diagnostic Trouble Code (DTC) List/Type .

Electrical Information Reference

- Circuit Testing

- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Testing

Clear the DTC and operate the vehicle under the conditions for running and setting the DTC.

If the DTC resets, test the TCM ignition 1 voltage circuit for battery positive voltage at the TCM 16-way connector.

If the voltage is less than battery voltage, test the Ignition 1 voltage circuit for an open or short to ground and repair the circuit as necessary.

Repair Instructions

Important: Always perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Perform the Service Fast Learn Adapts .

DTC P2544

Circuit Description

To improve shift feel, the transmission control module (TCM) may request that the engine control module (ECM) reduce engine torque during shift events. When such a request is received, the ECM responds by retarding the base ignition timing and notifying the TCM that the request has succeeded. If the ECM is unable to comply with the request, the ECM sends the TCM a message that the request has failed.

The torque reduction request is sent to the ECM through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P2544 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P2544.

When the TCM receives a torque reduction failure message from the ECM, then DTC P2544 will set. DTC P2544 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2544 Transmission Torque Request Circuit

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- No other GMLAN errors are present.

Conditions for Setting the DTC

The ECM notifies the TCM that a torque reduction request has failed for 2 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM turns power off to the PCS.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2544 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 3
3	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start, and allow the engine to idle. Did DTC P2544 reset?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 5

DTC P2637

Circuit Description

Engine torque information is sent to the transmission control module (TCM) by the engine control module (ECM) through a communication network called GMLAN. Two circuits are used to communicate GMLAN data between the ECM and TCM. A fault in the GMLAN will not cause DTC P2637 to set by itself. If a GMLAN fault occurs, other DTCs will set before DTC P2637.

When the ECM sends the TCM an engine torque signal that is invalid, DTC P2637 will set. DTC P2637 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2637 Transmission Torque Delivered Circuit

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2637 Transmission Torque Delivered Circuit

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- No other GMLAN errors are present.

Conditions for Setting the DTC

Engine torque signal is below the lower limit, above the upper limit, or is an unreliable value for 2 seconds.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off the pressure control solenoid. When the pressure control solenoid is off, line pressure is at maximum.
- The TCM freezes transmission adaptive functions.
- The TCM inhibits Autograde braking and shift stabilization.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the

Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.

- The TCM stores DTC P2637 in TCM history.

Conditions for Clearing the DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without a non emission related diagnostic fault occurring.
- The TCM cancels the DTC default actions when the ignition is OFF long enough in order to power down the TCM.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Failure Records. Did you record any ECM Failure Records?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 3
3	1. Clear the DTC. 2. Turn the ignition OFF for at least 30 seconds. 3. Start, and allow the engine to idle. Did DTC P2637 reset?	--	Go to Step 4	Go to Testing for Intermittent Conditions and Poor Connections
4	Did any other DTCs set?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 5
	Replace the TCM.			

5	Refer to Control Module References. Is the action complete?	--	Go to Step 6	--
6	Perform the following operation to verify the repair: 1. Select DTC on the scan tool. 2. Select Clear Info. 3. Start, and idle the engine. 4. Select Specific DTC. 5. Enter DTC P2637. Has the test run and passed?	--	Go to Step 7	Go to Step 2
7	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DTC P2670 or P2671

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P2670: Solenoid High Control Circuit Group 2 Low Voltage

DTC P2671: Solenoid High Control Circuit Group 2 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
High Side Driver 2	P2670	P2670	P2671

Circuit/System Description

The transmission control module (TCM) provides voltage to the pressure control solenoid, the shift solenoids, and the torque converter clutch pulse width modulated (TCC PWM) solenoid through two separate solid-state devices called high side drivers, called HSD1 and HSD2. HSD1 provides electrical power to the pressure control solenoid. HSD2 provides power to the shift solenoids. A normal function of the TCM is to run tests on each driver to ensure that it is functioning properly.

Conditions for Running the DTC

P2670

The engine run time is greater than 5 seconds.

P2671

The ignition is ON.

Conditions for Setting the DTC

P2670

The TCM detects a short to ground on the HSD2 circuit when the HSD2 is commanded ON.

P2671

The TCM detects greater than 6.4 volts at the HSD2 terminal prior to commanding the HSD2 ON.

Action Taken When the DTC Sets

- DTC P2670 and P2671 are Type B DTCs.
- The TCM turns off power to all solenoids.
- The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear.
- The TCM commands maximum line pressure.
- The TCM freezes transmission adaptive functions.
- The TCC is disabled.

Conditions for Clearing the DTC

DTC P2670 and P2671 are Type B DTCs.

Diagnostic Aids

1. P2670 and P2671 only sets on the High Side Driver 2 side of the shift solenoids. Electrical faults on the ground side of the shift solenoids will set the shift solenoids code for that circuit.
2. An open on the High Side Driver 2 side of the shift solenoids will set one or more of the shift solenoid codes.
3. When a code is set, the TCM turns OFF power to HSD2.

- *J 45681* Jumper Harness

Circuit / System Verification

Ignition ON, engine OFF. With a scan tool, observe the High Side Driver 2 parameter status for:

- Short to Ground
- Open
- Short to Volts

Circuit / System Testing

1. Ignition OFF, disconnect the X121 harness connector.
2. Install the *J 45681* harness on the transmission pass-thru connector.
3. Using the brown J35616-6 test probes from the most current *J 35616* kit , test the resistance for the following: 1-2 Shift Solenoid Valve, 2-3 Shift Solenoid Valve, 4-5 Shift Solenoid Valve, TCC PWM Solenoid Valve. Refer to Component Resistance.

   If less than the specified value, test the affected circuits for a short together condition. If circuits test normal, replace the affected solenoid.

   If greater than the specified value, test the affected circuits for an open. If circuits test normal, replace the affected solenoid.
4. Test for greater than 10 K ohms between the solenoid supply voltage circuit, terminal 17, and all other circuits of the *J 45681* harness , except:
   - 1-2 Shift Solenoid Valve Control circuit, pin 14
   - 2-3 Shift Solenoid Valve Control circuit, pin 9
   - 4-5 Shift Solenoid Valve Control circuit, pin 5
   - TCC PWM Solenoid Valve Control circuit, pin 20

   If less than the specified value, the affected circuits are shorted together. Replace the transmission internal wire harness.
5. Test for greater than 50 K ohms between the solenoid supply voltage circuit, terminal 17, and the transmission case.

   If less than the specified value, test the following circuits and solenoids for short to the transmission case.
   - 1-2 Shift Solenoid Valve Control circuit, pin 14
   - 2-3 Shift Solenoid Valve Control circuit, pin 9
   - 4-5 Shift Solenoid Valve Control circuit, pin 5
   - TCC PWM Solenoid Valve Control circuit, pin 20
6. Remove the *J 45681* harness from the transmission pass-thru connector and install it on the

engine side of the X121.

7. Key ON, engine OFF. Using the brown J35616-7 test probes from the most current *J 35616* kit , test for greater than 50 K ohms between the solenoid supply voltage circuit, terminal 17, and the transmission case.

   If less than the specified value, test the solenoid supply voltage circuit for a short to the transmission case. If circuits test normal, replace the TCM.

8. Disconnect the X1 harness connector at the TCM.

   Note: When test probing the TCM harness terminals; it is imperative to use the proper test probe from the most current version of the *J 35616* kit . Use the light blue J35616-64B probes.

9. Using a 5A fused jumper wire and the light blue probes J35616-64B, test for greater than 10 K ohms between the solenoid supply voltage circuit, terminal F8, and all other circuits of the X1.

   If less than the specified value, the affected circuits are shorted together.

10. If all circuits and connections test normal, replace the TCM.

Component Testing

1. Ignition OFF, disconnect the X121 harness connector. Install the *J 45681* harness on the transmission pass-thru connector.
2. Using the brown J35616-4 test probes form the most current *J 35616* kit , test the following: 1-2 Shift Solenoid Valve, 2-3 Shift Solenoid Valve, 4-5 Shift Solenoid Valve, TCC PWM Solenoid Valve. Refer to Component Resistance.

   If less than the specified value, test the affected circuits for a short together. If the circuits test normal, replace the affected solenoid.

   If greater than the specified value, test the affected circuits for an open. If circuits test normal, replace the affected solenoid.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- 1-2 Shift Solenoid Valve Replacement
- 2-3 Shift Solenoid Valve Replacement
- 4-5 Shift Solenoid Valve Replacement
- Torque Converter Clutch Solenoid Replacement
- Transmission Internal Electrical Harness Replacement
- Component Resistance
- Refer to Control Module References for replacement, setup and reprogramming.

TCC Solenoid Valve Control

The transmission control module (TCM) provides voltage to the torque converter clutch pulse width modulated (TCC PWM) solenoid valve through High Side Driver 2 (HSD2). The TCM controls the ON and OFF time of the solenoid by providing a ground through the output driver module (ODM) . The TCM uses a PWM duty cycle, in order to control application and release of the TCC. When the solenoid is commanded OFF, the TCM senses high voltage. When the solenoid is commanded ON, the TCM senses low voltage.

When the TCM detects a continuous open or short to ground in the TCC PWM Solenoid valve circuit, then DTC P2763 sets. DTC P2763 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2763 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit High Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P2763 sets when the TCM detects an short to voltage in the TCC PWM solenoid valve circuit when the PWM duty cycle is 45 percent or greater.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM inhibits fifth gear if the transmission is in Hot Mode.
- The TCM inhibits the TCC.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2763 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

2. Listen for a soft rattling sound when the solenoid energizes. Use a stethoscope if necessary.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF.			

2	**Important:** - Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. - Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. TCC Solenoid Valve Control

The transmission control module (TCM) provides voltage to the torque converter clutch pulse width modulated (TCC PWM) solenoid valve through High Side Driver 2 (HSD2). The TCM controls the ON and OFF time of the solenoid by providing a ground through the output driver module (ODM) . The TCM uses a PWM duty cycle, in order to control application and release of the TCC. When the solenoid is commanded OFF, the TCM senses high voltage. When the solenoid is commanded ON, the TCM senses low voltage.

When the TCM detects a continuous open or short to ground in the TCC PWM Solenoid valve circuit, then DTC P2764 sets. DTC P2764 is a type B DTC.

DTC Descriptor

This diagnostic procedure supports the following DTC:

DTC P2764 Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid Control Circuit Low Voltage

Conditions for Running the DTC

- The engine run time is greater than 5 seconds.
- HSD2 is commanded ON.

Conditions for Setting the DTC

DTC P2764 sets when either of the following conditions occurs:

- The TCM detects an open in the TCC PWM solenoid valve circuit when the PWM duty cycle is greater than 20 percent.
- The TCM detects a short to ground in the TCC PWM solenoid valve circuit when the PWM duty cycle is greater than 20 percent but less than 50 percent.

Action Taken When the DTC Sets

- The TCM requests the ECM to illuminate the malfunction indicator lamp (MIL) during the second consecutive drive trip in which the Conditions for Setting the DTC are met.
- The TCM turns off power to all solenoids. When the solenoids are off:
    - The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear. If the transmission is operating in fifth gear, fourth gear may be obtained if the engine is stopped briefly and started again.
    - The line pressure is at maximum.
- The TCM freezes transmission adaptive functions.
- At the time of the first failure, the TCM records the operating conditions when the Conditions for Setting the DTC are met. The TCM stores this information as a Failure Record.
- At the time of the second failure, the ECM records the operating conditions when the Conditions for Setting the DTC are met. The ECM stores this information as a Freeze Frame.
- The TCM stores DTC P2764 in TCM history.

Conditions for Clearing the MIL/DTC

- The ECM turns OFF the MIL after the sixth consecutive drive trip in which the TCM does not send a MIL illumination request.
- A scan tool can clear the MIL/DTC.
- The TCM clears the DTC from TCM history if the vehicle completes 40 warm-up cycles without an emission related diagnostic fault occurring.
- The TCM cancels the default actions when the ignition is OFF long enough in order to power down the TCM.

Test Description

The number below refers to the step number on the diagnostic table.

2. Listen for a soft rattling sound when the solenoid energizes. Use a stethoscope if necessary.

Step	Action	Value (s)	Yes	No
1	Did you perform the Diagnostic System Check - Vehicle?	--	Go to Step 2	Go to Diagnostic System Check - Vehicle
2	1. Install a scan tool. 2. Turn ON the ignition with the engine OFF. **Important:** • Before clearing the DTC, use the scan tool in order to record the ECM Freeze Frame and the TCM Failure Records. Using the Clear Info function erases the Freeze Frame and Failure Records from the ECM and the TCM. • Using the Clear Info function erases stored DTCs in both the ECM and TCM. 3. Record the DTC Freeze Frame and Failure Records. 4. Clear the DTC. 5. Use the scan tool in order to command the TCC PWM solenoid ON. Does the solenoid operate?	--	Go to Step 9	Go to Step 3
3	1. Turn OFF the ignition. 2. Disconnect the Automatic transmission 20-way inline harness connector. 3. Install the J 45681 jumper harness to the TCM side of the 20-way connector. 4. Turn ON the ignition with the engine OFF. 5. With the test lamp connected to ground, probe the HSD2 circuit, terminal 17, of J 45681 . Does the test lamp illuminate?	--	Go to Step 4	Go to Step 7
4	1. Turn OFF the ignition. 2. Install the J 45681 to the transmission side of the 20-way connector. 3. Using the DMM, measure the resistance between terminal 17 and 20 of the J 45681 . Refer to Component Resistance . Is the resistance within the specified range?	10.0-13.6Ω	Go to Step 5	Go to Step 8
	Using the DMM, measure the resistance between terminal 17 of the J 45681 and ground.			

5	Is the resistance greater than the specified value?	50K Ω	Go to Step 6	Go to Step 8
6	1. Disconnect the TCM. 2. Test the TCC PWM solenoid valve control circuit for the following conditions: • Open circuit • Short to ground • Refer to Testing for Continuity and Testing for Short to Ground . Did you find a condition?	--	Go to Step 10	Go to Step 9
7	1. Turn OFF the ignition. 2. Disconnect the TCM. 3. Test the HSD2 circuit from the TCM to the TCC PWM solenoid for an open circuit. Refer to Testing for Continuity . Did you find a condition?	--	Go to Step 10	Go to Step 9
8	1. Remove the transmission oil pan. 2. Test the TCC PWM solenoid wiring from the 20-way connector to the TCC PWM solenoid connector for the following conditions: • Open circuit • Short to ground • Refer to Testing for Continuity and Testing for Short to Ground . Did you find a condition?	--	Go to Step 11	Go to Step 12
9	Replace the TCM. Refer to Control Module References for replacement, set-up and programming. Is the action complete?	--	Go to Step 13	--
10	Perform the necessary wiring repairs. Refer to Wiring Repairs . Is the action complete?	--	Go to Step 13	--
11	Replace the Automatic transmission internal transmission wiring harness. Refer to Transmission Internal Electrical Harness Replacement . Is the action complete?	--	Go to Step 13	--
	Replace the TCC PWM solenoid valve.			

12	Refer to Torque Converter Clutch Solenoid Replacement . Is the action complete?	--	Go to Step 13	--
13	Perform the following procedure in order to verify the repair: 1. Select DTC. 2. Select Clear Info. 3. Turn ON the ignition, with the engine OFF. 4. Select Specific DTC. 5. Enter DTC P2764. Has the test run and passed?	--	Go to Step 14	Go to Step 2
14	With the scan tool, observe the stored information, capture info and DTC info. Does the scan tool display any DTCs that you have not diagnosed?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	System OK

DEFINITION: A buzz or high frequency rattle	
• Trace Cooler Pipes • Check for binding or contact at the Radiator, other than at the Cooler Pipe connectors	Verify a pressure buzz by watching for a needle vibration of the pressure gage. A road test may be necessary. Refer to Road Test.

Case Porosity Repair

Some external leaks are caused by case porosity in non-pressurized areas. You can usually repair these leaks with the transmission in the vehicle.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

   Caution: Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. While the transmission case is still hot, apply the epoxy. You can use a clean, dry soldering acid brush to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before starting the engine.
5. Repeat the fluid leak diagnosis procedures.

Clutch Plate Diagnosis

Composition Plates

Dry the plates and inspect the plates for the following conditions:

- Pitting
- Flaking
- Wear
- Glazing
- Cracking
- Charring
- Chips or metal particles embedded in the lining

Replace a composition plate which shows any of these conditions.

Steel Plates

Wipe the plates dry and inspect the plates for heat discoloration. If the surfaces are smooth, even if color smear is indicated, you can reuse the plate. If the plate is discolored with heat spots or if the surface is scuffed, replace the plate.

Causes of Burned Clutch Plates

The following conditions can result in a burned clutch plate:

- Incorrect usage of clutch plates
- Engine coolant in the transmission fluid
- A cracked clutch piston
- Damaged or missing seals
- Damaged fluid passage sleeves
- Low line pressure
- Valve body conditions
  - The valve body face is not flat.
  - Porosity is between channels.
  - The valve bushing clips are improperly installed.
  - The checkballs are misplaced.
- The Teflon® seal rings are worn or damaged.
- Low transmission fluid level

Degraded 1-2 and 2-1 Shifts

Check	Causes
DEFINITION: One of the two following conditions occurs during a first to second gear steady throttle upshift, or a second to first gear coast, or a light to moderate throttle detent downshift: • Harsh shift feel An unacceptable quick gear change occurs. • Soft shift feel An unacceptable long gear change occurs.	
Second Clutch	• Damaged piston, 1-2, 2-1 shift • Damaged or worn clutch plates, 1-2, 2-1 shift
Pressure Control Solenoid	Damaged
Fluid Pump	Damaged

Degraded 2-3 and 3-2 Shifts

Check	Causes
DEFINITION: One of the two following conditions occurs during a first to second gear steady throttle upshift, or a second to first gear coast, or a light to moderate throttle detent downshift: • Harsh shift feel An unacceptable quick gear change occurs. • Soft shift feel An unacceptable long gear change occurs.	
Second Clutch	• Damaged piston, 1-2, 2-1 shift • Damaged or worn clutch plates, 1-2, 2-1 shift
Pressure Control Solenoid	Damaged
Fluid Pump	Damaged

Degraded 4-5 Shift

Check	Causes
DEFINITION: One of the two following conditions occurs during a fourth to fifth gear steady throttle upshift, or a fifth to fourth coast, or a light to moderate throttle detent downshift: • Harsh shift feel An unacceptable quick gear change occurs. • Soft shift feel An unacceptable long gear change occurs.	
Coast Clutch	• Damaged or cut piston • Damaged or worn clutch plates • Damaged or stuck ball check valve
Intermediate Clutch	• Damaged piston, 2-3, 3-2 shift • Damaged or worn clutch plates, 2-3, 3-2 shift
Overdrive Clutch	• Damaged or worn clutch plates • Damaged or worn piston
Pressure Control Solenoid	Damaged
Fluid Pump	Damaged

Drives with Selector Lever in Position N

Check	Causes
DEFINITION: Vehicle moves forward while in Neutral.	
Forward Clutch and Coast Clutch Assembly	• Damaged or worn clutch plates • Damaged or cut piston • Damaged or stuck ball check valve
Selector Lever	Adjustment

Engine Coolant / Water in Transmission

If antifreeze or water has entered the transmission, perform the following:

1. Disassemble the transmission.
2. Replace all of the rubber type seals. The coolant will attack the seal material which will cause leakage.
3. Replace the composition-faced clutch plate assemblies. The facing material may separate from the steel centre portion.
4. Replace all of the washers.
5. Replace the torque converter.
6. Thoroughly clean and rebuild the transmission, using new gaskets and oil filter.
7. Flush the cooler lines after the transmission cooler has been properly repaired or replaced.

Fifth Gear Only

Check	Causes
DEFINITION: The transmission only provides fifth gear in Drive range. The vehicle accelerates from a stop in fifth gear.	
Control Valve Body Accumulator Assembly	Feed limit valve or spring stuck in the exhaust position
Wiring Harness	Improper electrical connection to shift solenoids
Inspect for active transmission DTCs	Transmission DTC default action active

First and Second Gears Only

Check	Causes
DEFINITION: The transmission only provides first and second gear in Drive range.	
Control Valve Body Accumulator Assembly	• 2-3 SS valve stuck • 2-3 shift valve stuck applied • Spacer plate or gaskets are mispositioned or damaged

First Gear Only

Check	Causes
DEFINITION: The transmission only provides first gear in Drive range. The vehicle accelerates from a stop in first gear and does not upshift.	
Control Valve Body Accumulator Assembly	• 1-2 shift control valve stuck applied • 1-2 shift valve stuck applied
Control Valve Body Accumulator Assembly	The spacer plate or gasket are mispositioned or damaged
Shift Solenoid Valve	• Stuck or damaged • Faulty electrical connection

First, Fourth, and Fifth Gears Only

Check	Causes
DEFINITION: The transmission provides first, fourth and fifth gear in Drive range.	
Control Valve Body Accumulator Assembly	• 1-2 SS valve stuck off • Spacer plate or gaskets are mispositioned or damaged

Flex Plate / Torque Converter Vibration Test

Isolating Vibration

Notice: Some engine/transaxle combinations cannot be balanced in this manner due to restricted access or limited clearances between the torque converter bolts and the engine. Ensure that the bolts do not bottom out in the lug nuts or the torque converter cover which could dent and cause internal damage.

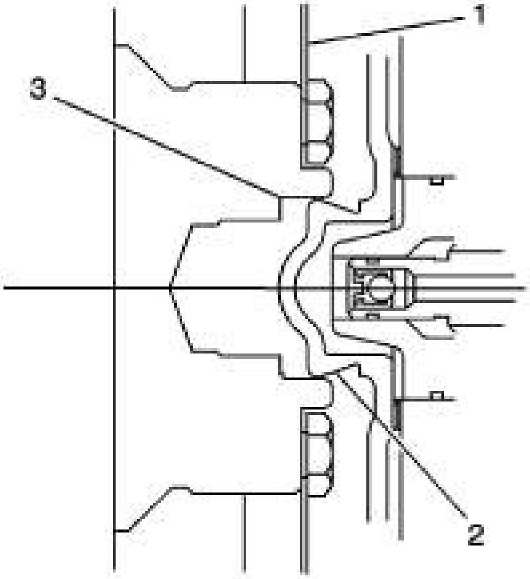
To isolate and correct a flywheel or torque converter vibration, separate the torque converter from the flywheel to determine if vibration is in the engine or transmission.

1. With the engine at idle speed and the transmission in PARK or NEUTRAL, observe the vibration.
2. Turn the engine OFF.
3. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Mark the relationship of the converter to the flywheel.
5. Remove the bolts attaching the converter to the flywheel. Refer to Fastener Tightening Specifications.
6. Slide the torque converter away from the flywheel.
7. Rotate the flywheel and torque converter to inspect for defects or missing balance weights. Refer to Engine Flywheel Cleaning and Inspection.
8. Lower the vehicle.

Indexing Torque Converter

To determine and correct a torque converter vibration, the following procedure may have to be performed several times to achieve the best possible torque converter to flywheel balance.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Rotate the torque converter one bolt position.



3. Align the torque converter hub (2) in the engine crankshaft (3) and install the torque converter to flywheel bolts. Refer to Fastener Tightening Specifications.
4. Lower the vehicle.
5. With the engine at idle speed and the transmission in PARK or NEUTRAL, observe the vibration. Refer to Noise and Vibration Analysis.

   Repeat this procedure until you obtain the best possible balance.

Fluid Leak Diagnosis

Notice: Refer to General Repair Instructions in the Preface section.

Check transmission fluid lever. Refer to Transmission Fluid Check.

General Method

1. Verify that the leak is transmission fluid.
2. Thoroughly clean the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the engine.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

1. Thoroughly clean the suspected leak area with solvent.
2. Apply an aerosol type powder, such as foot powder, to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the engine.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Install the dye. Refer to Transmission Fluid Check.
3. Detect the leak with the black light.
4. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads

- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Oil Pan

- Incorrectly tightened fluid pan bolts
- Improperly installed or damaged fluid pan gasket
- Damaged fluid pan or mounting face
- Incorrect fluid pan gasket
- Fluid Drain Plug

Case Leak

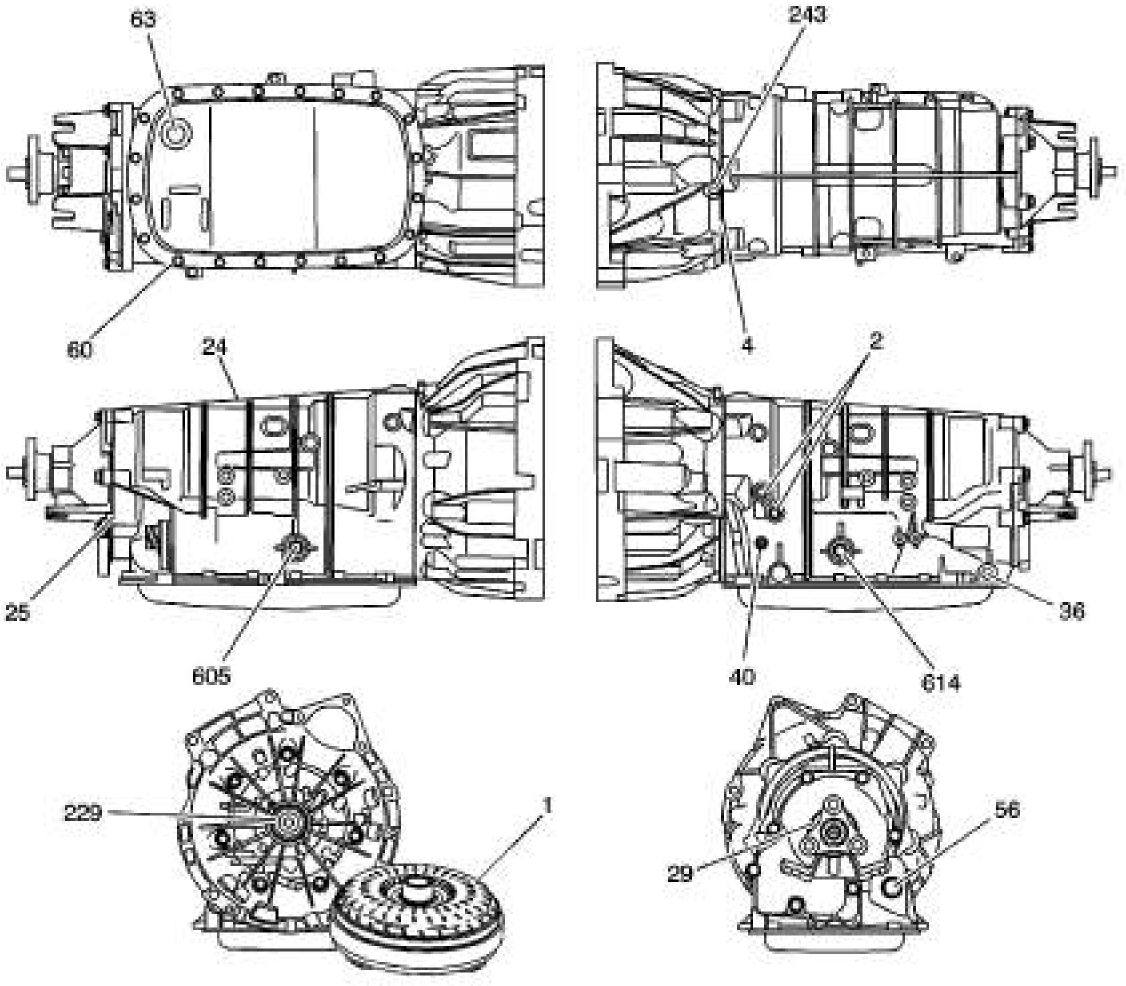
- Fluid Fill Plug
- Extension Housing
- Wiring harness O-ring seal
- Damaged manual shaft seal
- Loose or damaged fluid cooler line seals fittings
- Worn or damaged propeller shaft flange seal
- Loose line pressure test plug
- Porous casting
- Fluid fill plug

Leak at the Torque Converter End

- Converter leak in the weld area
- Converter seal lip cut. Check the converter hub for damage
- Converter seal bushing moved forward and damaged
- Converter seal garter spring missing from the seal
- Porous casting of the transmission case or the oil pump

Leak at the Vent

- Overfilled system.
- Water or coolant in the fluid. The fluid will appear milky.
- Transmission case porous.
- Plugged vent.
- Drain-back holes plugged.
- Mispositioned oil pump to case gasket, if equipped.



Fluid Pressure High or Low

Check	Causes
DEFINITION: Transmission main line pressure that is determined to be high or low. Refer to Line Pressure Check.	
Fluid Pump Assembly	• Pressure regulator valve stuck • Pressure regulator valve spring • Line boost valve spring • Line boost valve or bushing stuck, damaged or incorrectly assembled • Pressure relief ball not seated or damaged • Pressure relief ball spring • Pump slide seal out of location • Fluid pump screen assembly plugged or damaged • Fluid pump rotor guide omitted or misassembled • Fluid pump rotor cracked or broken • Porosity in fluid pump • Fluid pump surfaces not flat • Excessive fluid pump rotor clearance
Fluid Filter	• Intake pipe restricted · • Cracks in fluid filter • Fluid filter seal missing, cut or damaged
Control Valve Body Accumulator Assembly	• Manual valve scored or damaged • Spacer plate or gaskets misassemble or damaged • Control valve top channel plate not flat • Control valve bottom channel plate not flat • Feed limit valve or spring stuck in the exhaust position
Pressure Control Solenoid Assembly	• Contaminated • O-rings cut or damaged • Electrical connection
System Voltage	• 12 Volts not supplied to transmission • Electrical short - pinched solenoid wire • Solenoid not grounded
Clutch Accumulator	Leaking
Inspect for active transmission DTCs	Transmission DTC default action active

Harsh Shift 4 to 5, or 5 to 4

Check	Causes
DEFINITION: One of the two following conditions occurs during a 4th to 5th and 5th to 4th gear steady throttle upshift, or a 4th to 5th gear coast, or a light to moderate throttle detent downshift: Harsh shift feel - an unacceptable quick gear change occurs.	
Overdrive Clutch and Coast Clutch	• Damaged or cut piston • Damaged or worn clutch plates
Fluid Pump Assembly	• Pressure regulator valve stuck • Pressure regulator valve spring • Line boost valve spring • Line boost valve or bushing stuck, damaged or incorrectly assembled • Fluid pump screen assembly plugged or damaged • Fluid pump rotor guide omitted or misassembled • Fluid pump rotor cracked or broken • Porosity in fluid pump • Fluid pump surfaces not flat • Excessive fluid pump rotor clearance • Pump slide seal out of location • Pump vanes damaged • Pump slide spring damaged
Pressure Control Solenoid	Damaged

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1979615**

Harsh Shift D to R

Check	Causes
DEFINITION: Gear engagement that is harsh when the engine is idling in Park or Neutral, and the gear selector is moved to Drive or Reverse range.	
Forward Clutch	• · Damaged or worn piston (436) • · Damaged or worn clutch plates (449) • · Damaged or stuck ball check valve (434)
Reverse Clutch	• · Damaged or worn piston (404) • · Damaged or worn clutch plates (418/417) • · Damaged or stuck ball check valve (403)
Fluid Pump Assembly	Refer to Harsh Shift 4 to 5, or 5 to 4.
PC Solenoid	Damaged

Harsh Shifts

Harsh Shifts

Check	Causes
DEFINITION: Harsh shift feel - an unacceptable quick gear change occurs.	
Pressure Control Solenoid	• Damaged O-rings • Contamination
Output Speed Sensor	Open or grounded circuit
Input Speed Sensor	Open or grounded circuit
Throttle Position	Open or grounded circuit
Forward Clutch Assembly	• Damaged or worn clutch plates • Damaged or cut piston • Damaged or stuck ball check valve
Control Valve Body Accumulator Assembly	• Accumulator piston stuck • Stuck or missing ball check valves
Fluid Pump	• Pressure regulator valve stuck • Pressure regulator valve spring • Line boost valve spring • Line boost valve or bushing stuck, damaged or incorrectly assembled • Fluid pump screen assembly plugged or damaged • Fluid pump rotor guide omitted or misassembled • Fluid pump rotor cracked or broken • Porosity in fluid pump • Fluid pump surfaces not flat • Excessive fluid pump rotor clearance • Pump slide seal out of location • Pump vanes damaged • Pump slide spring damaged
Inspect for active transmission DTCs	Transmission DTC default action active

Harsh Torque Converter Clutch Apply

Check	Causes
DEFINITION: A unacceptable quick TCC apply or release occurs in third, fourth or fifth gear, overdrive, Drive or Manual third range, with the throttle held steady.	
Control Valve Body & Accumulator Assembly	Stuck TCC regulator apply valve
TCC Solenoid Valve	Stuck ON

Inaccurate Shift Points

Check	Causes
DEFINITION: An upshift or a downshift, or TCC apply, that occurs at a speed outside of the calibrated range. Refer to Shift Speed.	
Fluid Pump Assembly	• Stuck pressure regulator valve • Sticking pump slide
Control Valve Body Accumulator Assembly	Spacer plate and gasket misaligned or damaged
Throttle Position Sensor	Disconnected or damaged
Input Speed Sensor	• Disconnected or damaged • Bolt not torqued properly
Output Speed Sensor	• Disconnected or damaged • Bolt not torqued properly
Shift Solenoids	Leaking
Sport Mode active	Shorted switch or circuit

Line Pressure Check

Tools Required

- DT 46450 Pressure Gage
- J 36648-A Pressure Gage Adapter

Important: Before performing a line pressure check, verify that the pressure control (PC) solenoid valve is receiving the correct electrical signal from the ECM.

1. Install a scan tool.

Caution: Keep the brakes applied at all times in order to prevent unexpected vehicle motion. Personal injury may result if the vehicle moves unexpectedly.

2. Start the engine and set the parking brake.
3. Inspect for a stored Diagnostic Trouble Code (DTC).
4. Repair the vehicle, if necessary.
5. Check the fluid level. Refer to the Transmission Fluid Check.
6. Check the manual linkage for proper adjustment.

Caution: Refer to General Repair Instructions in the Preface section.

7. Turn the engine Off. Remove the transmission pressure test plug (40) and install J 36648-A and DT 46450 .
8. Put the gear selector in PARK range and set the parking brake.
9. Start the engine and allow the engine to warm up at idle.

Notice: Refer to General Repair Instructions in the Preface section.

10. Access the PC solenoid valve control test on the scan tool.
11. Increase the PC solenoid actual current from 0 to 1 amps in 0.1 amp increments. Allow the pressure to stabilize for five seconds after each pressure change. Read the corresponding line pressure on the DT 46450 .
12. Refer to the Line Pressure specification table. Compare the data to the table.
13. If pressure readings differ greatly from the table, refer to Fluid Pressure High or Low.
14. Turn engine OFF. Remove the DT 46450 .
15. Inspect the pressure test plug (40) and O-ring (66) for damage.

Notice: Refer to Fastener Notice in the Preface section.

Important: If the pressure test plug (40) and O-ring (66) are not damaged, they should be reused.

16. Install the transmission pressure test plug (40).

Tighten
Tighten the transmission pressure test plug to 11 N·m (8 lb. ft).

No Drive in All Ranges

Check	Causes
DEFINITION: A large engine RPM increase is noted, with no vehicle forward speed increase, during the following conditions: The engine is running. The transmission is in Drive range. The vehicle is stopped or moving slowly. The vehicle brakes are not applied. The throttle is opened 25 percent or greater.	
Forward Clutch Assembly	• Damaged or worn clutch plates • Damaged or cut piston • Damaged or stuck ball check valve
Forward Clutch Sprag	• Damaged sprag • Worn or pitted inner race
Fluid Pump	• Damaged vanes • Missing slide spring • Fluid pump screen assembly plugged or damaged • Fluid pump rotor guide omitted or misassembled • Fluid pump rotor cracked or broken • Porosity in fluid pump • Fluid pump surfaces not flat • Excessive fluid pump rotor clearance
Low Clutch Sprag	• Damaged sprag • Worn or pitted inner race
Input and Reaction Carrier	Damaged or worn gears

No Engagement of Torque Converter Clutch

Check	Causes
DEFINITION: A large difference in RPM is noted between the engine speed and the transmission input turbine speed in third or fourth gear, Drive or Manual Third range when the TCC is commanded ON by the ECM.	
Control Valve Body and Accumulator Assembly	• TCC regulator apply valve stuck released • TCC regulator apply valve spring broken
Torque Converter Housing	Transmission fluid pump cover damaged or misaligned
TCC PWM Solenoid Assembly	• Stuck Off • Internal damage • Damaged or cut O-ring • Screen damaged • Electrical connector damage
Fluid Pump	• Stuck, binding TCC control valve • TCC enable valve • Stick or binding TCC enable valve spring • Misaligned gasket
Turbine Shaft	Damaged or cut O-ring
Inspect for active transmission DTCs	Transmission DTC default action active

No Engine Braking in First Gear

Check	Causes
DEFINITION: A large engine RPM increase and forward vehicle speed decrease do not immediately occur when the transmission is shifted from Overdrive or fourth gear in Drive or manual third range to first.	
Low and Reverse Clutch	• Damaged or cut piston • Damaged or worn clutch plates
Control Valve Body Accumulator Assembly	• 3-4 shift control valve stuck • 3-4 shift valve stuck - 1st, 2nd or 3rd gear • Low pressure control valve - 1st, 2nd or 3rd gears • 4-5 SS valve stuck off - 1st, 2nd , or 3rd gears • 4-5 shift valve stuck applied - 1st, 2nd, 3rd gears • 3-4 shift valve and/or 3-4 control shift valve stuck released • Low pressure control valve stuck released • 4-5 shift valve and/or 4-5 control shift valve stuck released • 1-2 shift valve stuck released

No Engine Braking in First, Second, and Third Gear

Check	Causes
DEFINITION: A large engine RPM increase and forward vehicle speed decrease do not immediately occur when the transmission is shifted from Overdrive or fourth gear in Drive range to either first or second gear, manual second.	
Control Valve Body Accumulator Assembly	• 3-4 shift valve stuck released • Missing or stuck low pressure control valve • 4-5 shift valve and/or 4-5 control shift valve stuck released • 1-2 shift valve stuck released • 2-3 shift valve and/or 2-3 control shift stuck released

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1979625**

No Engine Braking in Second Gear

Check	Causes
DEFINITION: A large engine RPM increase and forward vehicle speed decrease do not immediately occur when the transmission is shifted from third to fourth gear in Drive or Manual Third range to either second gear, Manual Second.	
Coast Clutch	• Damaged or cut piston • Damaged or worn clutch plates • Damaged or stuck ball check valve • 3-4 shift valve and/or 3-4 control shift valve stuck released • Low pressure control valve stuck released • 4-5 shift valve and/or 4-5 control shift valve stuck released • 1-2 shift valve stuck applied • 2-3 shift and/or 2-3 control shift stuck released

No Engine Braking in Third Gear

Check	Causes
DEFINITION: A large engine RPM increase and forward vehicle speed decrease in third gear do not immediately occur when the transmission is shifted from overdrive or fourth gear in Drive or Manual Third range to third gear range.	
Overdrive Clutch	• Damaged or cut piston • Damaged or worn clutch plates
Control Valve Body Accumulator Assembly	• 3-4 shift valve and/or 3-4 control shift valve stuck released • Low pressure control valve stuck released • 4-5 shift valve and/or 4-5 control shift valve stuck released • 1-2 shift valve stuck applied • 2-3 shift and/or 2-3 control shift stuck applied

No Engine Braking

No Engine Braking

Check	Causes
DEFINITION: A large engine RPM increase and forward vehicle speed decrease do not immediately occur when the transmission is shifted from overdrive or fourth gear in Drive or manual third range to either first, second gear, or third gear, manual second.	
Coast Clutch	• Damaged or cut piston • Damaged or worn clutch plates • Damaged or stuck ball check valve
Overdrive Clutch	• Damaged or cut piston • Damaged or worn clutch plates

No Fifth Gear

Check	Causes
DEFINITION: A large engine RPM increase is noted in fifth gear, Drive range, with little or no vehicle forward speed increase. First, second, third gear and fourth operation are normal. Shifts into fifth gear are soft or do not occur.	
Control Valve Body Accumulator Assembly	• 4-5 SS valve stuck On • 4-5 shift valve stuck applied • 4-5 shift control valve stuck applied
Overdrive Clutch	• Damaged or cut piston • Damaged or worn clutch plates

No First Gear

No 1st Gear

Check	Causes
DEFINITION: A large engine RPM increase is noted in first gear, Drive range, with little or no vehicle forward speed increase. Second, third, and fourth gear operation are normal. Shifts into first gear are soft or do not occur.	
Control Valve Body Accumulator Assembly	• 1-2 shift control valve stuck released • 1-2 shift valve stuck released • 1-2 SS valve stuck ON
Forward and Low Clutch Sprag	• Damaged sprag • Worn or pitted inner race
Forward Clutch Assembly	Damaged

No Fourth Gear, or Slips in Fourth Gear

Check	Causes
DEFINITION: A large engine RPM is noted in fourth gear or no vehicle forward speed increase. Shifts into fourth gear are soft or do not occur.	
Control Valve Body Accumulator Assembly	• 3-4 shift valve stuck applied • 3-4 shift control valve stuck applied
Direct and Reverse Clutch	• Damaged or worn piston (406) • Damaged or worn clutch plates • Damaged ball check valve (405)

No Reverse or Slips in Reverse

Check	Causes
DEFINITION: A large engine RPM increase is noted with little or no vehicle rearward speed increase during the following conditions: • The engine is running. • The transmission is in Reverse range. • The vehicle is stopped or moving slowly. • The vehicle brakes are not applied. • The throttle is opened 25 percent or greater.	
Direct and Reverse Clutch Assembly	• Damaged reverse clutch housing ball check valve • Damaged or cut piston • Damaged or worn clutch plates
Control Valve Body Accumulator Assembly	• Reverse lockout valve stuck • TCC PWM solenoid valve leaking
Selector Lever	Adjustment

No Second Gear

Check	Causes
DEFINITION: A large engine RPM increase is noted in second gear, Drive range, with little or no vehicle forward speed increase. First, third, and fourth gear operation are normal. Shifts into second gear are soft or do not occur.	
Second Clutch	• Damaged piston • Damaged or worn clutch plates
Second Coast Clutch	• Damaged piston • Damaged or worn clutch plates
Second Clutch Sprag	• Damaged sprag • Worn or pitted inner race
Second Clutch Fluid Passage Sleeve	Leaking

No Third Gear

Check	Causes
DEFINITION: A large engine RPM increase is noted in third gear, Drive range, with no vehicle forward speed increase. First, second, and fourth gear operation are normal. Shifts into third gear are soft or do not occur.	
Intermediate Clutch Sprag	• Damaged sprag • Worn or pitted inner race
Intermediate Clutch	• Damaged piston • Damaged or worn clutch plates
Intermediate Fluid Passage Sleeve	Leaking

Noise and Vibration Analysis

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

If noise or vibration is noticeable in PARK and NEUTRAL with the engine at idle, but is less noticeable as RPM increases, the cause may be from poor engine performance.

- Vibration may also be caused by a small amount of water inside the converter.
- Inspect the tires for the following conditions:
  - Uneven wear
  - Imbalance
  - Mixed sizes
  - Mixed radial and bias ply
- Inspect the suspension components for the following conditions:
  - Alignment wear or damage
  - Loose fasteners
  - Driveline damage or wear
- Inspect the engine and transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
  - Missing bolts, nuts, and studs
  - Stripped threads
  - Cracks
- Inspect the flywheel for the following conditions:
  - Missing or loose bolts
  - Cracks
  - Imbalance
- Inspect the torque converter for the following conditions:
  - Missing or loose bolts or lugs
  - Missing or loose balance weights
  - Imbalance caused by heat distortion or fluid contamination

Noise in Random Ranges

Noise in Random Ranges

Checks	Action
DEFINITION: Noise only in certain gear ranges	
Refer to Range Reference. Determine the power flow and the applicable components that may be causing this noise.	

Popping Noise

Popping Noise

Checks	Action
DEFINITION: A popping noise, similar to popcorn popping	
Oil Pump System	• Check fluid level. • Inspect for pump cavitation, indicated by bubbles in fluid. • Inspect the transmission fluid filter for a leaky seam. • Inspect the transmission fluid filter seal for improper positioning or for a cut seal.

Road Test

Important: The Road Test Procedure should be performed only as part of the Symptom Diagnosis. Refer to Symptoms - Automatic Transmission .

The following test provides a method of evaluating the condition of the automatic transmission. The test is structured so that most driving conditions will be achieved. The test is divided into the following parts:

- Electrical Function Check
- Upshift Control and Torque Converter Clutch (TCC) Apply
- Part Throttle Detent Downshifts
- Full Throttle Detent Downshifts
- Manual Downshifts
- Coasting Downshifts
- Manual Gear Range Selection
  - REVERSE
  - Manual SECOND
  - Manual THIRD
  - Manual FOURTH

Important: Complete the test in the sequence given. Incomplete testing cannot guarantee an accurate evaluation.

Before the road test, make sure the following:

- The engine is performing properly.
- Transmission fluid level is correct. Refer to the Transmission Fluid Check .
- Tire pressure is correct.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- View the scan tool data while conducting this test.

  Take along qualified help in order to operate the vehicle safely.
- Observe any unusual sounds or smells.

After the road test, inspect for the following:

- Transmission fluid level

  Refer to the Transmission Fluid Check .

- Diagnostic Trouble Codes (DTCs) that may have set during the testing

  Refer to the applicable DTC.
- Scan tool data for any abnormal readings or data
- Fluid leaks

Electrical Function Check

Perform this check first, in order to make sure the electronic transmission components are connected and functioning properly. If these components are not checked, a simple electrical condition may be mis-diagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Start the engine.
4. Verify that the following scan tool data can be obtained and is functioning properly.

   Refer to Control Module References for typical data values. Data that is questionable may indicate a concern.

   - Engine Speed
   - Transmission output speed
   - Vehicle speed
   - IMS Range
   - Transmission range (engine list)
   - Commanded gear
   - PC solenoid reference current
   - PC solenoid actual current
   - PC solenoid duty cycle
   - Brake switch
   - Engine coolant temperature
   - Transmission fluid temperature
   - Acceleration Pedal Position
   - Ignition voltage
   - 1-2 shift solenoid
   - 2-3 shift solenoid
   - 4-5 shift solenoid
   - TCC solenoid duty cycle
   - TCC slip speed
5. Monitor the brake switch signal while depressing and releasing the brake pedal. The scan tool should display:
   - Open when the brake pedal is released.
   - Closed when the brake pedal is depressed.
6. Check the garage shifts.
   - 6.1. Apply the brake pedal and make sure that the parking brake is set.
   - 6.2. Move the gear selector through the following ranges:

        - 6.2.1. PARK to REVERSE
        - 6.2.2. REVERSE to NEUTRAL
        - 6.2.3. NEUTRAL to DRIVE
    - 6.3. Pause 2 to 3 seconds in each gear position.
    - 6.4. Verify the gear engagements are immediate and not harsh.

Important: Harsh engagement may be caused by any of the following conditions:

- High idle speed

  Compare engine idle speed to desired idle speed.
- Commanded low PC solenoid current

  Compare PC solenoid reference current to PC solenoid actual current.
- A default condition caused by certain DTCs that result in maximum line pressure to prevent slippage

Important: Soft or delayed engagement may be caused by any of the following conditions:

- Low idle speed

  Compare engine idle speed to desired idle speed.
- Low fluid level
- Commanded high PC solenoid current

  Compare PC solenoid reference current to PC solenoid actual current.
- Cold transmission fluid

  Inspect for low transmission fluid temperature.
- Selector linkage

  Inspect the adjustment.

7. Monitor transmission range on the scan tool, engine list.
    - 7.1. Apply the brake pedal and make sure the parking brake is set.
    - 7.2. Move the gear selector through all ranges.
    - 7.3. Pause 2-3 seconds in each range.
    - 7.4. Return gear selector to PARK.
    - 7.5. Verify that all selector positions match the scan tool display.
8. Check accelerator pedal input.
    - 8.1. Apply the brake pedal and make sure that the parking brake is set.
    - 8.2. Ensure the gear selector is in PARK.
    - 8.3. Monitor accelerator pedal while increasing and decreasing engine speed with the throttle pedal. The scan tool accelerator pedal should increase and decrease with engine speed.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Upshift Control and Torque Converter Clutch (TCC) Apply

The ECM calculates the upshift points based primarily on two inputs: throttle angle and vehicle speed. When the ECM determines that conditions are met for a shift to occur, the ECM commands the shift by closing or opening the ground circuit for the appropriate solenoid.

Perform the following steps:

1. Refer to the Shift Speed and choose a throttle position of 12 percent, 25 percent or 50 percent. All throttle angles shown should be tested to cover the normal driving range.
2. Monitor the following scan tool parameters:
   - Throttle angle
   - Vehicle speed
   - Engine speed
   - Output shaft speed
   - Commanded gear
   - Slip speed
   - Solenoid states
3. Place the gear selector in the OVERDRIVE position.
4. Accelerate the vehicle using the chosen throttle angle. Hold the throttle steady.
5. As the transmission upshifts, note the vehicle speed when the shift occurs for each gear change. There should be a noticeable shift feel or engine speed change within 1 to 2 seconds of the commanded gear change.
6. Compare the shift speeds to the Shift Speed table. Refer to Shift Speed . Shift speeds may vary slightly due to transmission fluid temperature or hydraulic delays in responding to electronic controls.
   - Note any harsh, soft or delayed shifts or slipping.
   - Note any noise or vibration.
7. Repeat steps 1- 6 to complete all throttle angles.

   Important: This transmission is equipped with an electronically controlled capacity clutch (ECCC). The pressure plate does not fully lock to the torque converter cover. The pressure plate maintains a small amount of slippage, approximately 20 RPM, in THIRD, FOURTH and FIFTH gears, depending on the vehicle application. ECCC was developed to reduce the possibility of noise, vibration or chuggle caused by TCC apply. Typical apply speeds are 49-52 km/h (30-32 mph) in THIRD gear and 65-73 km/h (40-45 mph) in FOURTH gear. Full lockup is available at highway speeds on some applications.

   Important: The TCC will not engage until the engine is in closed loop operation and the vehicle speed is as shown in the Shift Speed table. Refer to Shift Speed . The vehicle must be in a near-cruise condition, not accelerating or coasting, and on a level road surface.

8. Inspect for TCC apply in THIRD, FOURTH and FIFTH gear.
   - Note the TCC apply point. When the TCC applies there should be a noticeable drop in engine speed and a drop in slip speed to below 100 RPM. If the TCC apply can not be detected:
     - Check for DTCs.
     - Refer to Torque Converter Diagnosis .
   - Refer to the Shift Speed table for the correct apply speeds.
   - Lightly tap and release the brake pedal. The TCC will release on most applications.

Part Throttle Detent Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-88 km/h (40-55 mph) in FIFTH gear.
3. Quickly increase throttle angle to greater than 50 percent.
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to FOURTH gear
5. Place the gear selector in the OVERDRIVE position.

Full Throttle Detent Downshift

1. Accelerate the vehicle to speeds of 64-88 km/h (40-55 mph) in FIFTH gear.
2. Quickly increase throttle angle to 100 percent (WOT).
3. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to THIRD gear

Manual Downshifts

The shift solenoid valves control the initial downshift for the 5-4, 4-3, 3-2 manual downshifts. The solenoid states should change during or shortly after a manual downshift is selected.

Manual 5-4 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-88 km/h (40-55 mph) in FIFTH gear.
3. Release the throttle while moving the gear selector to FOURTH.
4. Verify the following:
   - The TCC releases
   - The transmission downshifts immediately to FOURTH gear
   - The engine slows the vehicle

Manual 5-3 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 64-72 km/h (40-45 mph).
3. Release the throttle while moving the gear selector to THIRD.
4. Verify the following:
   - The TCC releases.
   - The transmission downshifts immediately to THIRD gear.
   - The engine slows the vehicle.

Manual 5-2 Downshift

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to 48 km/h (30 mph).
3. Release the throttle while moving the gear selector to SECOND.
4. Verify the following:
   - The TCC releases.

- The transmission downshifts immediately to SECOND gear.
- The engine slows the vehicle.

Coasting Downshifts

1. Place the gear selector in the OVERDRIVE position.
2. Accelerate the vehicle to FIFTH gear with the TCC applied.
3. Release the throttle and lightly apply the brakes.
4. Verify the following:
    - The TCC releases
    - Downshifts occur at speeds shown in the Shift Speed table. Refer to Shift Speed .

Manual Gear Range Selection

The shift solenoids control the upshifts in the manual gear ranges.

Perform the following tests using 10-15 percent throttle angle.

Reverse

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise, or vibration.

Manual Second

1. With the vehicle stopped, move the gear selector to SECOND.
2. Accelerate the vehicle to 32 km/h (20 mph).
3. Verify the following:
    - No upshifts occur.
    - The TCC does not apply.
    - There is no noticeable slip, noise, or vibration.

Manual Third

1. With the vehicle stopped, move the gear selector to THIRD.
2. Accelerate the vehicle to 57 km/h (35 mph).
3. Verify the following:
    - The 1-2 shift occurs.
    - The 2-3 shift does not occur.
    - There is no noticeable slip, noise or vibration.

Manual Fourth

1. With the vehicle stopped, move the gear selector to FOURTH.
2. Accelerate the vehicle to 64 km/h (40 mph).
3. Verify the following:
    - The 1-2 shift occurs

- The 2-3 shift occurs
- There is no noticeable slip, noise or vibration

Second and Third Gears Only

Check	Causes
DEFINITION: The transmission only provides second and third gear in Drive range. The shift pattern as the vehicle accelerates from a stop is 2-2-3-3.	
Control Valve Body Accumulator Assembly	- 1-2 SS valve stuck applied - Spacer plate or gaskets are mispositioned or damaged
Winter Mode active	Shorted switch or circuit

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1992875**

Shift Solenoid Leak Test

Tools Required

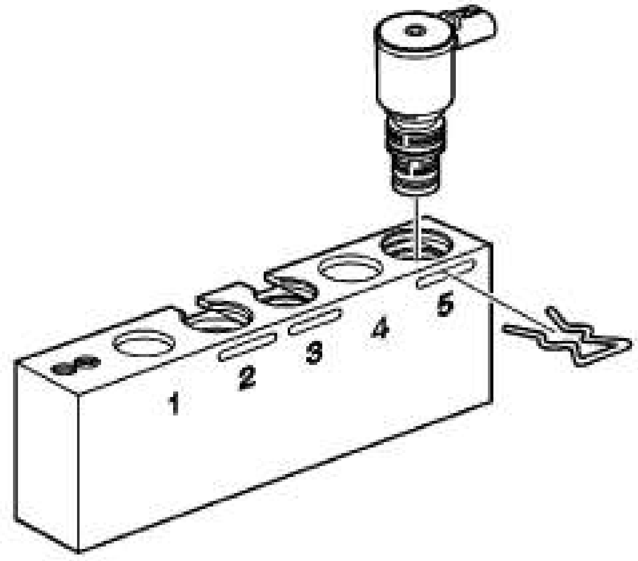
- J-44246 Solenoid Testing Kit
- J 35616 Holden Terminal Test Kit

Leak Test Procedure

Important:

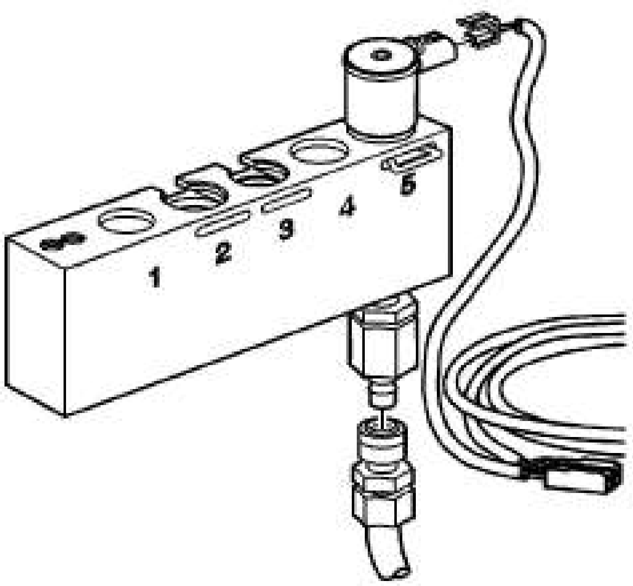
- This procedure tests On/Off type solenoid valves.
- Visually inspect the physical condition of the solenoid before testing. Inspect the O-rings before and after the test to be sure that they are not cut or damaged.

1. Remove the shift solenoid valve from the control valve body or the TCC solenoid valve from the transmission case. Refer to 1-2 SS Rplc*, 2-3 SS Rplc*, 4-5 SS Rplc* or Torq Conv Clutch TCC Sol Rplc*, Tran Elect H Rplc*.



2. Install the TCC solenoid valve, the 1-2 shift solenoid valve, the 2-3 shift solenoid valve or the 4-5 shift solenoid into bore number 5 of the J-44246 .

   Install the factory retainer clip to retain the solenoid.



3. Connect the solenoid testing harness supplied with the J-44246 to the solenoid.

   Important: Do not use air pressure in excess of 120 psi. Excessive pressure will not allow the solenoid ball check valve to seat properly. Recommended air pressure is 50 psi.

4. Apply compressed air to the J-44246 .
5. Connect the solenoid testing harness to the, 12 volt, positive and negative (-) battery terminals.
6. Observe if the solenoid is operating electrically. An audible clicking noise can be heard when connecting or disconnecting power.

   Important:

   - All solenoids need to be energised to seal.
   - A small amount of air leakage is normal +/- 21 kPa (+/- 3 psi).

7. Observe the air flow through the solenoid. The flow will completely or nearly completely stop. Replace the solenoid if there continues to be an obvious air leak when the solenoid is energised.

   Important: Inspect the O-rings after the test to be sure that they are not cut or damaged.

8. Install the shift solenoid valve into the control valve body or the TCC solenoid valve into the transmission case. Refer to 1-2 SS Rplc*, 2-3 SS Rplc*, 4-5 SS Rplc* or Torq Conv Clutch TCC Sol Rplc*, Tran Elect H Rplc*.

Slips or Shudders in First Gear

Checks	Causes
DEFINITION: A large engine RPM increase is noted in first gear, Drive range, with little or no vehicle forward speed increase. Second, third, and fourth gear operations are normal. Shifts into first gear are soft or do not occur. First gear ratio is 2.921:1	
Forward Clutch	• Clutch plates worn • Porosity in the piston • Piston seal damaged • Forward clutch housing ball check valve not sealing or damaged • Input shaft fluid seals damaged or missing
Control Valve Body Accumulator Assembly	• Face not flat • Spacer plate or gaskets mispositioned or damaged
Input Sun Gear Shaft	Broken shaft
Forward Sprag Clutch Assembly	Sprags not holding
Low Clutch Sprag Assembly	Sprags not holding
Torque Converter Assembly	Stator roller clutch not holding
Line Pressure	Refer to Fluid Pressure High or Low.

Slips while Shifting

Checks	Causes
DEFINITION: A large engine RPM increase is noted in fifth, fourth, third, second or first in Drive range, with little or no vehicle forward speed increase. Shifts into fifth, fourth, third, second or first gear are soft or do not occur.	
Control Valve Body Accumulator Assembly	• Accumulator piston seals • Porosity in the accumulator piston housings • Stuck or missing ball check valves
Pressure Control Solenoid	Damaged
Fluid Pump	Damaged

The sport and economy shift modes allow driver selection of 2 different shift patterns. Sport mode programming in the transmission control module (TCM) increases transmission line pressure and extends shift points for performance enhanced driving. In the economy mode, the TCM uses standard programming, permitting normal line pressure and shifting. The sport mode switch is a console mounted momentary contact switch located on the electronic PRNDL assembly. Accessory voltage is supplied to the electronic PRNDL assembly through the ELEC PRNDL fuse. When the sport mode switch is depressed, it momentarily contacts the switch signal circuit. The rear integration module (RIM) recognizes the voltage on the circuit and sends a GMLAN serial data message to the dash integration module (DIM). The DIM sends a GMLAN message to the engine control module (ECM). The ECM sends a request to the transmission control module (TCM) through GMLAN to enable the sport mode program.

The TCM evaluates the request, and if operating conditions are correct for enabling the program, the TCM sends a confirmation message to the ECM. The ECM then requests the instrument panel cluster (IPC) to illuminate the sport mode indicator.

The sport mode feature remains enabled until the sport mode switch is pressed again. Once disabled, the TCM will return to the economy mode programming.

Diagnostic Aids

- Test the instrument panel cluster (IPC) for proper operation and lamp illumination. Refer to Diagnostic System Check - Vehicle.
- Test the rear integration module (RIM) for proper sport mode switch input and output operation. Refer to Body Control System Description and Operation.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

1. Diagnose all communication and body DTCs first. The DTC may be the source of the symptom.

4. No PRNDL display may be open in the electronic PRNDL assembly accessory circuit.

6. This step tests the sport mode circuit by bypassing the electronic PRNDL assembly.

Step	Action	Value (s)	Yes	No
1	1. Install a scan tool. 2. Turn ON the ignition, with the engine OFF. 3. Select DTC Info. Does the scan tool display DTCs that start with "U" or "B"?	--	Go to Diagnostic Trouble Code (DTC) List - Vehicle	Go to Step 2
2	1. Place the gear selector in PARK. 2. Turn the ignition to the RUN position with the engine OFF. 3. While observing the sport mode indicator on the IPC, press the sport mode switch several times. Does the sport mode indicator illuminate On and Off with switch operation?	--	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	Is the sport mode indicator always On?	--	Go to Step 9	Go to Step 4
4	Move the gear selector from PARK through all gear positions while observing the electronic PRNDL display. Does the PRNDL display all gear	--		

	positions?		Go to Step 6	Go to Step 5
5	Test the accessory voltage circuit for an open. Refer to Testing for Continuity. Did you find and correct the condition?	--	Go to Step 12	Go to Step 7
6	1. Disconnect the electronic PRNDL assembly. 2. Install a fused jumper between terminal 3 and 6 of the electronic PRNDL connector. 3. Observe the sport mode indicator on the IPC. Is the sport mode indicator illuminated?	--	Go to Step 11	Go to Step 7
7	Test the electronic PRNDL ground circuits for an open. Refer to Testing for Continuity. Did you find and correct the condition?	--	Go to Step 12	Go to Diagnostic System Check - Vehicle
8	Test the sport mode switch signal circuit for an open. Refer to Testing for Continuity. Did you find and correct the condition?	--	Go to Step 12	Go to Step 9
9	Test the sport mode switch signal circuit for a short to ground. Refer to Testing for Short to Ground. Did you find and correct the condition?	--	Go to Step 12	Go to Step 10
10	While observing the sport mode indicator on the IPC, disconnect the electronic PRNDL assembly from the console wiring harness connector. Is the IPC sport mode indicator no longer illuminated?	--	Go to Step 11	Go to Diagnostic System Check - Vehicle
11	Replace the electronic PRNDL assembly. Refer to Front Floor Console Replacement. Is the action complete?	--	Go to Step 12	--
	After repairs, test the sport/economy mode under the following conditions: • With the ignition in the RUN position, the IPC sport mode indicator does not illuminate during the bulb test. • Engine running: - The IPC sport mode indicator			

12	illuminates when the sport mode button is pressed. - The IPC sport mode indicator does not illuminate when the sport mode button is pressed again. • Vehicle operating in drive: - Noticeable change in the shift pattern when the sport mode is selected On and then Off. - The shift pattern returns to the economy mode after the ignition is cycled. Does the sport/economy mode operate as described?	--	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1992802**

Symptoms - Automatic Transmission

Symptoms -- Automatic Transmission

Diagnostic Category	Diagnostic Information
The following table consists of nine diagnostic categories that are located in the left hand column. Using this column, choose the appropriate category based on the operating conditions of the vehicle or transmission. After selecting a category, use the right hand column to locate the specific symptom diagnostics information.	
Fluid Diagnosis This category contains the following topics: • Fluid condition - appearance, contaminants, smell, overheating • Line pressure - high or low • Fluid leaks	• Refer to Transmission Fluid Check . • Refer to Fluid Pressure High or Low . • Refer to Fluid Leak Diagnosis . • Refer to Automatic Transmission Overheating .
Noise and Vibration Diagnosis This category contains the following topics: • Ratcheting noise • Noise - drive gear, final drive, whine, growl, rattle, buzz, popping • Vibration	• Refer to Noise and Vibration Analysis . • Refer to Buzz Noise or High Frequency Rattle Sound . • Refer to Popping Noise . • Refer to Whine Noise Varying with RPM or Fluid Pressure . • Refer to Noise in Random Ranges .
Range Performance Diagnosis This category contains the following topics: • Drives in Neutral • No Park • No Drive • Shift selector indicator does not match transmission gear range	• Refer to No Drive in All Ranges . • Refer to Drives with Selector Lever in Position N .
Shift Quality Feel Diagnosis This category contains the following topics: • Harsh, soft or slipping shifts • Harsh, soft or delayed engagement • Shift shudder, Flare or tie-up • No engine braking	• Refer to Harsh Shifts . • Refer to Harsh Shift 4 to 5, or 5 to 4 . • Refer to Harsh Shift D to R . • Refer to Degraded 1-2 and 2-1 Shifts . • Refer to Degraded 2-3 and 3-2 Shifts . • Refer to Slips or Shudders in First Gear . • Refer to Degraded 4-5 Shift . • Refer to No Engine Braking in Second Gear .

	• Refer to No Engine Braking in First, Second, and Third Gear . • Refer to No Engine Braking in First Gear . • Refer to No Engine Braking . • Refer to No Engine Braking in First Gear .
Shift Pattern This category contains the following topics: • One forward gear only • Two forward gears only • Third gear only • Gear missing or slipping • No upshift or slipping • No downshifts • Non- First gear start	• Refer to First and Second Gears Only . • Refer to First Gear Only . • Refer to First, Fourth, and Fifth Gears Only . • Refer to Second and Third Gears Only . • Refer to Fifth Gear Only . • Refer to No Reverse or Slips in Reverse . • Refer to Slips while Shifting . • Refer to No Second Gear . • Refer to No Third Gear . • Refer to No First Gear . • Refer to No Fourth Gear, or Slips in Fourth Gear . • Refer to No Fifth Gear . • Refer to Slips while Shifting .
Shift Speed Diagnosis This category consists of the following topic: Inaccurate or inconsistent shift points	• Refer to Inaccurate Shift Points . • Refer to Sport Mode Switch/Indicator Always On or Inoperative .
Torque Converter Diagnosis This category contains the following topics: • Torque converter diagnosis • TCC does not apply • TCC does not release • TCC apply/release quality	• Refer to Torque Converter Diagnosis . • Refer to No Engagement of Torque Converter Clutch . • Refer to Harsh Torque Converter Clutch Apply .
Indicator ON or Message Centre Displays Message This category contains the following topics: • Change transmission fluid light ON • Service transmission light ON • Transmission hot idle engine light ON	• Refer to Transmission Indicators and Messages . • Refer to Sport/Economy Mode Operation .

- Sport light ON	
If Symptom Not Found	- Refer to Transmission Fluid Check . - Refer to Road Test . - Refer to Line Pressure Check .

Torque Converter Diagnosis

The Torque Converter Clutch (TCC) is applied by fluid pressure, which is controlled by a PWM solenoid valve. This solenoid valve is located inside of the automatic transmission assembly. The solenoid valve is controlled through a combination of computer controlled switches and sensors.

Torque Converter Stator

The torque converter stator roller clutch can have two different malfunctions.

- The stator assembly freewheels in both directions.
- The stator assembly remains locked up at all times.

Poor Acceleration at Low Speed

If the stator is freewheeling at all times, the car tends to have poor acceleration from a standstill. At speeds above 50-55 km/h (30-35 mph), the car may act normally. For poor acceleration, you should first determine that the exhaust system is not blocked, and the transmission is in First gear when starting out.

If the engine freely accelerates to high RPM in NEUTRAL, you can assume that the engine and the exhaust system are normal. Check for poor performance in DRIVE and REVERSE to help determine if the stator is freewheeling at all times.

Poor Acceleration at High Speed

If the stator is locked up at all times, performance is normal when accelerating from a standstill. Engine RPM and car speed are limited or restricted at high speeds. Visual examination of the converter may reveal a blue color from overheating.

If the converter has been removed, you can check the stator roller clutch by inserting a finger into the splined inner race of the roller clutch and trying to turn the race in both directions. You should be able to freely turn the inner race clockwise, but you should have difficulty in moving the inner race counterclockwise or you may be unable to move the race at all.

Noise

Important: Do not confuse this noise with pump whine noise, which is usually noticeable in PARK, NEUTRAL and all other gear ranges. Pump whine will vary with line pressure.

You may notice a torque converter whine when the vehicle is stopped and the transmission is in DRIVE or REVERSE. This noise will increase as you increase the engine RPM. The noise will stop when the vehicle is moving or when you apply the torque converter clutch, because both halves of the converter are turning at the same speed.

Torque Converter Clutch Shudder

The key to diagnosing Torque Converter Clutch (TCC) shudder is to note when it happens and under what conditions.

TCC shudder which is caused by the transmission should only occur during the apply or the release of the converter clutch. Shudder should never occur after the TCC plate is fully applied.

If Shudder Occurs During TCC Apply or Release

If the shudder occurs while the TCC is applying, the fault can be within the transmission or the torque converter. Something is causing one of the following conditions to occur:

- Something is not allowing the clutch to become fully engaged.
- Something is not allowing the clutch to release.
- The clutch is releasing and applying at the same time.

One of the following conditions may be causing the fault to occur:

- Leaking turbine shaft seals
- A restricted release orifice
- Defective friction material on the TCC plate

If Shudder Occurs After TCC has Applied

If shudder occurs after the TCC has applied, most of the time there is nothing wrong with the transmission.

The TCC is not likely to slip after the TCC has been applied. Engine faults may go unnoticed under light throttle and load, but they become noticeable after the TCC apply when going up a hill or accelerating. This is due to the mechanical coupling between the engine and the transmission.

Once TCC is applied, there is no torque converter fluid coupling assistance. Engine or driveline vibrations may be unnoticeable before TCC engagement.

Inspect the following components in order to avoid misdiagnosis of TCC shudder. An inspection will also avoid the unnecessary disassembly of a transmission or the unnecessary replacement of a torque converter.

- Spark plugs

  Inspect for cracks, high resistance or a broken insulator.
- Cylinder coil

  Look for a black discoloration on the bottom of each cylinder coil. This indicates arcing while the engine is misfiring.
- Fuel injector

  The filter may be plugged.
- Vacuum leak

  The engine will not get a correct amount of fuel. The mixture may run rich or lean depending on where the leak occurs.
- MAF sensor

Like a vacuum leak, the engine will not get the correct amount of fuel for proper engine operation.

- Carbon on the intake valves

  Carbon restricts the proper flow of air/fuel mixture into the cylinders.
- Flat cam

  Valves do not open enough to let the proper fuel/air mixture into the cylinders.
- Oxygen sensor

  This sensor may command the engine too rich or too lean for too long.
- Fuel pressure

  This may be too low.
- Engine mounts

  Vibration of the mounts can be multiplied by TCC engagement.
- Axle joints

  Check for vibration.
- Cylinder balance

  Bad piston rings or poorly sealing valves can cause low power in a cylinder.
- Fuel contamination

  This causes poor engine performance.

Replace the torque converter if any of the following conditions exist:

- External leaks appear in the hub weld area.
- The converter hub is scored or damaged.
- The converter pilot is broken, damaged, or fits poorly into the crankshaft.
- You discover steel particles after flushing the cooler and the cooler lines.
- The pump is damaged, or you discover steel particles in the converter.
- The vehicle has TCC shudder and/or no TCC apply. Replace the torque converter only after all hydraulic and electrical diagnoses have been made. The converter clutch material may be glazed.
- The converter has an imbalance which cannot be corrected. Refer to Flex Plate/Torque Converter Vibration Test.
- The converter is contaminated with engine coolant which contains antifreeze.
- An internal failure occurs in the stator roller clutch.
- You notice excessive end play.
- Overheating produces heavy debris in the clutch.
- You discover steel particles or clutch lining material in the fluid filter or on the magnet, when no internal parts in the unit are worn or damaged. This condition indicates that lining material came from the converter.

Do not replace the torque converter if you discover any of the following symptoms:

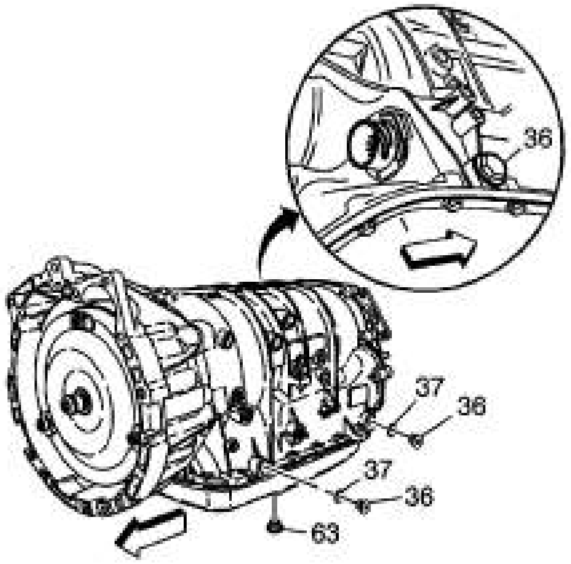
- The oil has an odor or the oil is discolored, even though metal or clutch facing particles are not present.
- Transmission failure did not display evidence of damaged or worn internal parts, steel

particles or clutch plate lining material in the unit and inside the fluid filter.

- The vehicle has been exposed to high mileage only. An exception may exist where the lining of the torque converter clutch dampener plate has seen excess wear by vehicles operated in heavy and/or constant traffic, such as taxi, delivery, or police use.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Diagnostic Information and Procedures | **Document ID: 1997749**

Transmission Fluid Check



Step	Action	Value(s)	Yes	No
1	**Important:** Transmission fluid level can only be accurately checked when the fluid temperature is between 30-50°C (86-122°F). 1. Start the engine. 2. Depress the brake pedal and move the shift lever through the gear ranges, pausing a few seconds in each range. Return the shift lever to the PARK range. 3. Raise the vehicle on a hoist. The vehicle must be level with the engine running and the shift lever in the PARK range. Refer to Lifting and Jacking the Vehicle . **Caution:** The engine must be running when the transmission fluid fill plug is removed, or excessive fluid loss will occur. Transmission fluid may be hot. Since the actual fluid level is unknown, stand clear when removing the fill plug. Have a container ready to capture any lost fluid. Do not turn the engine off with the fill plug removed, as you can be injured by hot transmission fluid being expelled out of the oil fill opening. 4. Remove the transmission fluid level hole plug (36). Location is model dependent. See the drawing above for locations.			

	Important: The transmission fluid may darken with normal use and does not always indicate contamination or oxidation. 5. Inspect the fluid color. If necessary, use a small screwdriver as a dipstick. Is the fluid color red or light brown with no burnt odor?		Go to Step 4	Go to Step 2
2	Does the fluid have a burnt odor or a dark brown color?	--	Go to Step 8	Go to Step 3
3	Does the fluid have a cloudy or milky appearance?	--	Go to Step 7	Go to Step 8
4	Let the fluid temperature rise until it has reached the specified value. Inspect the fluid level. The level should be even with the bottom of the threaded plug hole. Is the fluid level low?	30-50°C (86-122° F)	Go to Step 5	Go to Step 11
5	Add DEXRON® VI automatic transmission fluid in increments of 0.5 L (0.5 qt) until the fluid drains from the hole plug. Did you add more than 1.5 L (1.6 qt) to the transmission?	--	Go to Step 6	Go to Step 11
6	The transmission may have a leak. Refer to Fluid Leak Diagnosis . Was a transmission leak found?	--	Go to Step 9	Go to Step 11
7	The transmission fluid is contaminated with engine coolant. Repair or replace the transmission cooler in the radiator. Is the transmission cooler repair complete?	--	Go to Step 9	--
8	1. Drain the fluid by removing the transmission fluid pan drain plug (63). 2. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement . **Important:** A very small amount of material in the bottom of the pan is a normal condition. 3. Inspect the bottom pan for any excessive debris. Was excessive debris found?	--	Go to Step 9	Go to Step 10
	1. Repair the transmission, if required. **Important:** If the transmission is overhauled, it may be necessary to flush the transmission fluid cooler and pipes. Refer to Transmission Fluid Cooler Flushing and			

9	Flow Test . 2. Add enough DEXRON® VI automatic transmission fluid to bring the fluid to the fluid level to the bottom of the threaded plug hole. 3. Start the engine. 4. Depress the brake pedal and move the shift lever through the gear ranges, pausing a few seconds in each range. Return the shift lever to the PARK range. 5. Raise the vehicle on a hoist. The vehicle must be level with the engine running and the shift lever in the PARK range. Refer to Lifting and Jacking the Vehicle . **Caution:** The engine must be running when the transmission fluid fill plug is removed, or excessive fluid loss will occur. Transmission fluid may be hot. Since the actual fluid level is unknown, stand clear when removing the fill plug. Have a container ready to capture any lost fluid. Do not turn the engine off with the fill plug removed, as you can be injured by hot transmission fluid being expelled out of the oil fill opening. 6. Let the Automatic transmission fluid temperature rise until it has reached the specified value. Remove the transmission plug. 7. If needed, add DEXRON®VI automatic transmission fluid in increments of 0.5 L (0.5 qt) until the fluid drains from the threaded hole plug. **Notice:** Refer to Fastener Notice in the Preface section. **Important:** If the level hole plug (36) and O-ring (37) are not damaged, they should be reused. 8. Allow fluid to finish draining out of the plug hole. Inspect the level hole plug (36) and O-ring (37) for damage. Install the transmission hole plug (36) and tighten to the specified value. 9. Wipe any excess fluid from the transmission with a rag or shop towel. Is the repair complete?	30-50°C (86-122°F) 20 N·m (15 lb. ft)	System OK	--
	1. Change the fluid and fluid filter. Refer to Automatic Transmission Fluid and Filter Replacement . 2. Start the engine. 3. Depress the brake pedal and move the shift lever through the gear ranges, pausing a few seconds in each range. Return the shift lever to the PARK range. 4. Raise the vehicle on a hoist. The vehicle must be level with the engine running and the shift lever in the PARK range. Refer to Lifting and Jacking the Vehicle .			

10	**Caution:** The engine must be running when the transmission fluid fill plug is removed, or excessive fluid loss will occur. Transmission fluid may be hot. Since the actual fluid level is unknown, stand clear when removing the fill plug. Have a container ready to capture any lost fluid. Do not turn the engine off with the fill plug removed, as you can be injured by hot transmission fluid being expelled out of the oil fill opening. 5. Let the Automatic transmission fluid temperature rise until it has reached the specified value. Remove the transmission level hole plug (36). 6. If needed, add DEXRON®VI automatic transmission fluid in increments of 0.5 L (0.5 qt) until the fluid drains from the threaded hole plug. **Notice:** Refer to Fastener Notice in the Preface section. **Important:** If the level hole plug (36) and O-ring (37) are not damaged, they should be reused. 7. Allow fluid to finish draining out of the plug hole. Inspect the level hole plug (36) and O-ring (37) for damage. Install the transmission level hole plug (36) and tighten to the specified value. 8. Wipe any excess fluid from the transmission with a rag or shop towel. Is the repair complete?	30-50°C (86-122° F) 20 N·m (15 lb. ft)	System OK	--
11	**Notice:** Refer to Fastener Notice in the Preface section. **Important:** If the level hole plug (36) and O-ring (37) are not damaged, they should be reused. 1. Let the Automatic transmission fluid temperature rise until it has reached the specified value. Allow fluid to finish draining out of the hole plug. Inspect the level hole plug (36) and O-ring (37) for damage. Install the transmission level hole plug (36) and tighten to the specified value. 2. Wipe any excess fluid from the transmission with a shop towel or rag. Is the repair complete?	30-50°C (86-122° F) 20 N·m (15 lb. ft)	System OK	--

Transmission Fluid Cooler Flushing and Flow Test

Holden studies indicate that plugged or restricted transmission oil coolers and pipes cause insufficient transmission lubrication and elevated operating temperatures which can lead to premature transmission failure. Many repeat repair cases may have been prevented by following published procedures for transmission oil cooler flushing and flow checking. This procedure includes flow checking and flushing the auxiliary transmission oil cooler, if equipped.

Important: Use the J 45096 or equivalent to flush and flow test the transmission oil cooler and the oil cooler pipes after the transaxle is removed for repairs.

Only DEXRON®VI automatic transmission fluid should be used when doing a repair on a Holden transmission.

Time allowance for performing the cooler flow checking and flushing procedure has been included in the appropriate labor time guide operations since the 1987 model year. The service procedure steps for oil cooler flushing and flow testing are as follows:

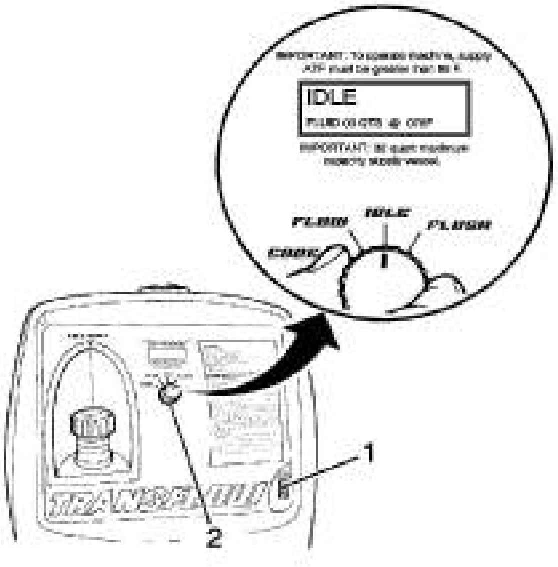
Cooler Flow Check and Flushing Steps

1. Machine Set-up
2. Determine Minimum Flow Rate
3. Back Flush
4. Forward Flush
5. Flow Test
6. Code Recording Procedure
7. Clean-up

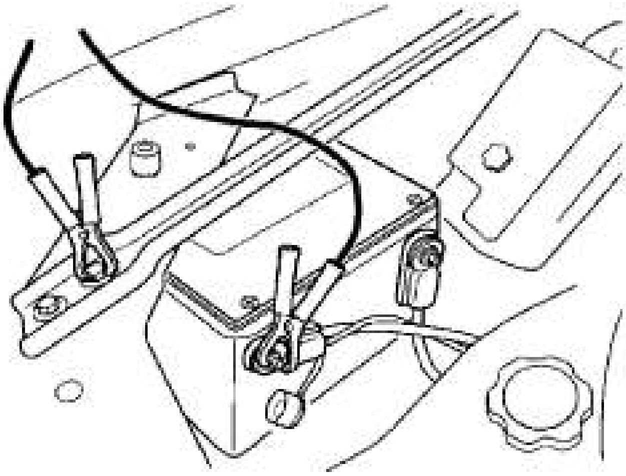
Tools Required

- J 45096 Transmission Oil Cooling System Flush and Flow Test Tool
- J 45806 Cooler Flushing Adapter
- Shop air supply with water/oil filters, regulator and pressure gage -- minimum 90 psi
- Eye protection
- Rubber gloves

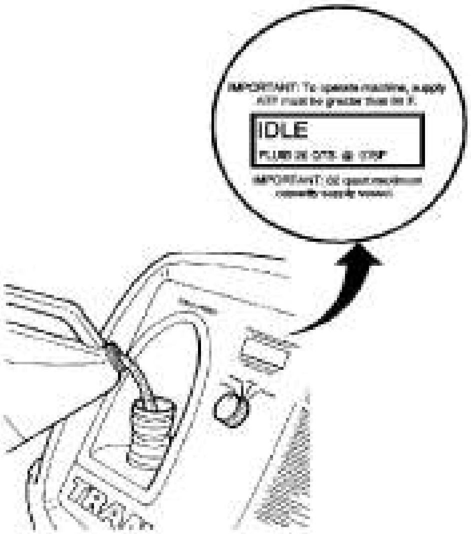
Machine Set-up



1. Verify that the main power switch (1) is in the OFF position.
2. Place the main function switch (2) in the IDLE position.

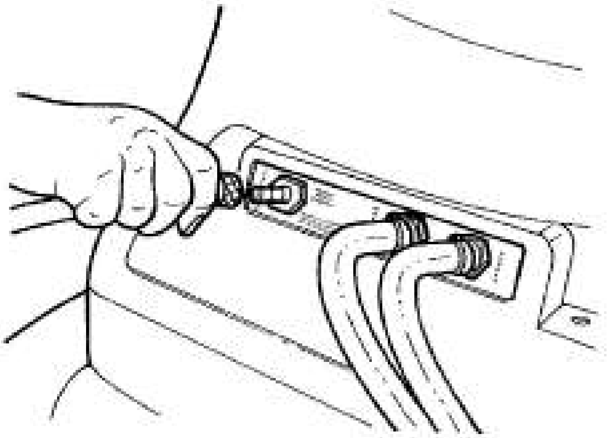


3. Connect J 45096 to the vehicle 12V DC power source by connecting the red battery clip to the positive, +, battery post on the vehicle and connect the negative lead to a known good chassis ground.
4. Turn the main power switch to the ON position.



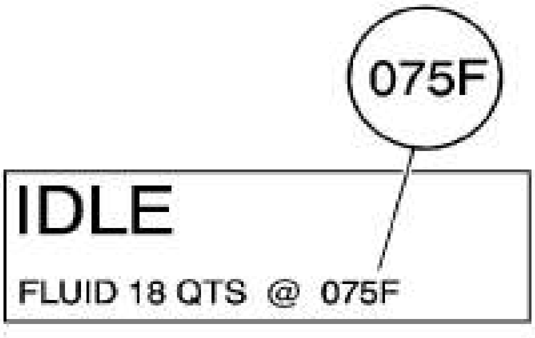
Notice: Do not overfill the supply vessel. Damage to the unit may result. To verify the fluid level, view the LCD screen display while filling the unit, to ensure the fluid level does not exceed 30 L (32 qt).

5. Fill the supply tank with Dexron®VI/Mercon®, or equivalent, through the fill port.
6. Reinstall and tighten the fill cap.

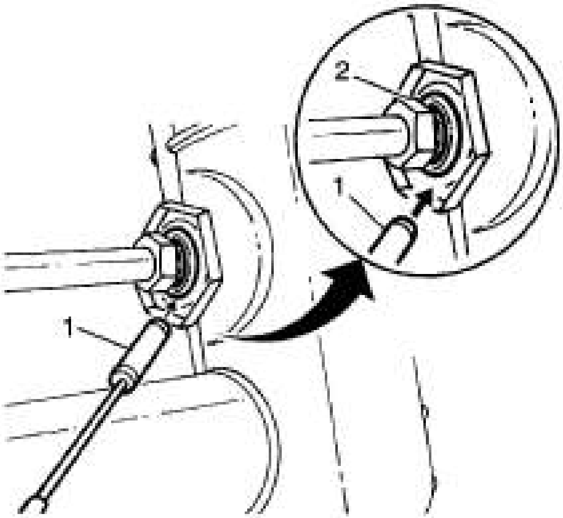


7. Connect a shop air supply hose to the quick-disconnect on the rear panel marked SUPPLY AIR.

Determine Minimum Flow Rate



1. From the machine display, identify the temperature of the automatic transmission fluid that is stored in the supply vessel of J 45096 .



2. Determine whether the transmission oil cooler is steel or aluminum by using a magnet (1) at the cooler flange (2) at the radiator.
3. Refer to the table below. Using the temperature from step 1, locate on either the Steel MINIMUM Flow Rate table or the Aluminium MINIMUM Flow Rate table the minimum flow rate in gallons per minutes (GPM). Record the minimum flow rate in GPMs and the supply fluid temperature for further reference.

   Example:

   - Fluid temperature: 75°F
   - Cooler type: Steel

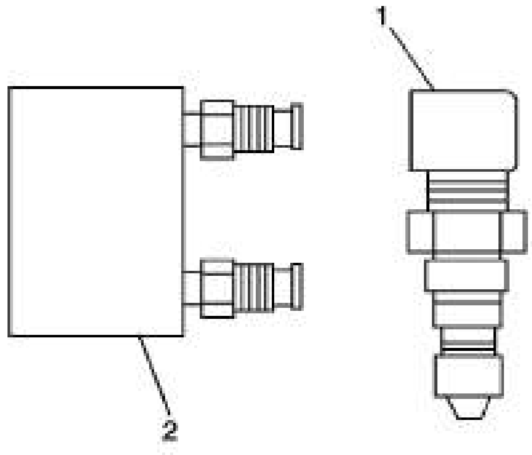
The MINIMUM flow rate for this example is 0.8 GPM.

4. Inspect transmission oil cooler lines for damage or kinks that may cause restricted oil flow. Repair as needed and refer to the appropriate Holden service manual procedures.

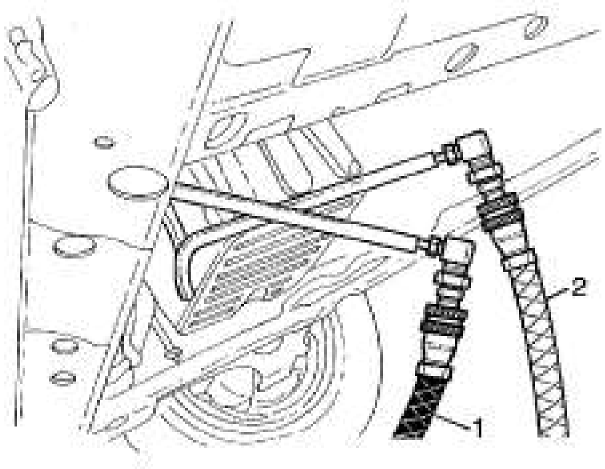
Minimum Flow Rate in Litres Per Minute (LPM)

Temperature Range	Steel	Aluminium
65 - 66°F	2.3 lpm	1.9 lpm
67 - 70°F	2.7 lpm	2.7 lpm
71 - 75°F	3.0 lpm	3.0 lpm
76 - 80°F	3.4 lpm	3.4 lpm
81 - 84°F	3.8 lpm	3.8 lpm
85 - 89°F	4.2 lpm	4.2 lpm
90 - 94°F	4.5 lpm	4.5 lpm
95 - 98°F	4.9 lpm	4.9 lpm
99 - 103°F	5.3 lpm	5.3 lpm
104 - 108°F	5.7 lpm	5.7 lpm
109 - 112°F	5.7 lpm	5.7 lpm
113 - 117°F	5.7 lpm	6.0 lpm
118 - 120°F	6.8 lpm	6.4 lpm

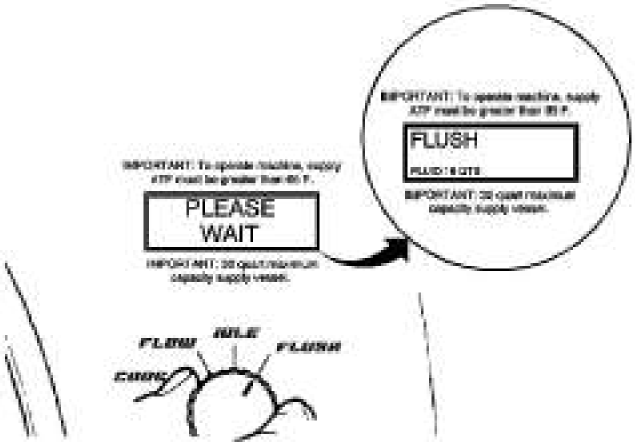
Back Flush Procedure



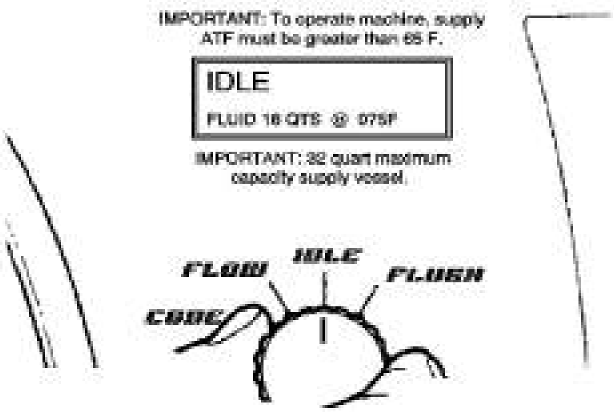
1. Connect the J 45096 adapters (1) to the vehicle's transmission oil cooler supply and return lines at the transmission using J 45806 (2).



2. Connect the black supply hose (1) to the return line, top connector of the transmission, and the clear waste hose (2) to the feed line, bottom connector of the transmission, to the vehicle cooler lines. This is the reverse flow - backflush direction.



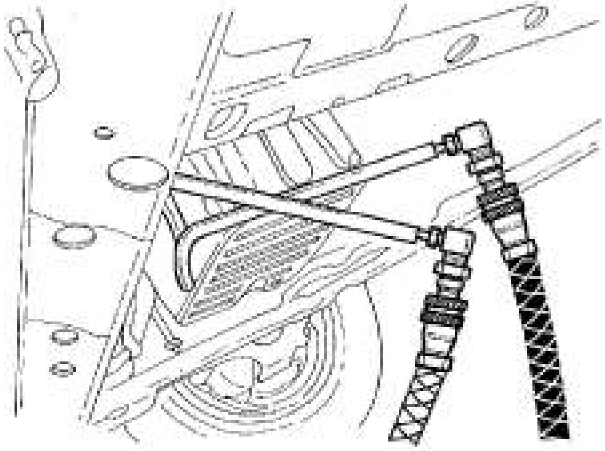
3. Turn the main function switch to the FLUSH position. Allow the machine to operate for 30 seconds.



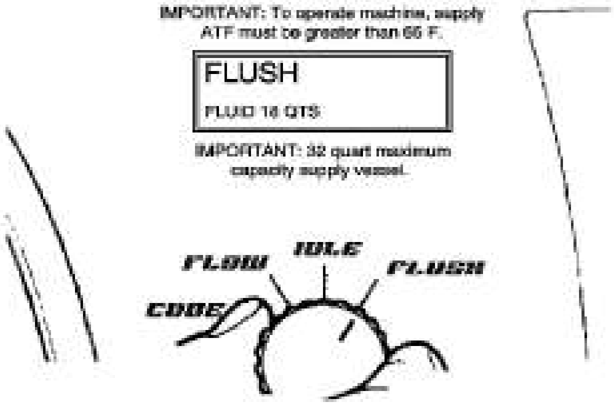
IMPORTANT: To operate machine, supply ATF must be greater than 65 F.
IDLE
FLUID 16 QTS @ 075F
IMPORTANT: 32 quart maximum capacity supply vessel.
FLOW
IDLE
FLUSH
CODE

4. Turn the main function switch to the IDLE position and allow the supply vessel pressure to dissipate.

Forward Flush



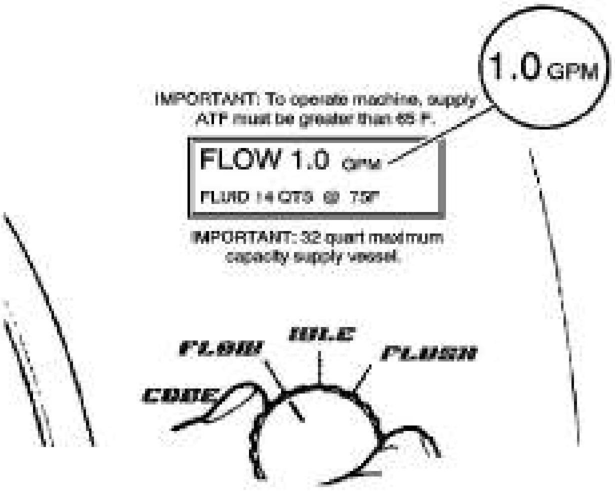
1. Disconnect the supply and waste hoses from the vehicle cooler lines. Reverse the supply and waste hoses to provide a normal flow direction.



IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.
FLUSH
FLUID 16 QTS
IMPORTANT: 32 quart maximum
capacity supply vessel.
FLOW
IDLE
FLUSH
CODE

2. Turn the main function switch to the FLUSH position and allow machine to operate for 30 seconds.

Flow Test



1.0 GPM
IMPORTANT: To operate machine, supply
ATF must be greater than 65 F.
FLOW 1.0 GPM
FLUID 14 QTS @ 75F
IMPORTANT: 32 quart maximum
capacity supply vessel.
FLOW
IDLE
FLUSH
CODE

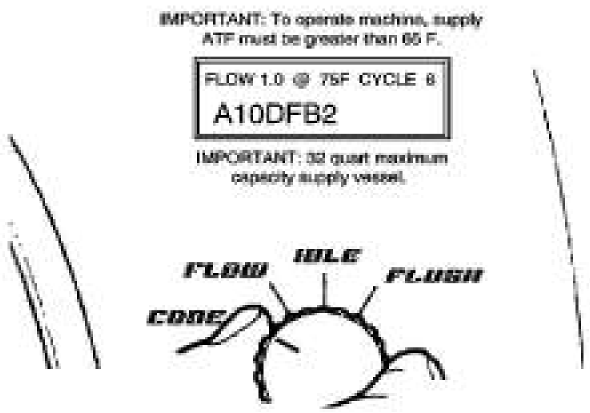
Important: If the flow rate is less than 0.5 gpm, the LCD displays an error message. Refer to the Troubleshooting section of the operation manual.

1. Turn the main function switch to the FLOW position and allow the oil to flow for 15 seconds. Observe and note the flow rate; this is the TESTED flow rate.
2. Compare the TESTED flow rate to the MINIMUM flow rate information previously recorded.

- If the TESTED flow rate is equal to or greater than the MINIMUM flow rate recorded, the oil cooling system is functioning properly. Perform Code Recording Procedure.
- If the TESTED flow rate is less than the MINIMUM flow rate previously recorded, repeat the back flush and forward flush procedures.

3. If the TESTED flow rate is less than the MINIMUM flow rate after the second test, perform Code Recording Procedure.
   3.1. Replace the transmission oil cooler.
   3.2. Reconnect supply and waste hoses to the cooler lines in the normal flow direction. Perform Flow Test.
   3.3. Perform Code Recording Procedure.

Code Recording Procedure



IMPORTANT: To operate machine, supply ATF must be greater than 65 F.
FLOW 1.0 @ 75F CYCLE 8
A10DFB2
IMPORTANT: 32 quart maximum capacity supply vessel.
FLOW
IDLE
FLUSH
CODE

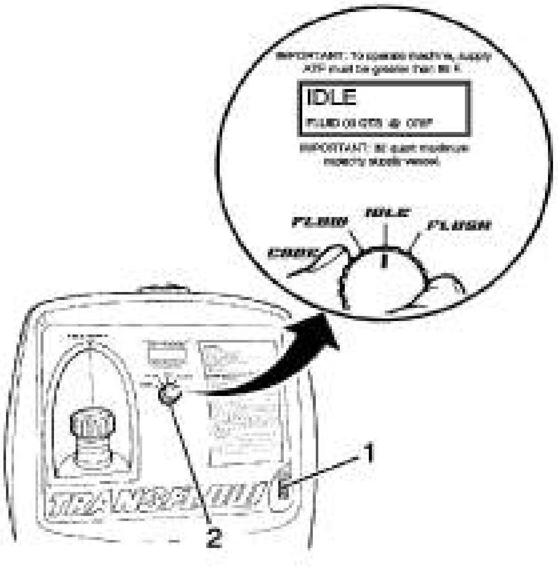
1. Turn the main function switch to the CODE position.

   Important:

   - If power is interrupted prior to the recording of the seven-character code, the code will be lost and the flow rate test will need to be repeated.
   - The flow test must run for a minimum of 8-10 seconds and be above 0.5 gpm for a code to be generated.

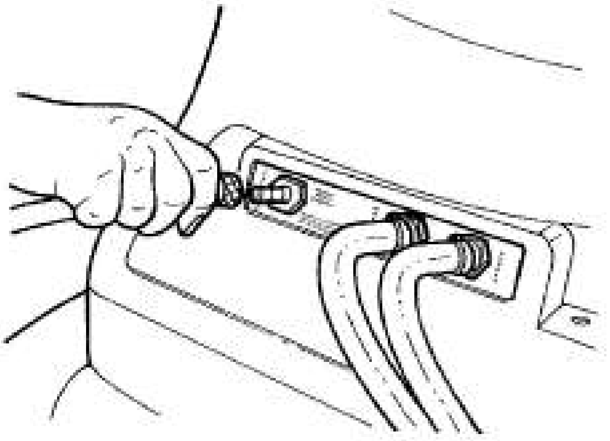
2. Record TESTED flow rate, temperature, cycle and seven-character flow code information on repair order.

Clean-up



1. Turn the main function switch (2) to the IDLE position and allow the supply vessel pressure to dissipate.
2. Turn the main power switch (1) to the OFF position.
3. Disconnect the supply and waste hoses and the 12-volt power source from the vehicle.

   Note: A small amount of water may drain from the bottom of the unit when the air supply is disconnected. This is a normal operation of the built-in water separator.



4. Disconnect the air supply hose from J 45096 .
5. Dispose of the waste Automatic transmissionF in accordance with all applicable federal, state, and local requirements.

Whine Noise Varying with RPM or Fluid Pressure

Whine Noise Varying with RPM or Fluid Pressure

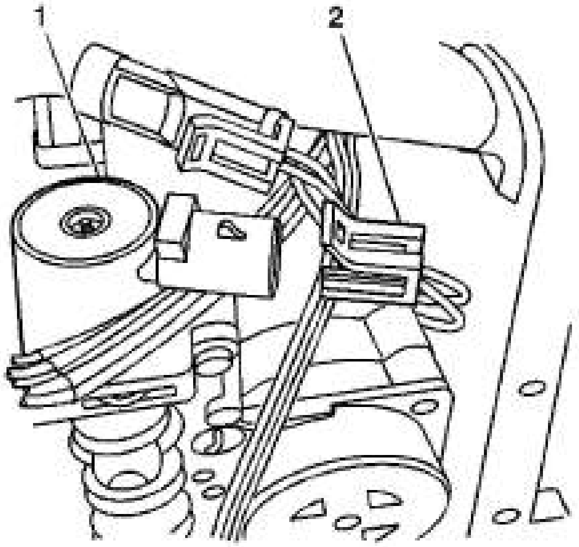
Checks	Action
DEFINITION: In all ranges, a whine which may be sensitive to RPM load, or which ceases when the TCC engages, or which is sensitive to the oil pressure	
Torque Converter (1)	Verify that the noise is internal to the torque converter by placing your left foot on the brake with the gear or selector in Drive. Momentarily stall the engine. Torque Converter noise increases under load.
Oil Pump System	Pump whine noise, which is usually noticable in Park, Neutral and all other gear ranges. Pump whine will vary with line pressure.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1994223**

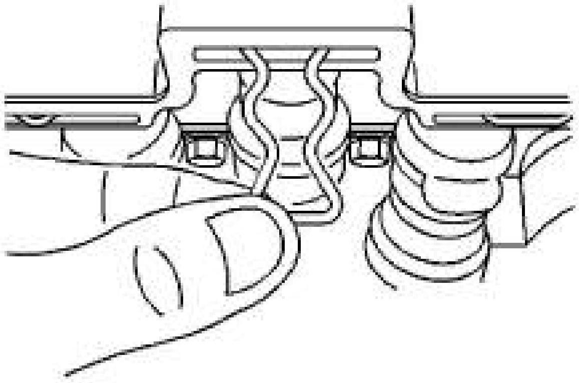
1-2 Shift Solenoid Valve Replacement

Removal Procedure

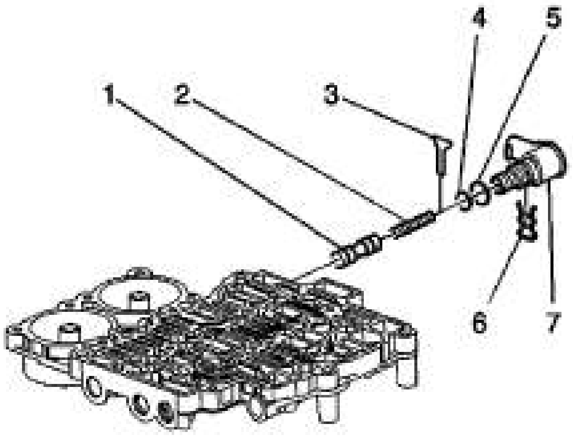
1. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement.



2. Disconnect the electrical connector (2) from the 1-2 shift solenoid (1).

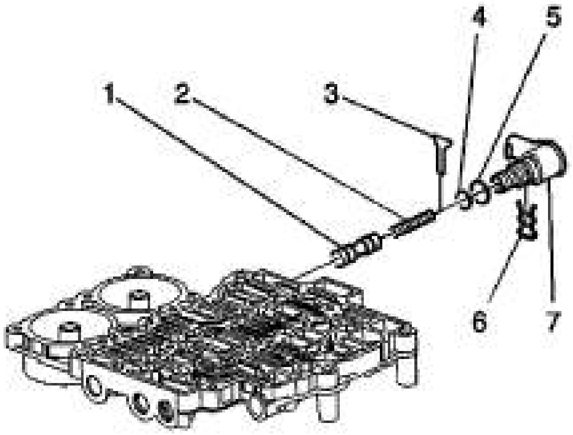


3. Using a suitable tool, remove the 1-2 shift solenoid retainer from the control valve body.

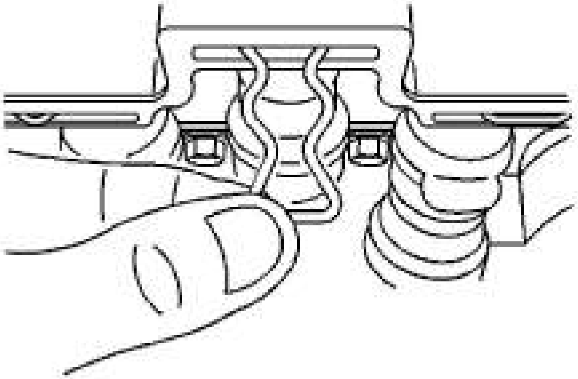


4. Remove the 1-2 shift solenoid (7) from the control valve body.
5. Remove the O-ring seals (4-5) from the 1-2 shift solenoid (7) ONLY if the O-rings are cut or worn.

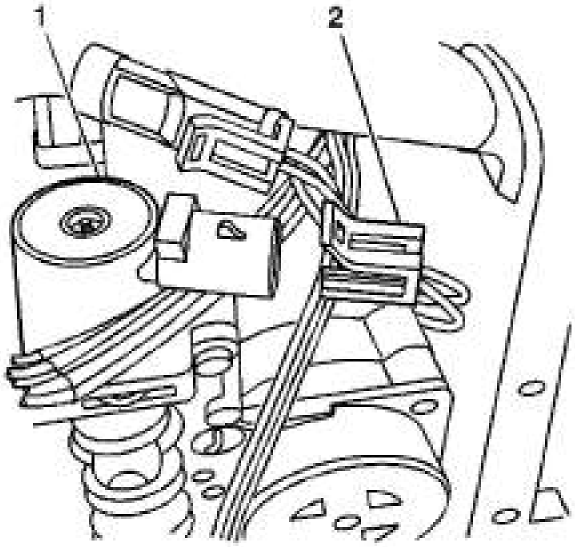
Installation Procedure



1. Install new O-ring seals (4-5) to the 1-2 shift solenoid (7), if the O-rings were previously removed.
2. Install the 1-2 shift solenoid (7) into the control valve body.



3. Install the 1-2 shift solenoid retainer into the control valve body.



4. Connect the electrical wiring harness connector (2) to the 1-2 shift solenoid (1).
5. Install the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement.

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

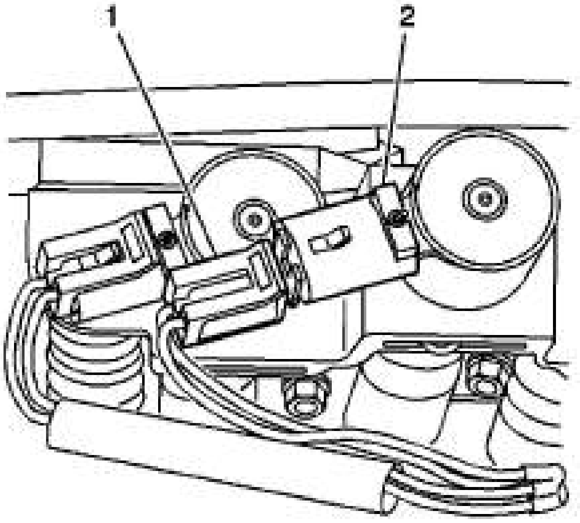
Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Transmission Adaptive Functions.

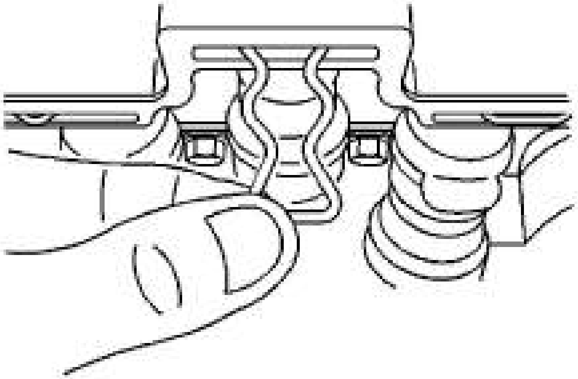
2-3 Shift Solenoid Valve Replacement

Removal Procedure

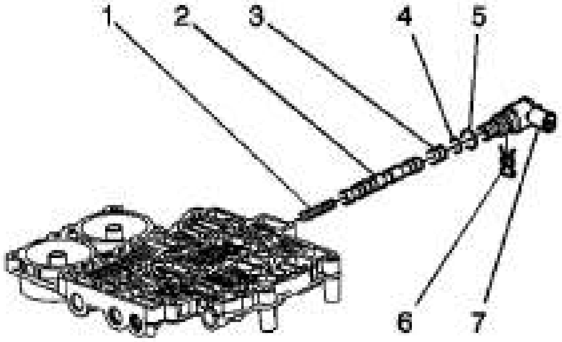
1. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement.



2. Disconnect the electrical connector (1) from the 2-3 shift solenoid (2).

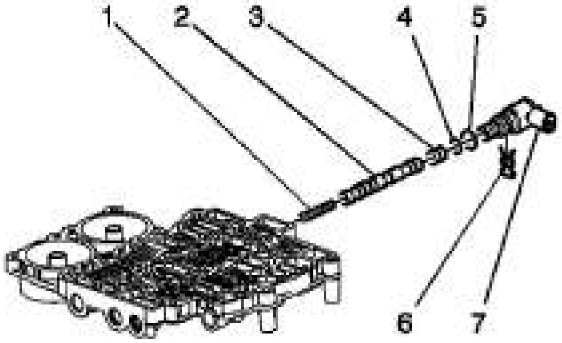


3. Using a suitable tool, remove the 2-3 shift solenoid retainer from the control valve body.

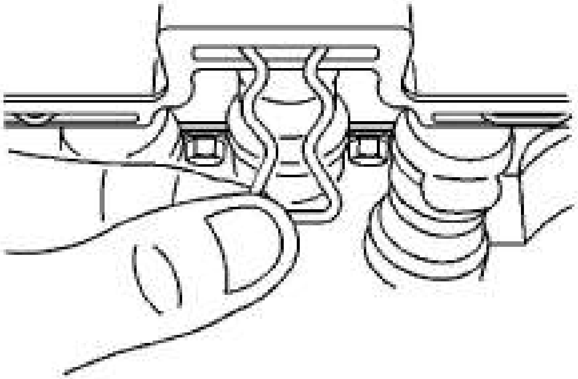


4. Remove the 2-3 shift solenoid (7) from the control valve body.
5. Remove the O-ring seals (4-5) from the 2-3 shift solenoid (7) ONLY if the O-rings are cut or worn.

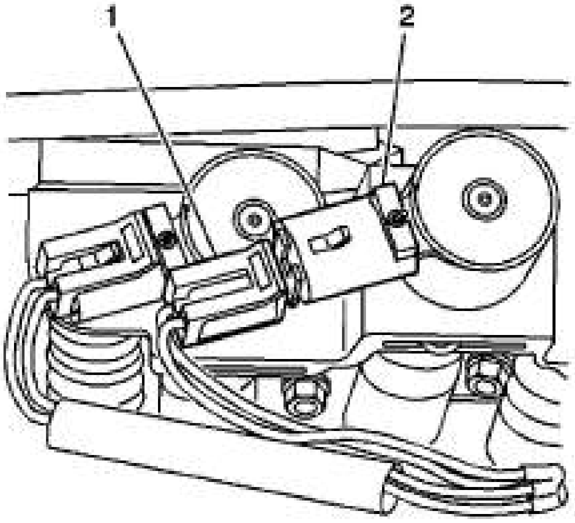
Installation Procedure



1. Install new O-ring seals (4-5) to the 2-3 shift solenoid (7), if the O-rings were previously removed.
2. Install the 2-3 shift solenoid (7) into the control valve body.



3. Install the 2-3 shift solenoid retainer into the control valve body.



4. Connect the electrical connector (1) to the 2-3 shift solenoid (2).
5. Install the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement.

   Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

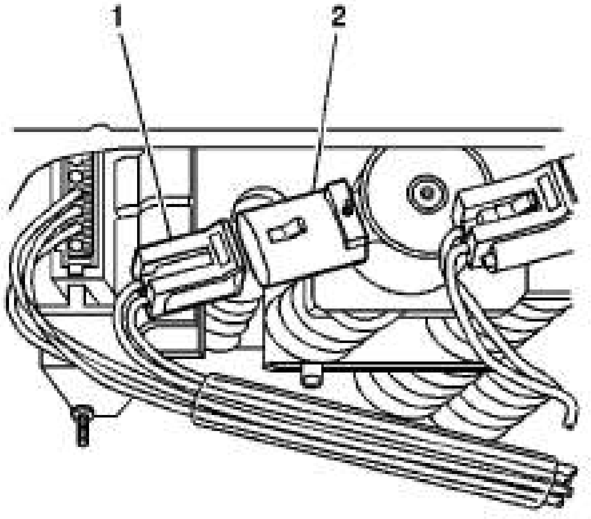
   Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Transmission Adaptive Functions.

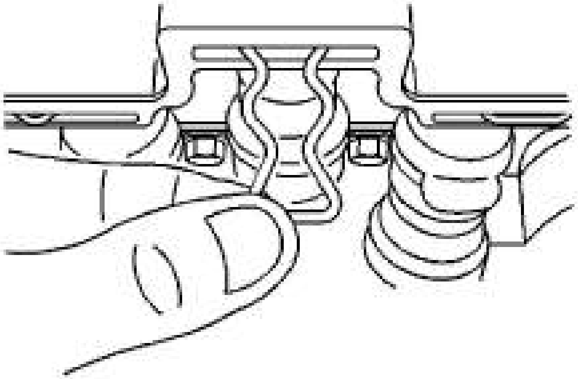
4-5 Shift Solenoid Valve Replacement

Removal Procedure

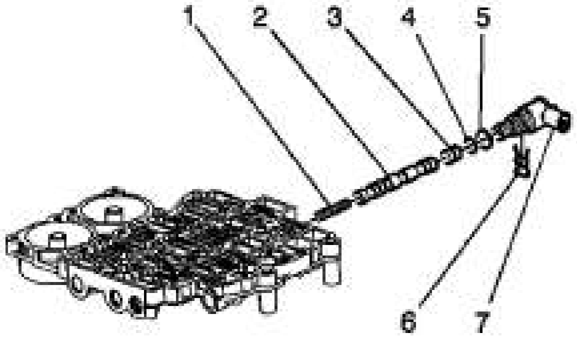
1. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement .



2. Disconnect the electrical wiring harness connector (1) from the 4-5 shift solenoid (2).

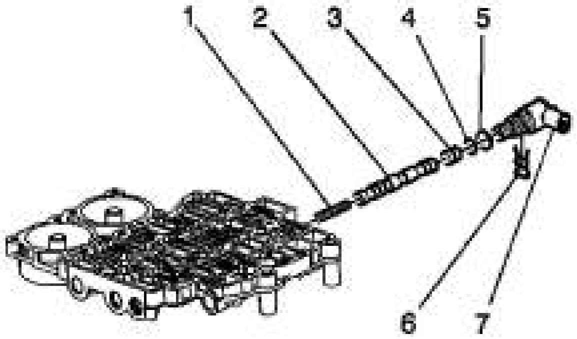


3. Using a small screwdriver or pick, remove the 4-5 shift solenoid retainer from the control valve body.

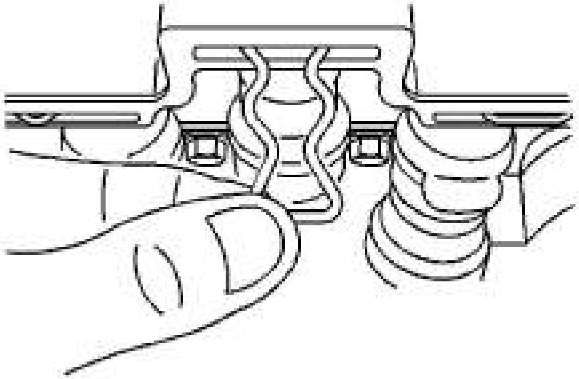


4. Remove the 4-5 shift solenoid (7) from the control valve body.
5. Remove the O-ring seals (4-5) from the 4-5 shift solenoid (7) ONLY if the O-rings are cut or worn.

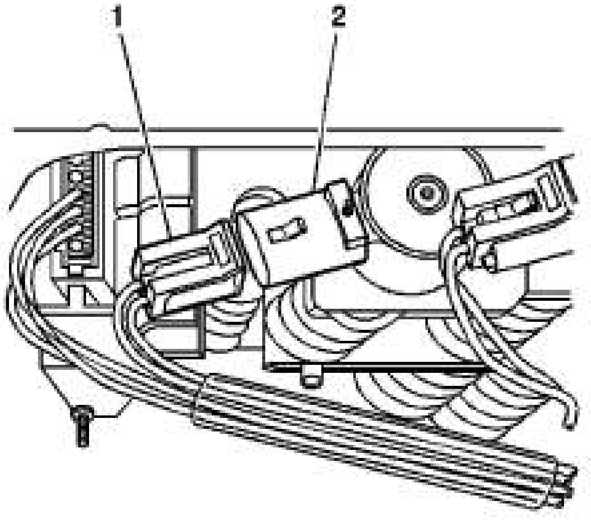
Installation Procedure



1. Install new O-ring seals (4-5) to the 4-5 shift solenoid (7), if the O-rings were previously removed.
2. Install the 4-5 shift solenoid (7) into the control valve body.



3. Install the 4-5 shift solenoid retainer into the control valve body.



4. Connect the electrical wiring harness connector (1) to the 4-5 shift solenoid (2).
5. Install the transmission fluid pan. Refer to Automatic Transmission Fluid and Filter Replacement .

   Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

   Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM, PCM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Control Module References .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1997143**

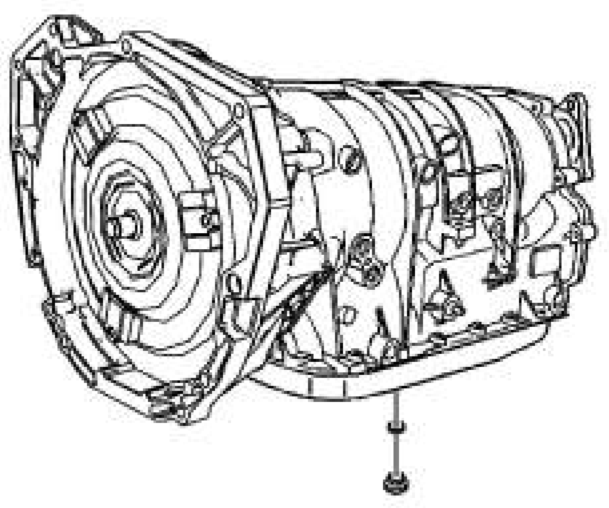
Automatic Transmission Fluid and Filter Replacement

Tools Required

- J 6125-1B Slide Hammer Adapter
- J 23129 Universal Seal Remover

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Place a suitable drain pan under the transmission fluid drain plug.

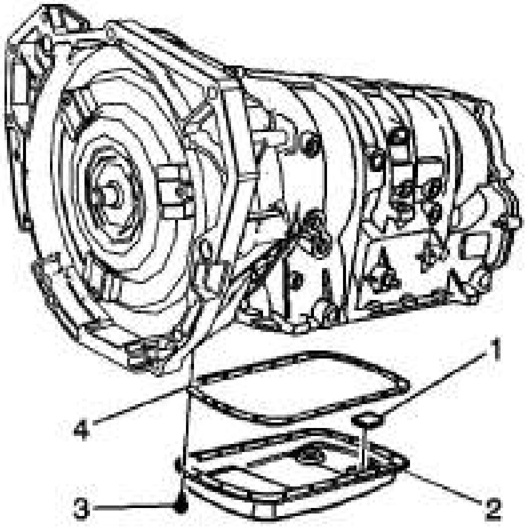


3. Remove and discard the transmission fluid drain plug.
4. Allow the transmission fluid to drain.
5. Inspect the transmission fluid for discoloration and contamination while draining.

Notice: Refer to Component Fastener Tightening Notice in the Preface section.

6. After the transmission fluid has finished draining, Install a NEW transmission fluid drain plug.

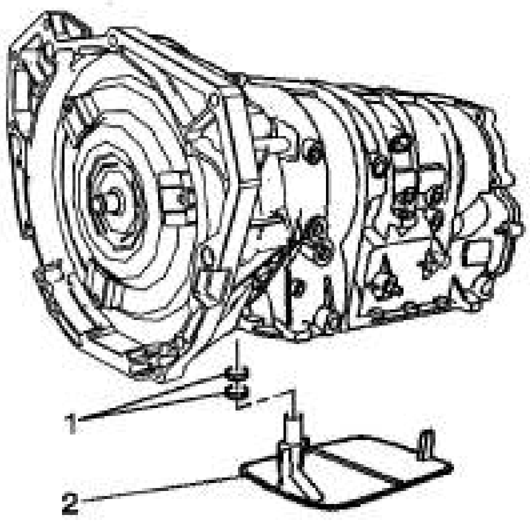
Tighten
Tighten the fluid drain plug to 20 N·m (15 lb. ft).



7. Remove the fluid pan retaining bolts (3).

   Important: Lightly tap the fluid pan (2) with a rubber mallet if necessary in order to loosen.

8. Remove the fluid pan (2) and the gasket (4).
9. Clean and inspect the following for damage or wear.
   - magnet (1)
   - pan (2)
   - bolts (3)
   - gasket (4)

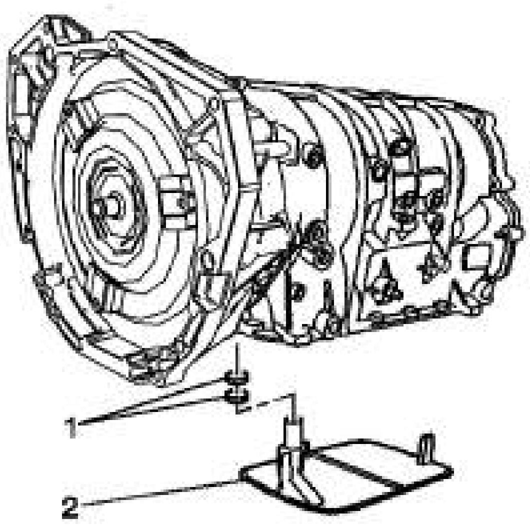


10. Remove the fluid filter (2). Use a suitable tool in order to pry the fluid filter neck out of the

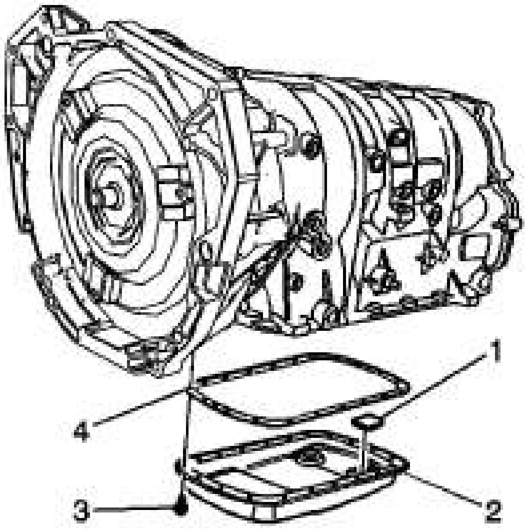
seals.

11. Remove the fluid filter seals (1) using J 23129 and J 6125-1B .

Installation Procedure



1. Install NEW fluid filter seals (1), onto the transmission fluid filter neck. Coat the new seals with a small amount of J 36850 or petroleum jelly before installation.
2. Install the transmission fluid filter (2) into the case.



Important: Fluid pan gaskets are reusable. Replace the gasket ONLY if the sealing surface is damaged.

3. Install the fluid pan (2) and the gasket (4) at the same time.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the fluid pan retaining bolts (3).

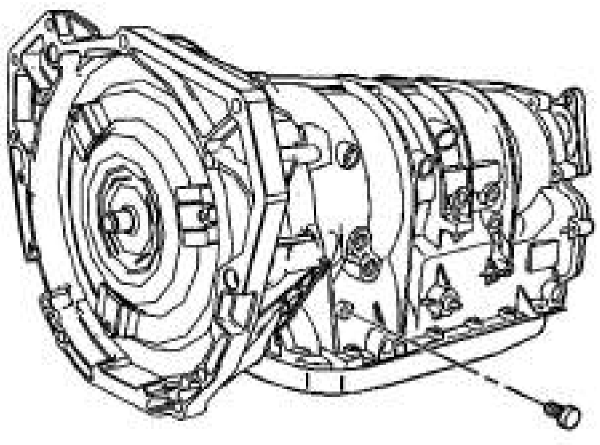
   Tighten
   Tighten the bolts to 11 N·m (97 lb. in).

5. Fill the transmission to the correct level. Refer to Transmission Fluid Check.
6. Inspect the oil pan gasket for leaks.
7. Lower the vehicle.

Automatic Transmission Fluid Pressure Test Hole Plug Replacement

Removal Procedure

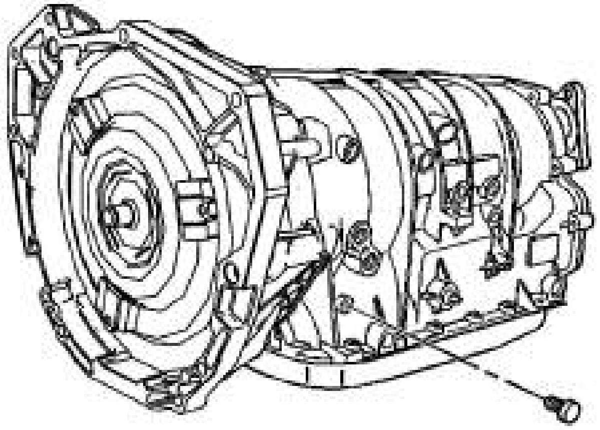
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove and discard the oil pressure test plug.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



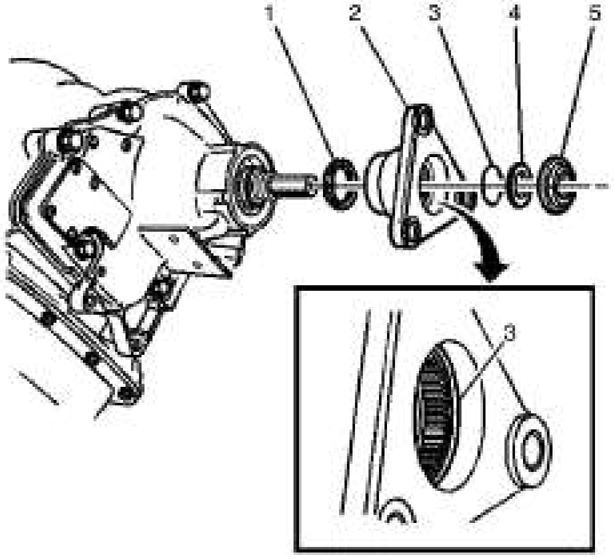
1. Install a NEW oil pressure test plug.

   Tighten
   Tighten the oil pressure test plug to 11 N·m (97 lb. in).

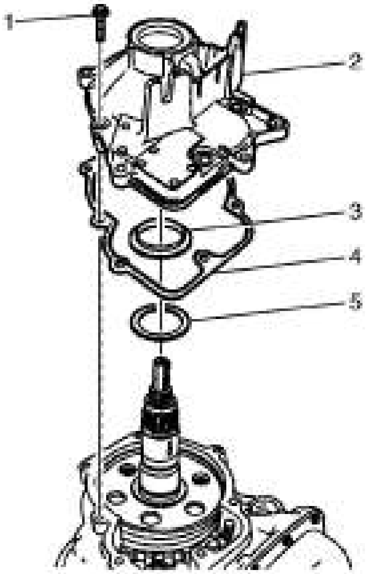
2. Check the transmission fluid level (fill if necessary). Refer to Transmission Fluid Check.
3. Lower the vehicle.

Case Extension and Gasket Replacement

Removal Procedure



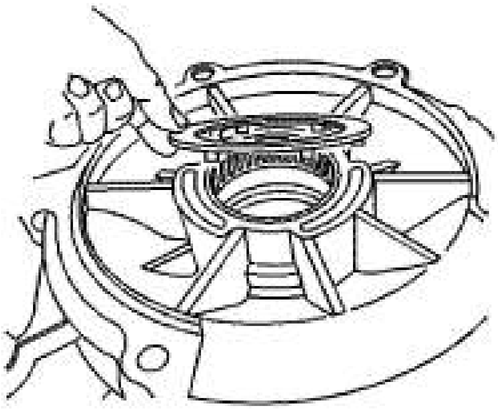
1. Remove the drive flange (2) and seal (3). Refer to Drive Flange and Seal Replacement .
2. Place a suitable jack under the transmission pan in order to support the transmission.
3. Remove the transmission support. Refer to Transmission Support Replacement .
4. Place a suitable drain pan under the extension housing.



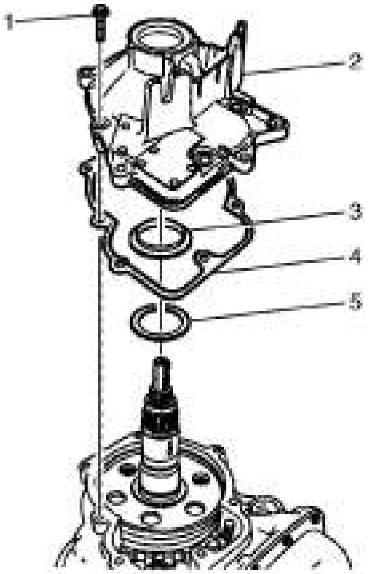
5. Remove the extension housing retaining bolts (1).

6. The output shaft retainer will slide off the output shaft while removing the case extension housing.
7. Remove the extension housing (2) and the seal (4).

Installation Procedure



1. Install the output shaft thrust washer to the inner side of the case extension housing prior to installing of the case extension housing. Align the thrust washer tabs with the locating slots on the case extension housing.



Important: The case extension housing gasket seal is reusable. Replace the gasket ONLY if the sealing surface is damaged.

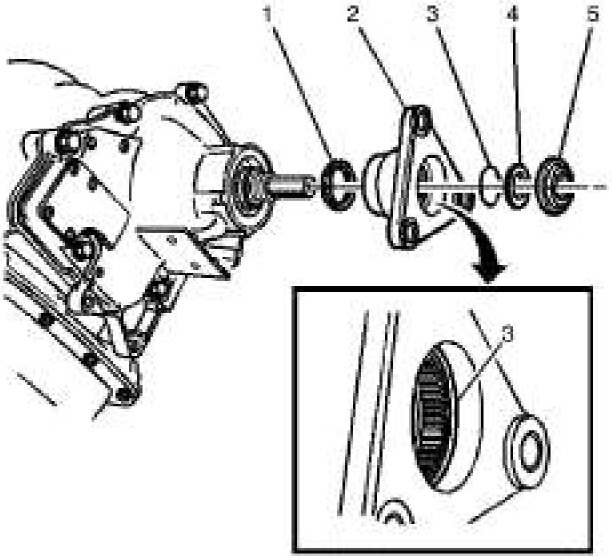
2. Install the extension housing (2) and the seal (4).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the extension housing bolts (1).

   Tighten
   Tighten the bolts to 22 N·m (16 lb. ft).

4. Install the transmission support. Refer to Transmission Support Replacement .
5. Remove the transmission jack.



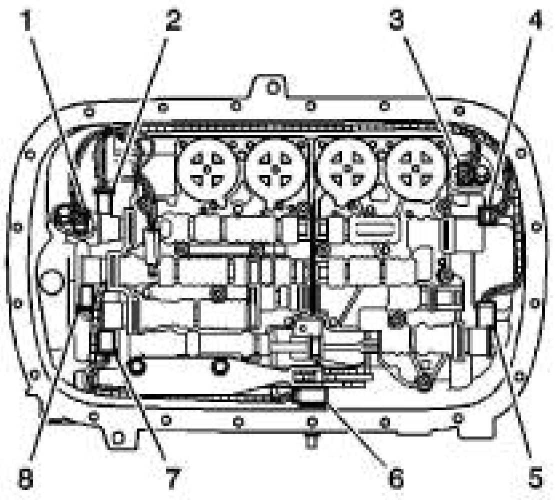
6. Install the drive flange (2) and seal (3). Refer to Drive Flange and Seal Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | Document ID: 1994228

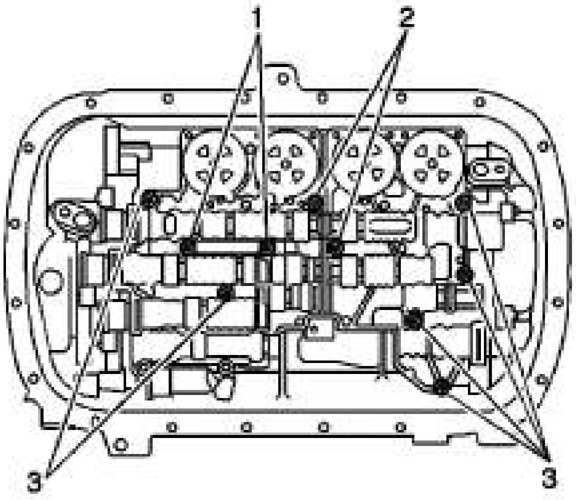
Control Valve Body Accumulator Assembly Replacement

Removal Procedure

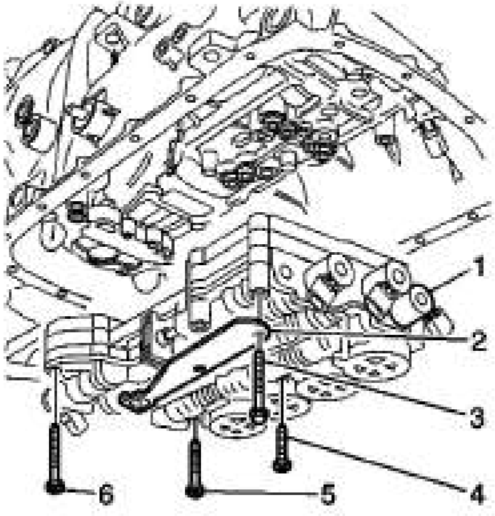
1. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement .



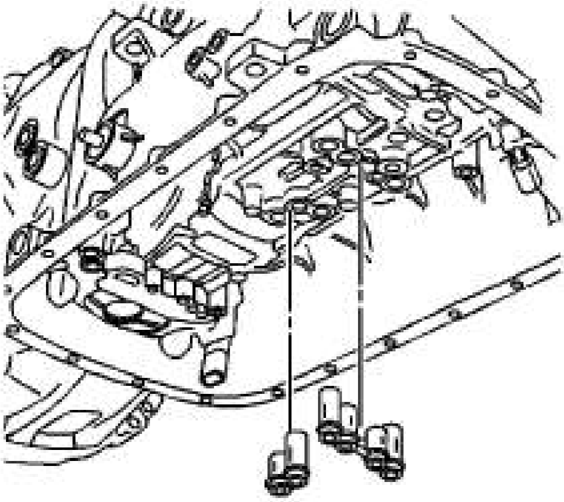
2. Disconnect the internal electrical connectors from all internal electrical components (1-8).



3. Remove ONLY bolts (1, 3) from the valve body assembly. Do NOT remove bolts (2) called out in the graphic.

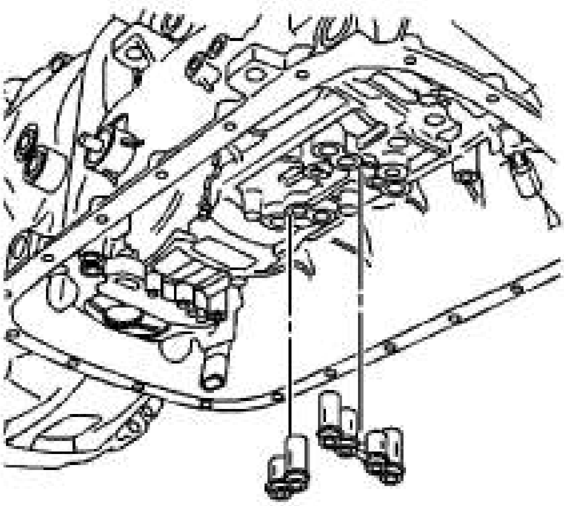


4. Remove the bolts (3-6) securing the control valve body accumulator assembly (1) and manual shaft detent assembly (2) to the transmission case.
5. Remove the manual shaft detent assembly (2) and control valve body accumulator assembly (1) from the transmission.

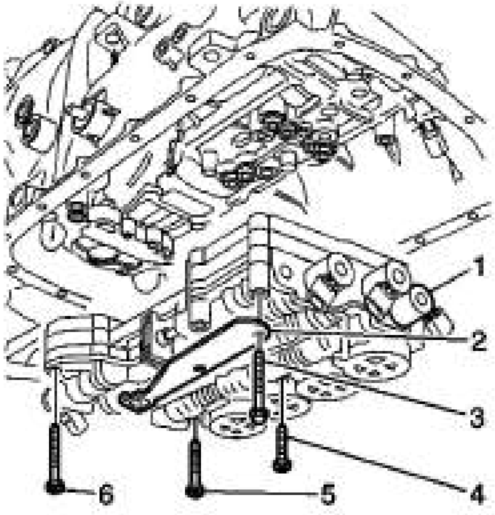


6. Remove the fluid passage sleeves only if replacement of the sleeves is necessary.

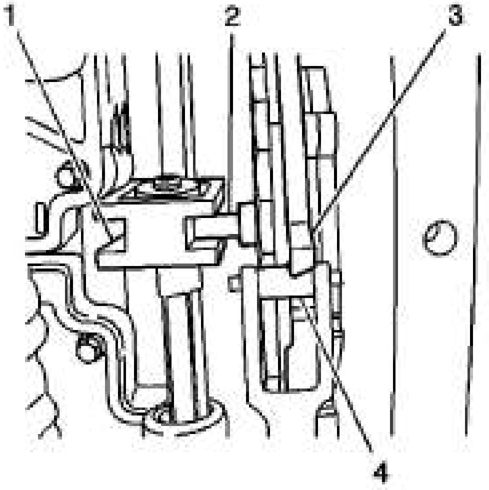
Installation Procedure



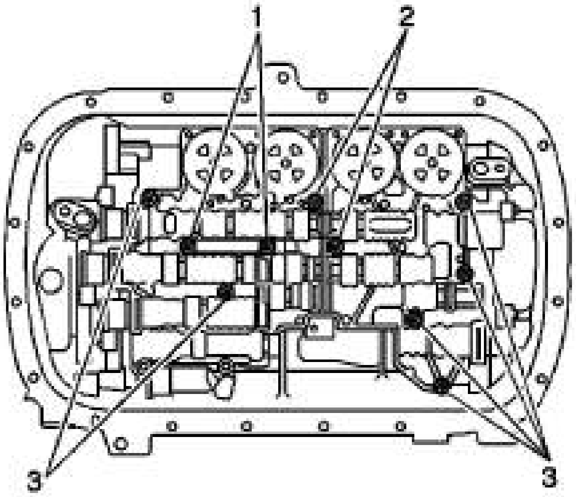
1. Install NEW fluid passage sleeves if previously removed.



2. Install the control valve body accumulator assembly (1) and manual shaft detent spring (2) to the transmission.
3. Install the manual shaft detent spring bolt (3) and hand tighten.



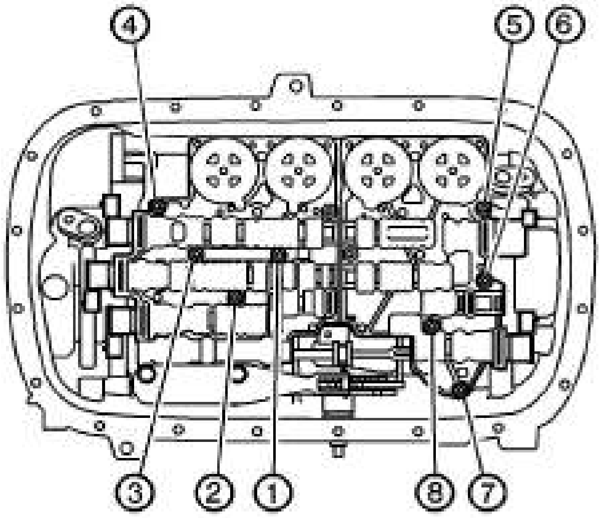
4. Make sure that the manual shift shaft detent lever locating pin (2) is properly engaged with the manual valve link (1).
5. Make sure that the detent spring roller (4) is properly engaged with the manual shift shaft switch (3).



Important: Do not tighten the bolts at this stage

6. Install the control valve body accumulator assembly retaining bolts (1-3).

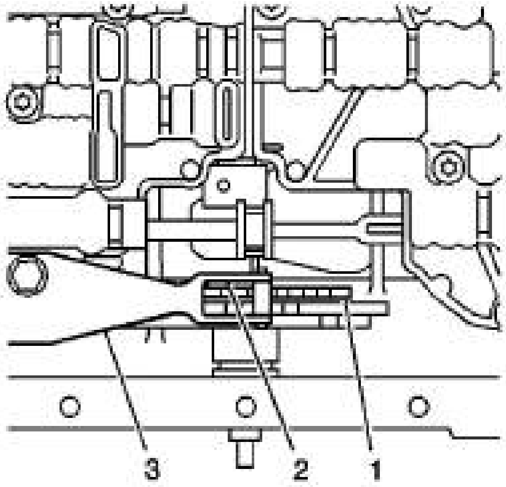
Notice: Refer to Fastener Notice in the Preface section.



Important: If the bolts are tightened at random, valve bores may become distorted and inhibit correct valve operation.

7. Tighten the control valve body assembly bolts in sequence.

Tighten
Tighten the bolts to 11 N·m (97 lb. in).

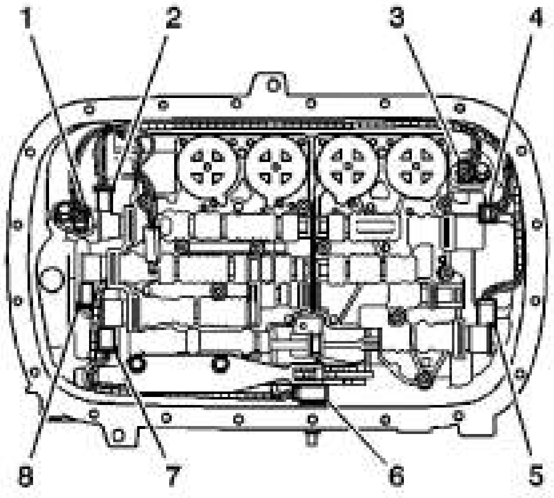


8. Install a 0.8 mm spacer (2) between the manual shift shaft detent lever (1) and the manual shift shaft detent spring (3).
9. Tighten the detent spring bolts.

Tighten

Tighten the bolts to 11 N·m (97 lb. in).

10. Remove the spacer (2).



11. Connect the internal electrical connectors to all internal electrical components (1-8).
12. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement .

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

13. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1997741**

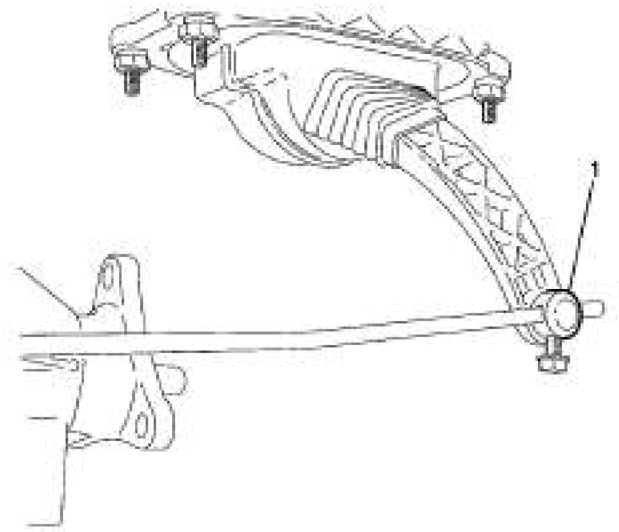
Drive Flange and Seal Replacement

Tools Required

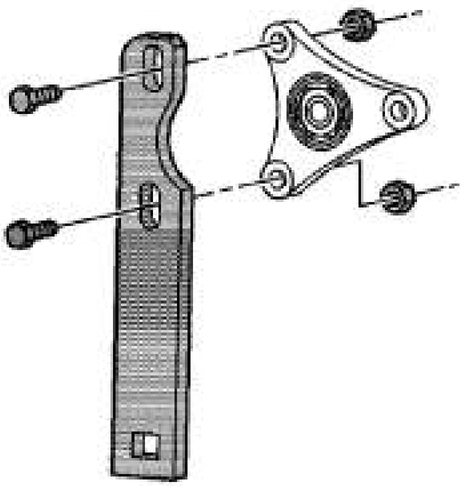
- J 6125-1B Slide Hammer
- J 23129 Universal Seal Remover
- J 29873 Injector Nozzle Socket 30 mm
- J 44765 Seal Installer
- J 45012 Holding Fixture
- J 45019 Universal Puller

Removal Procedure

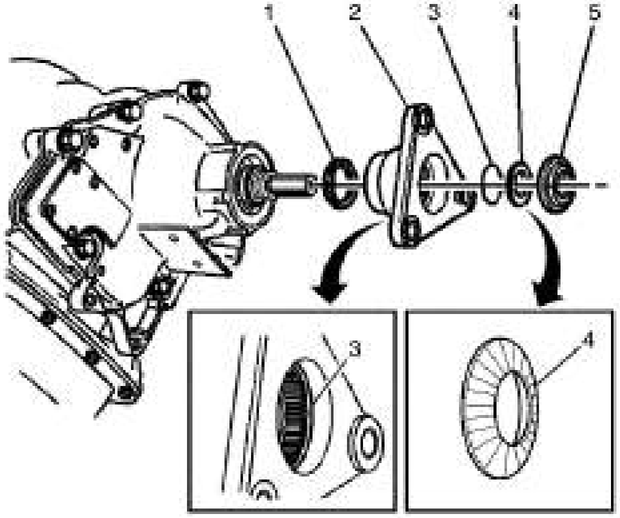
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



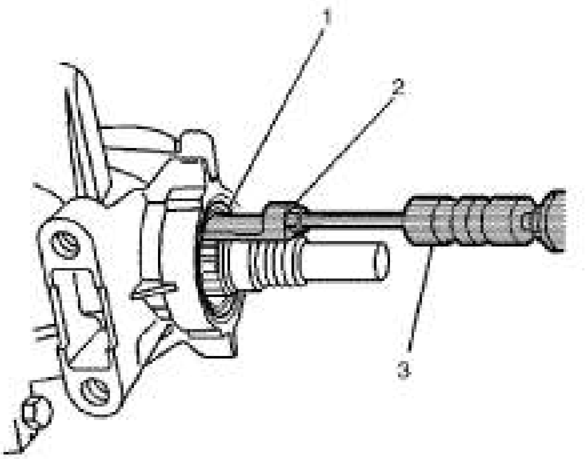
2. Remove the transmission manual shift shaft nut.
3. Disconnect the shift linkage from the transmission.
4. Place the transmission in neutral by rotating the transmission shift shaft clockwise 2 clicks.
5. Remove the exhaust system. Refer to Exhaust System Replacement .
6. Remove the propeller shaft coupler (1) from the transmission flange. Refer to Propeller Shaft Replacement .



7. Install J 45012 to the drive flange.
8. While holding J 45012 . Loosen the drive flange nut using J 29873 .
9. Remove J 45012 from the drive flange.

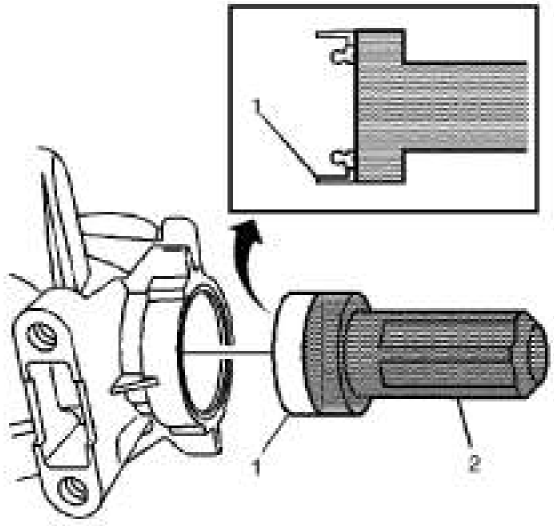


10. Remove the drive flange nut (5).
11. Remove the drive flange thrust washer (4).
12. Remove the drive flange (2) using J 45019 .
13. Remove the drive flange O-ring seal (3) from the drive flange.
14. Remove the output shaft assembly retainer (1).



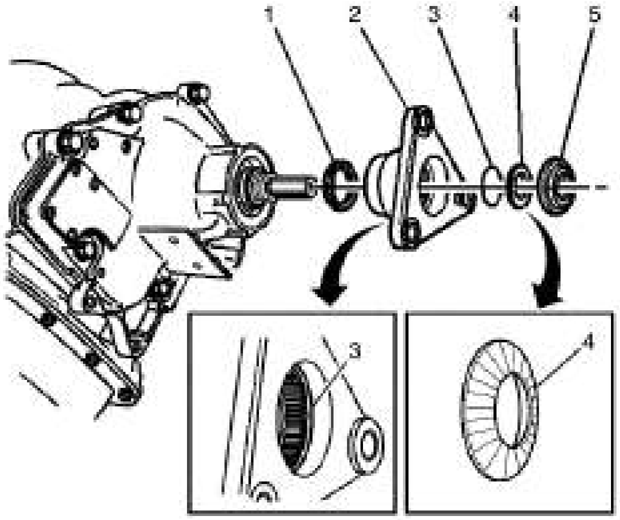
15. Use J 6125-1B and J 23129 (2&3) to remove the transmission case extension seal (1).

Installation Procedure



Important: Install the seal onto the tool before installing into the case to prevent damage to the seal.

1. Using J 44765 (2) install the NEW transmission case extension seal (1).



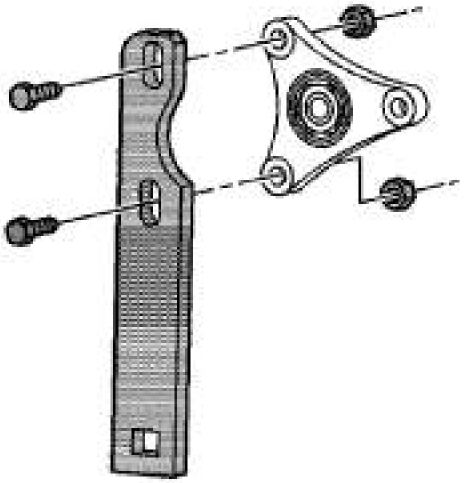
2. Install a NEW output shaft assembly retainer (1).

   Important: Position the retainer on the end of the output shaft splines. The retainer will be pushed to the correct depth as the drive flange is installed onto the output shaft.

3. Install a NEW drive flange O-ring seal (3) into the drive flange (2).
4. Install the drive flange (2) to the transmission output shaft.

   Important: Install the NEW drive flange thrust washer (4) as shown in diagram.

5. Install a NEW drive flange thrust washer (4).
6. Apply Loctite 272 to the NEW drive flange nut threads.
7. Start the NEW drive flange nut (5).



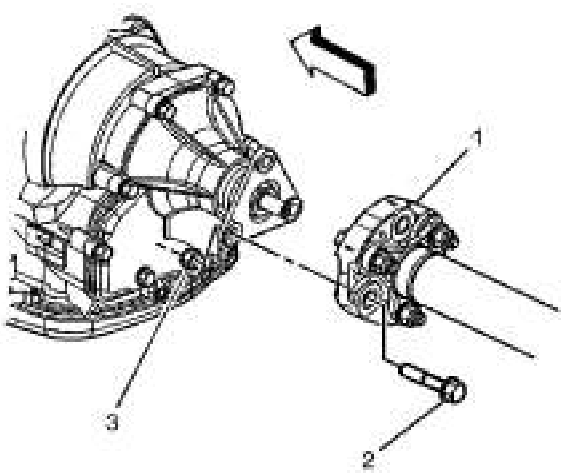
8. Install J 45012 to the drive flange.

   Notice: Refer to Fastener Notice in the Preface section.

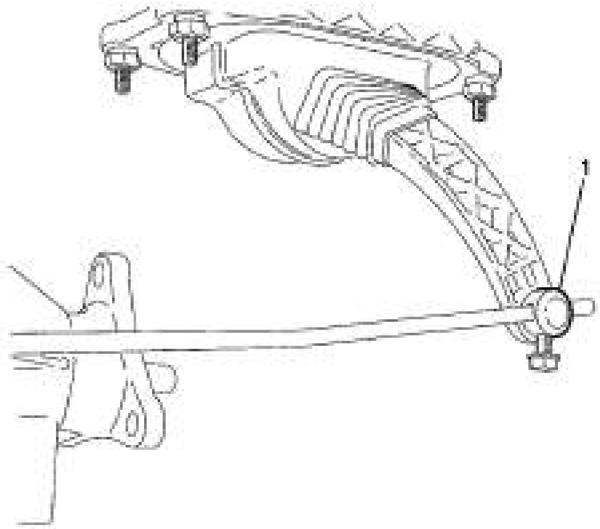
9. While holding J 45012 tighten the NEW drive flange nut using J 29873 .

   Tighten
   Tighten the drive flange nut to 60 N·m (44 lb. ft).

10. Remove J 45012 from the drive flange.



11. Install the propeller shaft. Refer to Propeller Shaft Replacement .
12. Install the exhaust system. Refer to Exhaust System Replacement .



13. Place the transmission in the park position by rotating the selector lever shaft fully counter

clockwise.

14. Connect the selector lever linkage to the transmission.
15. Install the transmission manual shift shaft nut.

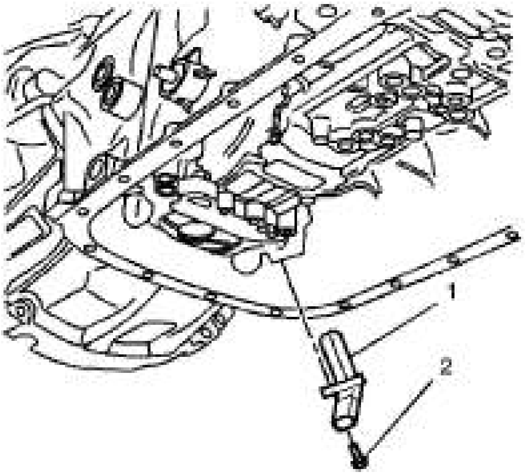
    Tighten
    Tighten the transmission manual shift shaft nut to 9 N·m (80 lb. in).

16. Check the transmission fluid level. Refer to Transmission Fluid Check .
17. Lower the vehicle.

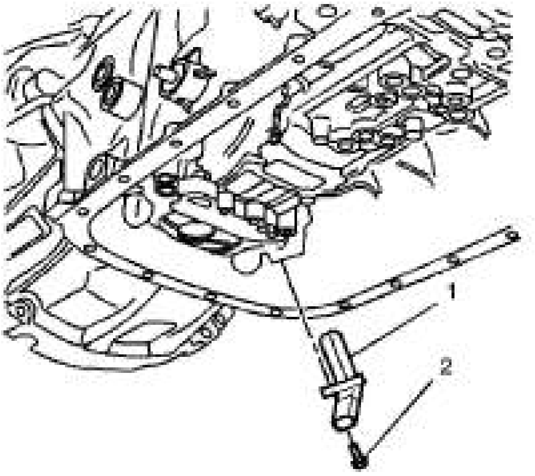
Input Speed Sensor Replacement

Removal Procedure

1. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



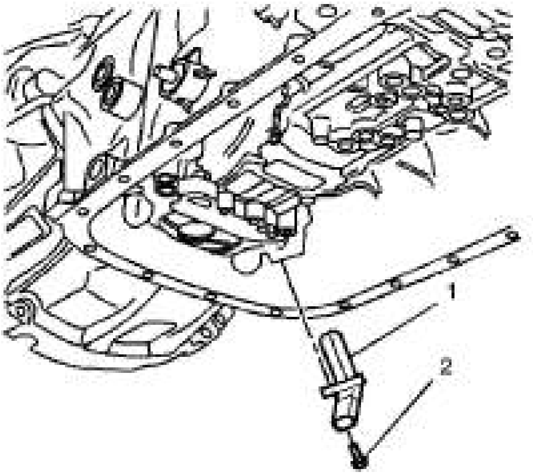
2. Disconnect the electrical wiring harness connector (1) from the input speed sensor (2).
3. Remove the input speed sensor retaining bolt (3).



4. Remove the input speed sensor (1).
5. Inspect the input speed sensor (1) for the following conditions:

- Damaged or missing magnet
- Damaged housing
- Bent or missing electrical terminals
- Metal contamination stuck to magnet

Installation Procedure

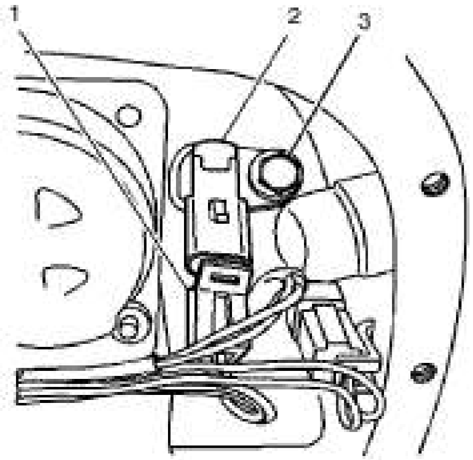


1. Install the input speed sensor (1).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the input speed sensor retaining bolt (2).

   Tighten
   Tighten the input speed sensor bolt to 11 N·m (97 lb. in).



3. Connect the electrical connector (1) to the input speed sensor (2).
4. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

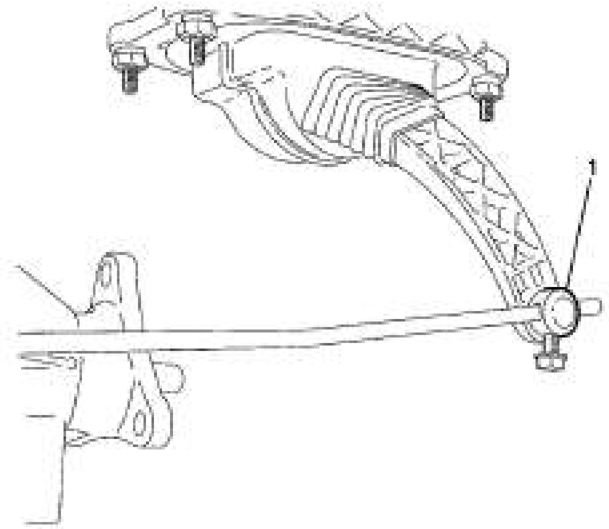
Manual Shift Shaft Position Switch Replacement

Tools Required

- J 44767 Seal Installer.
- EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

Removal Procedure

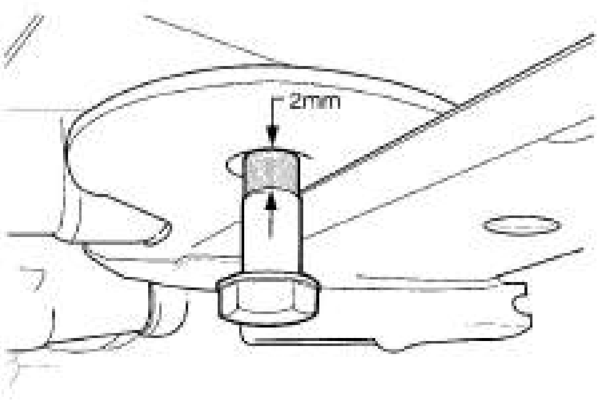
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



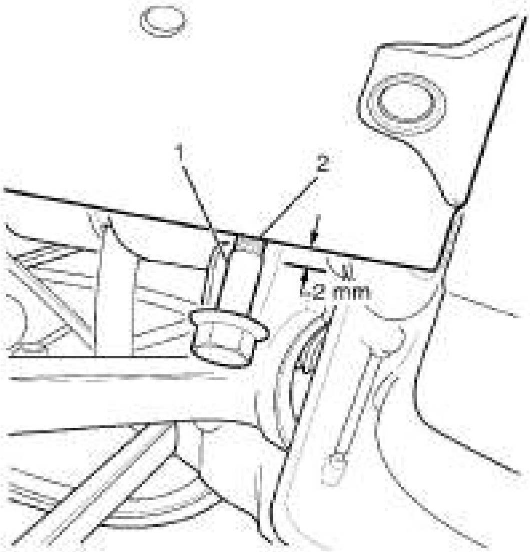
2. Remove the transmission manual shift shaft nut.
3. Disconnect the shift linkage from the transmission manual shift shaft.
4. Remove the exhaust system. Refer to Exhaust System Replacement.
5. Remove the propeller shaft. Refer to Propeller Shaft Replacement.

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

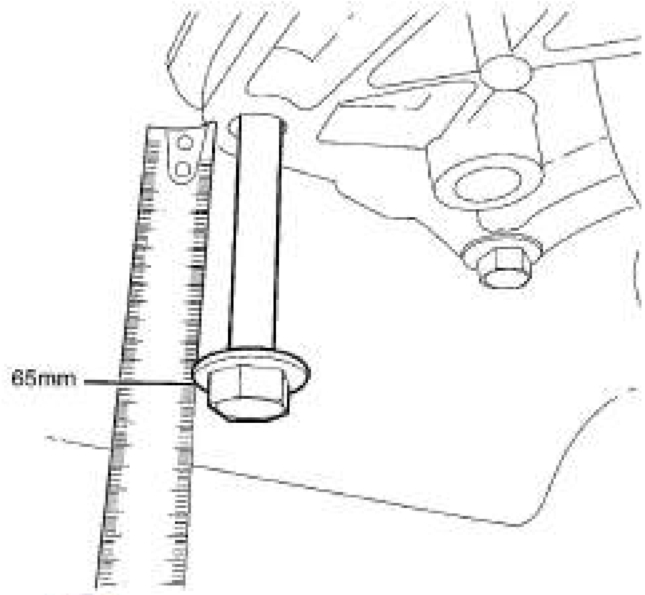
6. Support the powertrain with a suitable jack or table.



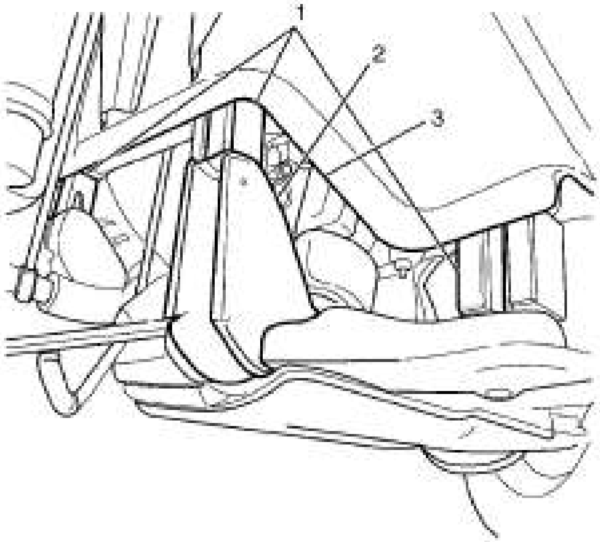
7. Replace the front sub frame rear bolts and fit bolts from special tool kit, Refer to EN-48536 .
8. Install bolt till stepped shank (1) is 2mm below sub frame (2).



9. Replace the front sub frame front bolts and fit bolts from special tool kit , Refer to EN-48536 .
10. Install bolt till stepped shank (1) is 2mm below chassis rail flange (2).



11. Remove all four transmission mount to body bolt and install two bolts from special tool kit in diagonal holes e.g Left hand front and Right hand rear.
12. Install in till 65mm is measured between bolt heads (1) and transmission mount (2).
13. Remove front sub frame middle bolts.
14. Lower power train slowly untill the subframe and transmission mount are resting on bolts.



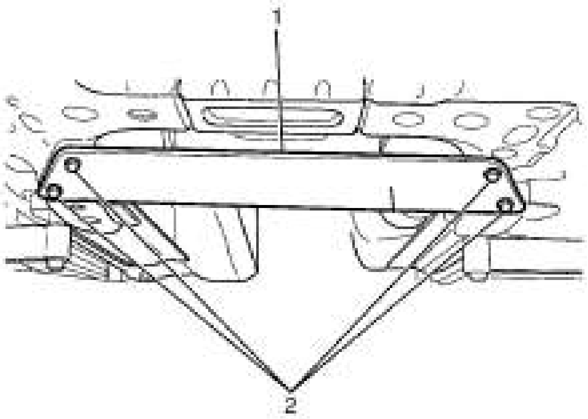
15. Insert 65mm spacer blocks (1) between subframe (2) and chassis rails (3).
16. Tighten the front sub frame front and rear bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

17. Install and tighten the middle sub frame bolts.

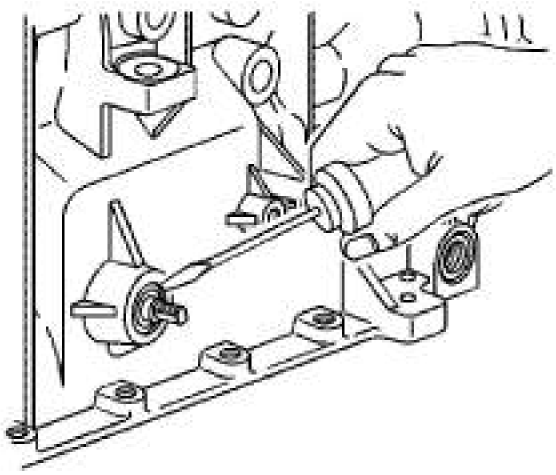
Tighten
Tighten the bolts to 95 N·m (70 lb. ft).

18. Remove supporting jack or table



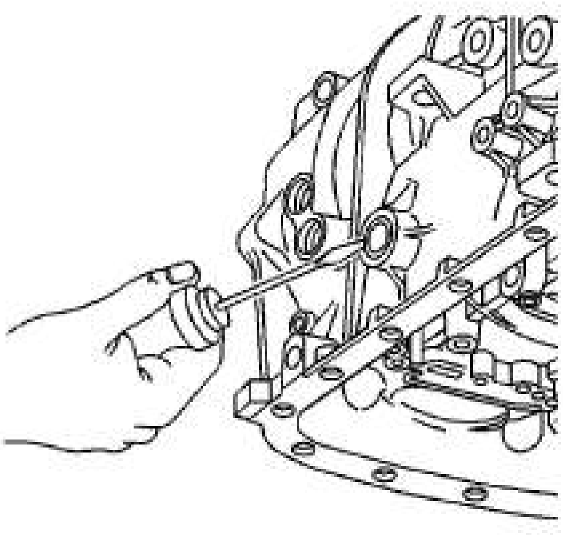
19. Install engine support plate (1) to front sub frame (2).
20. Tighten the plate securing bolts (3).

Tighten
Tighten the bolts to 10 N·m (89 lb. in).



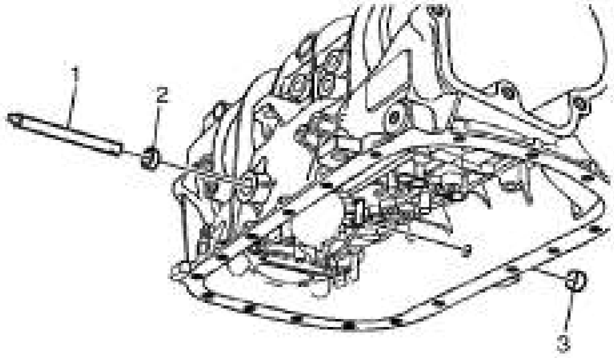
Important: Replace the shaft seal if damaged or worn.

21. Using a suitable tool, remove and discard the shaft seal.



Important: Replace the cup plug if damaged or worn.

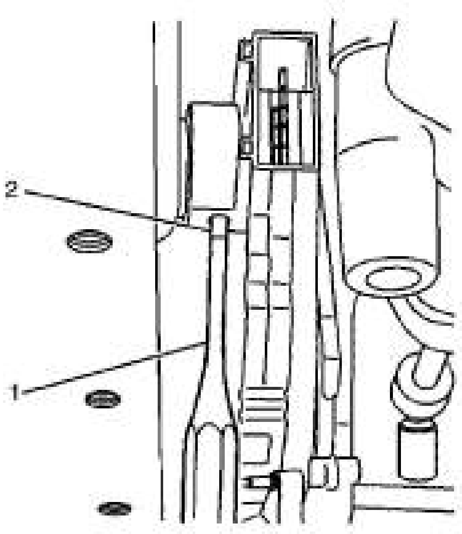
22. Using a suitable tool, remove and discard the cup plug.



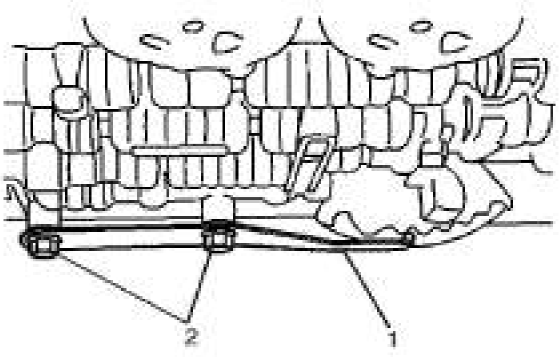
Important: Removal of the transmission is NOT required for the removal or replacement of the shift shaft position switch. Remove the transmission from the vehicle and refer to Unit Repair for replacement of the manual shift shaft ONLY if replacement of the manual shift shaft (3) is necessary.

23. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

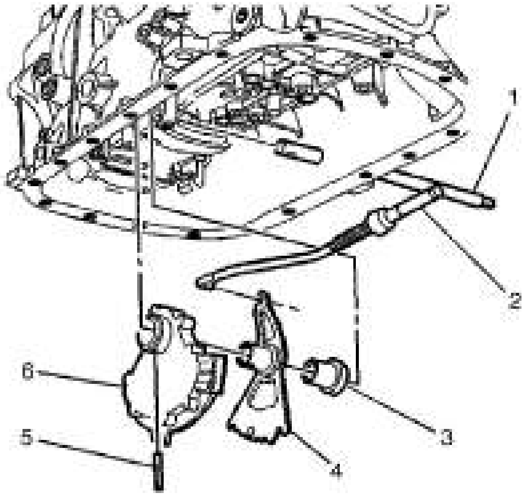
24. Disconnect the selector lever electrical connector from the selector lever shaft position switch.



25. Using a suitable pin punch (1). Remove the selector lever shaft position switch retaining pin (2).

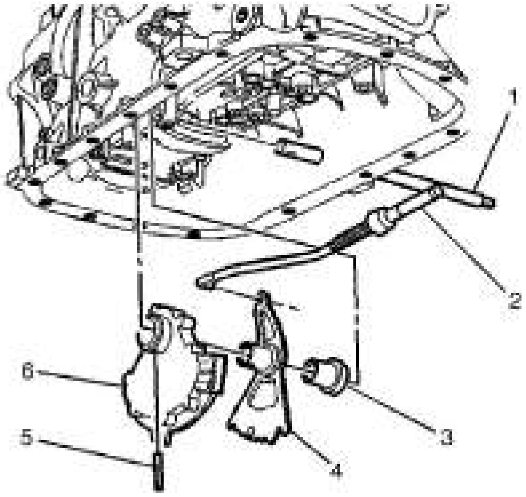


26. Remove the selector lever shaft detent spring (1) and retaining bolts (2).

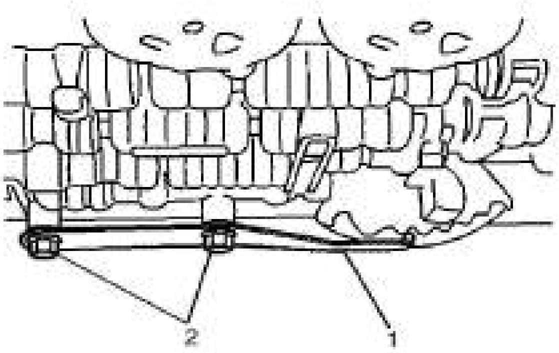


27. Extract the manual shift shaft (1) from the transmission case only far enough to allow removal of the manual shift shaft position switch (6).
28. Remove the manual shift shaft position switch (6), the manual shift shaft detent lever (4), the manual shift shaft assembly spacer (3), and the park pawl actuator (2) as an assembly.

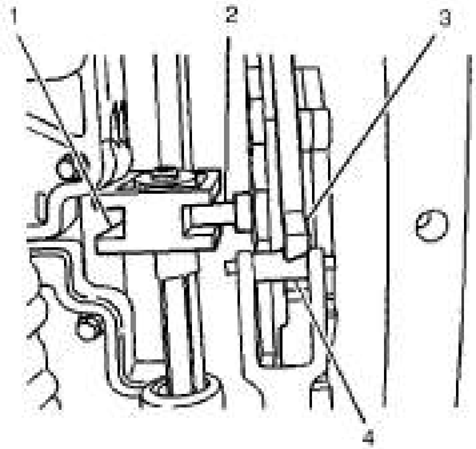
Installation Procedure



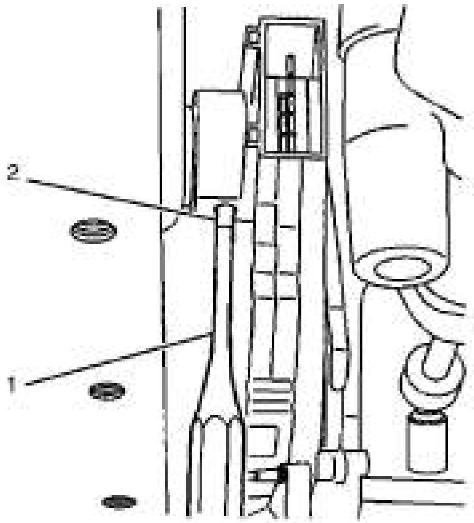
1. Install the manual shift shaft position switch (6), the manual shift shaft detent lever (4), the manual shift shaft assembly spacer (3), and the park pawl actuator (2) as an assembly. It may be necessary to push up on the park pawl in order to fully insert the park pawl actuator (2).
2. Fully insert the manual shift shaft (1) into the transmission case.



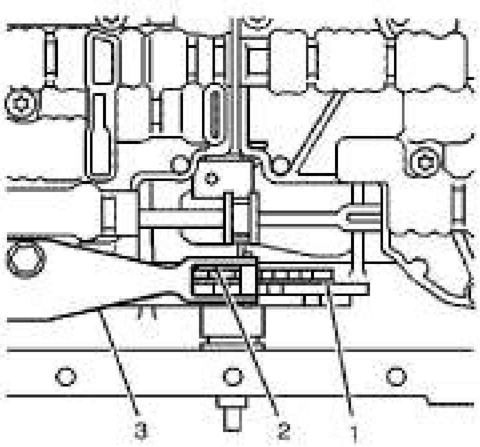
3. Install the manual shift shaft detent spring (1).
4. Install the control valve body bolts (2) retaining the manual shift shaft detent spring. Do not tighten at this time.



5. Confirm that the manual shift shaft detent lever locating pin (2) is properly engaged with the manual valve link (1).
6. Confirm that the detent spring roller (4) is properly engaged with the manual shift shaft switch (3).



7. Using a suitable pin punch (1). Install the manual shift shaft position switch retaining pin (2).
8. Connect the electrical connector to the manual shift shaft position switch.



9. Install a 0.8 mm spacer (2) between the manual shaft detent lever (1) and the manual shaft detent spring (3).

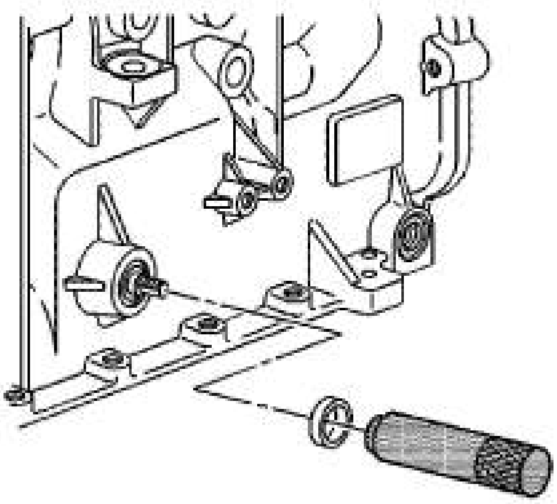
   Notice: Refer to Fastener Notice in the Preface section.

10. tighten the detent spring bolts.

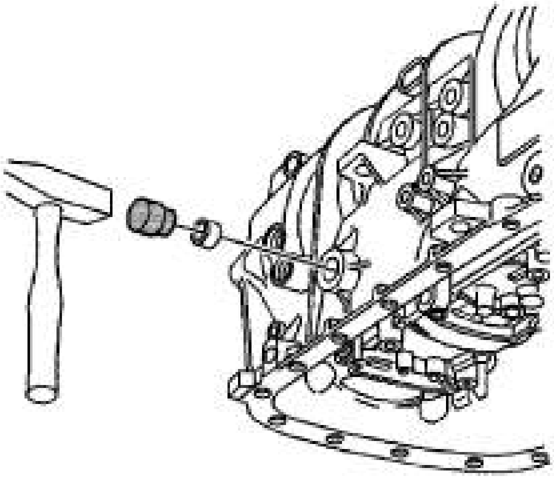
    Tighten
    Tighten the bolts to 11 N·m (97 lb. in).

11. Remove the spacer (2).

12. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



13. If previously removed, install a new shaft seal using J 44767 .
14. Position the seal onto the J 44767 before installing the seal into the transmission case.
15. Carefully slide the seal and tool over the manual shift shaft and Insert the seal into the transmission until fully seated



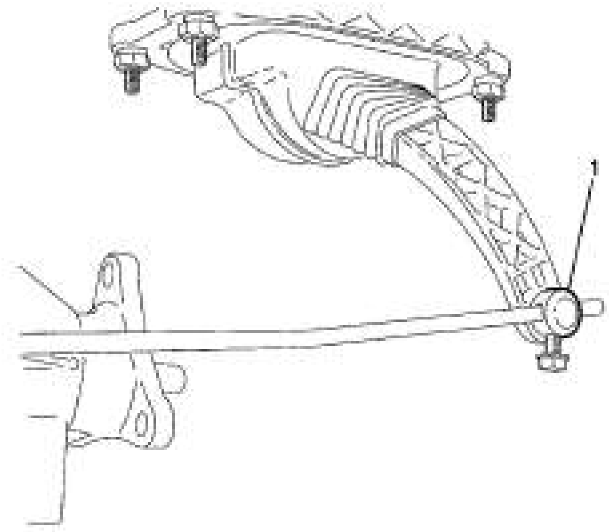
16. If previously removed, install a new cup plug. Lubricate the cup plug with transmission fluid before installation.
17. Insert the cup plug into the transmission until flush with the transmission case.
18. Remove engine and transmission lowering blocks and engine support plate.
19. Raise the powertrain back up into the engine bay and support.
20. Remove the special tool bolts and install the front sub frame bolts.
21. Tighten the front sub frame bolts.

Tighten
Tighten the bolts to 160 N·m (118 lb. ft).

22. Tighten the transmission support to under body retaining bolts.

    Tighten
    Tighten the bolts to 63 N·m (46 lb. ft).

23. Install the propeller shaft coupler (1) to the transmission flange. Refer to Propeller Shaft Replacement.
24. Install the exhaust system. Refer to Exhaust System Replacement.



25. Connect the shift linkage to the transmission manual shift shaft.
26. Install the transmission manual shift shaft nut.

    Tighten
    Tighten the nut to 15 N·m (11 lb. ft).

27. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
28. Lower the vehicle.

    Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

    Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

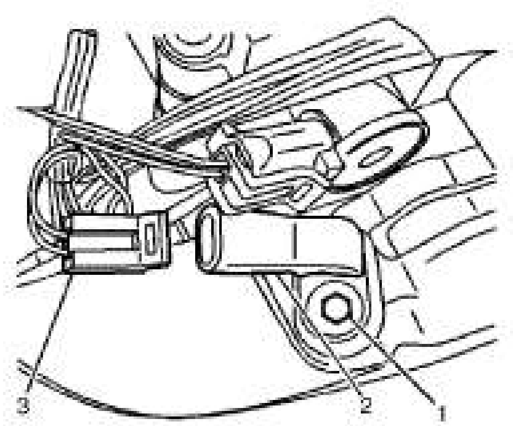
29. Reset the TAP values. Refer to Transmission Adaptive Functions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1998006**

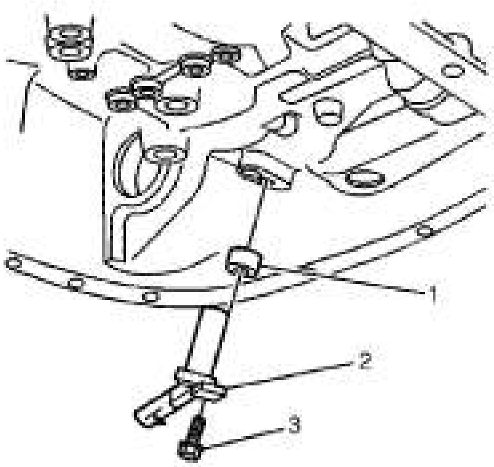
Output Speed Sensor Replacement

Removal Procedure

1. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



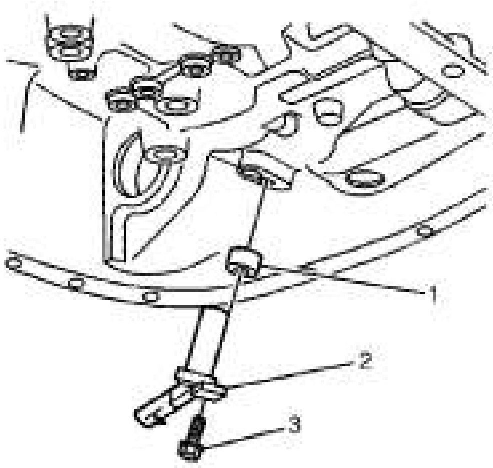
2. Disconnect the electrical connector (3) from the output speed sensor (2).



3. Remove the output speed sensor retaining bolt (3).
4. Remove the output speed sensor (2).
5. Remove the output speed sensor spacer (1).

6. Inspect the output speed sensor (2) for the following conditions:
   - Damaged or missing magnet
   - Damaged housing
   - Bent or missing electrical terminals

Installation Procedure

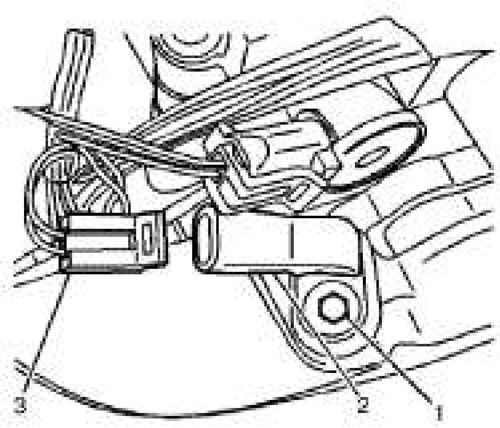


1. Install the output speed sensor spacer (1).
2. Install the output speed sensor (2).

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the output speed sensor retaining bolt (3).

   Tighten
   Tighten the output speed sensor bolt to 11 N·m (97 lb. in).



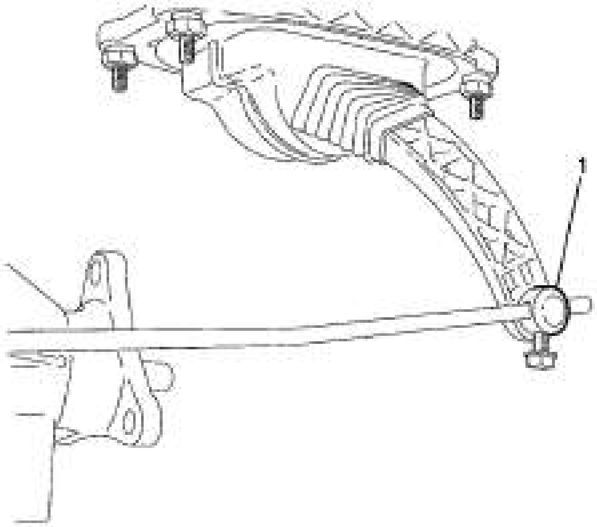
4. Connect the electrical connector (3) to the output speed sensor (2).
5. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1977401**

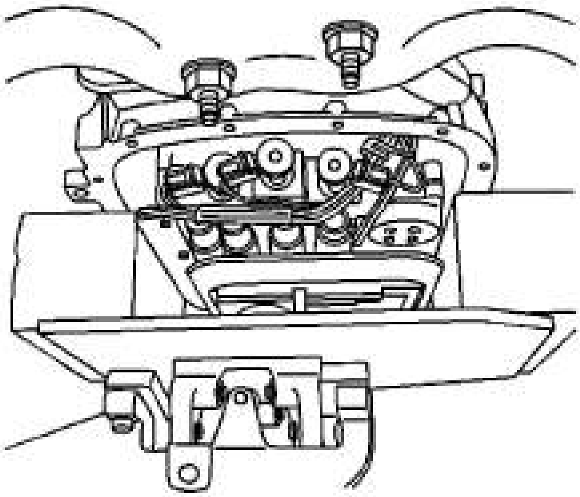
Parking Pawl Replacement

Removal Procedure

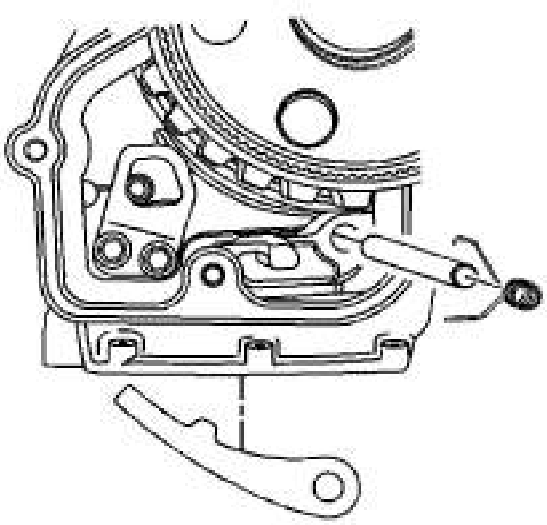
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove the transmission manual selector lever shaft nut.
3. Disconnect the selector lever linkage from the transmission.
4. Place the transmission in neutral by rotating the transmission shift shaft clockwise 2 clicks.
5. Remove the exhaust system. Refer to Exhaust System Replacement.
6. Disconnect the propeller shaft coupler (1) from the transmission flange. Refer to Propeller Shaft Replacement.
7. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

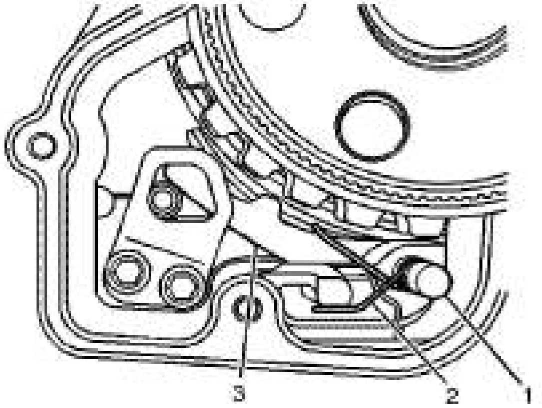


8. Using two equally sized suitable blocks of wood and a suitable transmission jack positioned under the transmission pan area. Support the transmission case on both sides with the wood blocks to prevent the transmission internal components from contacting the transmission jack.
9. Remove the transmission support. Refer to Transmission Support Replacement.
10. Remove the extension housing. Refer to Case Extension and Gasket Replacement.



11. Remove the parking pawl spring.
12. Remove the parking pawl pivot pin.
13. Remove the parking pawl.
14. Inspect the following:
    - Parking pawl tooth for chipping or wear
    - Parking pawl spring for over expansion
    - Pivot pin for scoring, excessive wear

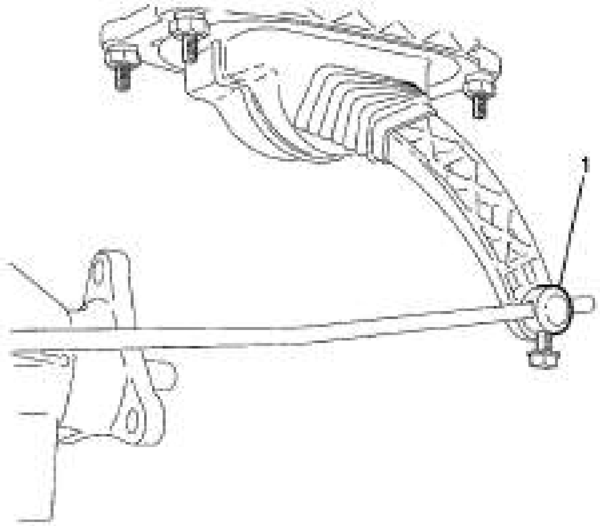
Installation Procedure



1. Install the parking pawl (3).
2. Install the pivot pin (1).

Important: The straight end of the spring locates against the case and the hooked end locates over the parking pawl.

3. Install the parking pawl spring (2).
4. Install the extension housing. Refer to Case Extension and Gasket Replacement.
5. Install the transmission support. Refer to Transmission Support Replacement.
6. Remove the transmission jack.
7. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.
8. Install the propeller shaft. Refer to Propeller Shaft Replacement.
9. Install the exhaust system. Refer to Exhaust System Replacement.



10. Place the transmission in the park position by rotating the shift shaft fully counter clockwise.
11. Connect the shift linkage to the transmission.

Notice: Refer to Fastener Notice in the Preface section.

12. Install the transmission manual shift shaft nut.

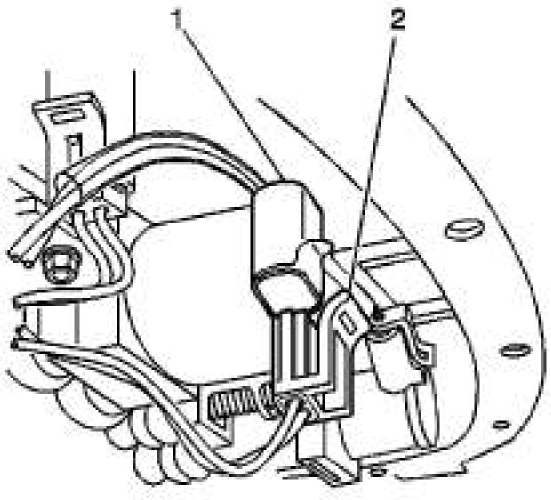
Tighten
Tighten the transmission manual shift shaft nut to 15 N·m (11 lb. ft).

13. Fill the transmission to the correct level. Refer to Transmission General Specifications, Fluid Capacity Specifications, and Transmission Fluid Check.
14. Lower the vehicle.

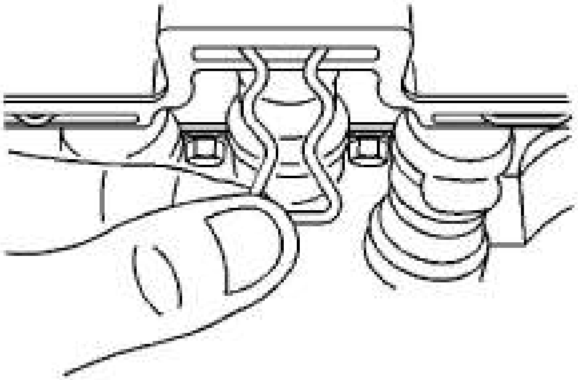
Pressure Control Solenoid Valve Replacement

Removal Procedure

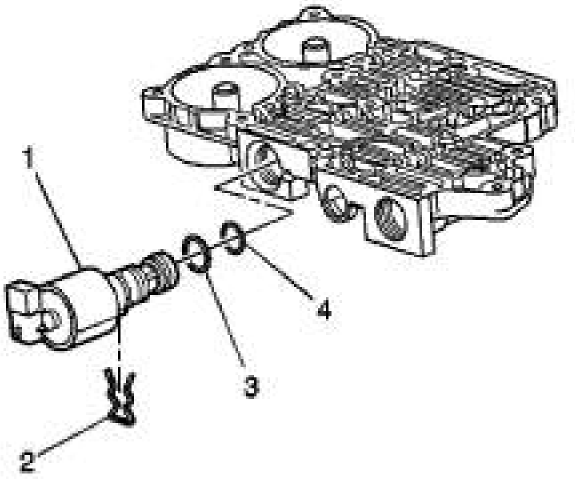
1. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



2. Disconnect the electrical connector (2) from the pressure control solenoid (1).

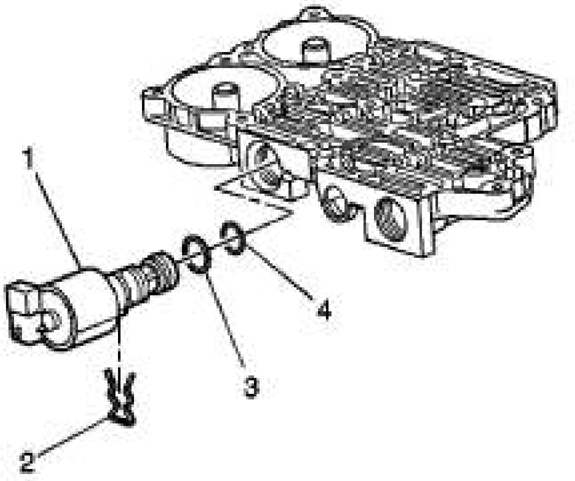


3. Using a small suitable tool, remove the pressure control solenoid retainer from the control valve body.

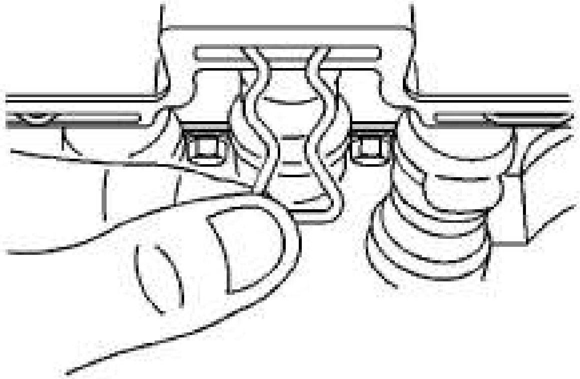


4. Remove the pressure control solenoid (1) from the control valve body.
5. Remove the O-ring seals (3-4) from the pressure control solenoid (1), ONLY if the O-rings are cut or worn.

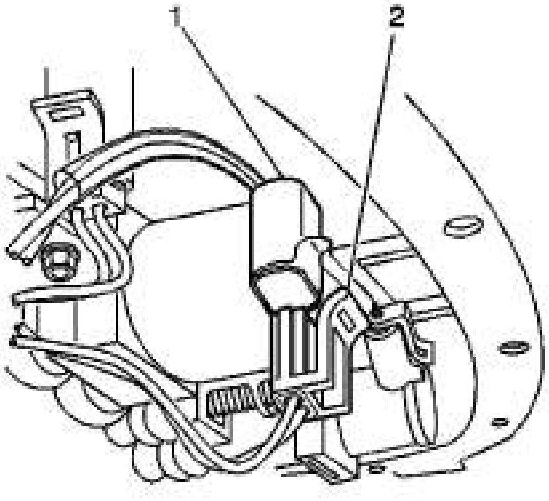
Installation Procedure



1. Install new O-ring seals (3-4) to the pressure control solenoid (1), if the O-rings were previously removed.
2. Install the pressure control solenoid (1) into the control valve body.



3. Install the pressure control solenoid retainer into the control valve body.



4. Connect the electrical connector (2) to the pressure control solenoid (1).
5. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

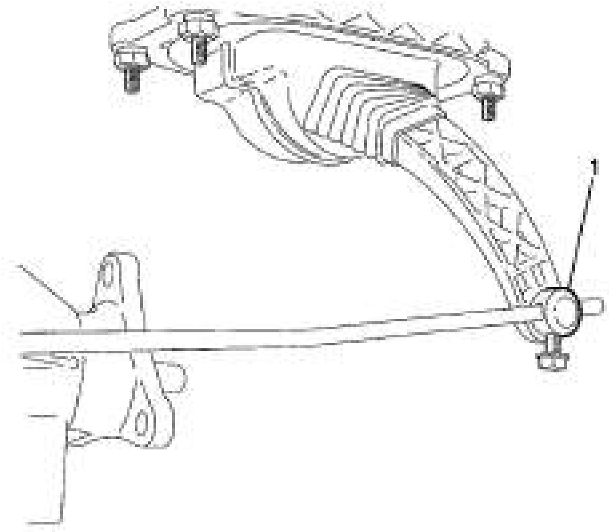
Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Transmission Adaptive Functions.

Shift Control Linkage Adjustment

1. Position the shift lever in PARK.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

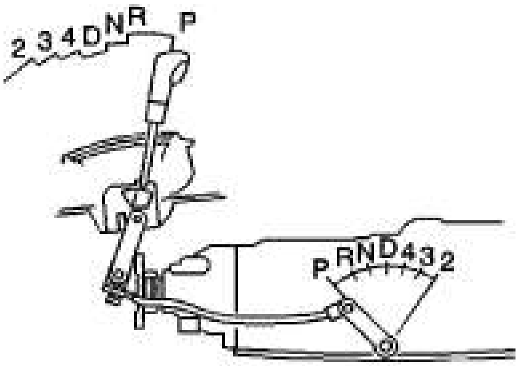
   Notice: Refer to Fastener Notice in the Preface section.



3. Loosen the shift control linkage adjustment bolt to allow the adjuster (1) to slide freely.
4. Hold the selector lever on the transmission against the rear stop to eliminate any play.

   Tighten
   Tighten the shift control linkage adjustment nut to 9 N·m (80 lb. in).

5. Lower the vehicle.



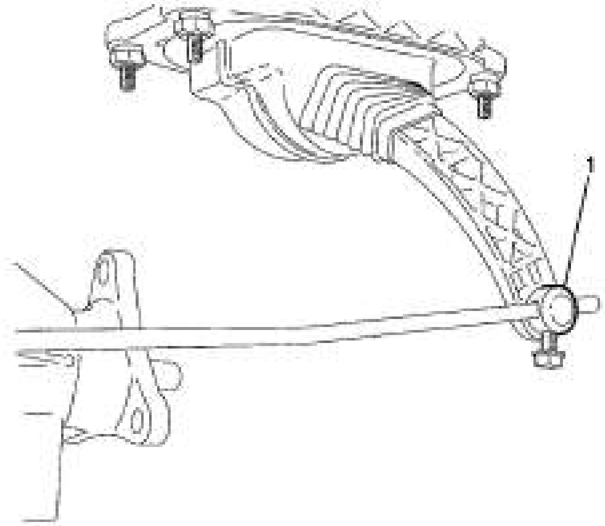
6. Check the operation of the starting system with the shift lever in each position. The engine should only crank when the lever is in the PARK or NEUTRAL position.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | Document ID: 1977390

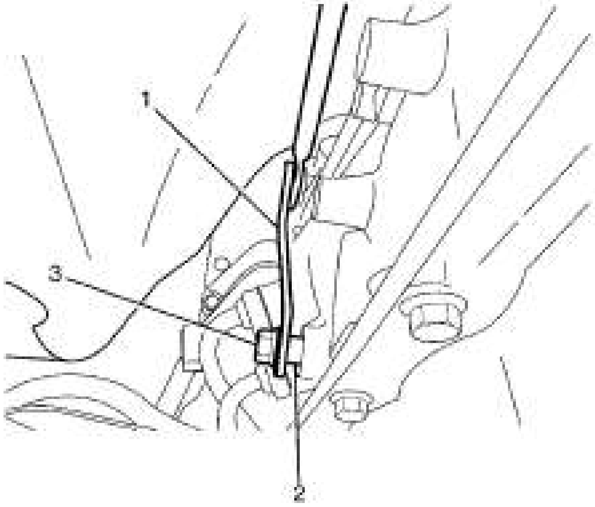
Shift Control Linkage Replacement

Removal Procedure

1. Place the selector lever in PARK.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

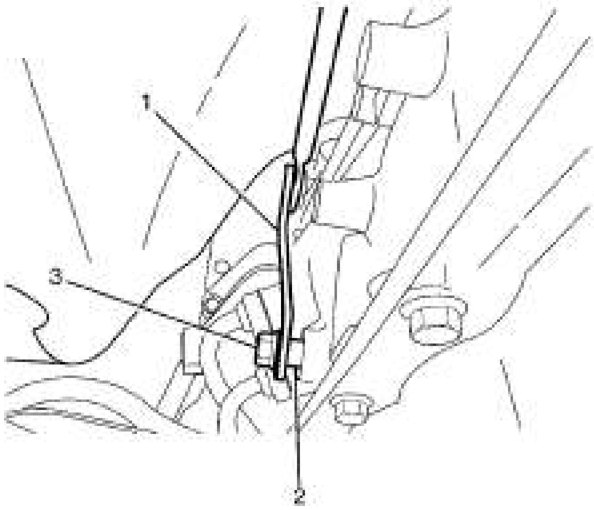


3. Remove the nut from the shift control linkage rod.
4. Disconnect the shift control linkage rod from the shift control.



5. Remove the shift selector linkage rod to shift selector shaft retaining nut (3).
6. Remove the shift selector linkage rod (1) from the shift selector shaft (2).

Installation Procedure

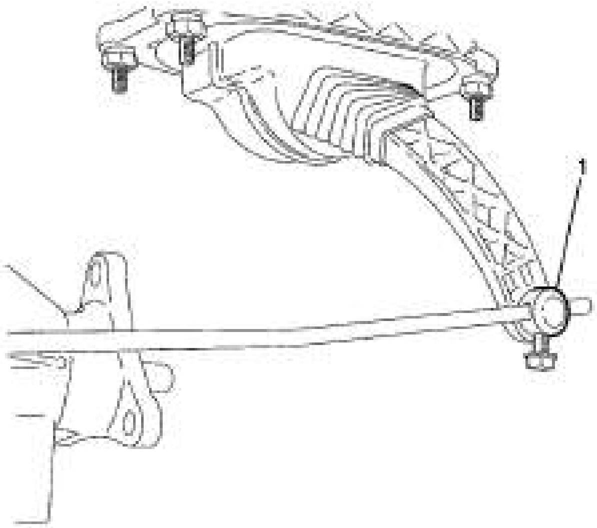


1. Install the shift selector linkage rod (1) to the shift selector shaft (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the shift selector linkage rod to shift selector shaft retaining nut (3).

   Tighten
   Tighten the manual shift shaft nut to 9 N·m (80 lb. in).

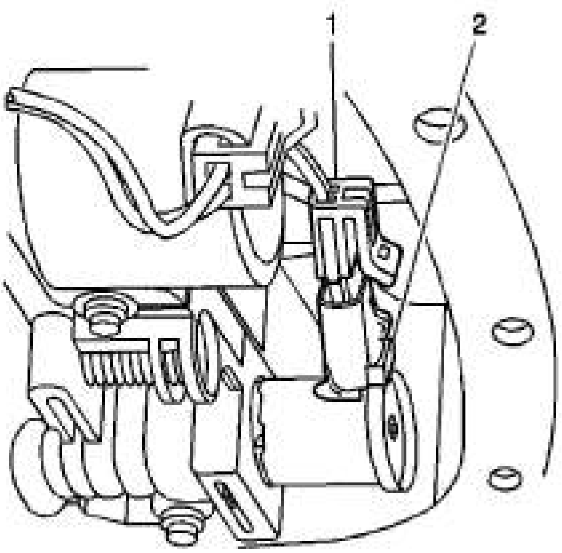


3. Connect the shift control linkage rod to the shift control assembly.
4. Install the nut to the shift control linkage rod.
5. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
6. Lower the vehicle.

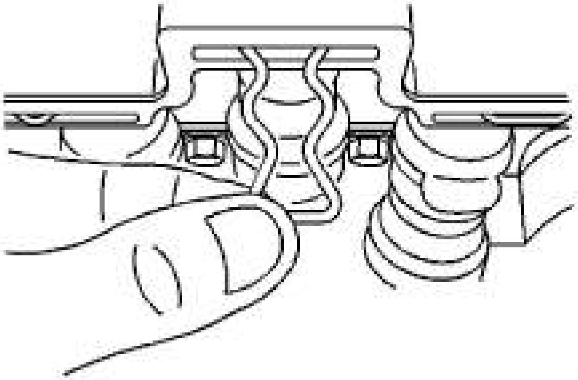
Torque Converter Clutch Solenoid Replacement

Removal Procedure

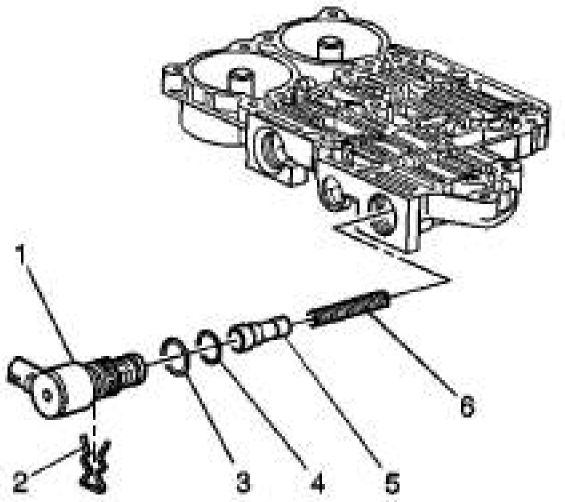
1. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



2. Disconnect the electrical connector (1) from the torque converter clutch (TCC) pulse width modulation (PWM) solenoid valve (2).

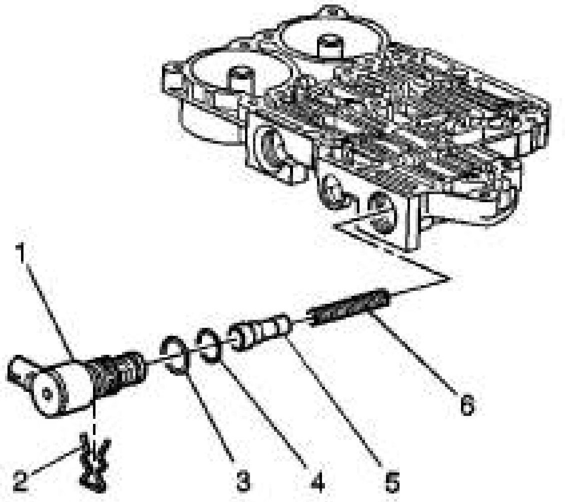


3. Using a small suitable tool, remove the TCC PWM solenoid valve retainer from the control valve body.

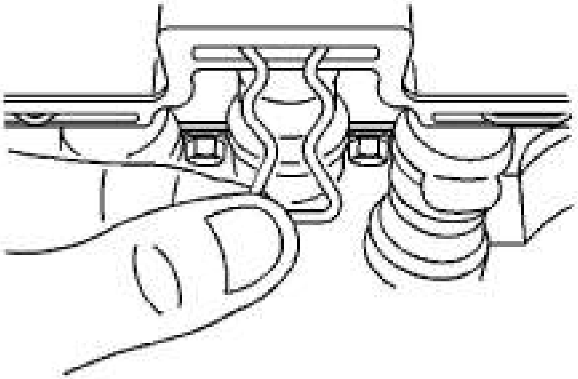


4. Remove the TCC PWM solenoid valve (1) from the control valve body.
5. Remove the O-ring seals (3-4) from the TCC PWM solenoid valve (1), ONLY if the O-rings are cut or worn.

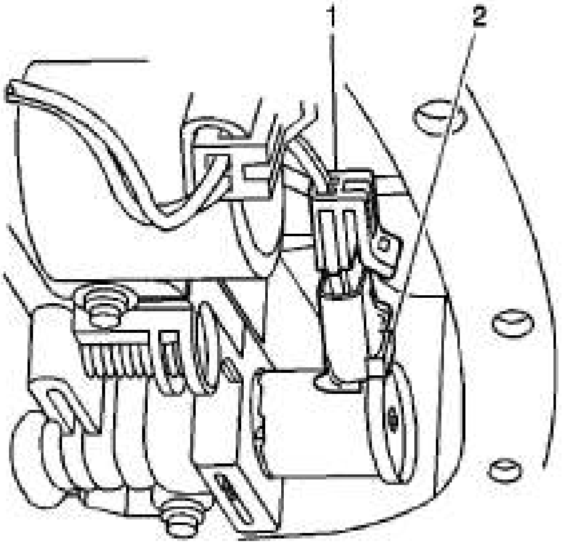
Installation Procedure



1. Install new O-ring seals (3-4) to the torque converter clutch (TCC) pulse width modulation (PWM) solenoid valve (1), if the O-rings were previously removed.
2. Install the TCC PWM solenoid valve (1) into the control valve body.



3. Install the TCC PWM solenoid valve retainer into the control valve body.



4. Connect the electrical connector (1) to the TCC PWM solenoid valve (2).
5. Install the transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Transmission Adaptive Functions.

Torque Converter Clutch / Cruise Control Release Switch Adjustment

Refer to Stop Lamp Switch Adjustment.

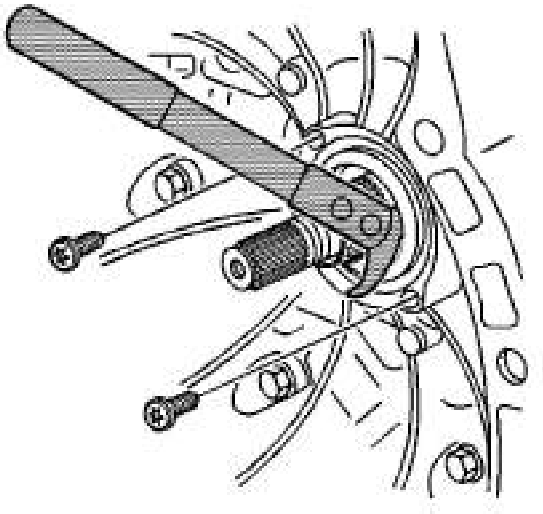
Torque Converter Fluid Seal Replacement

Tools Required

- J 8092 Universal driver Handle
- J 44766 Seal Installer
- J 45000 Seal Remover

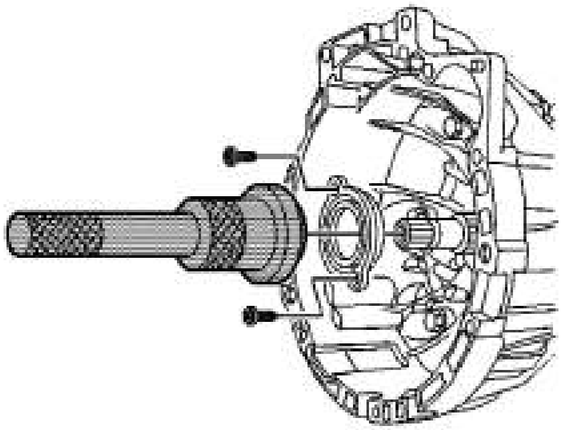
Removal Procedure

1. Remove the transmission torque converter. Refer to Torque Converter Replacement .



2. Remove and discard the torque converter seal retaining bolts.
3. Remove the torque converter seal using J 45000 .

Installation Procedure



1. Assemble J 8092 onto J 44766 .
2. Install the torque converter seal onto the tool before installing into the case to prevent damage to the seal.

   Important: Align the torque converter seal with the bolt holes.

3. Install the torque converter seal into the torque converter housing.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the NEW torque converter seal retaining bolts.

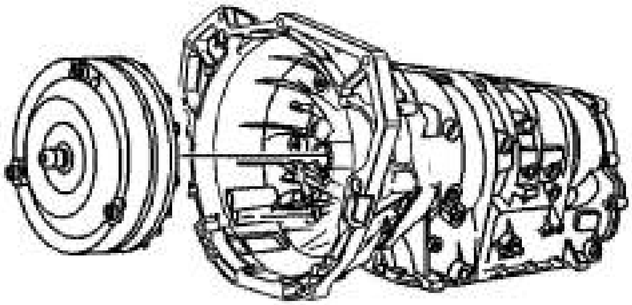
   Tighten
   Tighten the bolts to 3.6 N·m (32 lb. in).

5. Install the transmission torque converter. Refer to Torque Converter Replacement .

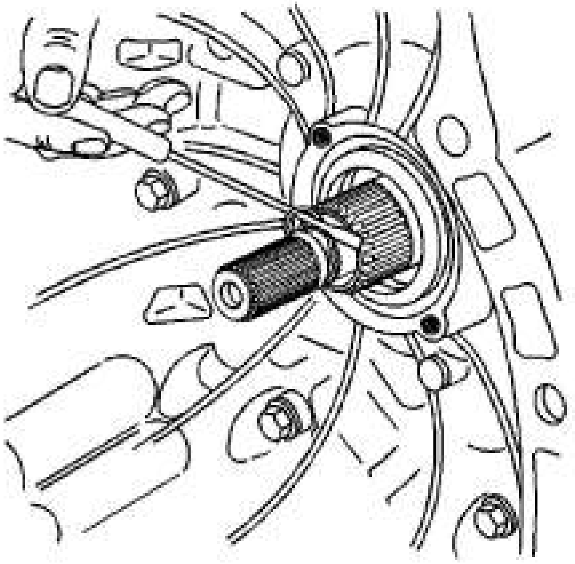
Torque Converter Replacement

Removal Procedure

1. Remove the transmission from the vehicle. Refer to Transmission Replacement.

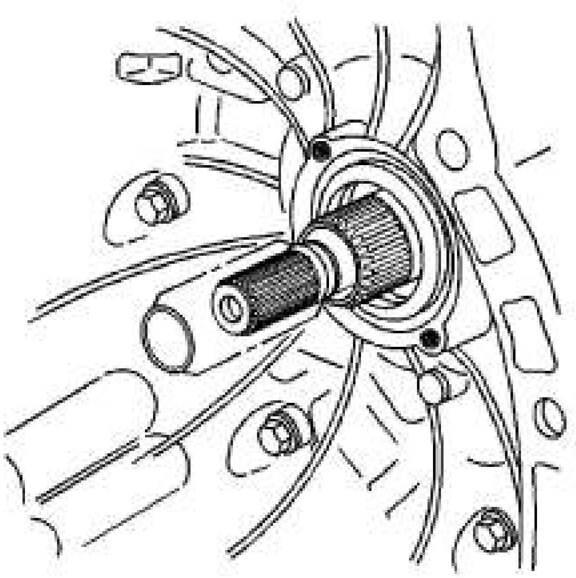


2. Remove the torque converter from the transmission.



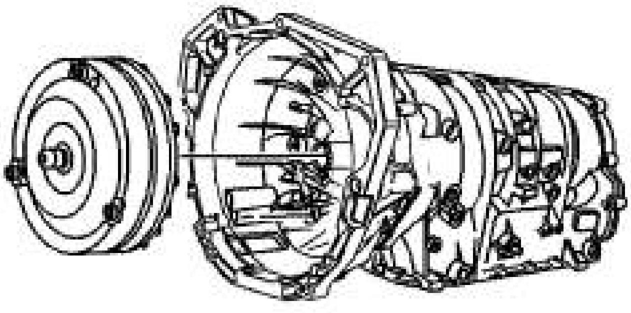
3. Remove the input shaft seal. Refer to Torque Converter Fluid Seal Replacement.

Installation Procedure



Important: Take care to prevent cutting of the input shaft seal on the input shaft splines.

1. Install the input shaft seal. Refer to Torque Converter Fluid Seal Replacement.



Important: Ensure the torque converter is fully seated into the transmission pump drive gear and turbine shaft.

2. Install the torque converter. Push the torque converter into position while rotating.
   - The torque converter must be fully seated on the turbine shaft
   - The torque converter must be fully seated in the pump drive gear

3. Install the transmission to the vehicle. Refer to Transmission Replacement.

   Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

   Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

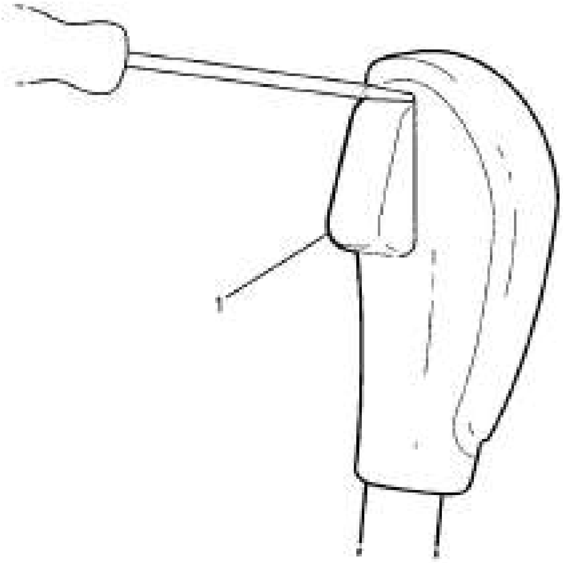
4. Reset the TAP values. Refer to Transmission Adaptive Functions.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1977388**

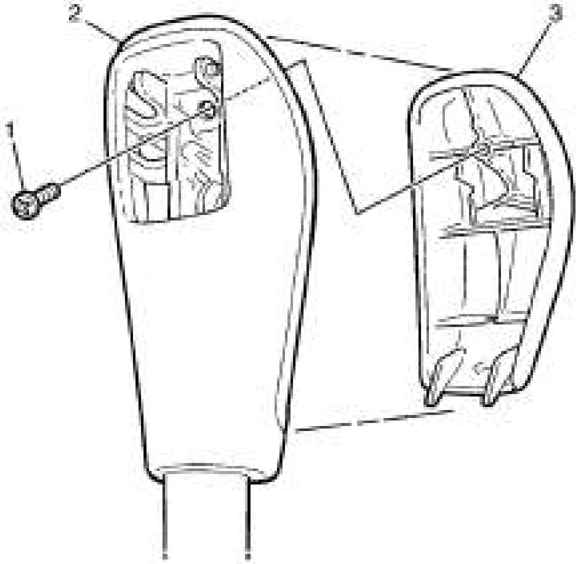
Transmission Control Lever Knob Replacement

Removal Procedure

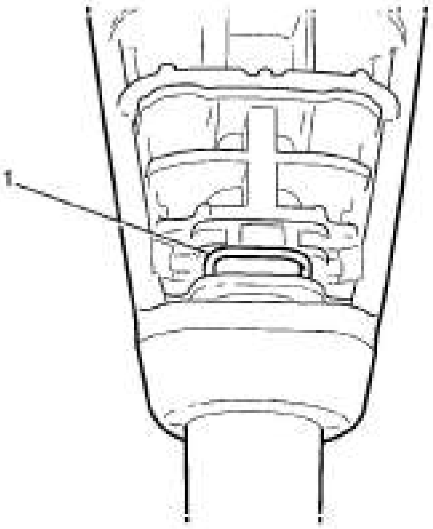
1. Remove transmission control lever assembly. Refer to Floor Shift Control Knob Replacement.



2. Using a suitable tool lever release knob (1) out of selector lever

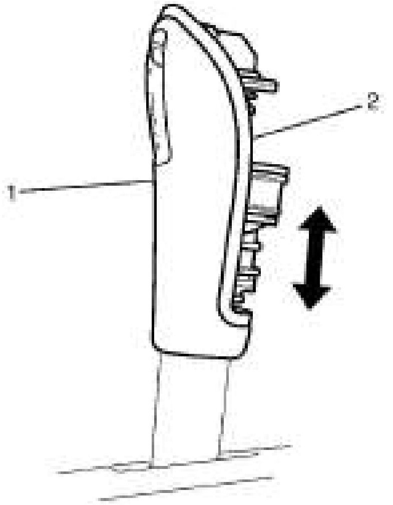


3. Remove selector retaining screw (1) from the selector lever (2) and remove lever backing (3).

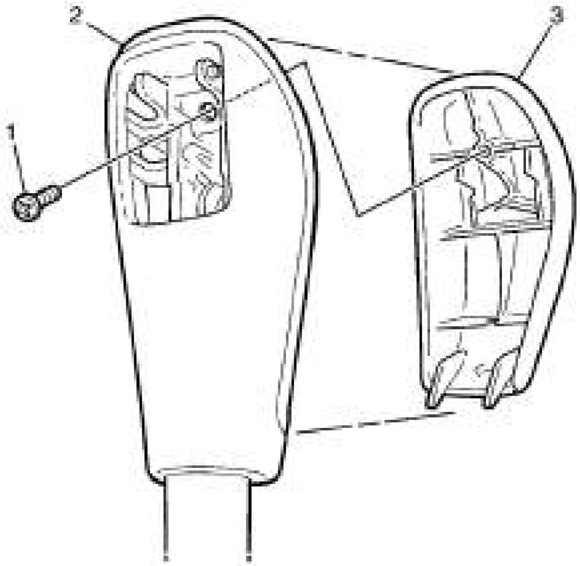


4. Remove the selector lever knob metal retainer clip (1).
5. Remove selector lever knob spacer.
6. Remove selector lever knob by sliding upwards off assembly.

Installation Procedure



1. Install the selector lever knob (1) by sliding down on the assembly.
2. Install the selector lever knob spacer (2).
3. Install the selector lever knob metal retainer clip.



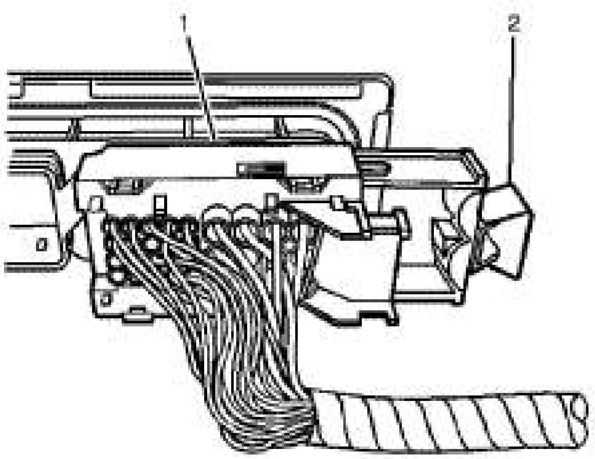
4. Install the lever backing (3) and retaining screw (1) to the selector lever (2).
5. Install the release knob into selector lever.
6. Install the transmission control lever assembly. Refer to Floor Shift Control Knob Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1975513**

Transmission Control Module Replacement

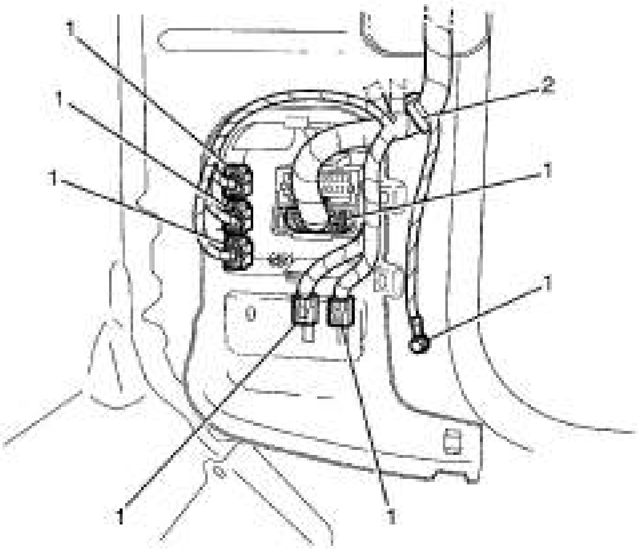
Removal Procedure

1. Remove the right side hinge pillar trim from the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
2. Remove the knee bolster assembly. Refer to Knee Bolster Replacement .

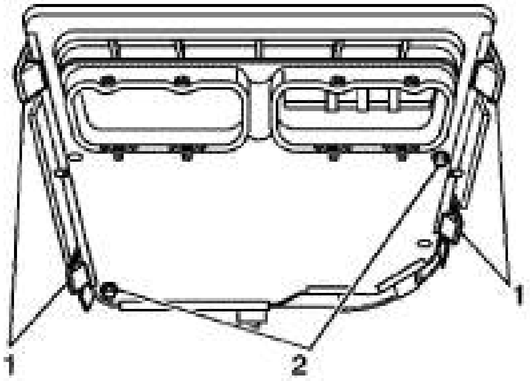


3. Unlock the transmission control module electrical connector by pulling the retainer (2) away from the electrical connector (1).

   Important: Twisting or tilting of the transmission control module electrical connector while disconnecting may result in bent or misaligned electrical terminal pins.

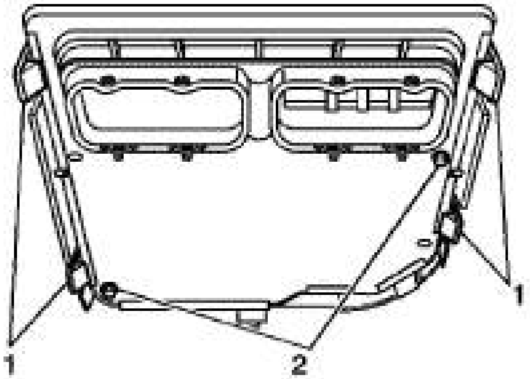


4. Carefully disconnect the electrical connector (1) from the transmission control module.
5. Disconnect the electrical connectors (1) from right hand side junction box and position loom towards the cowl

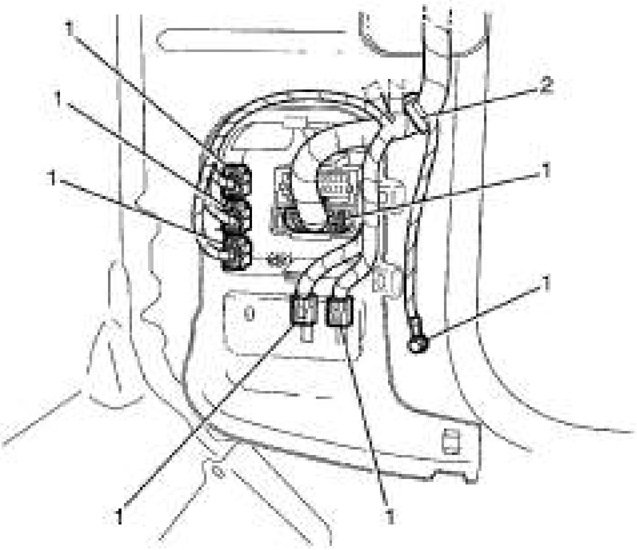


6. Remove the transmission control module from the mounting bracket by pulling back on the retaining tabs (1) to release the control module .

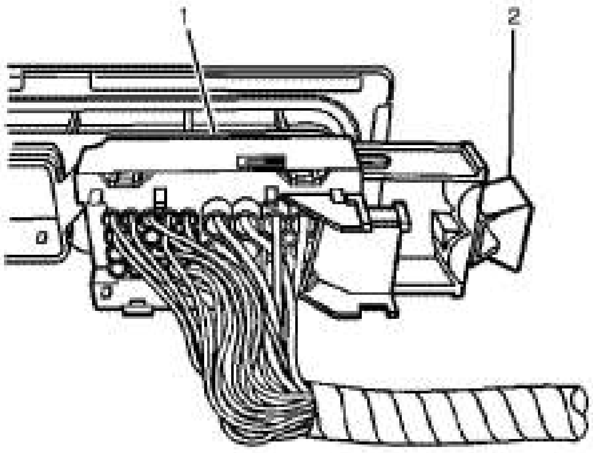
Installation Procedure



1. Align the transmission control module with the locating pins (2) on the module mounting bracket.
2. Install the transmission control module by seating it fully into the bracket until all of the retaining tabs (1) have engaged the edge of the module edge.



3. Install connectors (1) into the right hand side junction box



Important: Twisting or tilting of the transmission control module electrical connector while connecting may result in bent or misaligned electrical terminal pins.

4. Carefully connect the transmission control module electrical connector (1) to the transmission control module.
5. Lock the transmission control module electrical connector securely to the transmission control module by pushing the retainer (2) toward the electrical connector (1) until fully seated.
6. Install the right side hinge pillar trim on the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
7. Install the knee bolster assembly. Refer to Knee Bolster Replacement .
8. If re-programming is required. Refer to Control Module References .

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

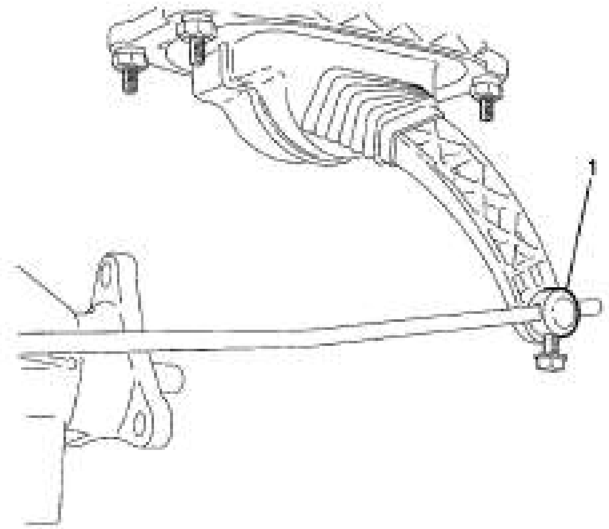
9. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1977386**

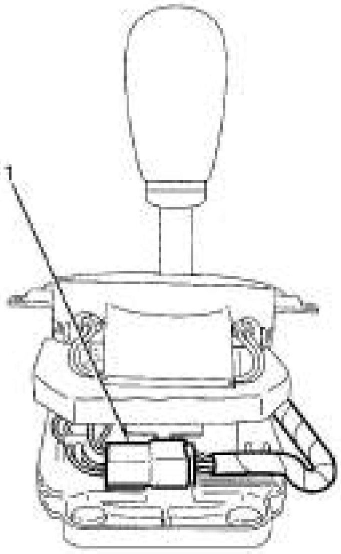
Transmission Control Replacement

Removal Procedure

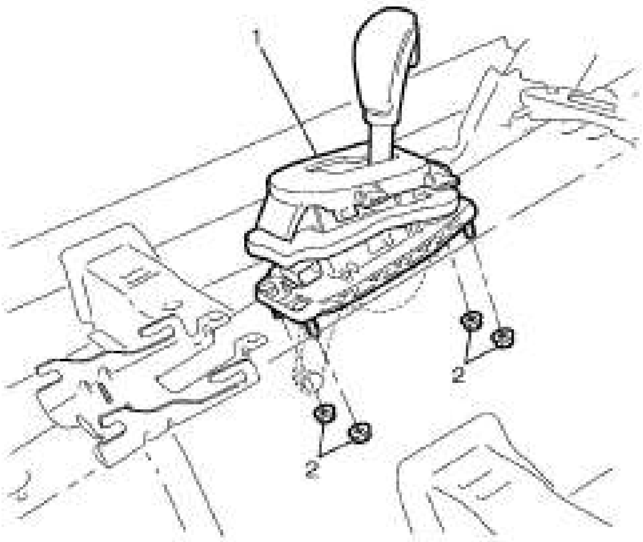
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove the adjustment nut (1) from the shift control linkage.
3. Disconnect the shift control linkage rod from the shift control assembly.
4. Lower the vehicle.
5. Remove the center console assembly. Refer to Front Floor Console Replacement.

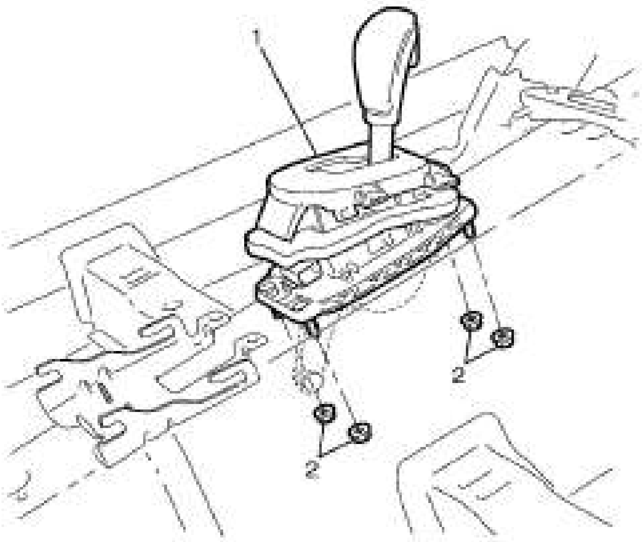


6. Remove the electrical connector (1) from the shift control assembly.



7. Remove the nuts (2) securing the shift control assembly to the tunnel reinforcement.
8. Remove the shift control assembly (1) from the tunnel reinforcement.

Installation Procedure

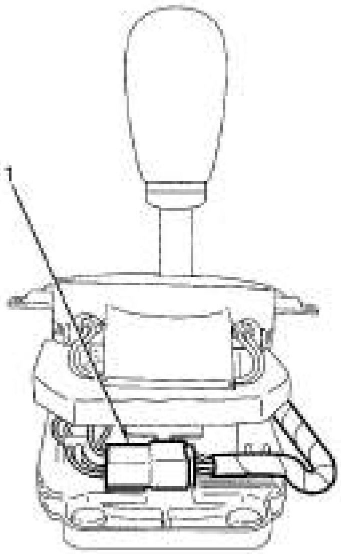


1. Install the shift control assembly (1) to the tunnel reinforcement.

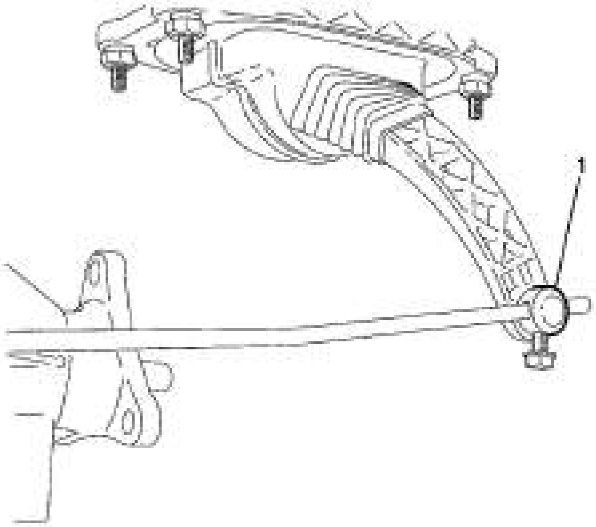
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the nuts (2) securing the shift control assembly to the tunnel reinforcement.

Tighten
Tighten the nuts to 12 N·m (106 lb. in).



3. Install the electrical connector (1) to the shift control assembly.
4. Install the centre console assembly. Refer to Front Floor Console Replacement.
5. Install the shift control trim plate by inserting the front retaining tabs to the console. Press down on the rear of the trim plate to engauge the rear retaining tabs.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

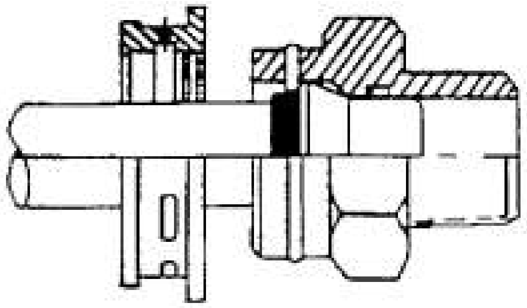


7. Connect the shift control linkage rod to the shift control assembly.
8. Install the shift control linkage adjustment nut finger tight.
9. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
10. Lower the vehicle.

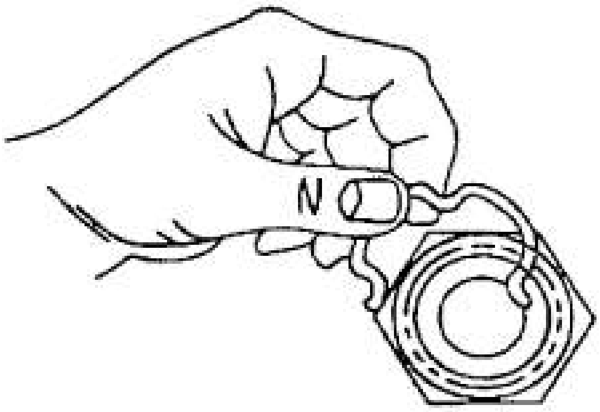
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 1997146**

Transmission Fluid Cooler Hose / Pipe Quick-Connect Fitting Disconnection and Connection

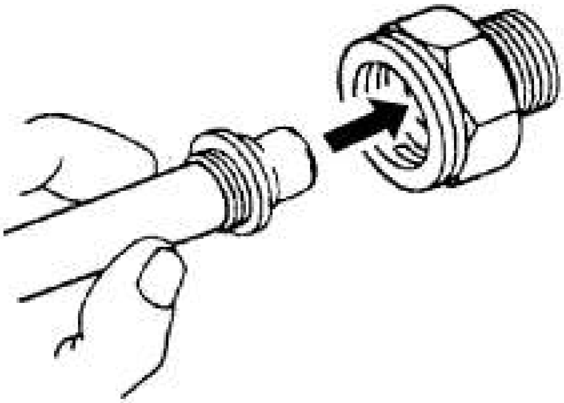
Removal Procedure



1. Remove the plastic cap from the quick connect fitting.



2. Remove the retaining ring from the quick connect fitting.



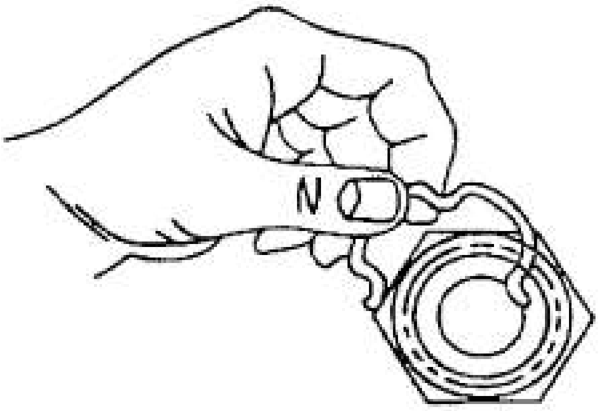
3. Remove the cooler line from the quick connect fitting.

Installation Procedure

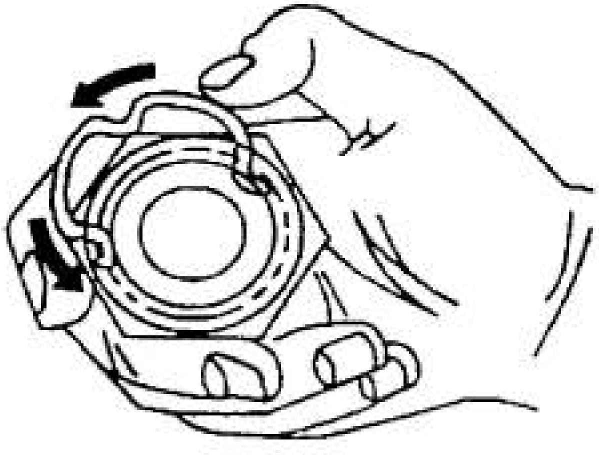
Important:

- Do not reuse any of the existing oil lines or oil line fittings if there is excessive corrosion.
- Do not reuse any of the existing retaining rings that were removed from the existing quick connect fittings. Install new retaining rings.
- Make sure the following procedures are performed when installing the new retaining rings onto the fittings.

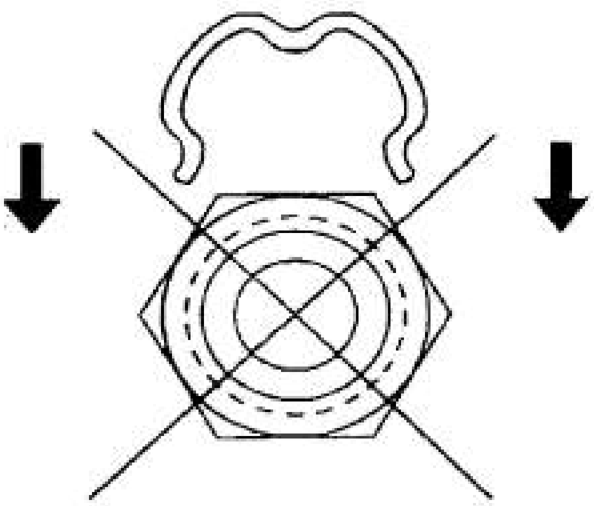
1. Install a new retaining ring into the quick connect fitting using the following procedure:



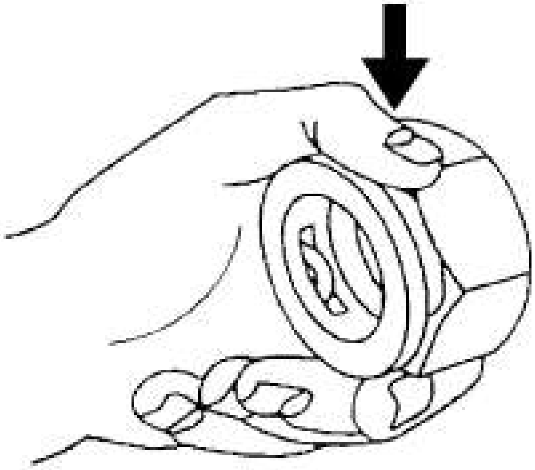
2. Hook one of the open ends of the retaining ring in one of the slots on the quick connect fitting.



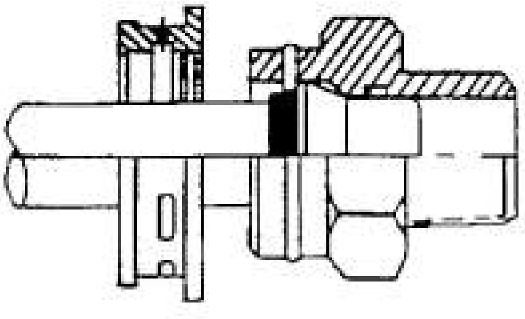
3. Rotate the retaining ring around the fitting until the retaining ring is positioned with all three ears through the three slots on the fitting.



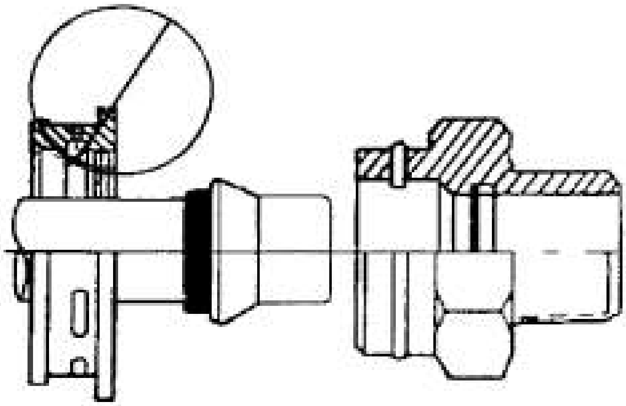
4. Do not install the new retaining ring onto the fitting by pushing the retaining ring.



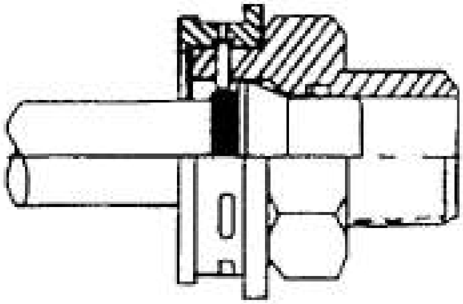
5. Make sure that the three retaining ring ears are seen from inside the fitting and that the retaining ring moves freely in the fitting slots.



6. Install the cooler line into the quick connect fitting.
7. Insert the cooler line end into the quick connect fitting until a click is either heard or felt.

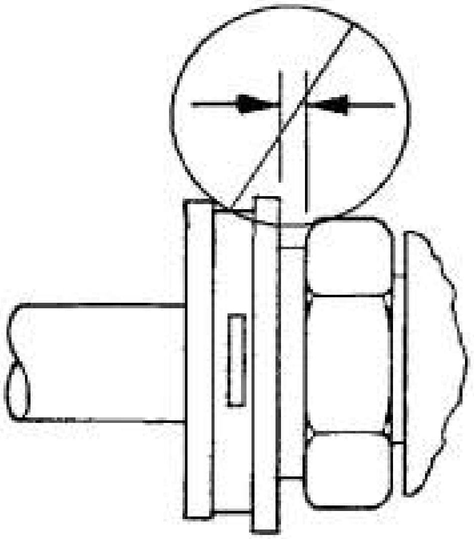


8. Do not use the plastic cap on the cooler line in order to install the cooler line into the fitting.
9. Pull back sharply on the cooler line in order to make sure that the cooler line is fastened into the quick connect fitting.

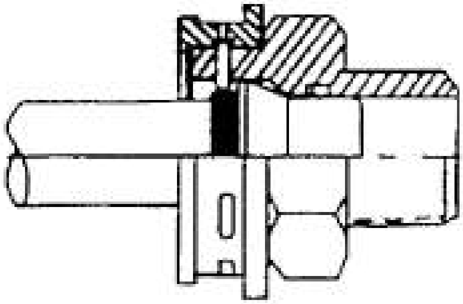


Important: Do not manually depress the retaining clip when installing the plastic cap.

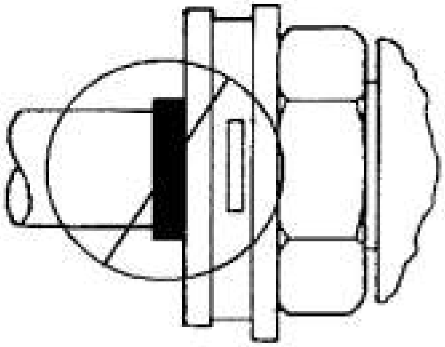
10. Position (snap) the plastic cap onto the fitting. Do not manually depress the retaining ring when installing the plastic cap onto the quick connect fitting.
11. Make sure that the plastic cap is fully seated against the fitting.



12. Make sure that no gap is present between the cap and the fitting.



13. Make sure that the yellow identification band on the tube is hidden within the quick connect fitting.



14. A hidden yellow identification band indicates proper joint seating.
15. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

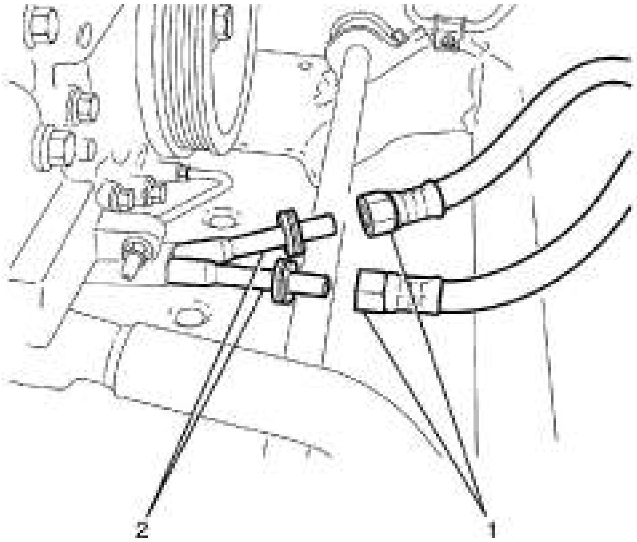
Transmission Fluid Cooler Hose/Pipe Replacement

Tools Required

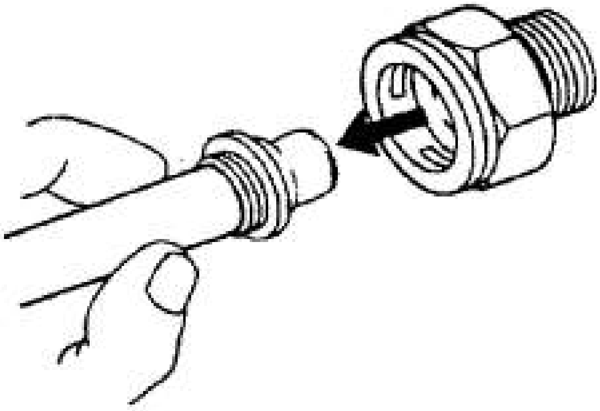
J 44827 Transmission Cooler Quick Disconnect

Removal Procedure

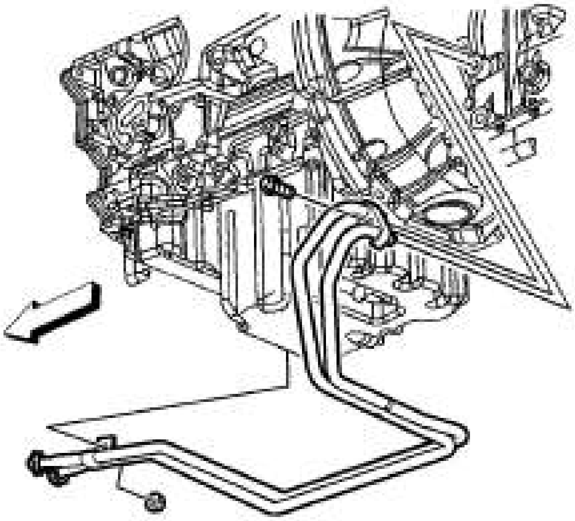
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the front air deflector. Refer to Front Air Deflector Replacement .



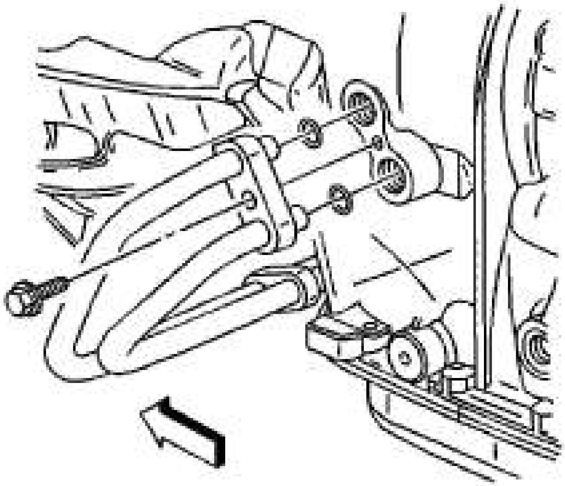
3. Place an oil drain pan under the transmission fluid cooler pipes (1&2) near the radiator.



4. Disconnect the transmission fluid cooler pipes from the transmission fluid cooler by using the J 44827 .

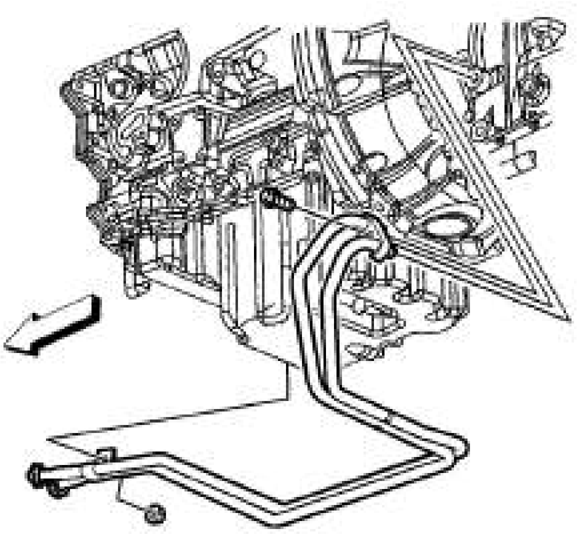


5. Remove the transmission fluid cooler pipes bracket retaining bolt.

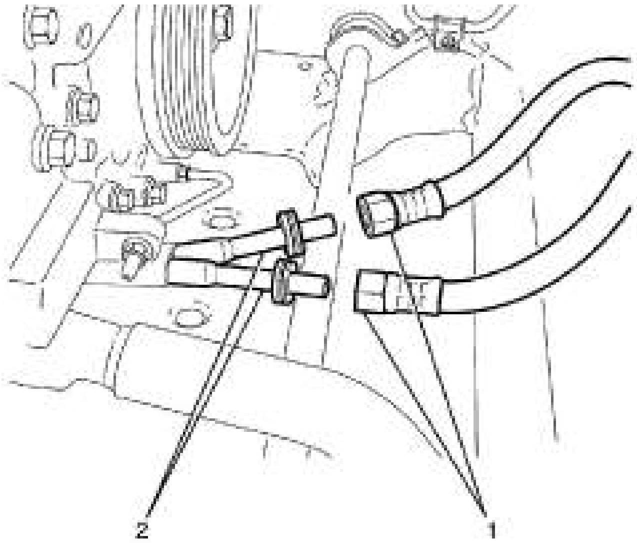


6. Remove the transmission fluid cooler pipes retaining bolt.
7. Remove the transmission fluid cooler pipes.
8. Remove and discard the O-rings. Do not reuse the O-rings.

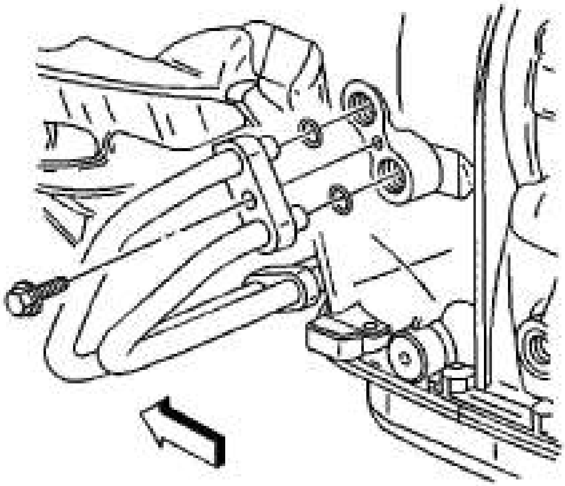
Installation Procedure



1. Install the transmission fluid cooler pipe.



2. Connect the transmission fluid cooler pipes (1&2) to the transmission fluid cooler using the following steps:
    2.1. Push the transmission fluid cooler pipes into the quick connect fitting, until a "audible click" is heard.
    2.2. Tug gently on the transmission cooler pipes to make sure the trans cooler pipes are fully connected.

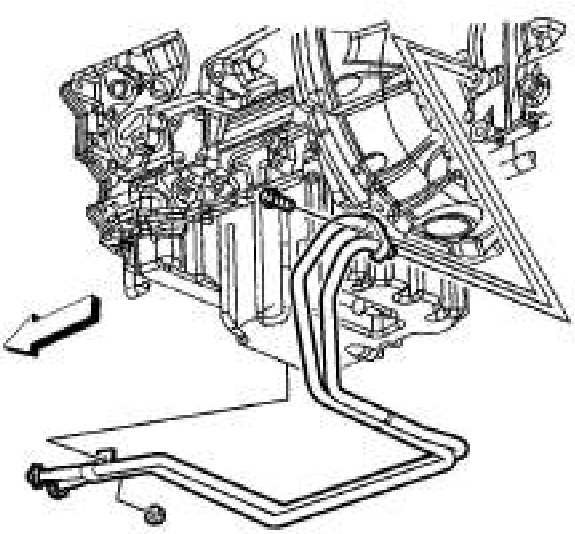


3. Install NEW sealing washers over the transmission fluid cooler pipes.
4. Install the transmission fluid cooler pipes into the transmission.

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the transmission fluid cooler pipe retaining bolt.

   Tighten
   Tighten the transmission fluid cooler pipe retainer bolt to 25 N·m (18 lb. ft).



6. Install the transmission fluid cooler pipes bracket retaining bolt.

Tighten

Tighten the transmission fluid cooler pipes bracket bolt to 50 N·m (37 lb. ft).

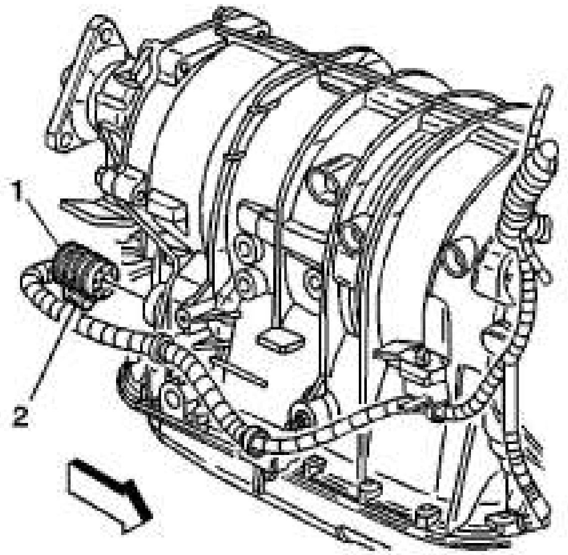
7. Install the front air deflector. Refer to Front Air Deflector Replacement .
8. Lower the vehicle.
9. Inspect the transmission fluid level. Refer to Transmission Fluid Check .
10. Inspect for fluid leaks.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | Document ID: 1997150

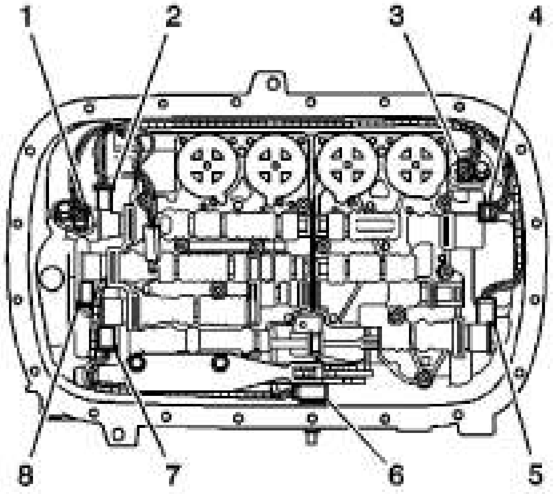
Transmission Internal Electrical Harness Replacement

Removal Procedure

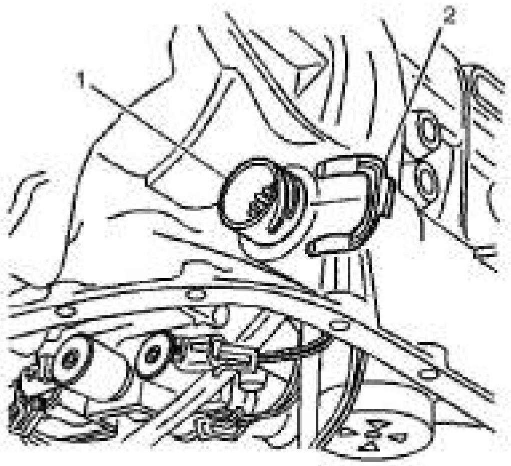
1. Remove the Transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.



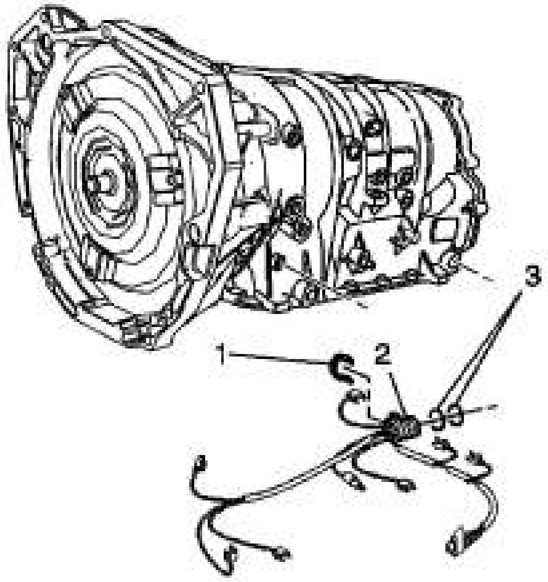
2. Disconnect the transmission wiring harness electrical connector (1) from the transmission by rotating the locking latch (2) counterclockwise.



3. Disconnect the transmission internal wiring harness from components (1-8).

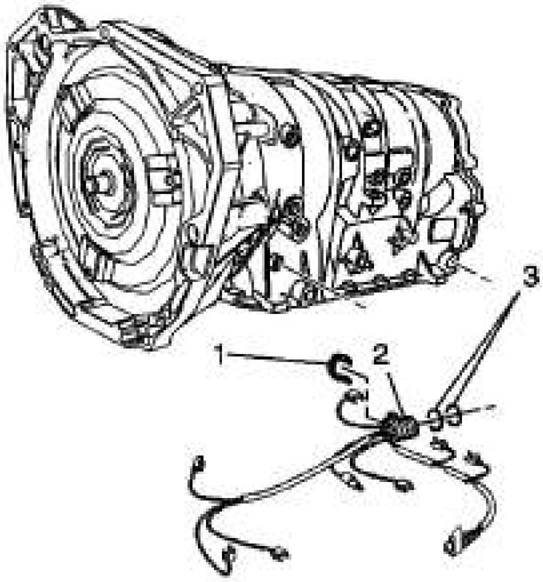


4. Remove the transmission internal wiring harness retainer (2) from the transmission internal wiring harness (1).

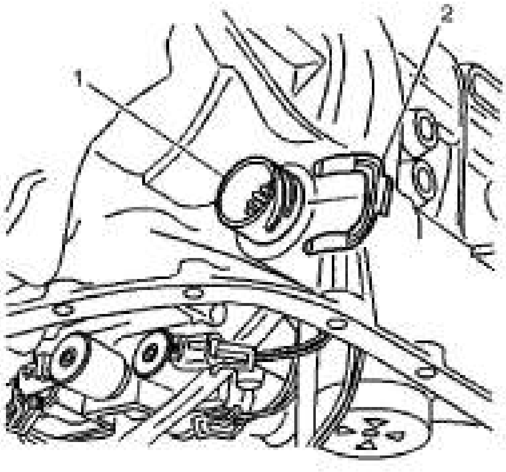


5. Remove the transmission internal wiring harness (2) from the transmission.
6. Remove the O-ring seals (3) from the internal wiring harness (2) only if the O-rings are cut or worn.

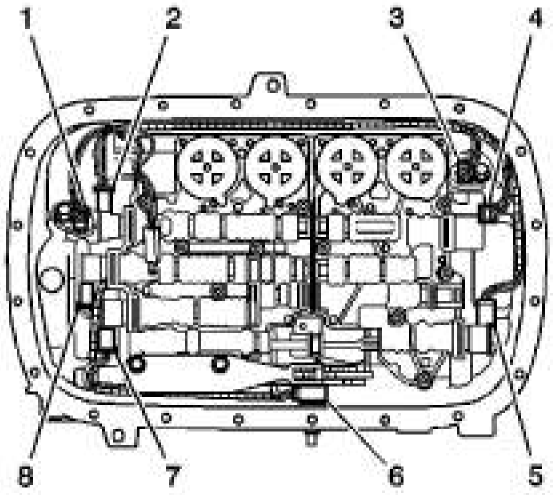
Installation Procedure



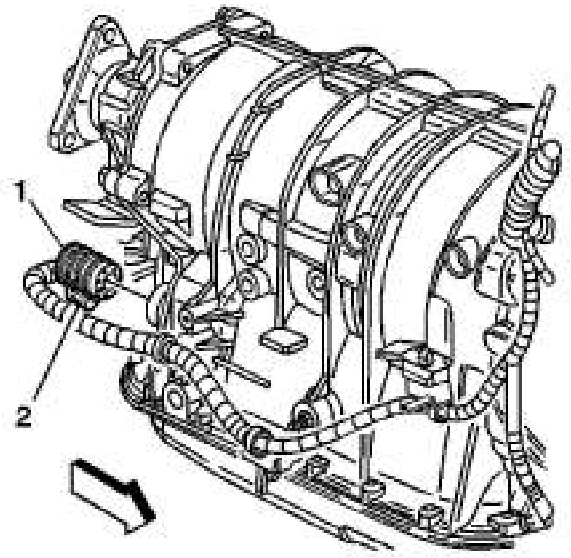
1. Install the internal wiring harness (2) to the transmission.



2. Install the transmission internal wiring harness retainer (2) to the internal wiring harness (1).



3. Connect the transmission internal wiring harness to components (1-8).



4. Connect the transmission wiring harness electrical connector (1) to the transmission by rotating the locking latch (2) clockwise.
5. Install the Transmission fluid pan and filter. Refer to Automatic Transmission Fluid and Filter Replacement.

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

6. Reset the TAP values. Refer to Transmission Adaptive Functions.

Transmission Mount Inspection

Notice: In order to avoid oil pan damage and possible engine failure, insert a block of wood that spans the width of the oil pan bottom between the oil pan and the jack support.

1. Raise the transmission/transaxle in order to remove the weight from the transmission/transaxle mount and create slight tension in the rubber.
2. Observe the transmission/transaxle mount while raising the transmission/transaxle. Replace the transmission/transaxle mount if the transmission/transaxle mount exhibits any of the following conditions:

   Important: Black paint on the rubber will crack with time, this does no constitute a failure.

   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the transmission/transaxle mount.
   - The rubber is split through the centre of the transmission/transaxle mount.
3. If there is movement between the metal plate of the transmission/transaxle mount and its attaching points, lower the transmission/transaxle on the transmission/transaxle mount. Tighten the retaining bolts or nuts attaching the transmission/transaxle mount to the frame or transmission/transaxle mount bracket.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - On Vehicle | **Document ID: 2006929**

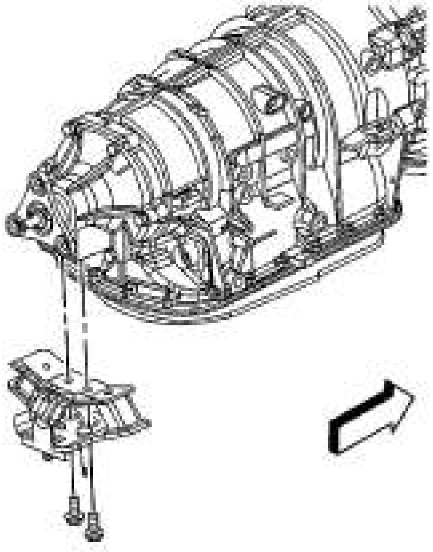
Transmission Rear Mount Replacement

Removal Procedure

1. Remove the exhaust system. Refer to Exhaust System Replacement.

   Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

2. Support the transmission with a suitable jack and a block of wood.
3. Remove the transmission support. Refer to Transmission Support Replacement.



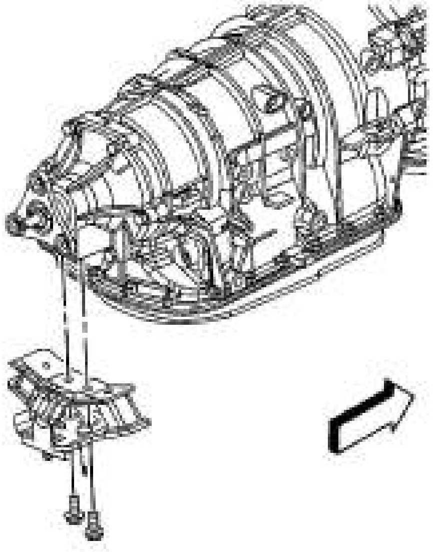
4. Remove the transmission mount retaining bolts.
5. Remove the transmission mount from the vehicle.

Installation Procedure

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

1. Install the transmission mount to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the transmission mount retaining bolts.

   Tighten
   Tighten the bolts to 60 N·m (44 lb. ft).

3. Install the transmission support. Refer to Transmission Support Replacement.
4. Remove the jack and block of wood.
5. Install the exhaust system.
6. Lower the vehicle.

Transmission Replacement

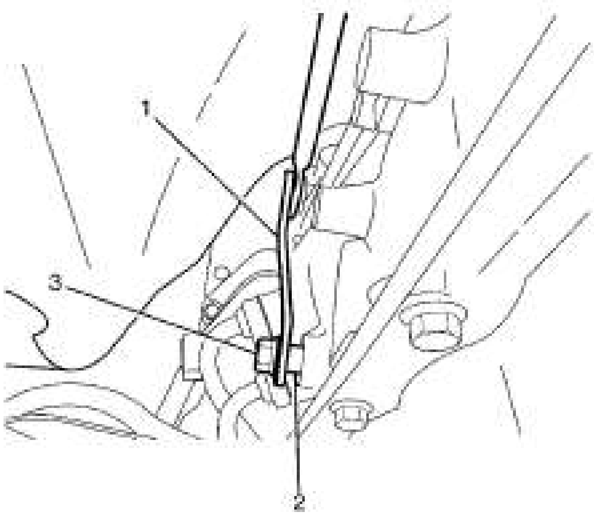
Tools Required

EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

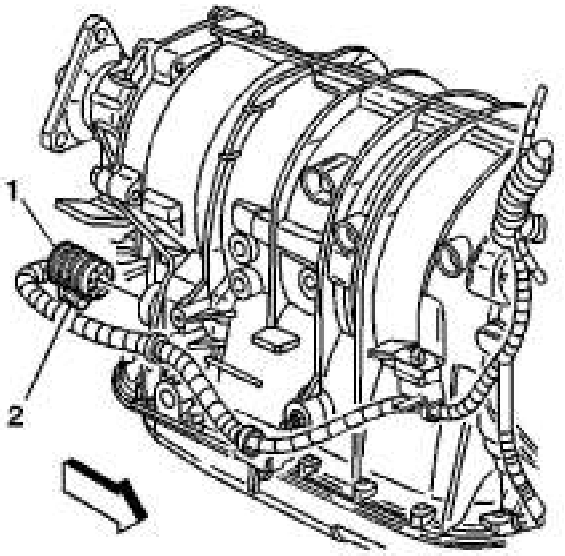
Removal Procedure

Important: NEW torque converter retaining bolts will be required each time the torque converter bolts are removed.

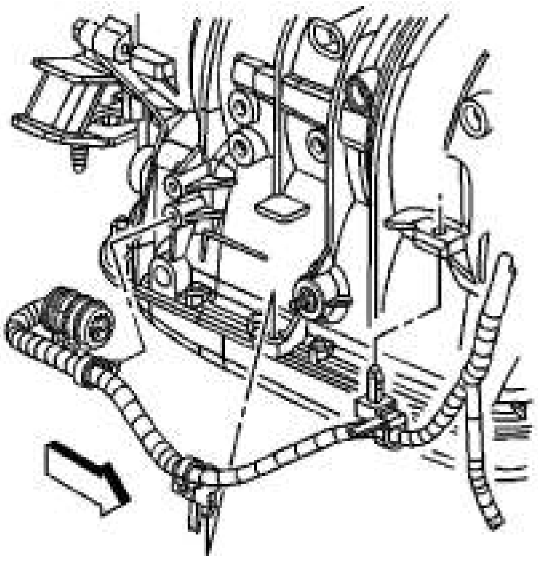
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
2. Remove engine air intake ducting.
3. Remove radiator retaining clips.
4. Disconnect the evap purge pipe.
5. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
6. Remove the propeller shaft. Refer to Propeller Shaft Replacement.
7. Remove the air deflector front (1). Refer to Front Air Deflector Replacement.
8. Remove the splash shield.



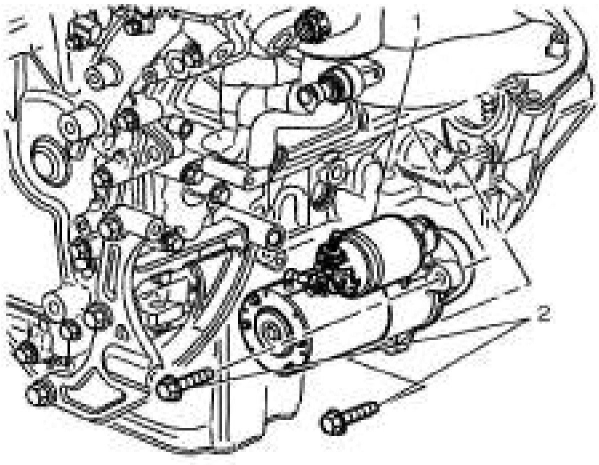
9. Remove the transmission manual shift shaft retaining nut (3).
10. Disconnect the shift linkage (1) from the transmission.



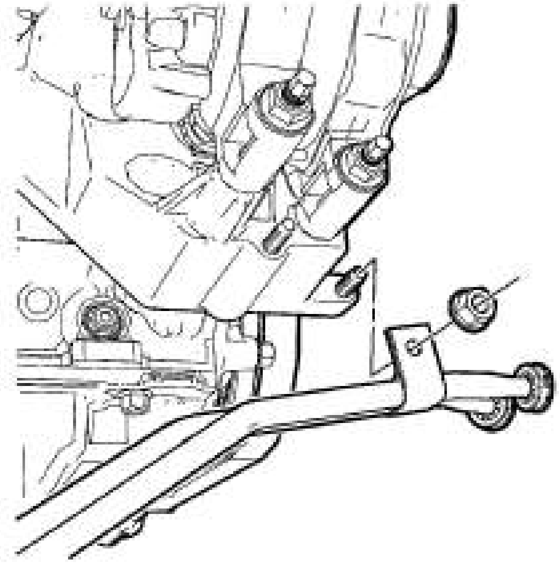
11. Disconnect the transmission wiring harness connector (1) from the transmission by rotating the locking latch (2) counter clockwise.



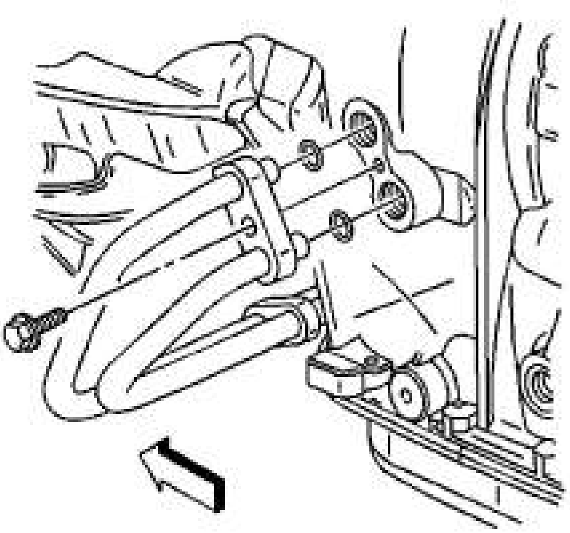
12. Disconnect the wiring harness clips from the transmission, and position the wiring harness aside.



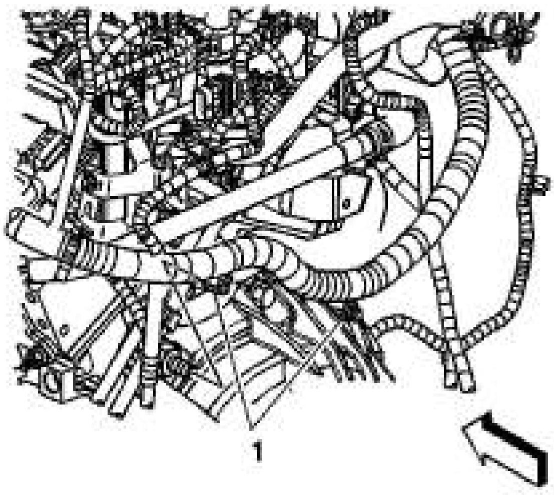
13. Remove the starter motor to gain access to the torque converter bolts. Refer to Starter Motor Replacement.
14. Mark the torque converter to flexplate/flywheel orientation to make sure proper realignment.
15. Repeat the following steps for all 3 torque converter bolts:
    15.1. Rotate the harmonic balancer centre bolt clockwise ONLY, in order to align the torque converter bolt with the starter motor opening in the engine block.
    15.2. Remove and discard the torque converter bolt. The bolt is self locking and is NOT reusable.
16. Using inspection hole push torque converter back towards transmission pump
17. Place an oil drain pan under the transmission fluid cooler pipes.



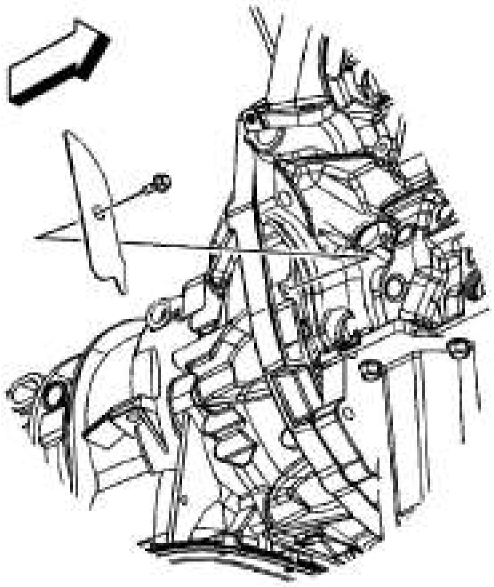
18. Remove the bolt securing the transmission fluid cooler pipes brace to the engine.



19. Disconnect the fluid cooler pipes from the transmission.
20. Plug the open outlet ports to prevent fluid loss and contamination.



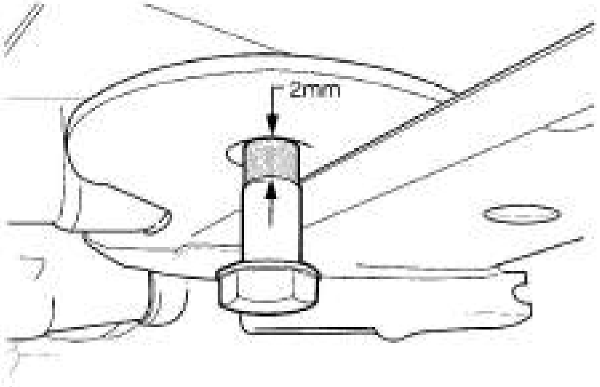
21. Disconnect the engine wiring harness retaining clips (1) to the transmission mounting bolts.
22. Disconnect the steering shaft from the steering rack.



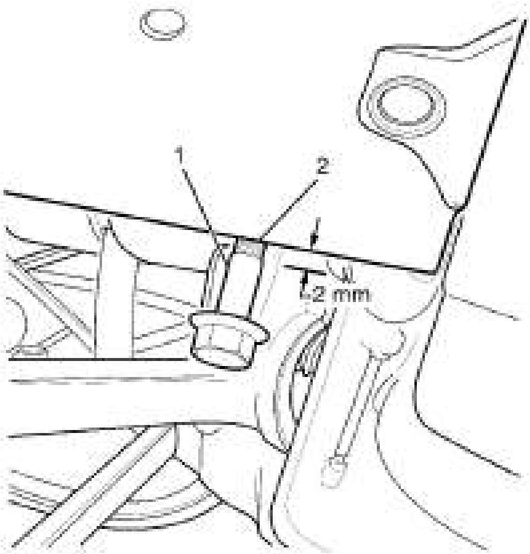
23. Remove the engine close out cover.

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

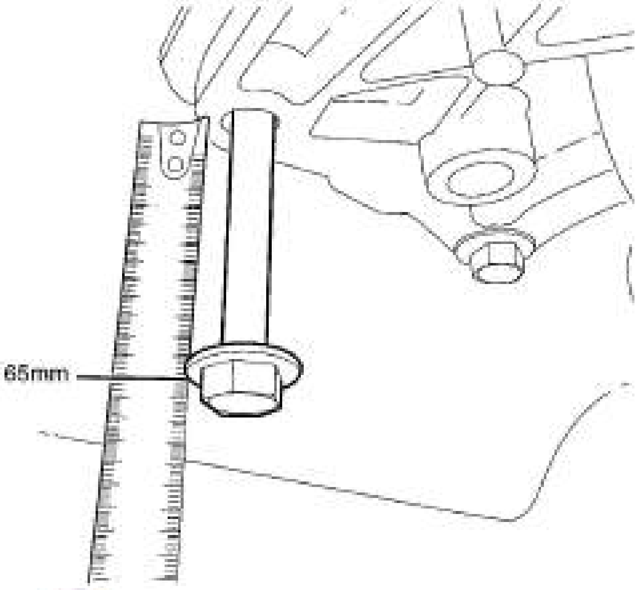
24. Support the power train with a suitable jack or table.



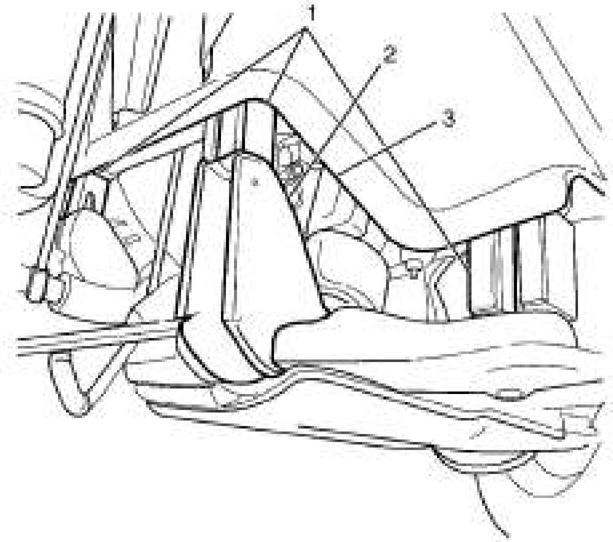
25. Remove the front sub frame rear retaining bolts and fit bolts from special tool kit EN-48536
26. Install bolt till stepped shank (1) is 2mm below sub frame (2).



27. Remove the front sub frame front retaining bolts and fit bolts from special tool kit EN-48536
28. Install bolt till stepped shank (1) is 2mm below chassi rail flange (2).



29. Remove all four transmission mount to body retaining bolts and install two bolts from special tool kit in diagonal holes e.g Left hand front and Right hand rear.
30. Install the bolts until 65mm is measured between the bolt heads (1) and transmission mount (2).
31. Remove the front sub frame middle bolts.
32. Lower the power train slowly until the subframe and transmission mount are resting on bolts.



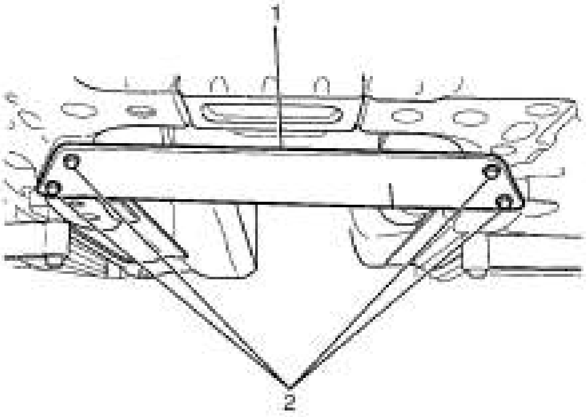
33. Insert the 65mm spacer blocks (1) between the subframe (2) and chassis rails (3).
34. Tension the front sub frame front and rear bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

35. Install and tension the middle sub frame bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

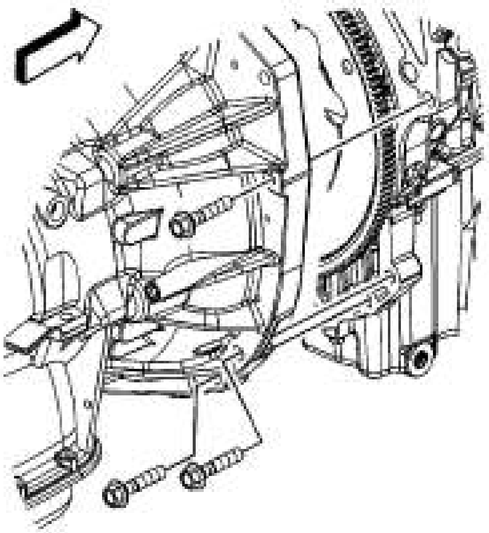
36. Remove the supporting jack or table



37. Install engine support plate (1) to the front sub frame.

38. install the engine support plate retaining bolts (2).

    Tighten
    Tighten the bolts to 10 N·m (89 lb. in).



39. Remove the transmission retaining bolts.
40. Pull the transmission free from the engine dowels.

    Important: Ensure clearance is maintained between the transmission and the following:
    - The catalytic converters
    - The wiring harnesses
    - The cooler pipes
    - The propeller shaft

41. Carefully lower the transmission from the vehicle.
42. Flush the transmission oil cooler. Refer to Transmission Fluid Cooler Flushing and Flow Test.

Installation Procedure

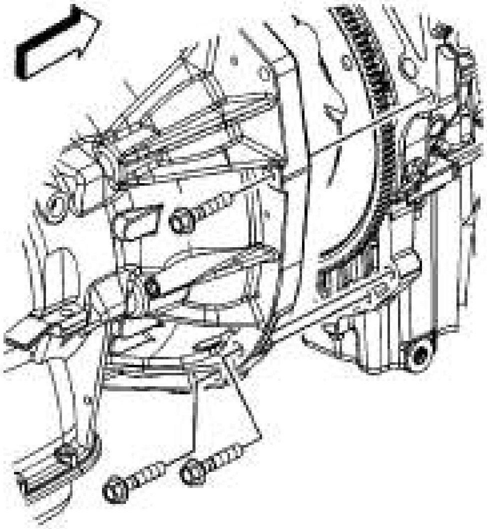
Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

Important: Ensure clearance is maintained between the transmission and the following:
- The catalytic converters
- The wiring harnesses
- The cooler pipes
- The propeller shaft

1. Using the transmission jack, carefully raise the transmission to the vehicle.

2. Align the transmission with the engine dowels.

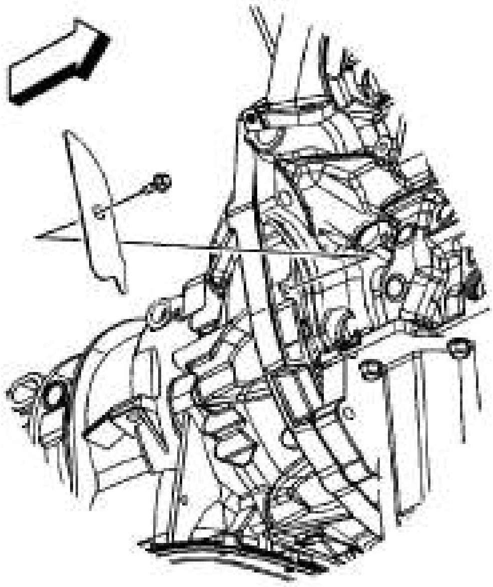
   Notice: Refer to Fastener Notice in the Preface section.



3. Install the right hand side transmission retaining bolts.

   Tighten
   Tighten the bolts to 50 N·m (37 lb. ft).

4. Install the remaining transmission retaining bolts.



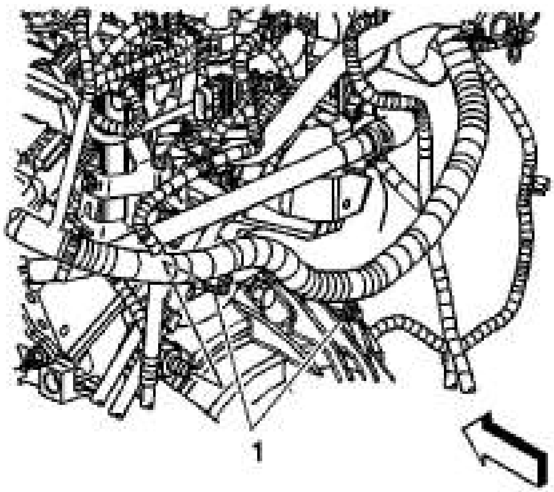
5. Install the engine close out cover.

Tighten
Tighten the studs to 10 N·m (89 lb. in).

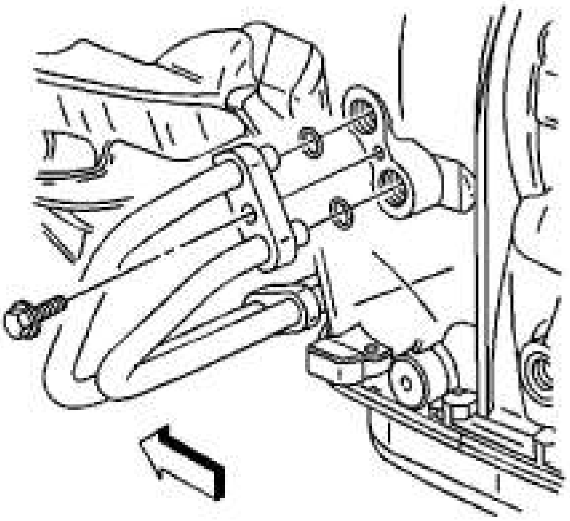
6. Remove the engine and transmission lowering blocks and engine balance plate.
7. Raise the powertrain back up into the engine bay and install the front sub frame bolts.

Tighten
Tighten the front sub frame bolts to 160 N·m (118 lb. ft.).

Tighten
Tighten the transmission support to under body retaining bolt to 63 N·m (46 lb ft).



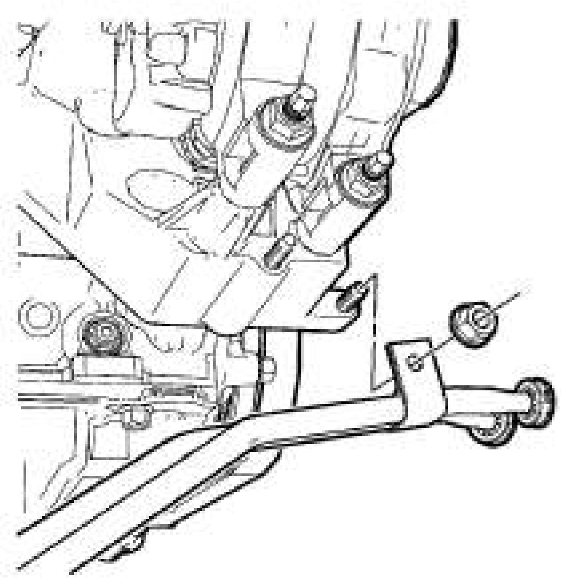
8. Connect the engine wiring harness retaining clips (1) to the transmission mounting bolts.
9. Install the steering shaft to the steering rack.



Important: Replace the O-rings seals if cracked, cut, or distorted.

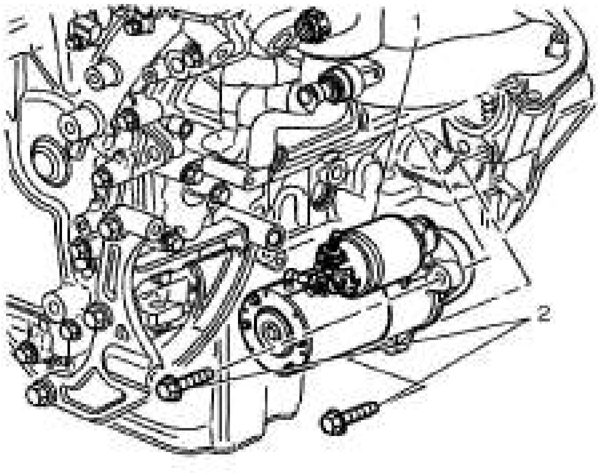
10. Lubricate the O-rings seals with automatic transmission fluid.
11. Install the O-rings seals onto the cooler pipes prior to inserting the cooler pipes into the transmission.
12. Insert the transmission fluid cooler pipes into the transmission.
13. Install the bolt securing the transmission fluid cooler pipe retainer to the transmission.

Tighten
Tighten the bolt to 25 N·m (18 lb. ft).



14. Install the bolt securing the transmission fluid cooler pipes brace to the engine.

Tighten
Tighten the bolt to 50 N·m (37 lb. ft).



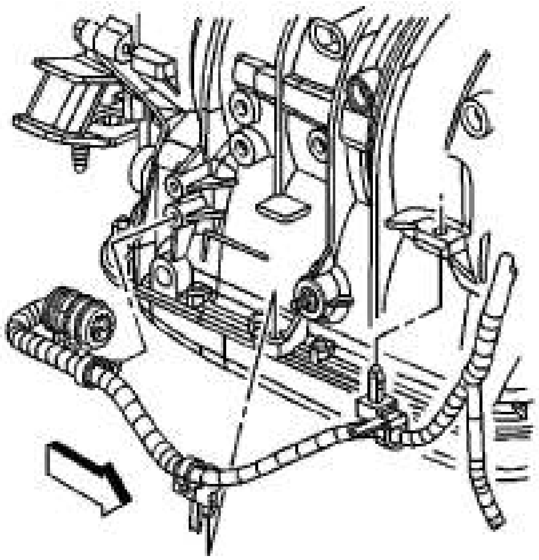
15. Align the torque converter to flexplate/flywheel orientation marks made during the removal procedure.

    Important: Torque converter bolts are self locking and must be replaced with NEW torque converter bolts every time the bolts are removed.

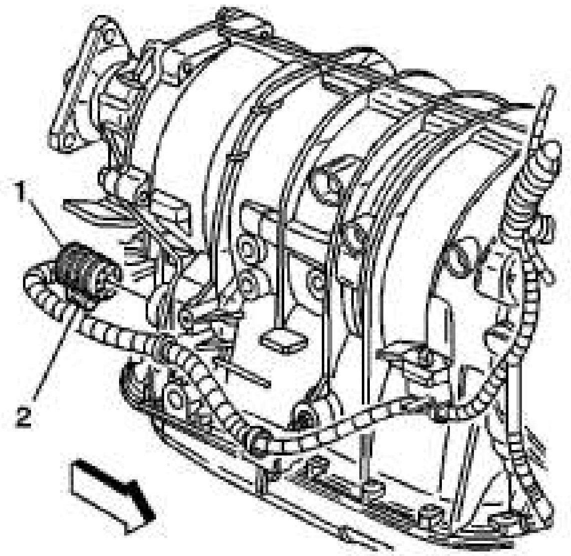
16. Repeat the following steps for all 3 torque converter bolts:
    - 16.1. Rotate the harmonic balancer centre bolt clockwise ONLY, in order to align the torque converter bolt holes in the flexplate/flywheel with the starter motor opening in the engine block.
    - 16.2. To aid in alignment of the torque converter to the flexplate/flywheel. Install all 3 NEW torque converter retaining bolts before fully tightening.

    Tighten
    Tighten the bolts to 63 N·m (46 lb. ft).

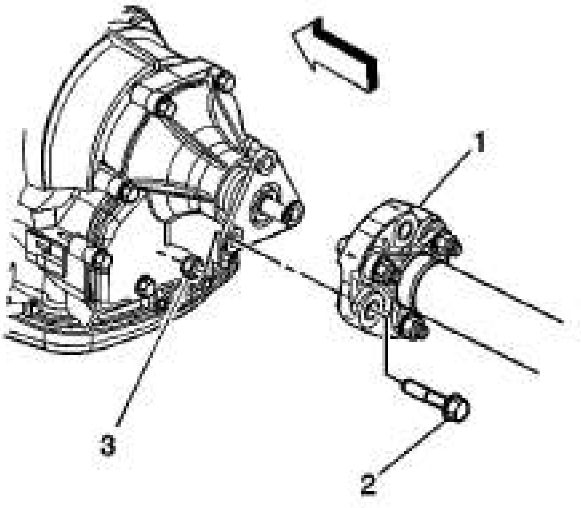
17. Install the starter motor. Refer to Starter Motor Replacement.
18. Install the air deflector front (1). Refer to Front Air Deflector Replacement.



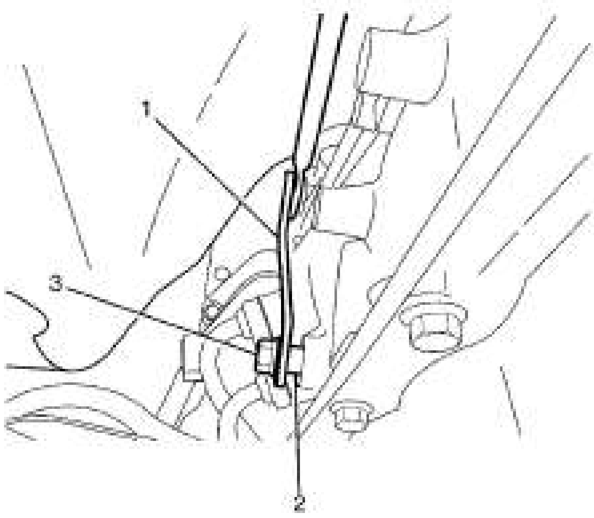
19. Connect the wiring harness clips to the transmission.



20. Connect the transmission wiring harness connector (1) to the transmission by rotating the locking latch (2) clockwise.



21. Install the propeller shaft coupler (1) to the transmission flange. Refer to Propeller Shaft Replacement.



22. Place the transmission in the park position by rotating the shift shaft (2) fully counter clockwise.
23. Connect the shift linkage (1) to the transmission.
24. Install the transmission manual shift shaft retaining nut (3).

    Tighten
    Tighten the nut to 15 N·m (11 lb. ft).

25. Check the transmission fluid level (fill if necessary). Refer to Transmission Fluid Check.
26. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
27. Lower the vehicle.

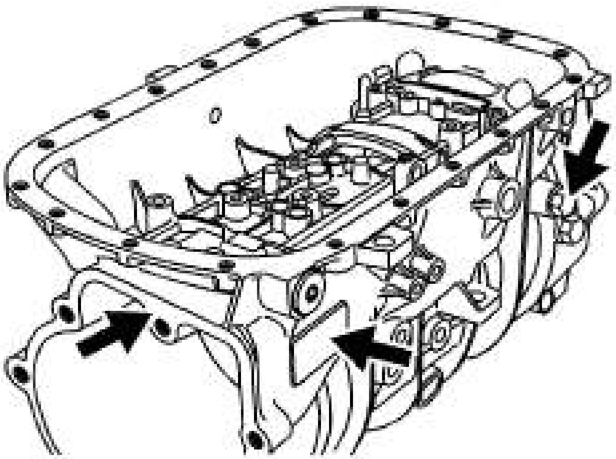
28. Connect the evap purge pipe.
29. Install radiator retaining clips
30. Install air intake ducting from engine
31. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection.
32. The transmission control module must be programmed with the proper software/calibrations. Refer to Control Module References.

Transmission Final Test and Inspection

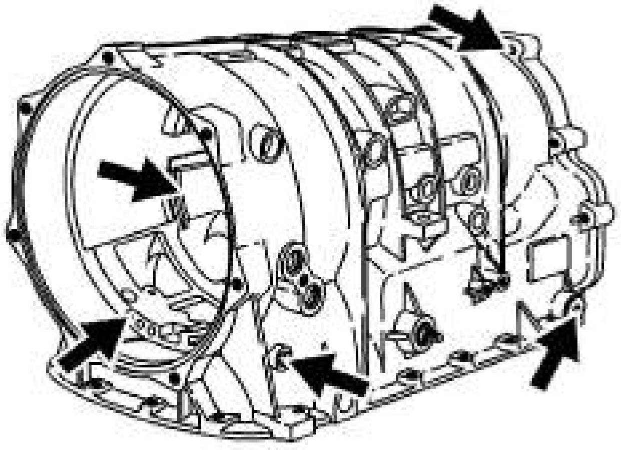
Complete the following procedure after the transmission is installed in the vehicle:

1. With the ignition OFF or disconnected, turn the engine by hand several times. Listen for any unusual noises or evidence that any parts are binding.
2. Start the engine and listen for abnormal sounds.
3. While the engine continues to idle raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Inspect for fluid leaks while the engine is idling.
5. Lower the vehicle.
6. Perform a final inspection for the proper fluid level.
7. Road test the vehicle.

Case Assembly Inspection



1. Inspect the components that are still on the transmission case for the following conditions:
   - Loose, cross-threaded, or damaged threads on the transmission oil cooler fittings
   - A loose, missing, or damaged transmisssion name plate

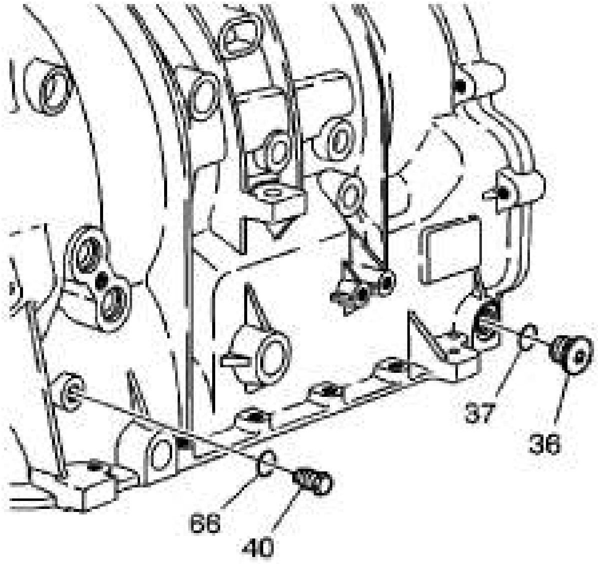


2. Inspect the transmission case for the following conditions:
   - Gasket sealing surfaces that are damaged or have porosity

- Bolt and screw holes that are stripped or damaged - repair with thread insert
- Damaged or porous case and fluid passages
- Damaged snap ring grooves or housing splines
- A loose, cross threaded, or damaged pressure test plug and fluid level hole plug

Case Components Assemble

Notice: Refer to Fastener Notice in the Preface section.



Important: If the pressure test plug (40), O-ring (66), level hole plug (36) and O-ring (37) are not damaged, they should be reused.

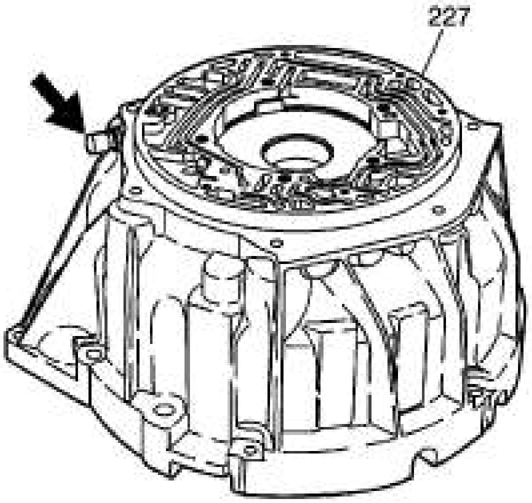
1. Inspect the pressure test hole plug (40) and O-ring seal (66) for damage.
2. Install the pressure test plug (40) and O-ring seal (66).

   Tighten
   Tighten the pressure test plug to 11N·m (8 lb. ft).

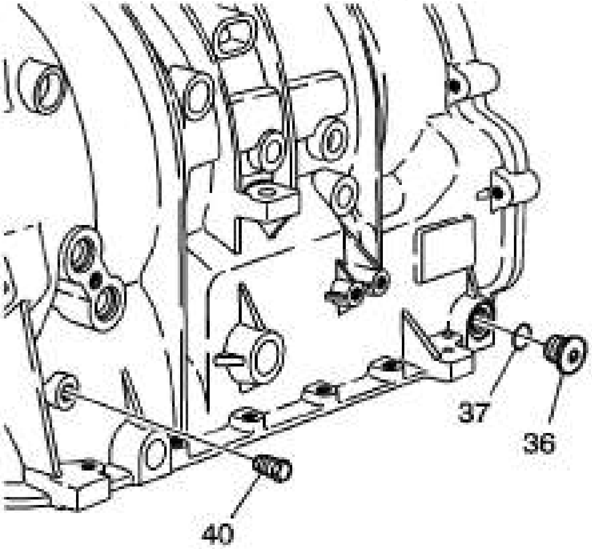
3. Inspect the fluid level hole plug (36) and O-ring seal (37) for damage.
4. Install the transmission fluid level hole plug O-ring seal (37) and the transmission fluid level hole plug (36).

   Tighten
   Tighten the level hole plug to 20N·m (15 lb. ft).

Case Components Disassemble



1. Inspect the transmission vent assembly for damage or being plugged. If the vent is damaged the torque converter housing (227) must be replaced.

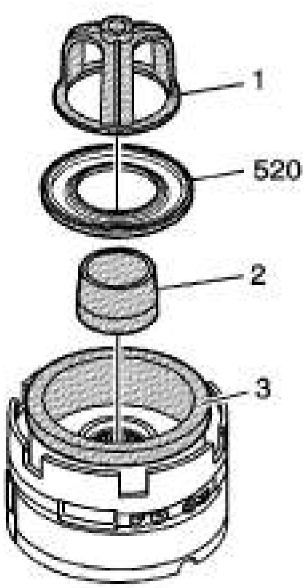


2. Remove the pressure test plug (40).
3. Remove the fluid level hole plug (36) and fluid level hole plug o-ring seal (37) from the case (604).

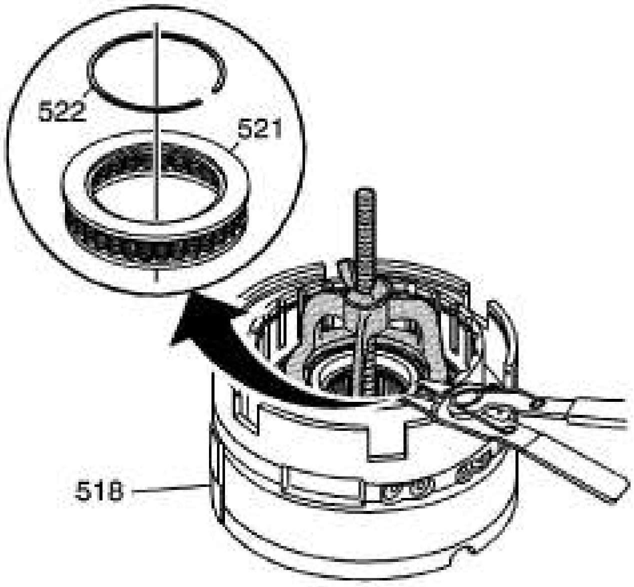
Center Support Assemble

Tools Required

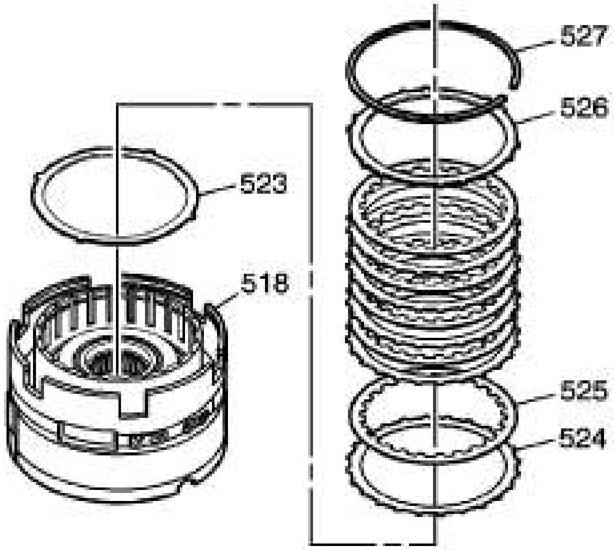
- J 23327 Clutch Spring Compressor
- J 45127 Centre Support Removal Tool
- J 45136 Seal Protector
- J 45140 Seal Protector
- J-45688 Piston Installer - Pusher
- J 46239-1 Second Coast Clutch Outer Protector
- J 46239-2 Second Coast Clutch Inner Protector
- J 46239-3 Second Coast Clutch Pusher
- J-46240-1 Seal Protector
- J 46240-2 Seal Protector



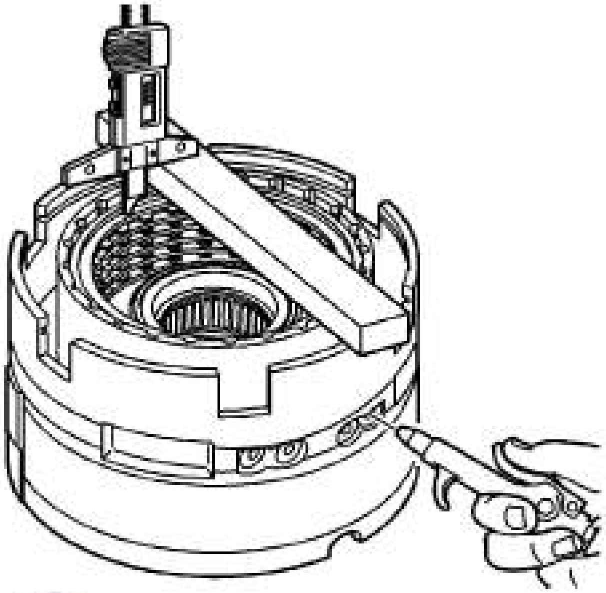
1. Inspect the centre support components for the following:
   - Plugged fluid passages
   - Worn or damaged splines
   - Worn or damaged pistons
   - Worn or damaged clutch plates
2. Install J-46240-1 (2), and J 45145 (3) into the centre support housing.



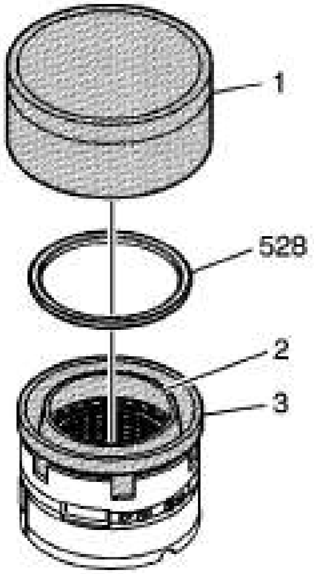
3. Install the 2nd clutch piston.
4. Install the 2nd clutch piston spring (521) into the centre support (518).
5. Use J 23327 to compress the 2nd clutch piston spring (521).
6. Install the 2nd clutch spring retainer ring (522) into the centre support (518).
7. Remove J 23327 from the centre support (518).



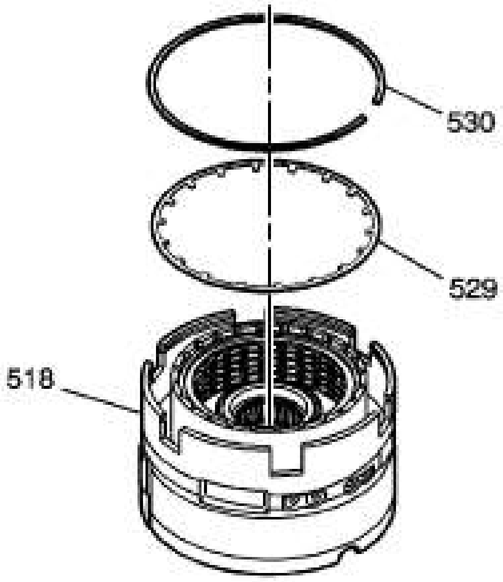
8. Install the 2nd clutch apply plate (523) into the centre support (518).
9. Install the 2nd clutch plates. Start by installing the 2nd clutch plate (524) with external splines. Alternate with the 2nd clutch plate (525) with internal splines. Refer to Clutch Plate Selection Specifications.
10. Install the 2nd clutch backing plate (526) into the centre support (518).
11. Install the 2nd clutch backing plate snap ring (527) into the centre support (518).



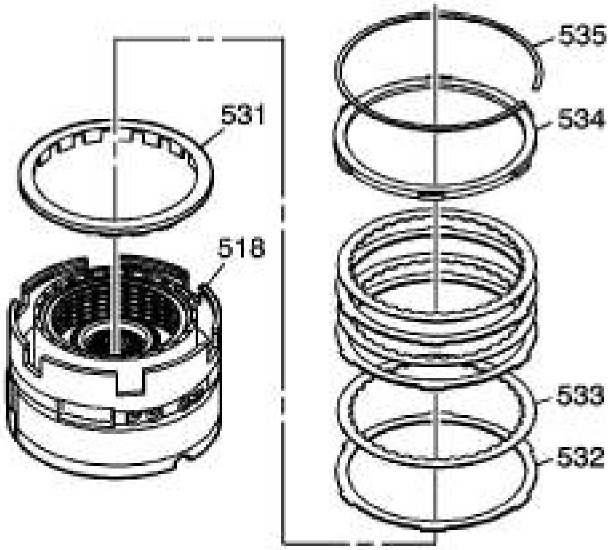
12. Measure the distance between the 2nd clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
13. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the 2nd clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
14. Subtract H2 from H1 this is the 2nd clutch pack travel. Refer to Clutch Piston Travel Specifications.



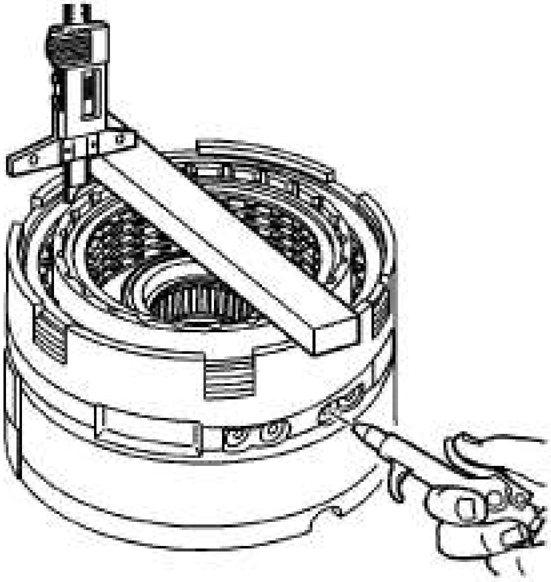
15. Using J 46239-1 (3), J 46239-2 (2) and J 46239-3 (1), install the 2nd coast clutch piston (528).



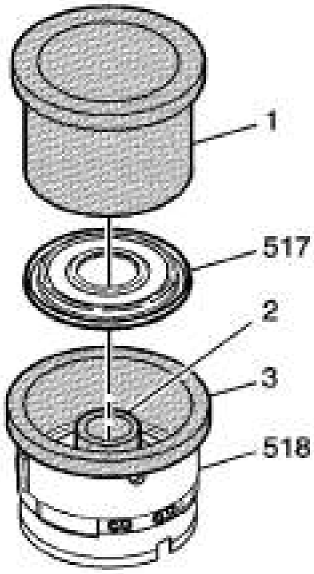
16. Install the 2nd coast clutch spring (529).
17. Using J 23327 compress the 2nd coast clutch spring (529).
18. Install the 2nd coast clutch spring retainer (530).
19. Remove J 23327 .



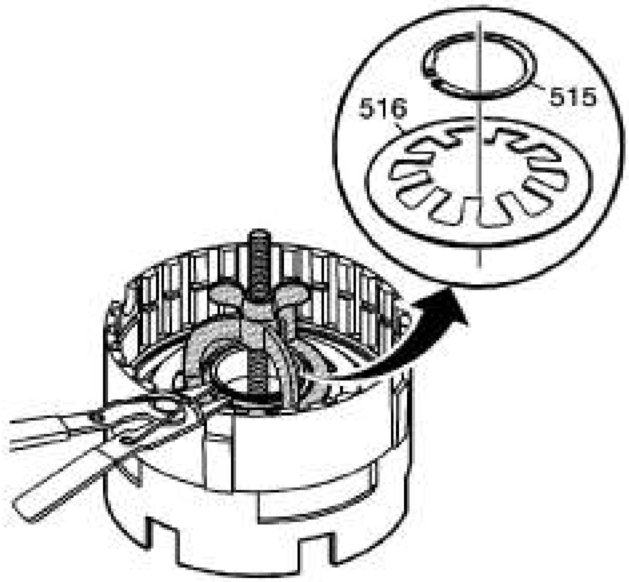
20. Install the 2nd coast clutch spacer (531).
21. Install the 2nd coast clutch plates. Starting with the 2nd coast clutch plate (532) with external splines. Alternate with the 2nd coast clutch plate (533) with internal splines. Refer to Clutch Plate Selection Specifications.
22. Install the 2nd coast clutch backing plate (534).
23. Install the 2nd coast clutch backing plate snap ring (535).



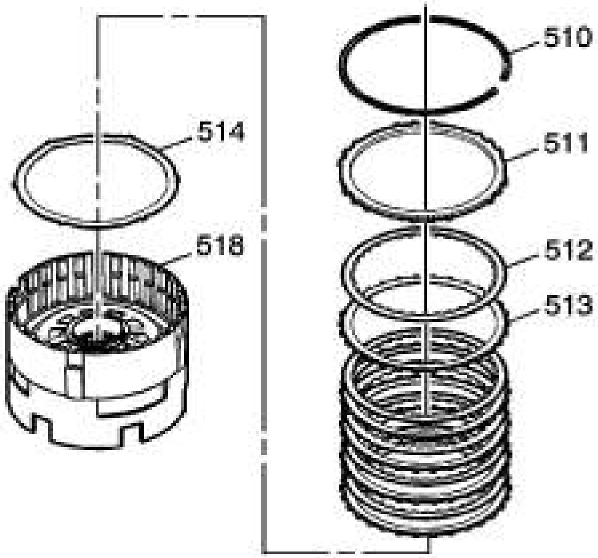
24. Measure the distance between the 2nd coast clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
25. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the 2nd coast clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
26. Subtract H2 from H1 this is the 2nd coast clutch pack travel. Refer to Clutch Piston Travel Specifications.



27. Use the J-46240-1 (2), J-45688 (1) and the J 45136 (3) to install the low and reverse clutch piston (517) into the centre support (518).



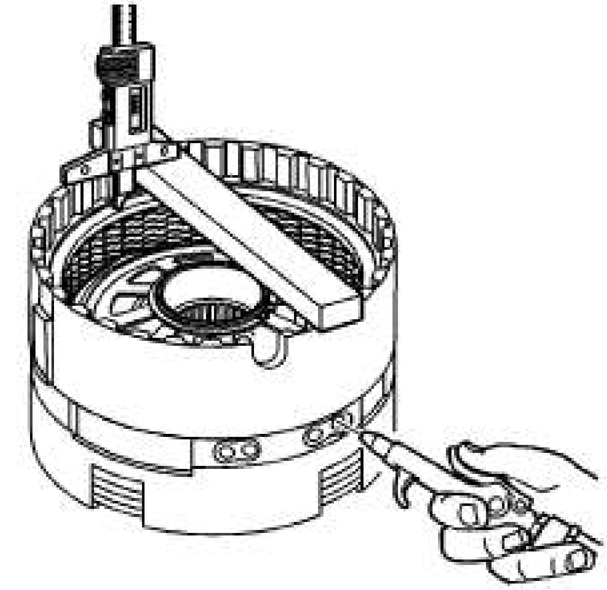
28. Use J 23327 , compress the low and reverse clutch piston spring (516).
29. Install the low and reverse clutch spring snap ring (515) into the centre support (518).



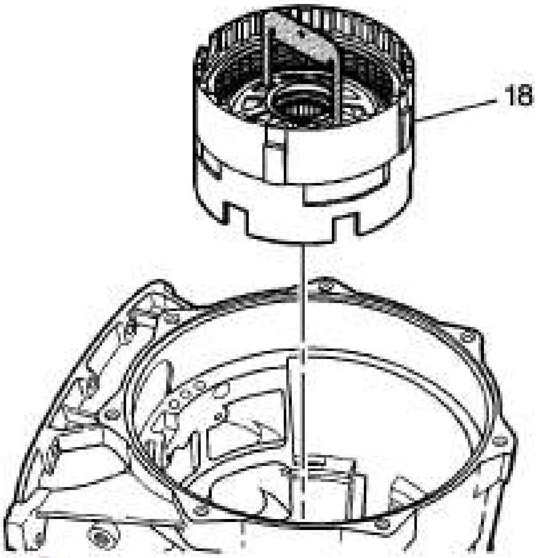
30. Install the low and reverse clutch plates. Start with the low and reverse clutch plate (513) with external splines. Alternate with the low and reverse clutch plate (512) with internal splines. Refer to Clutch Plate Selection Specifications.

    Install the low and reverse apply plate (514) into the centre support (518).

31. Install the low and reverse clutch backing plate (511) and the snap ring (510).



32. Measure the distance between the low and reverse clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
33. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the low and reverse clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
34. Subtract H2 from H1 this is the low reverse clutch pack travel. Refer to Clutch Piston Travel Specifications.



35. Using J 45127 install the centre support (18) into the case.

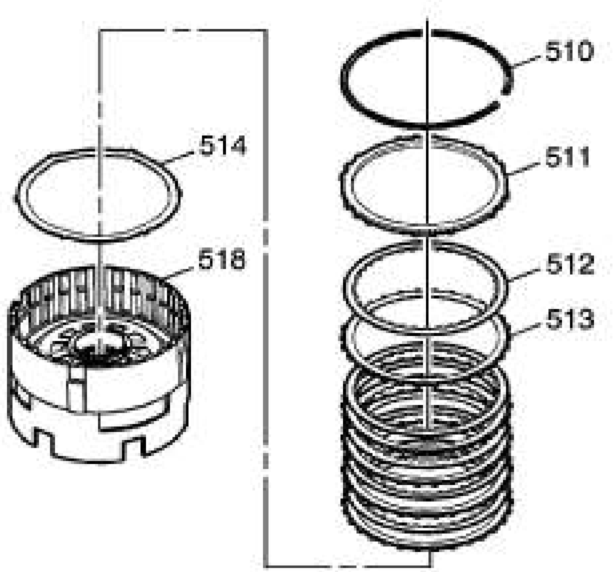
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 1993374**

Center Support Disassemble

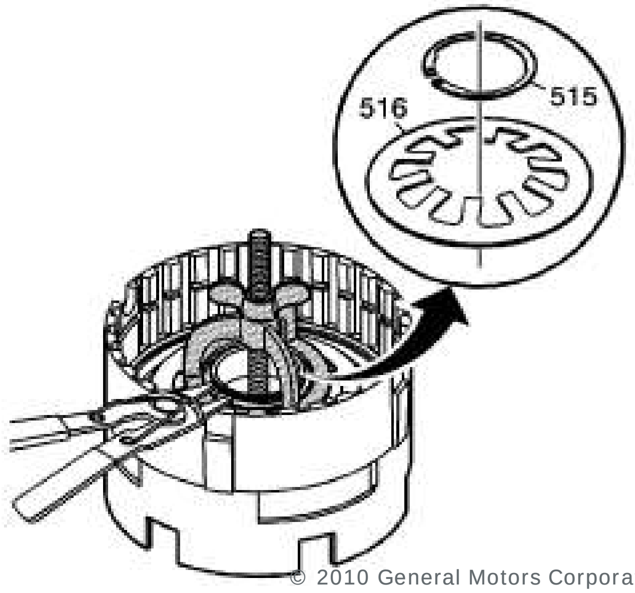
Caution: Refer to General Repair Instructions in the Preface section.

Tools Required

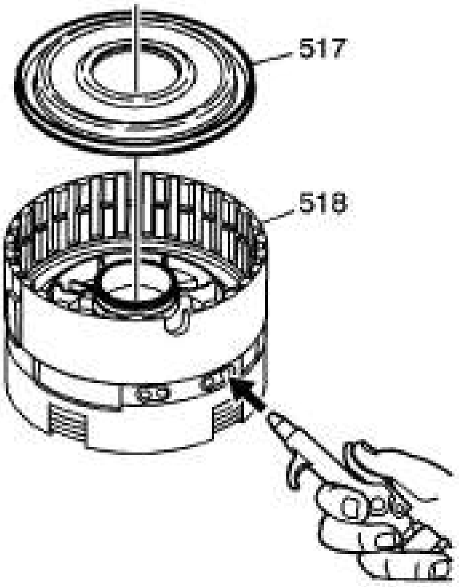
J 23327 Clutch Spring Compressor



1. Remove the snap ring (510).
2. Remove the low and reverse backing plate (511).
3. Remove the clutch plates (512 and 513). Refer to Clutch Plate Selection Specifications.
4. Remove the low and reverse apply plate (514).

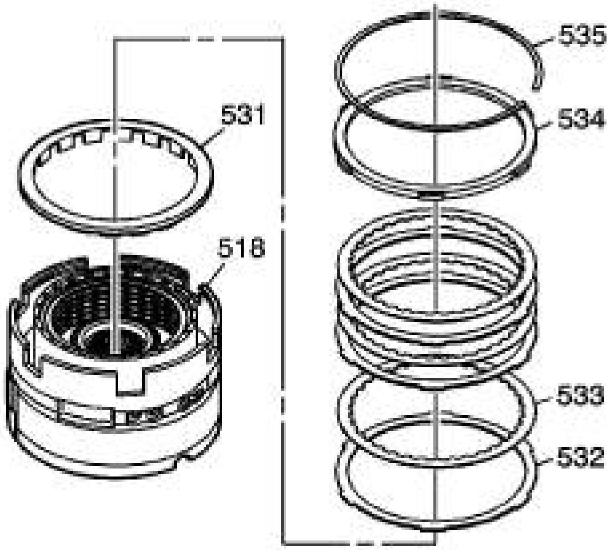


5. Use J 23327 to compress the low and reverse clutch spring (516).
6. Remove the low reverse clutch snap ring (515).
7. Remove J 23327 from the centre support.
8. Remove the clutch spring (516) from the centre support.



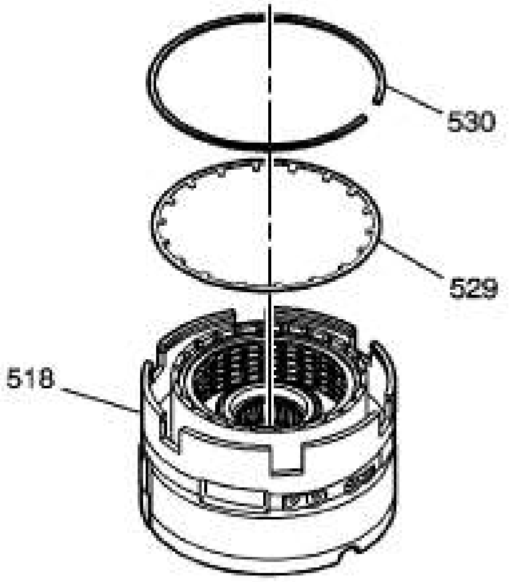
Important: It may be necessary to use air pressure to remove the piston.

9. Remove the low and reverse piston (517) from the centre support (518).

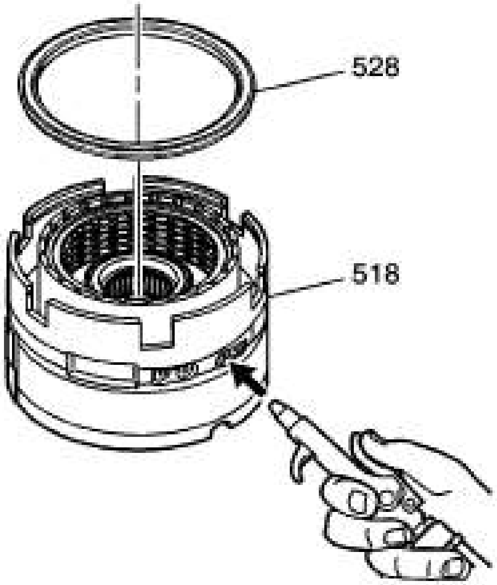


10. Remove the 2nd coast clutch plate snap ring (535) from the centre support (518).
11. Remove the 2nd coast clutch backing plate (534) from the centre support (518).
12. Remove the clutch plates (532 and 533). Refer to Clutch Plate Selection Specifications.

13. Remove the 2nd coast clutch spacer (531) from the centre support (518).

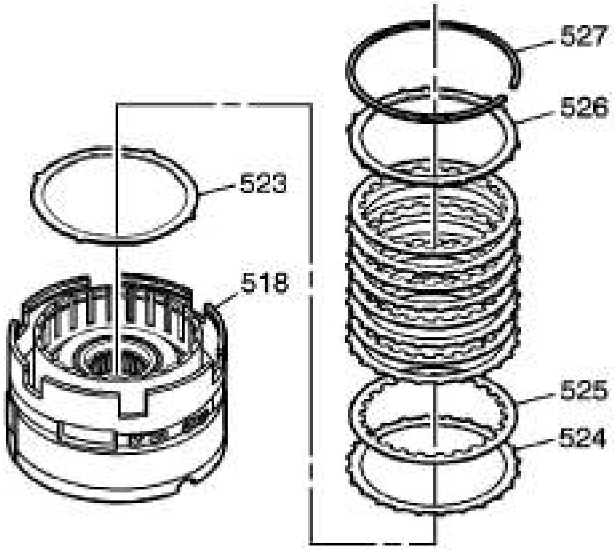


14. Remove the 2nd coast clutch snap ring retainer (530).
15. Remove the 2nd coast clutch spring (529) from the centre support (518).

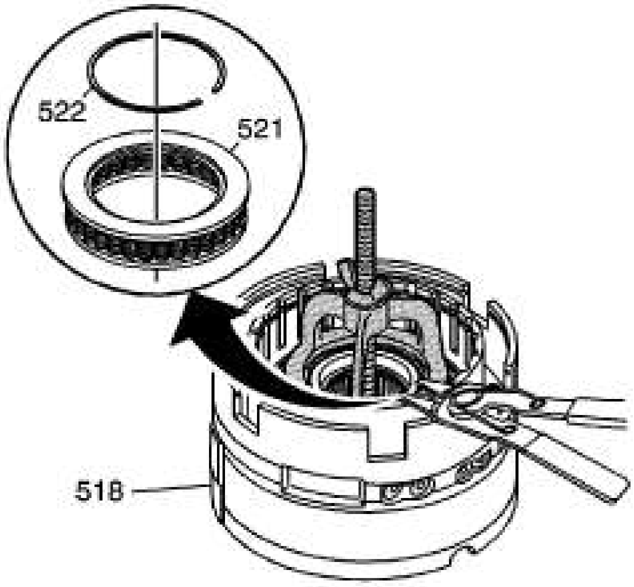


Important: It may be necessary to use air pressure to remove the piston.

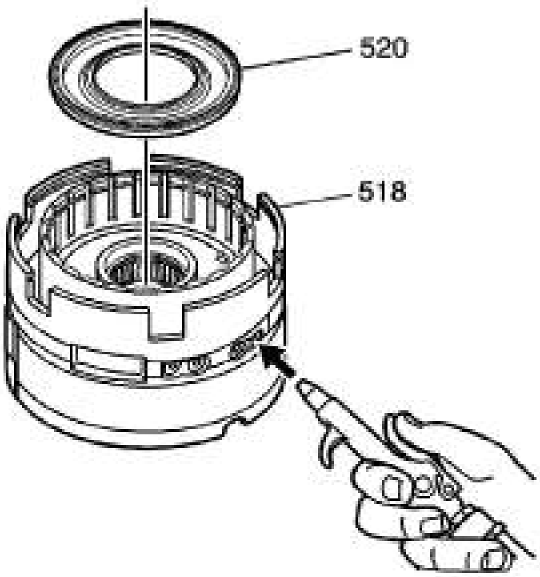
16. Remove the 2nd coast clutch piston (528) from the centre support (518).



17. Remove the snap ring (527) from the centre support (518).
18. Remove the 2nd clutch backing plate (526) from the centre support (518).
19. Remove the clutch plates (524 and 525) from the centre support (518). Refer to Clutch Plate Selection Specifications.
20. Remove the 2nd clutch apply plate (523) from the centre support (518).



21. Use J 23327 to compress the 2nd clutch piston spring (521).
22. Remove the snap ring (522) from the centre support (518).
23. Remove the J 23327 from the center support (518).
24. Remove the 2nd clutch piston spring (521) from the centre support (518).



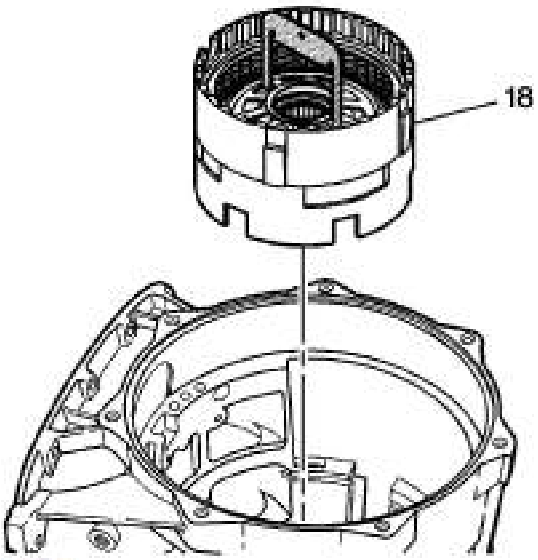
Important: It may be necessary to use air pressure to remove the piston.

25. Remove the 2nd clutch piston (520) from the centre support (518).

Center Support Removal

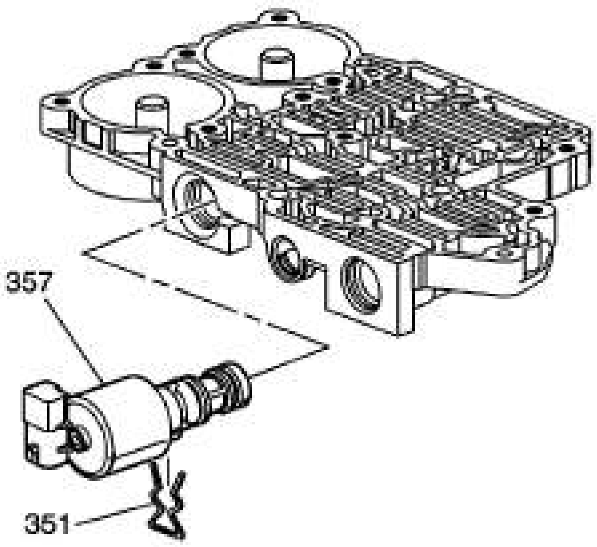
Tools Required

J 45127 Centre Support Removal Tool

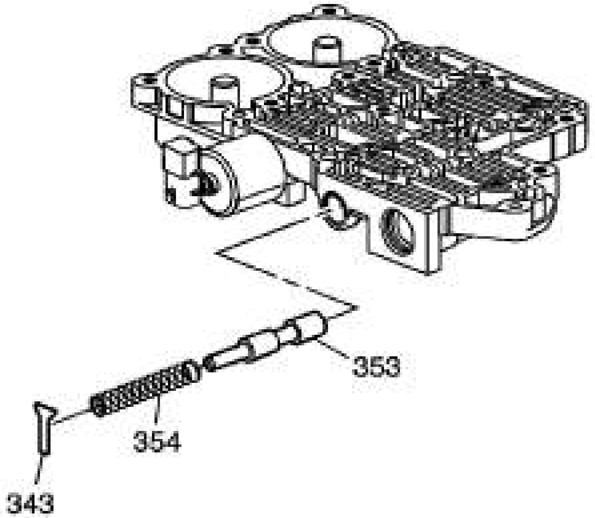


Use J 45127 to remove the centre support (18) from the case.

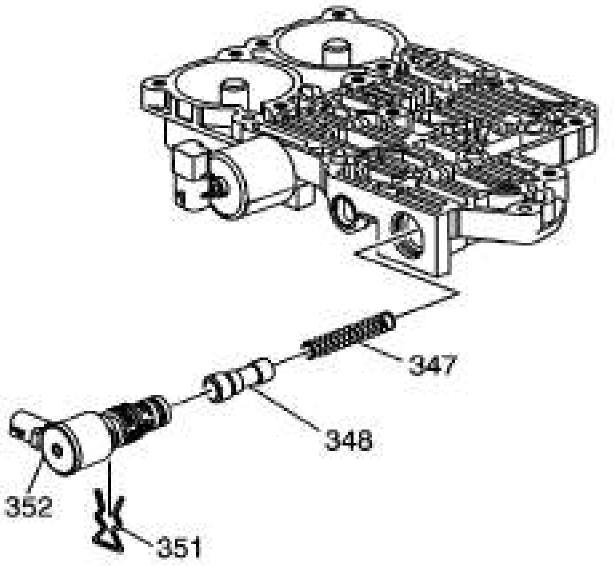
Control Valve Body Accumulator Assembly Assemble



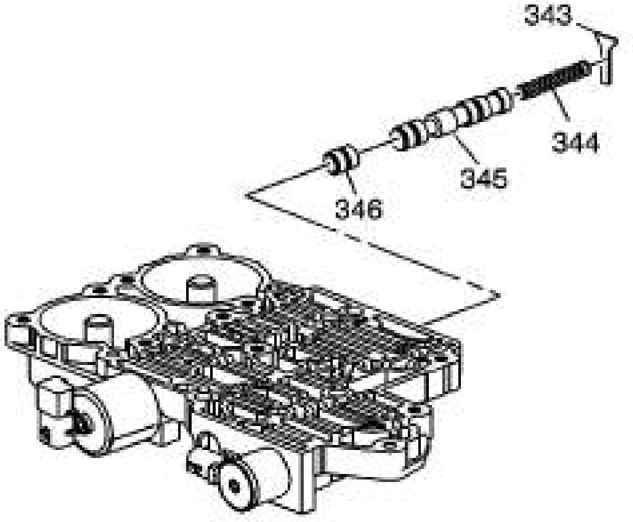
1. Install the pressure control solenoid (357).
2. Install the pressure control solenoid retainer (351).



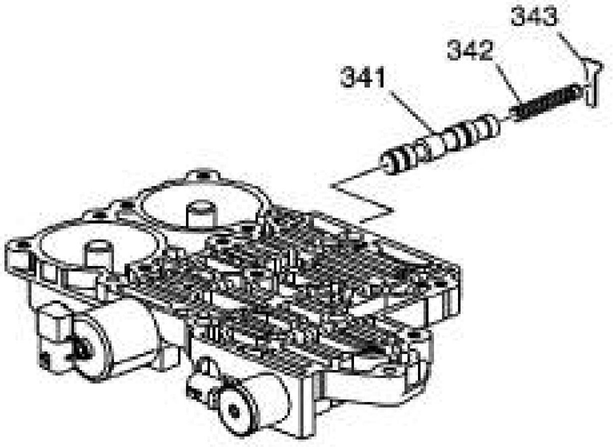
3. Install the feed limit valve (353).
4. Install the feed limit valve spring (354).
5. Install the feed limit valve retainer (343).



6. Install the tcc pwm solenoid valve spring (347).
7. Install the tcc regulator apply valve (348).
8. Install the tcc pwm solenoid (352).
9. Install the tcc pwm solenoid retainer (351).

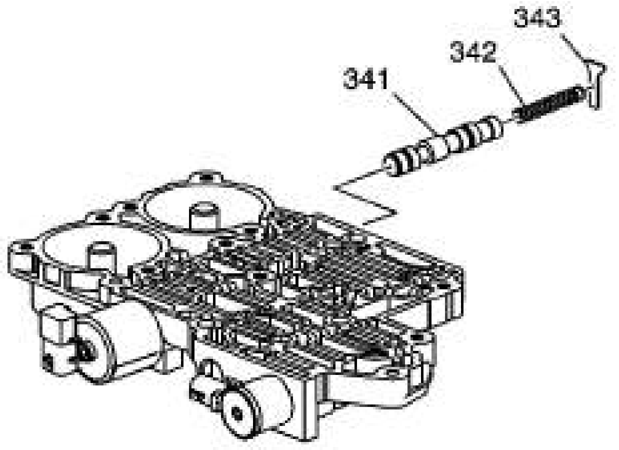


10. Install the 3-4 shift control valve (346).
11. Install the 3-4 shift valve (345).
12. Install the 3-4 shift valve spring (344).
13. Install the 3-4 shift control valve retainer (343).

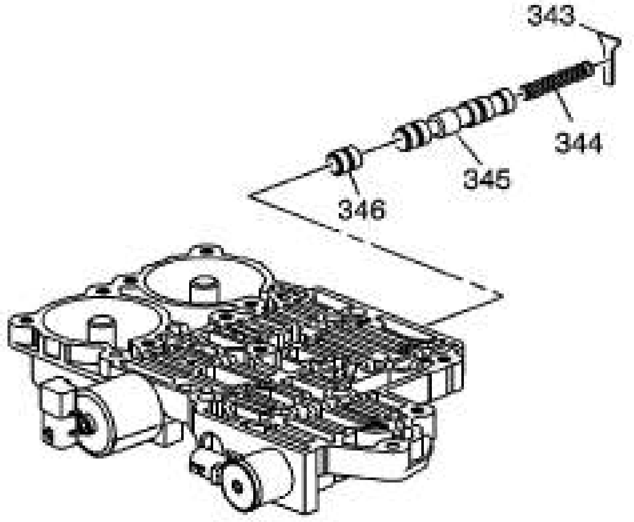


14. Install the safety mode valve (341).
15. Install the safety mode valve spring (342).
16. Install the safety mode valve retainer (343).

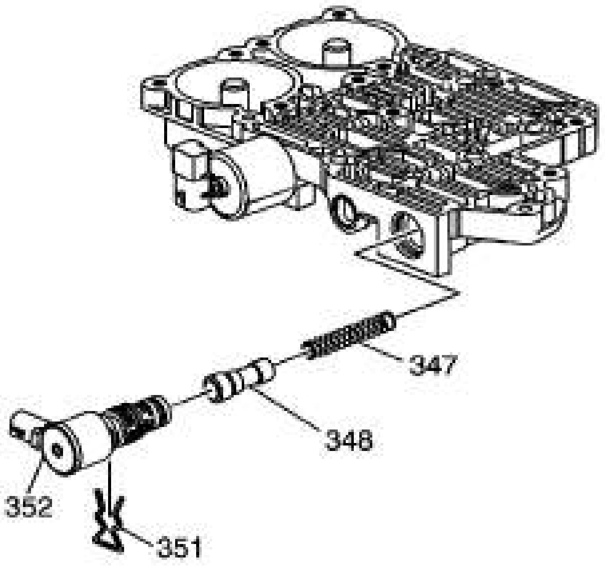
Control Valve Body Accumulator Assembly Disassemble



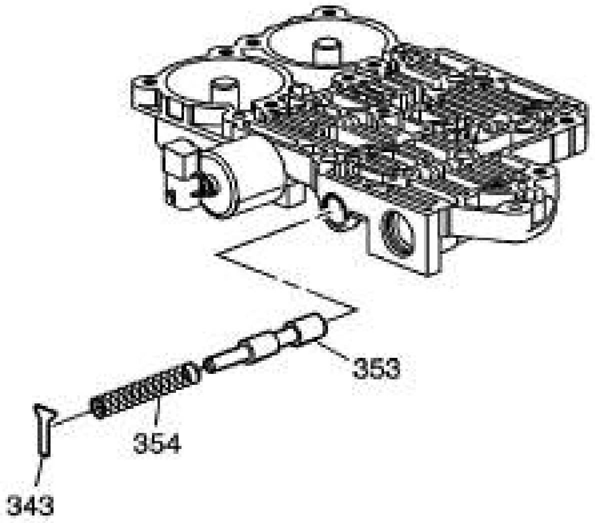
1. Remove the safety mode valve retainer (343).
2. Remove the safety mode valve spring (342).
3. Remove the safety mode valve (341).



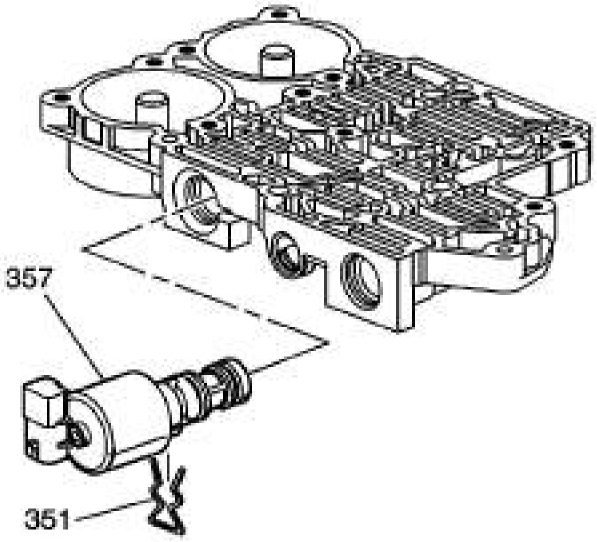
4. Remove the 3-4 shift valve retainer (343).
5. Remove the 3-4 shift valve spring (344).
6. Remove the 3-4 shift valve (345).
7. Remove the 3-4 shift control valve (346).



8. Remove the torque converter clutch (TCV) pulse width modulated (PWM) solenoid valve retainer (351).
9. Remove the tcc pwm solenoid (352).
10. Remove the tcc regulator apply valve (348).
11. Remove the tcc regulator apply valve spring (347).



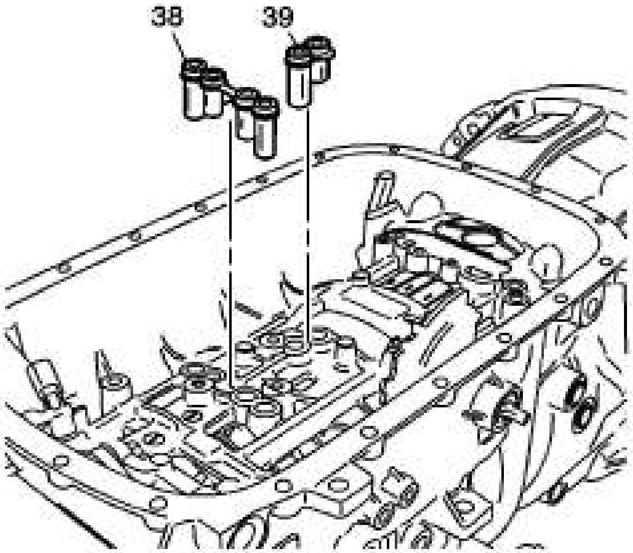
12. Remove the feed limit valve retainer (343).
13. Remove the feed limit valve spring (354).
14. Remove the feed limit valve (353).



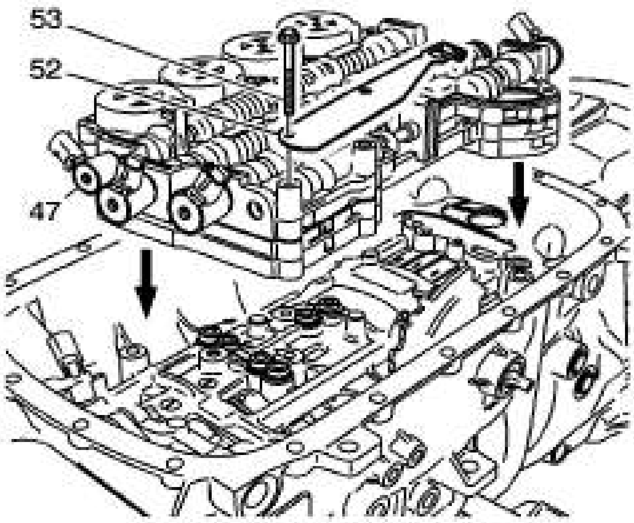
15. Remove the pressure control solenoid retainer (351).
16. Remove the pressure control solenoid (357).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 1977474**

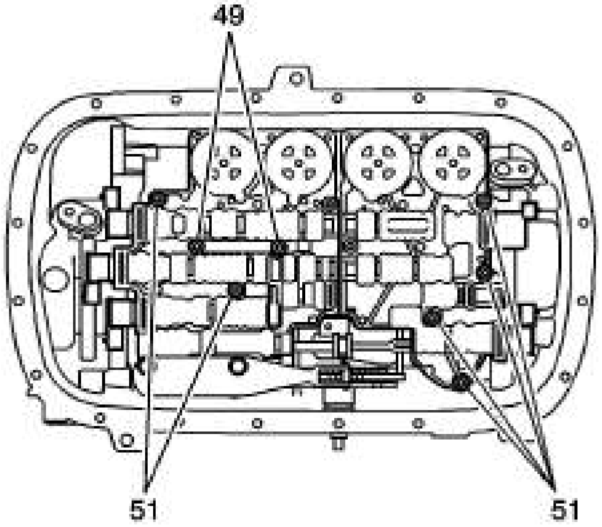
Control Valve Body Accumulator Assembly Installation



1. Install the NEW overdrive clutch fluid passage sleeve (39) into the case.
2. Install the NEW centre support fluid passage sleeve (38) into the case.

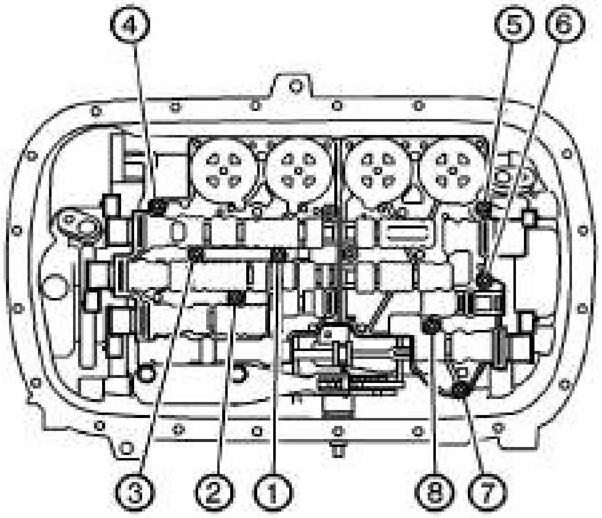


3. Install the control valve body accumulator assembly (47) onto the case.
4. Install the detent lever spring (52) onto the case.
5. Install the control valve body retaining bolts (53) into the case and hand tighten.



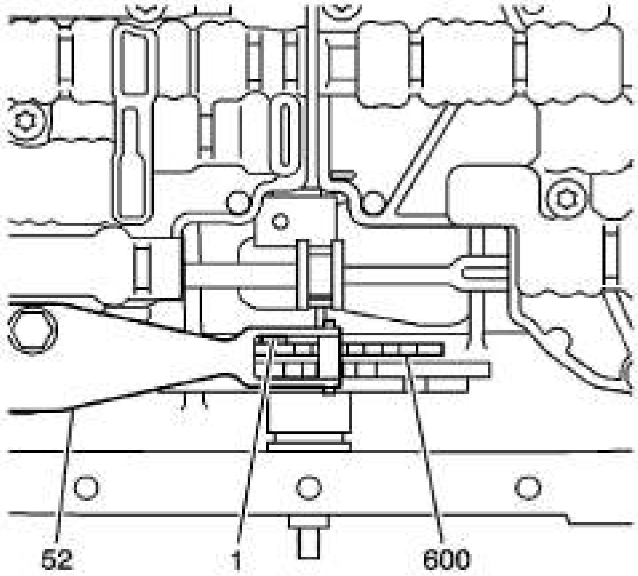
6. Install the control valve body accumulator assembly bolts (49, 51) into the case and hand tighten.

   Notice: Refer to Fastener Notice in the Preface section.



7. Tighten the control valve body accumulator retaining bolts in sequence.

   Tighten
   Tighten the control valve body accumulator bolts to 11 N·m (8 lb. ft).

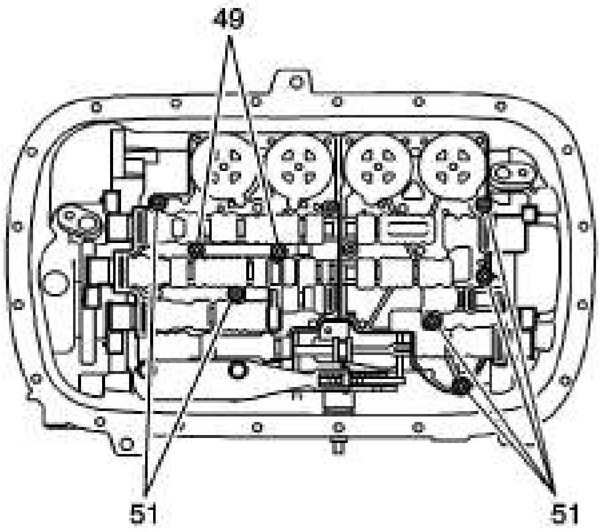


8. Install a 0.8 mm spacer (1) between the shift shaft detent lever (600) and the shift shaft detent assembly (52).
9. Tighten the detent assemby bolts (53).

   Tighten
   Tighten the control valve body bolts (53) to 11 N·m (8 lb. ft).

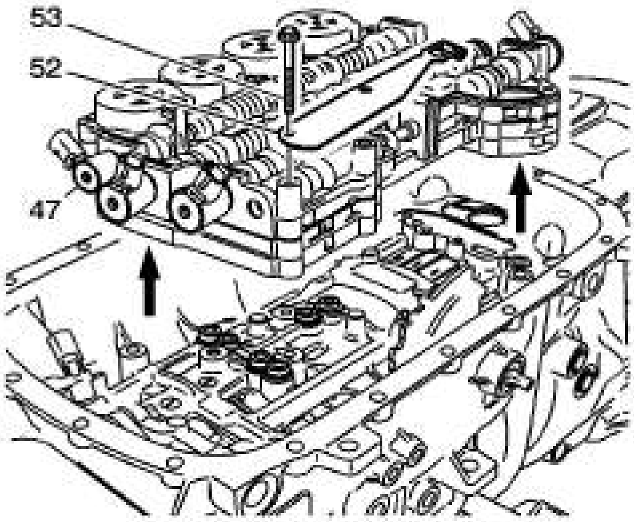
10. Remove the spacer (1).

Control Valve Body Accumulator Assembly Removal

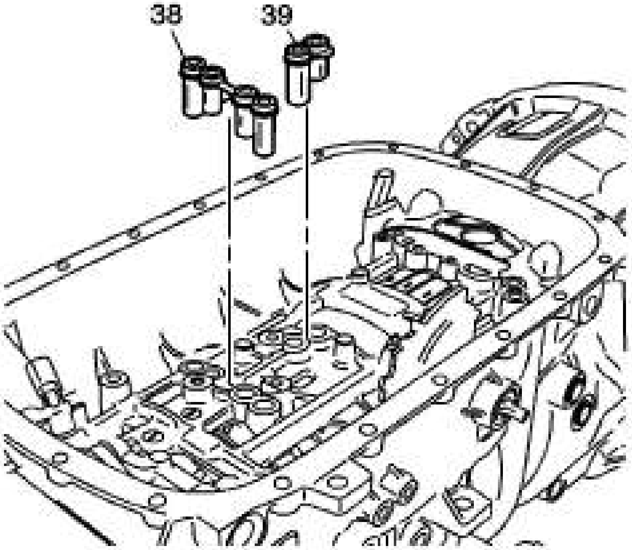


Important: Only remove the bolts called out in the graphic, there will be two remaining.

1. Remove the control valve body retaining bolts (49 and 51).

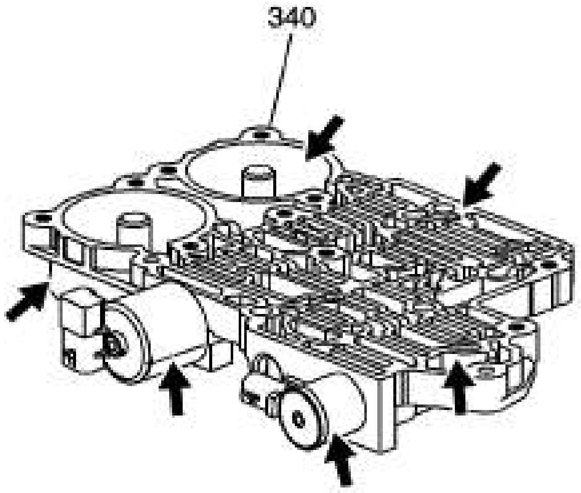


2. Remove the control valve body retaining bolts (53).
3. Remove the manual shaft detent (52).
4. Remove the control valve body (47).



5. Remove the centre support fluid passage sleeve (38) and the overdrive clutch fluid passage sleeve (39).

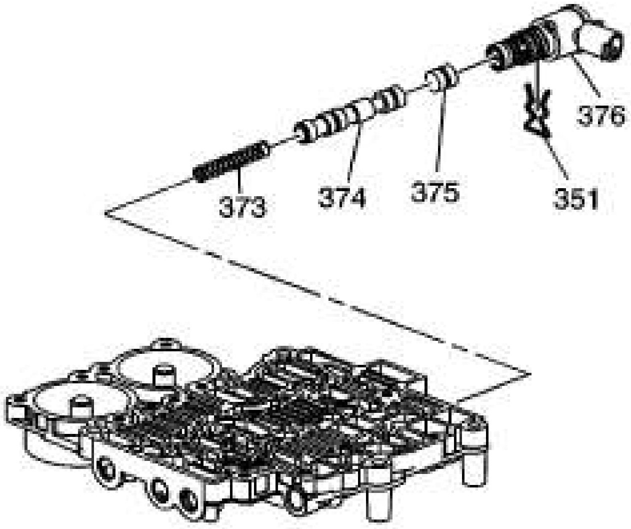
Control Valve Front Body Inspection



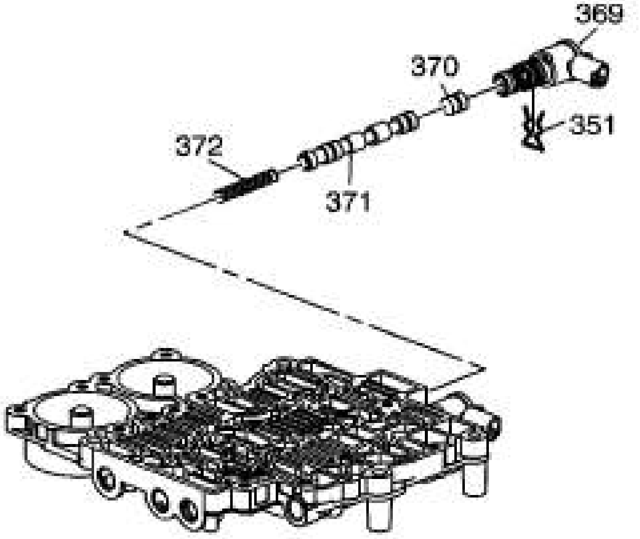
1. Inspect the front control valve body (340) for the following conditions:
   - Damaged or porous casting
   - Damaged sealing surfaces
   - Debris in fluid passages
2. Use a suitable tool, before disassembly, to inspect the front control valve body (340) components for the following conditions:
   - Valves binding or sticking in their bores or bushings
   - Broken missing or damaged springs
   - Missing or damaged retainers
   - Damaged solenoid valves
   - Debris in valve line ups or solenoid valves
3. During disassembly, inspect the front control valve body for the following conditions:
   - Worn or damaged valves, valve bores or bushings
   - Broken, missing or damaged springs
   - Missing or damaged retainers
   - Damaged solenoid valves
   - Debris in valve line ups or solenoid valve

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | Document ID: 2006962

Control Valve Rear Body Assemble

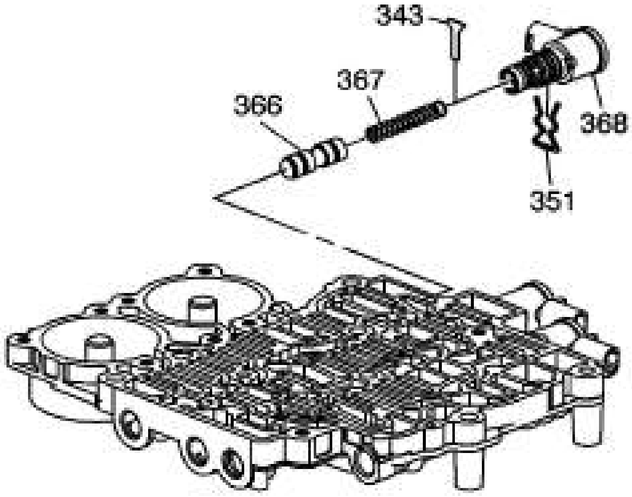


1. Install the 4-5 shift valve spring (373).
2. Install the 4-5 shift valve (374).
3. Install the 4-5 shift control valve (375).
4. Install the 4-5 shift solenoid (376).
5. Install the 4-5 shift solenoid retainer (351).

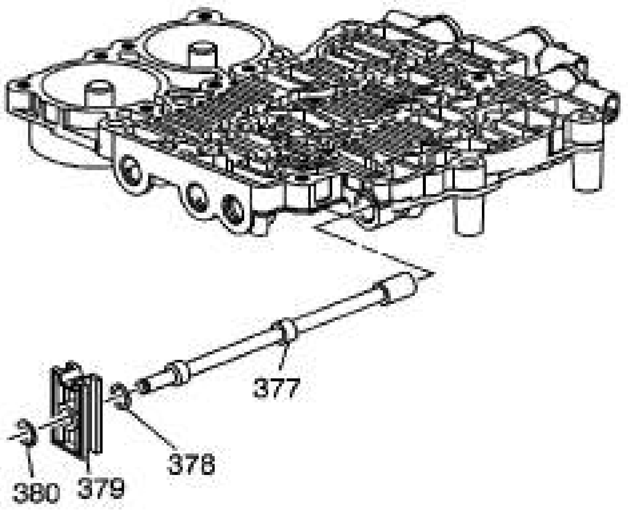


6. Install the 2-3 shift valve spring (372).
7. Install the 2-3 shift valve (371).
8. Install the 2-3 shift control valve (370).

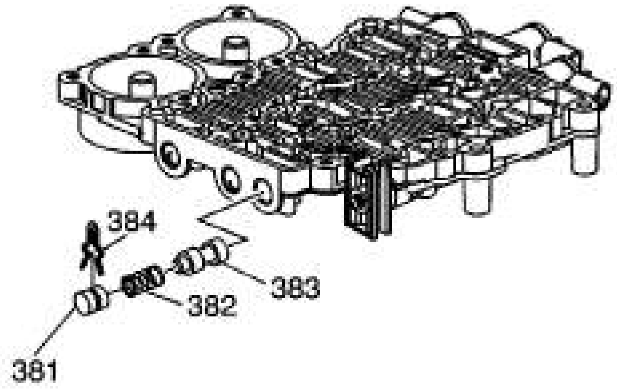
9. Install the 2-3 shift solemoid (369).
10. Install the 2-3 shift solenoid retainer (351).



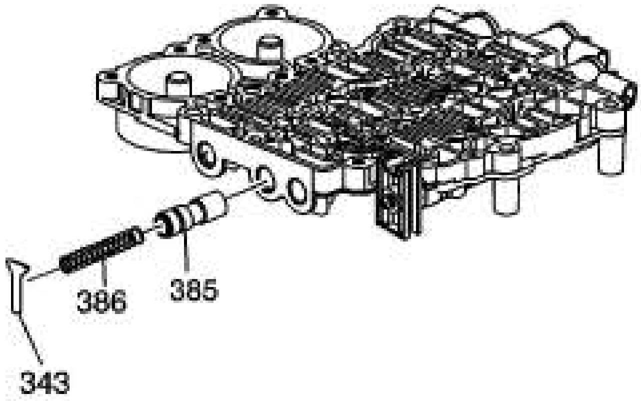
11. Install the 1-2 shift control valve (366).
12. Install the 1-2 shift control valve spring (367).
13. Install the 1-2 shift control valve retainer (343).
14. Install the 1-2 shift solenoid (368).
15. Install the 1-2 shift solenoid retainer (351).



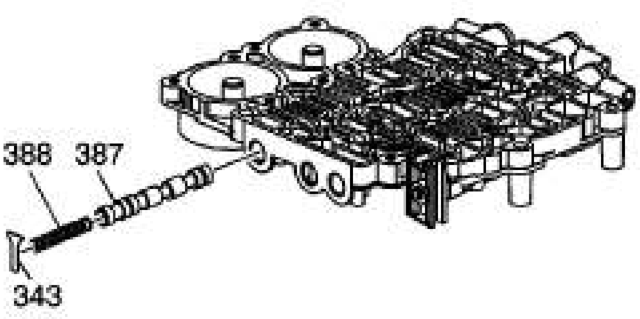
16. Install the manual valve link retainer (380).
17. Install the manual valve link (379).
18. Install the manual valve link retainer (378).
19. Install the manual valve (377).



20. Install the low pressure control valve (383).
21. Install the low pressure control valve spring (382).
22. Install the bore plug (381).
23. Install the low pressure control valve bore retainer (384).



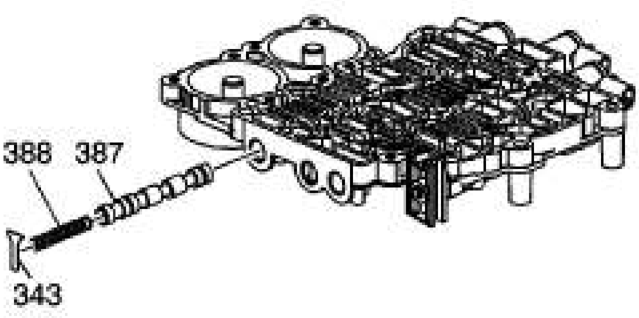
24. Install the reverse lock out valve (385).
25. Install the reverse lock out spring (386).
26. Install the reverse lock out valve retainer (343).



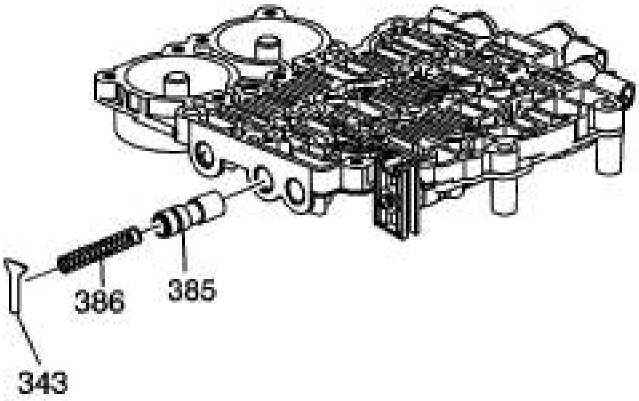
27. Install the 1-2 shift valve (387).
28. Install the 1-2 shift valve spring (388).
29. Install the 1-2 shift valve retainer (343).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 2006961**

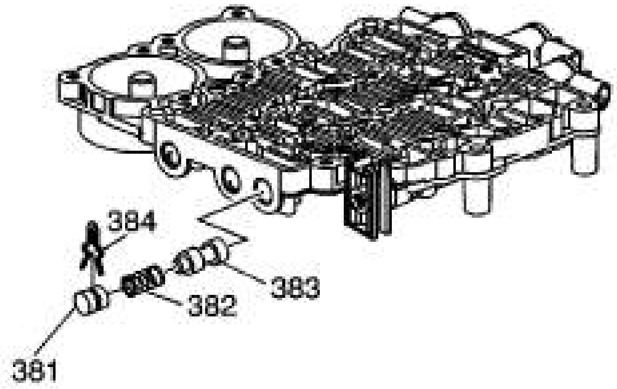
Control Valve Rear Body Disassemble



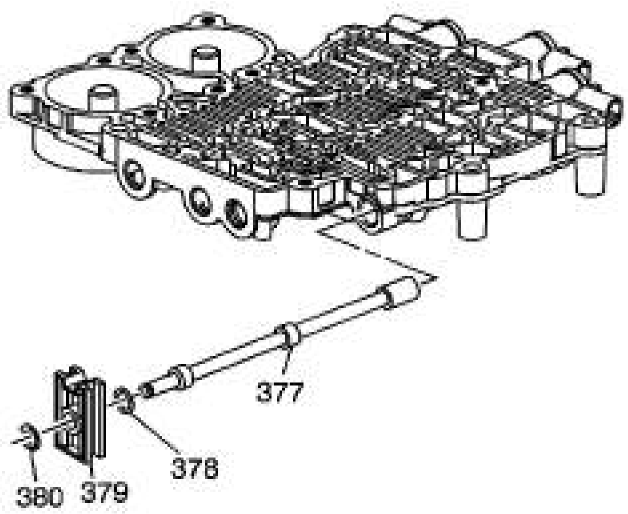
1. Remove the 1-2 shift valve retainer (343).
2. Remove the 1-2 shift valve spring (388).
3. Remove the 1-2 shift valve (387).



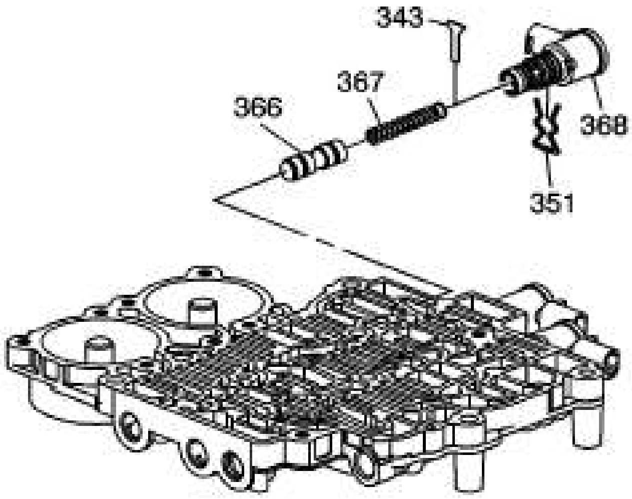
4. Remove the reverse lock out valve retainer (343).
5. Remove the reverse lock out spring (386).
6. Remove the reverse lock out valve (385).



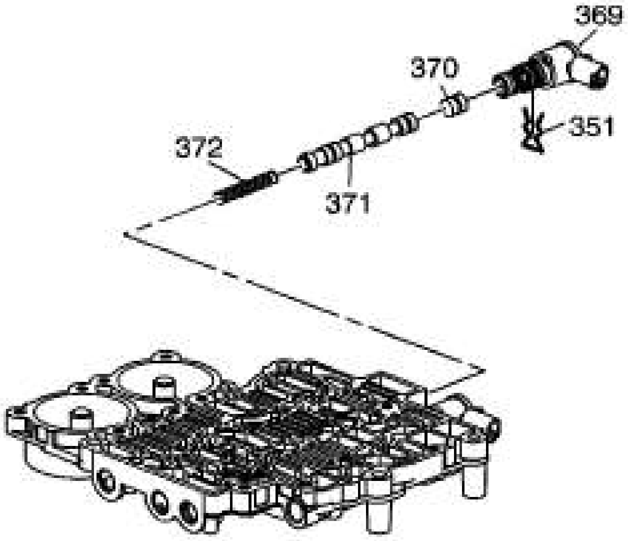
7. Remove the low pressure control valve bore retainer (384).
8. Remove the low pressure control valve bore plug (381).
9. Remove the low pressure control valve spring (382).
10. Remove the low pressure control valve (383).



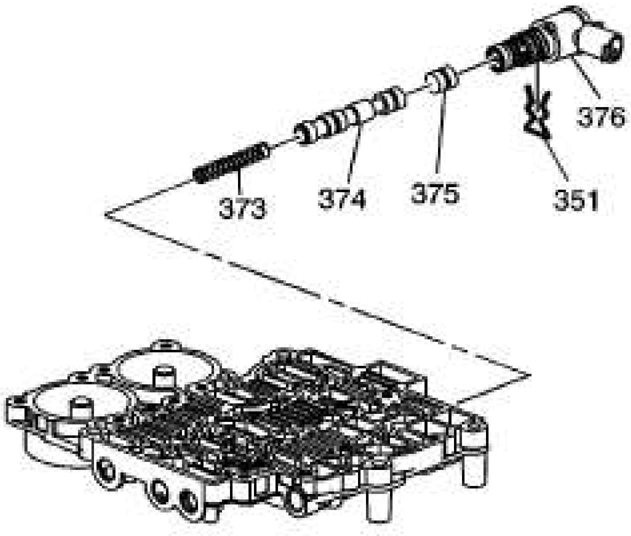
11. Remove the manual valve link retainer (380).
12. Remove the manual valve link (379).
13. Remove the manual valve link retainer (378).
14. Remove the manual valve (377).



15. Remove the 1-2 shift solenoid retainer (351).
16. Remove the 1-2 shift solenoid (368).
17. Remove the 1-2 shift control valve retainer (343).
18. Remove the 1-2 shift control valve spring (367).
19. Remove the 1-2 shift control valve (366).



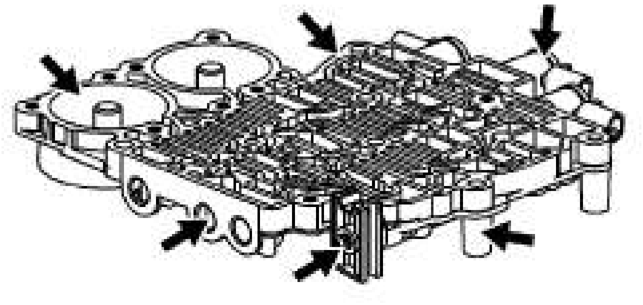
20. Remove the 2-3 shift solenoid retainer (351).
21. Remove the 2-3 shift solenoid (369).
22. Remove the 2-3 shift control valve (370).
23. Remove the 2-3 shift valve (371).
24. Remove the 2-3 shift valve spring (372).



25. Remove the 4-5 shift solenoid retainer (351).
26. Remove the 4-5 shift solenoid (376).
27. Remove the 4-5 shift control valve (375).
28. Remove the 4-5 shift valve (374).
29. Remove the 4-5 shift valve spring (373).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 2006960**

Control Valve Rear Body Inspection

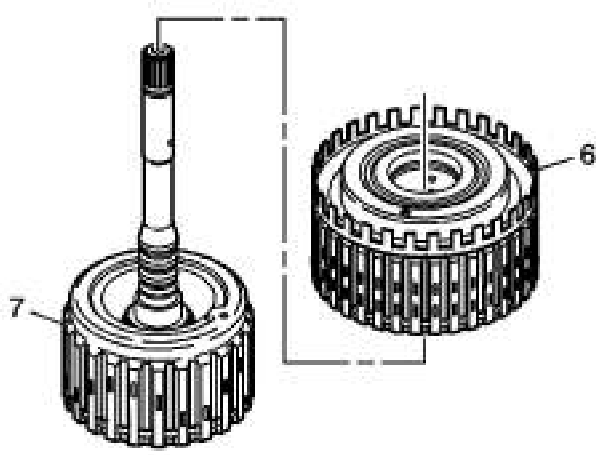


1. Inspect the rear control valve body (365) for the following conditions:
   - Damaged or porous casting
   - Damaged sealing surfaces
   - Debris in fluid passages
2. Use a suitable tool, before disassembly, to inspect the rear control valve body (365) components for the following conditions:
   - Valves binding or sticking in their bores or bushings
   - Broken missing or damaged springs
   - Missing or damaged retainers
   - Damaged solenoid valves
   - Debris in valve line ups or solenoid valves
3. During disassembly, inspect the rear control valve body for the following conditions:
   - Worn or damaged valves, valve bores or bushings
   - Broken, missing or damaged springs
   - Missing or damaged retainers
   - Damaged solenoid valves
   - Debris in valve line ups or solenoid valve

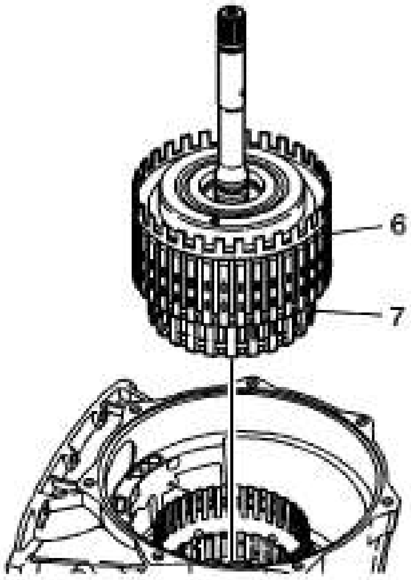
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 2006958**

Direct and Reverse and Forward and Coast Clutch Installation

Notice: Refer to General Repair Instructions in the Preface section.



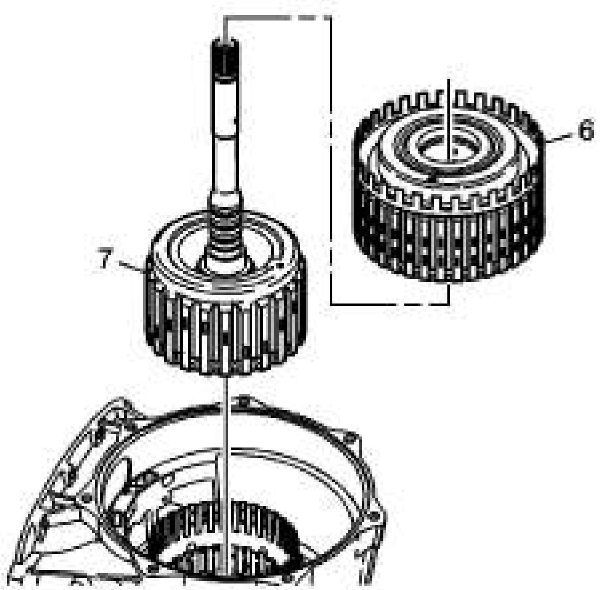
1. Place the direct and reverse clutch assembly (6) onto the forward and coast clutch assembly (7).



2. Install the direct and reverse clutch assembly (6) and the forward and coast clutch assembly (7) into the case (24).

Direct and Reverse and Forward and Coast Clutch Removal

Notice: Refer to General Repair Instructions in the Preface section.

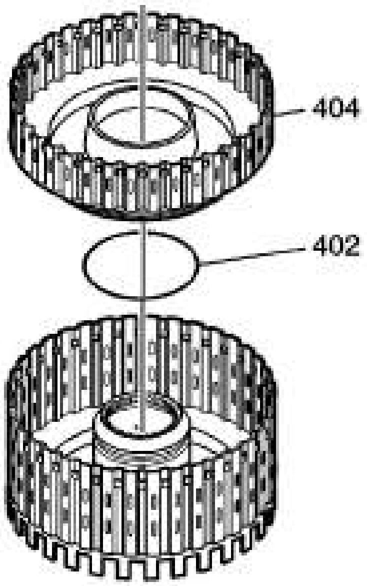


1. Remove the forward and coast clutch assembly (7) and the direct and reverse clutch assembly (6) from the case (24).
2. Remove the direct and reverse clutch assembly (6) from the forward and coast clutch assembly (7).

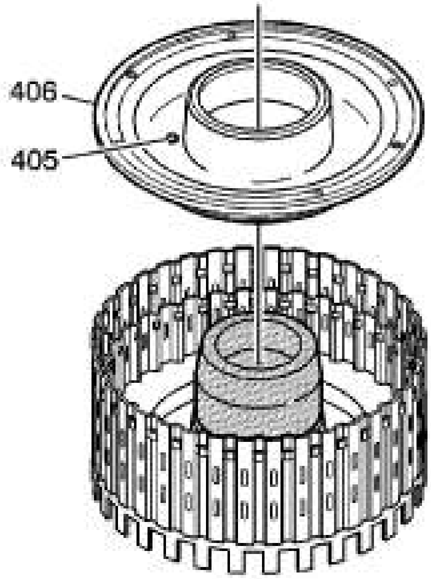
Direct and Reverse Clutch Assemble

Tools Required

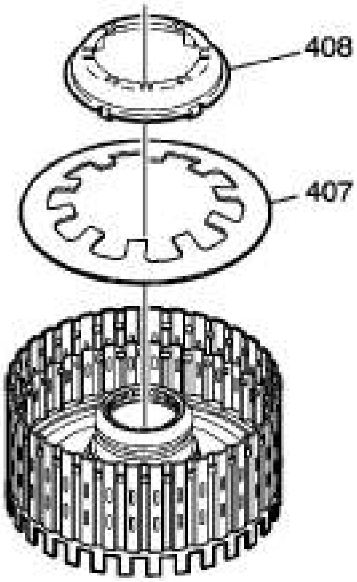
- J 38734 Intermediate Spring Compressor Adapter
- J 45133 Seal Protector
- J 45139 Compressor Plate



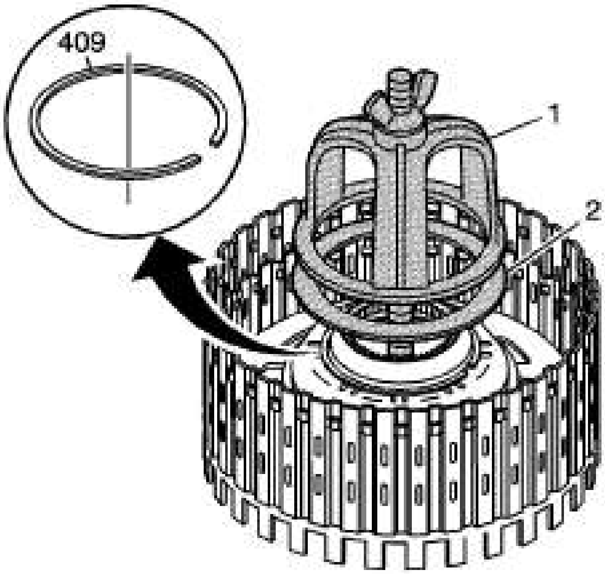
1. Inspect the reverse clutch housing for the following:
   - Plugged feed passages
   - Damaged or worn splines
   - Seal ring groove nicks or burrs
   - Cracked or blocked fluid passages
   - Damaged or worn bushing
2. Inspect the reverse clutch piston and the direct clutch piston for the following:
   - Cracks or damage to seal grooves
   - Wear on the piston
   - Inner seal damage
   - Damaged ball check valve
   - Damaged or worn clutch plates
3. Install the reverse clutch piston inner seal (402).
4. Install the reverse clutch piston (404).



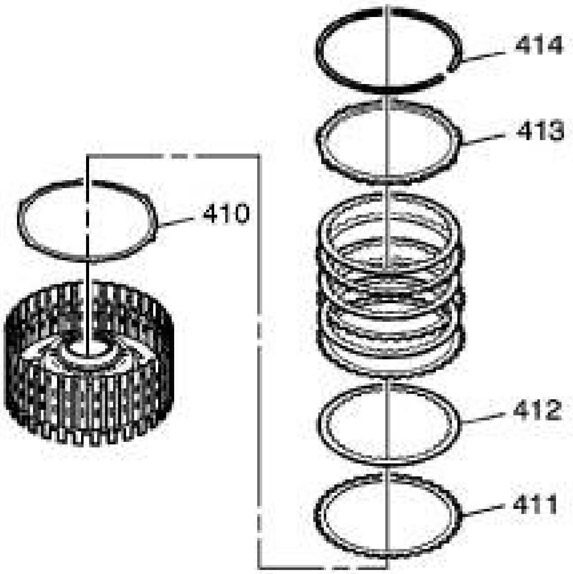
5. Install J 45133 onto the direct and reverse clutch assembly (6).
6. Install the direct clutch piston (406).



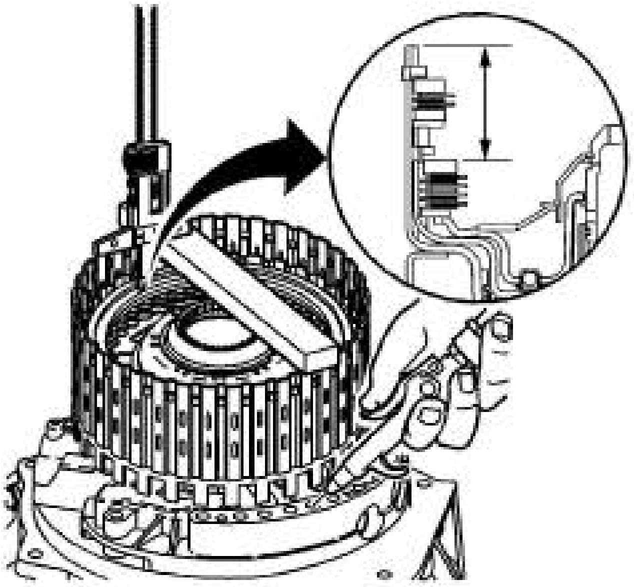
7. Install the piston spring (407).
8. Install the piston spring retainer (408).



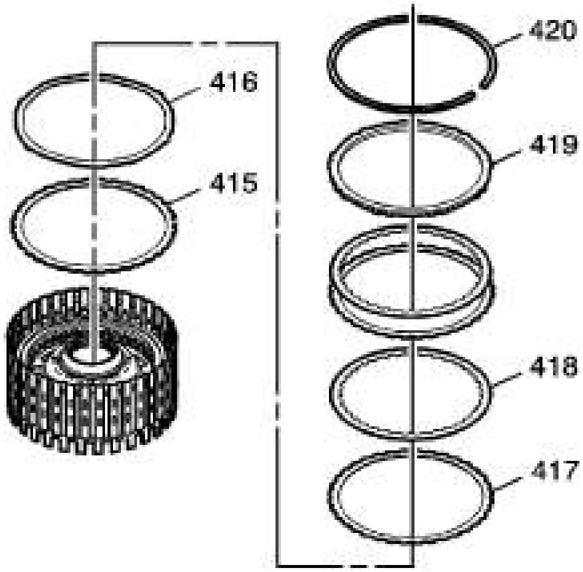
9. Use J 38734 (1) and J 45139 (2) to compress the direct and reverse piston spring.
10. Install the direct and reverse clutch spring snap ring (409).



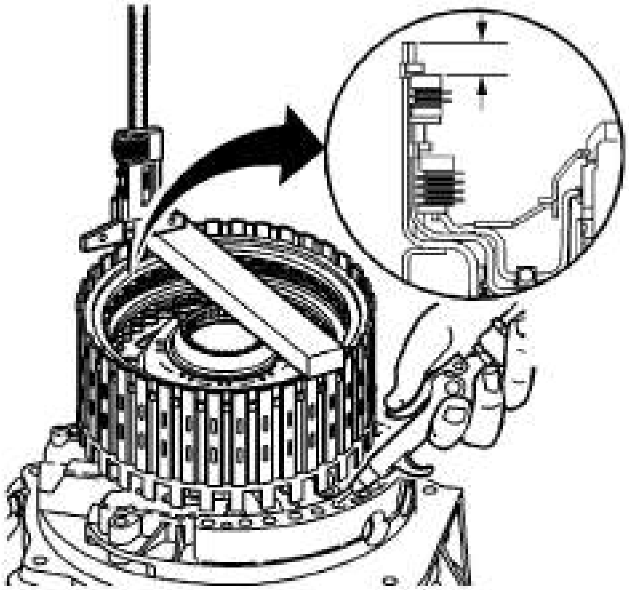
11. Install the apply plate (410).
12. Install the clutch plates (412, 411), starting with the direct clutch plate (411) with outer splines, alternating with the direct clutch plate (412) with inner splines. Refer to Clutch Plate Selection Specifications.
13. Install the backing plate (413).
14. Install the backing plate snap ring (414).



15. Measure the distance between the direct clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
16. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the direct clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
17. Subtract H2 from H1. This is the clutch pack travel. Refer to Clutch Piston Travel Specifications.



18. Install the reverse clutch spacer (415).
19. Install the apply plate (416).
20. Install the clutch plates (417 and 418), starting with clutch plates (417) with outer splines, alternating with clutch plates (418) with inner splines. Refer to Clutch Plate Selection Specifications.
21. Install the reverse clutch backing plate (419).
22. Install the reverse clutch backing plate snap ring (420).

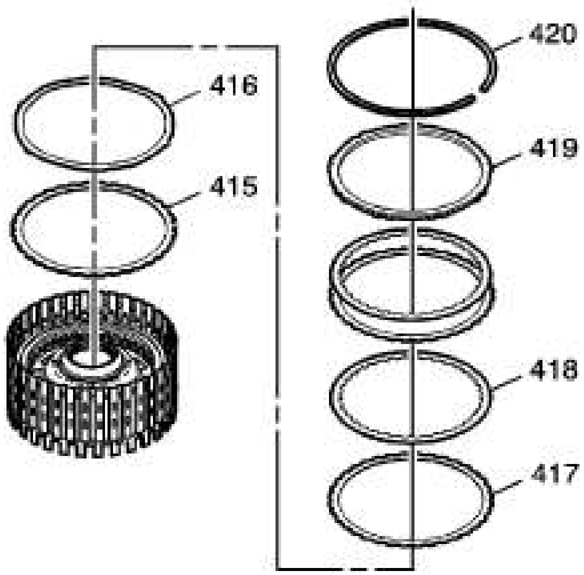


23. Measure the distance between the reverse clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
24. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the reverse clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
25. Subtract H2 from H1 this is the clutch pack travel. Refer to Clutch Piston Travel Specifications.

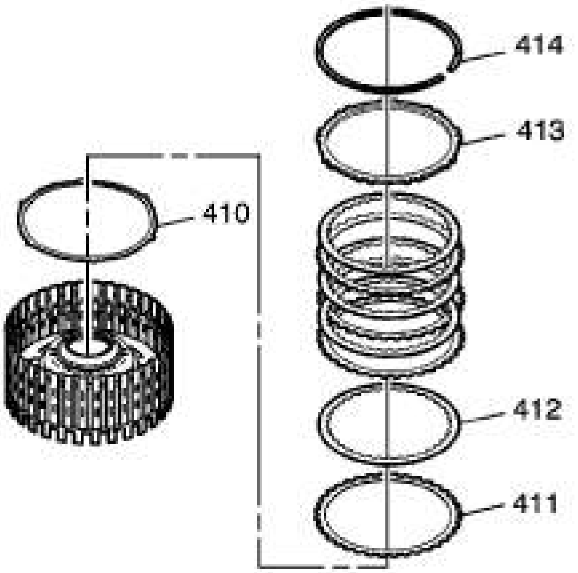
Direct and Reverse Clutch Disassemble

Tools Required

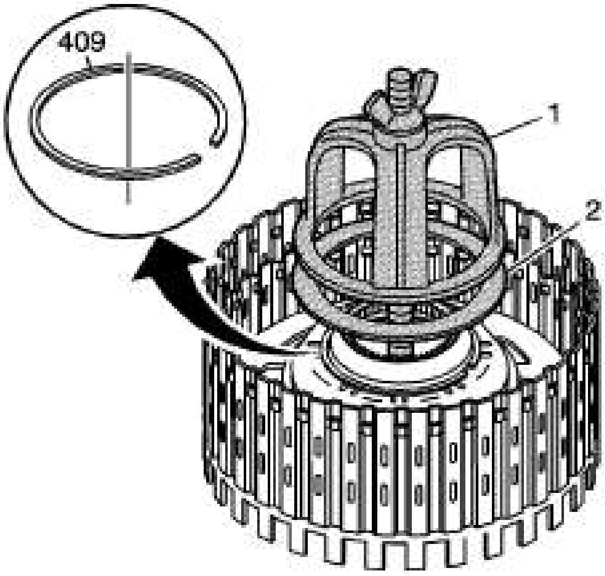
- J 38734 Intermediate Spring Compressor Adapter
- J 45139 Compressor Plate



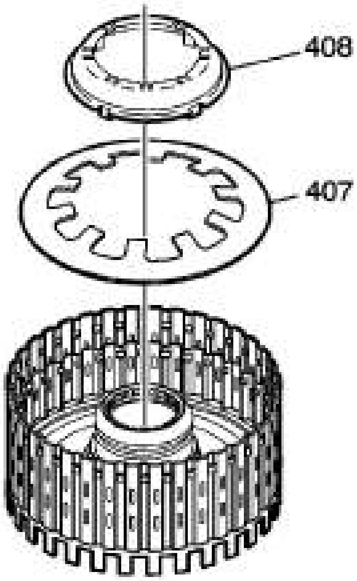
1. Remove the reverse clutch backing plate snap ring (420).
2. Remove the backing plate (419).
3. Remove the clutch plates (418 and 417). Refer to Clutch Plate Selection Specifications.
4. Remove the apply plate (416).
5. Remove the reverse clutch spacer (415).



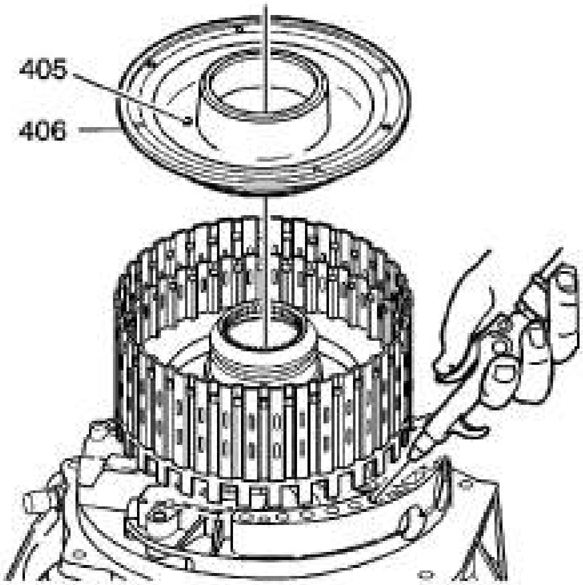
6. Remove the direct clutch backing plate snap ring (414).
7. Remove the backing plate (413).
8. Remove the clutch plates (412 and 411). Refer to Clutch Plate Selection Specifications.
9. Remove the apply plate (410).



10. Use J 38734 and J 45139 to compress the direct and reverse piston spring (407).
11. Remove the direct and reverse clutch spring snap ring (409).
12. Remove J 38734 and J 45139 .

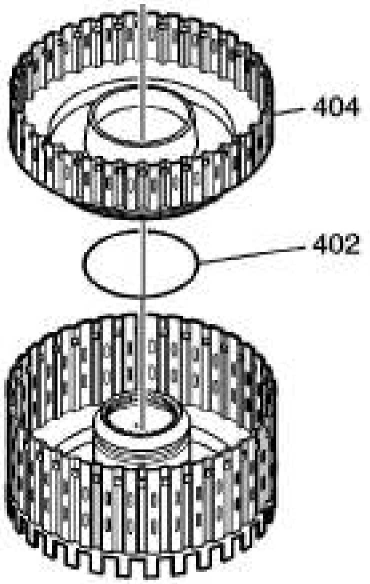


13. Remove the spring retainer (408).
14. Remove the spring (407).



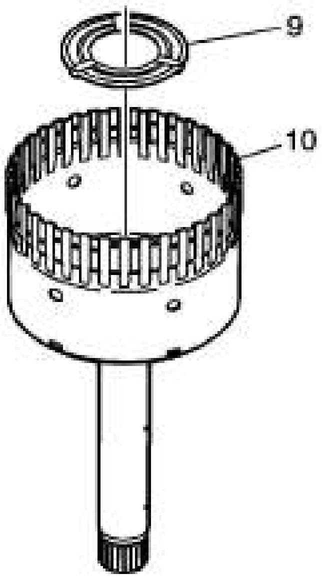
Important: It may be necessary to use air pressure to remove the piston.

15. Remove the direct clutch piston (406).

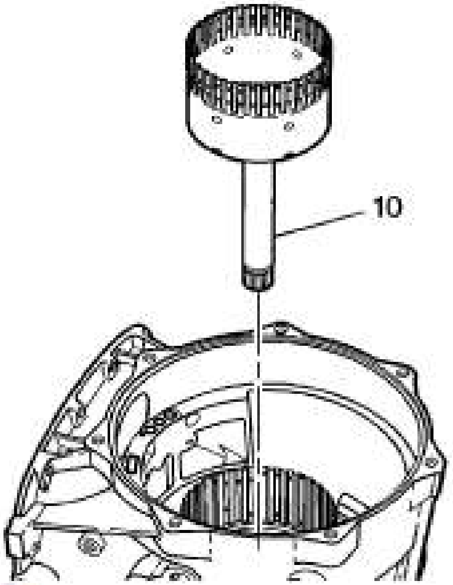


16. Remove the reverse clutch piston (404).
17. Remove the reverse clutch piston inner seal (402).

Direct Clutch Hub Assemble

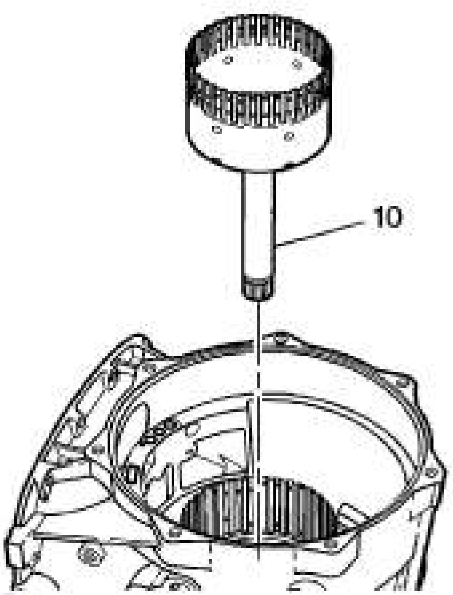


1. Inspect the housing for the following:
   - Damaged or worn splines
   - Damaged or worn bushings
   - Wear, cracks and scoring on the shaft
2. Install the direct clutch hub thrust washer (9) into the housing (10).



3. Install the direct clutch hub housing (10) into the case.

Direct Clutch Hub Removal

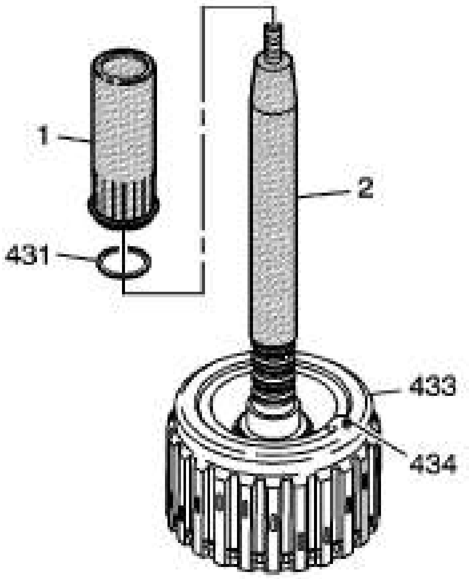


Remove the direct clutch hub assembly (10) from the case.

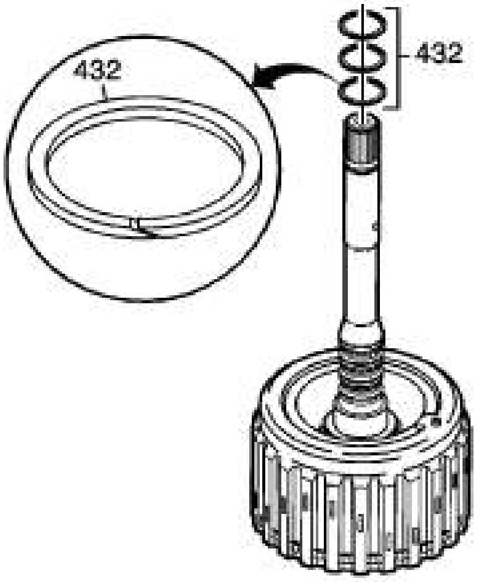
Forward and Coast Clutch Assemble

Tools Required

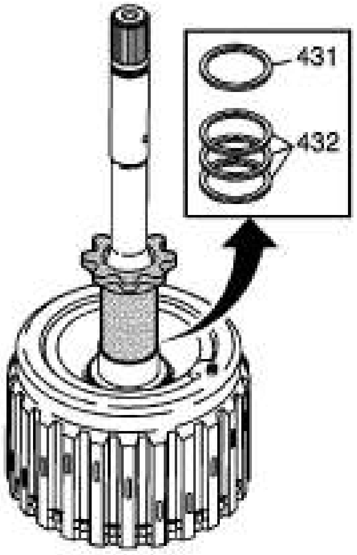
- J 43074 Forward Clutch Piston Spring Compressor
- J 45130-1 Seal Installer Sizer
- J 45130-2 Seal Installer Pusher
- J 45130-3 Seal Protector
- J 45132 Seal Protector
- J 45134 Seal Protector



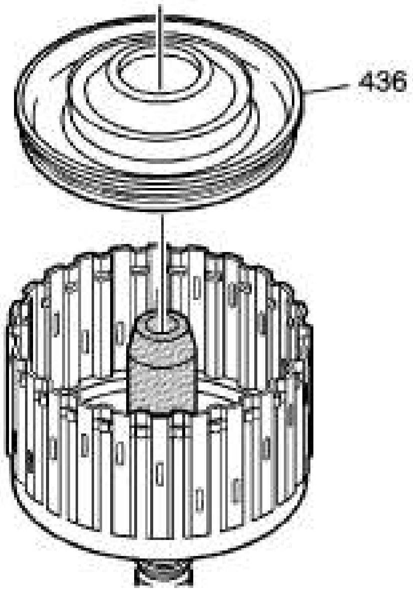
1. Inspect the forward clutch housing (433) for the following:
    - Plugged feed passages
    - Damaged ball check valve (434)
    - Damaged or worn splines
    - Seal ring groove nicks or burrs
    - Cracked or blocked fluid passages in the input shaft
    - Damaged or worn clutch plates
2. Inspect the input shaft fluid seals (431, 432) for damaged or worn seals.
3. Slide J 45130-3 (2) over the input shaft, and position J 45130-3 (2) at the seal groove closest to the housing. Coat J 45130-3 (2) with transmission fluid.
4. Guide a NEW seal (431) onto J 45130-3 (2) and slide the seal into the groove with J 45130-2 (1).



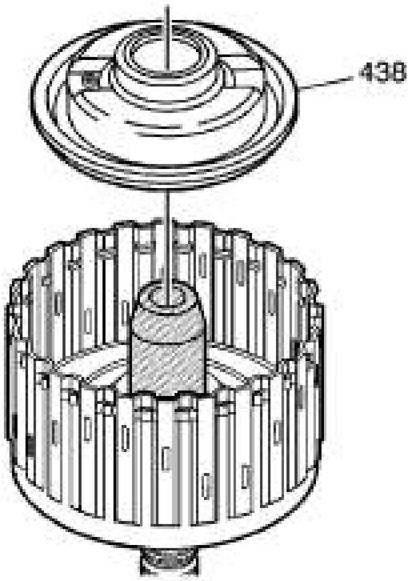
5. Remove J 45130-3 (2).
6. Install the input shaft fluid seals (432).



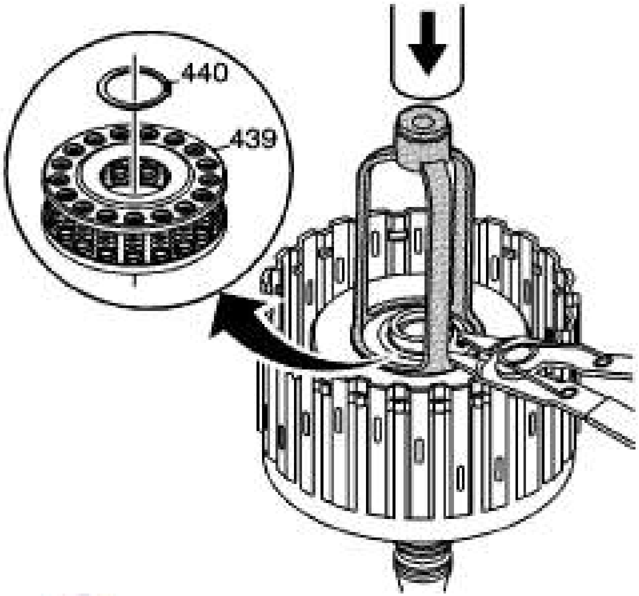
7. Size the seals (431, 432) with J 45130-1 .
8. Leave J 45130-1 in place for at least five minutes. If possible, leave J 45130-1 in place until you install the assembly into the transmission case.



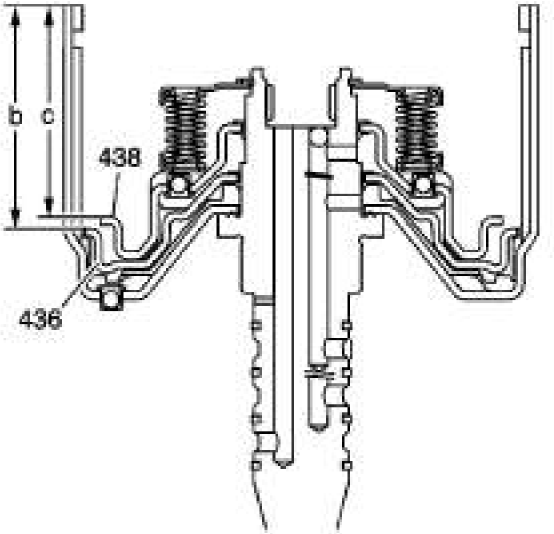
9. Inspect the forward piston and the coast clutch piston for the following:
    - Cracks or damage to seal grooves
    - Wear on the piston
    - Damaged or worn clutch plates
10. Use J 45134 to install the forward clutch piston (436).



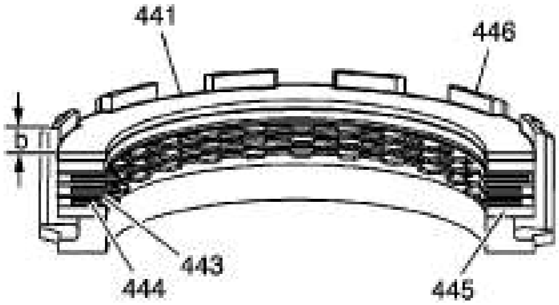
11. Use J 45132 to install the coast clutch piston (438).



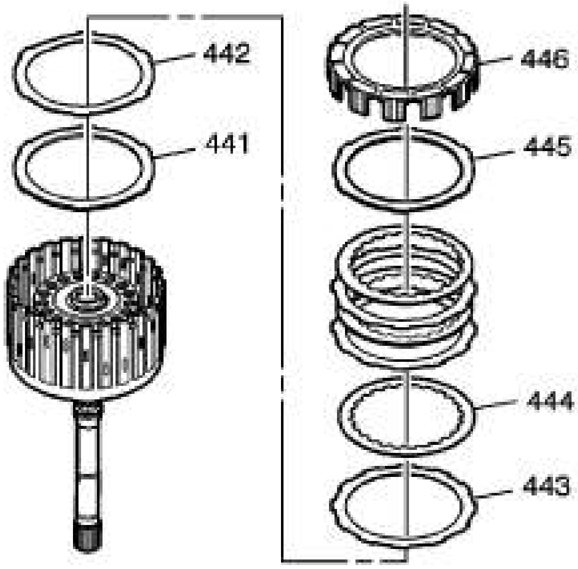
12. Inspect the forward and coast clutch piston spring for the following:
    - Damaged cage
    - Distorted or missing springs
13. Install the piston spring (439).
14. Use J 43074 to compress the spring and install the snap ring (440).



15. Measure the distance from the top of the forward clutch housing to the coast clutch piston (438), record this as dimension C.
16. Measure the distance from the top of the forward clutch housing to the forward clutch piston (436), record this as dimension B.
17. Subtract dimension C from dimension B. This is now dimension A.

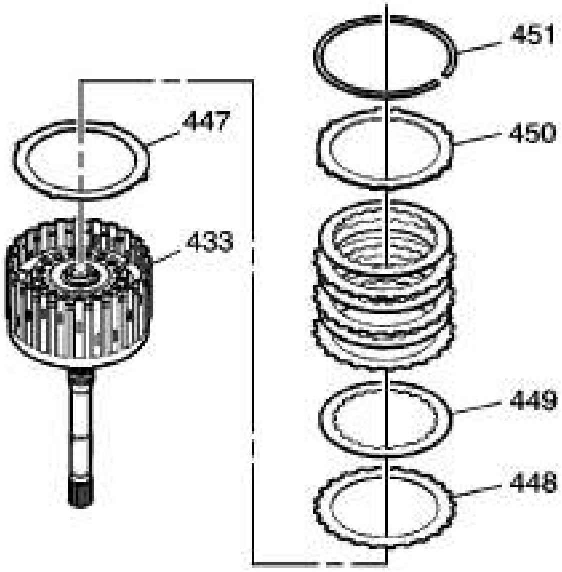


18. Install the coast clutch backing plate (445) into the coast clutch housing (446).
19. Install the coast clutch plates into the coast clutch housing (446). Starting with the coast clutch plate (443) with outer splines. Alternating with the coast clutch plate (444) with inner splines. Refer to Clutch Plate Selection Specifications.
20. Install the coast clutch apply plate into the coast clutch housing (446).
21. Install the coast clutch spacer plate (441) into the coast clutch housing (446).
22. Measure the distance from the top of the coast clutch housing (446) to the top of the coast clutch spacer plate (441), record this as dimension B.
23. Subtract dimension B from dimension A, this is clutch pack travel.

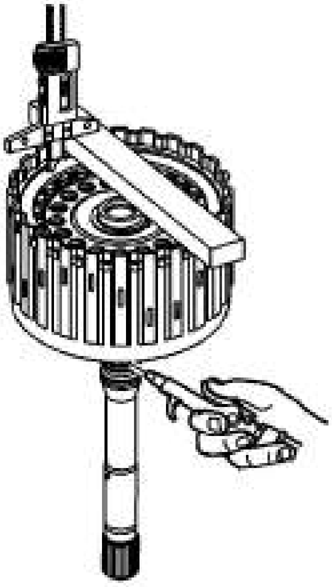


24. Install the coast clutch spacer plate (441).
25. Install the coast clutch apply plate (442).
26. Install the coast clutch plates. Starting with the coast clutch plate (443) with the outer splines. Refer to Clutch Plate Selection Specifications.
27. Alternating with the coast clutch plate (444) with inner splines.

28. Install the coast clutch backing plate (444).
29. Install the coast clutch housing (446).



30. Install the forward clutch apply plate (447).
31. Install the forward clutch plates. Starting with the forward clutch plate (448) with outer splines. Alternating with the forward clutch plate (449) with inner splines. Refer to Clutch Plate Selection Specifications.
32. Install the forward clutch backing plate (450).
33. Install the forward clutch backing plate snap ring (451).



34. Measure the distance between the forward clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
35. Apply air pressure to the specified port. Measure the distance between the forward clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
36. Subtract H2 from H1 this is the clutch pack travel. Refer to Clutch Piston Travel

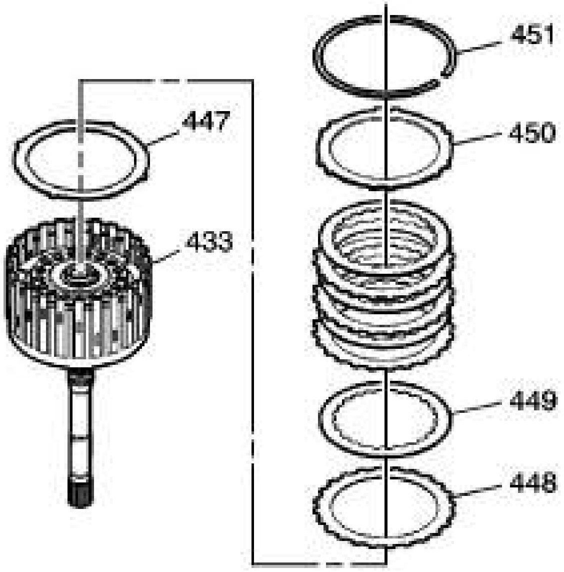
Specifications.

37. At this time you do not install the forward and coast clutch assembly into the transmission case. Set aside until told to do so.

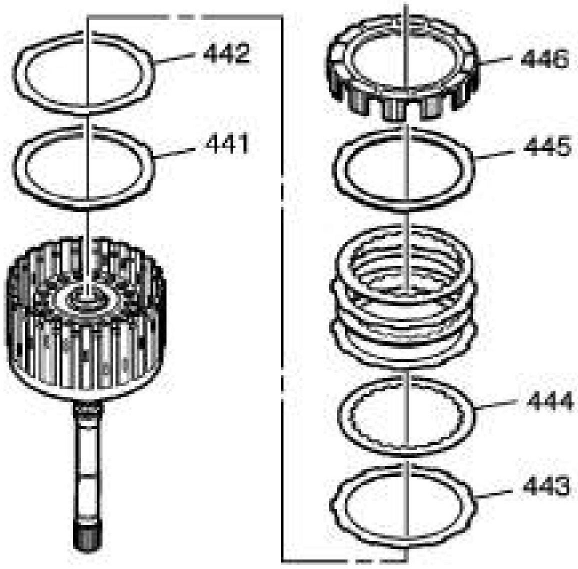
Forward and Coast Clutch Disassemble

Tools Required

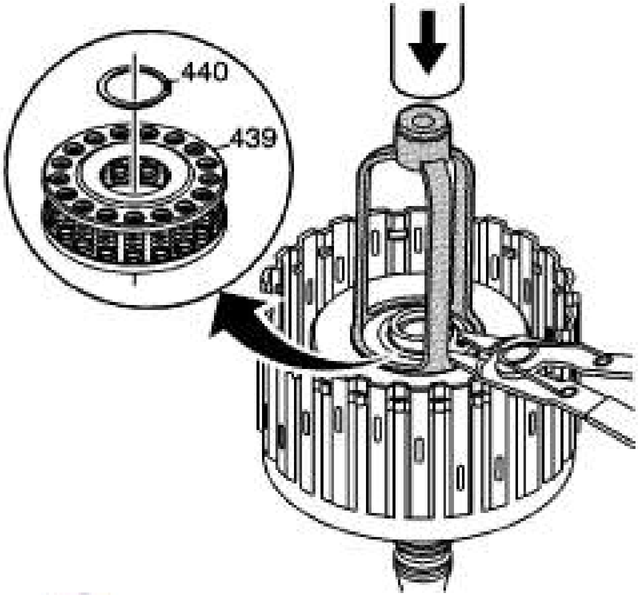
J 43074 Forward Clutch Piston Spring Compressor



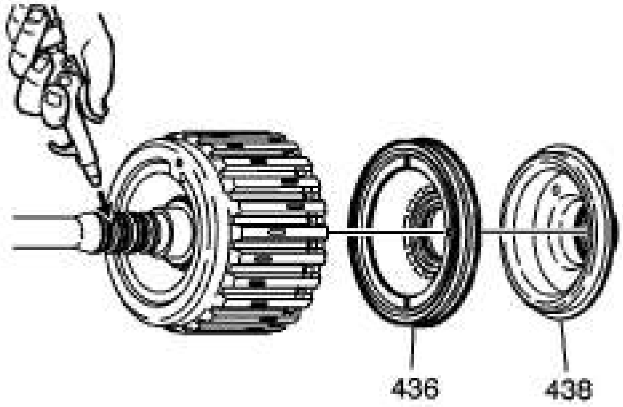
1. Remove the forward clutch backing plate retainer ring (451).
2. Remove the forward clutch backing plate (450).
3. Remove the forward clutch plates (448 and 449). Refer to Clutch Plate Selection Specifications.
4. Remove the forward apply plate (447).



5. Remove the coast clutch housing (446).
6. Remove the coast backing plate (445).
7. Remove the coast clutch plates (443, 444). Refer to Clutch Plate Selection Specifications.
8. Remove the coast apply plate (442).
9. Remove the coast clutch spacer plate (441).

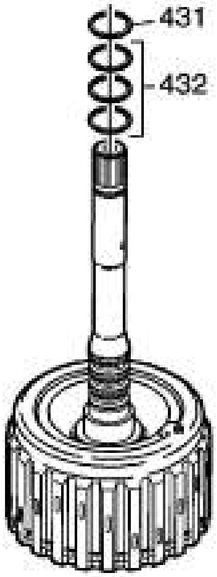


10. Use the J 43074 to compress the forward and coast clutch spring (439).
11. Remove the snap ring (440).
12. Remove J 43074 .
13. Remove the clutch spring (439).



Important: It may be necessary to apply air pressure to remove the piston.

14. Remove the coast clutch piston (438).
15. Remove the forward clutch piston (436).

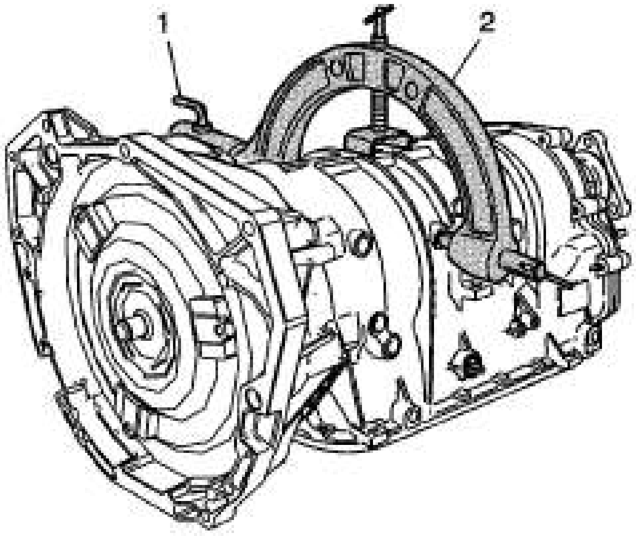


16. Remove the input shaft fluid seal (431).
17. Remove the input shaft fluid seals (432).

Holding Fixture Installation

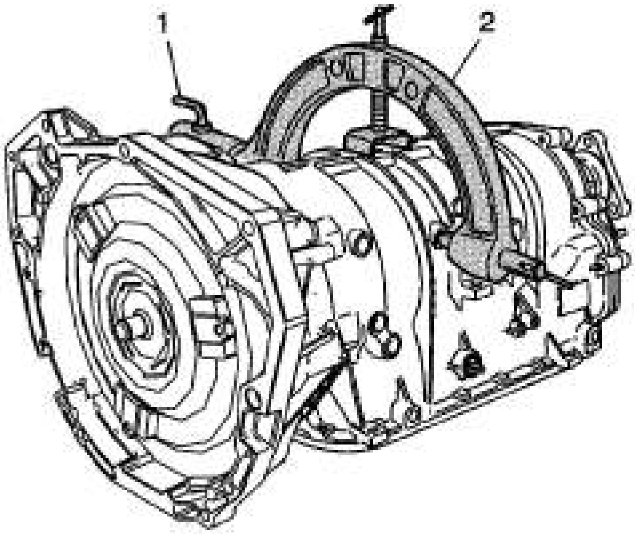
Tools Required

J 8763-B Holding Fixture and Base



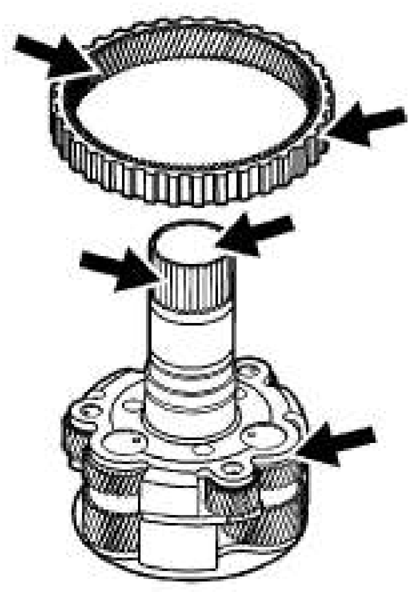
1. Install the J 8763-B onto the transmission.
2. Install the transmission onto the holding fixture tool base and use the pin to lock the holding fixture in place.

Holding Fixture Removal

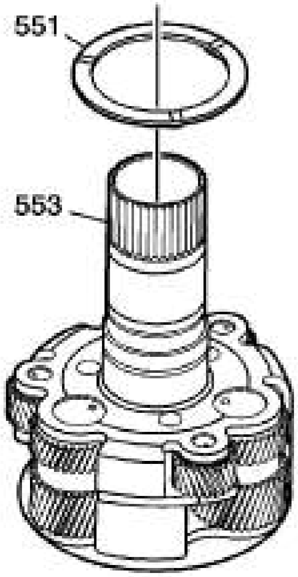


Remove J 8763-B from the transmission.

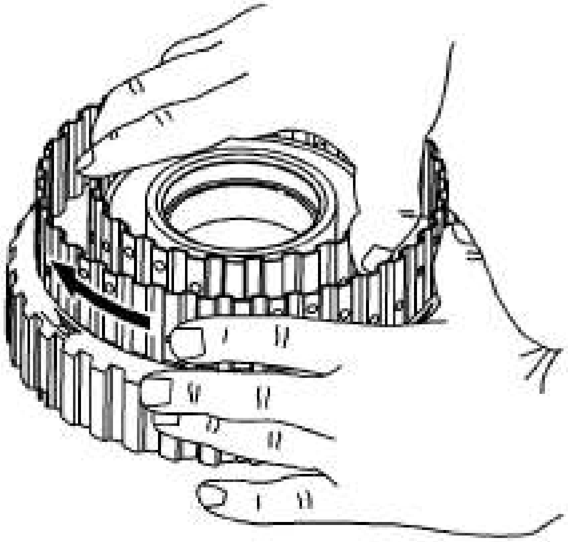
Input and Reaction Carrier Assemble



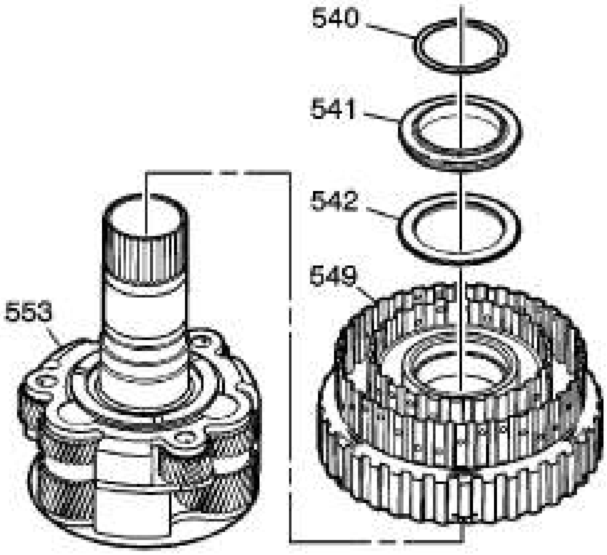
1. Inspect the reaction internal gear and the 2nd clutch sprag for the following:
   - Damaged or worn gear teeth
   - Damaged or worn splines
2. Inspect the input and reaction carrier for the following:
   - Damaged or worn teeth
   - Damaged or worn splines
   - Damaged or worn bushings
   - Damaged or worn bearings



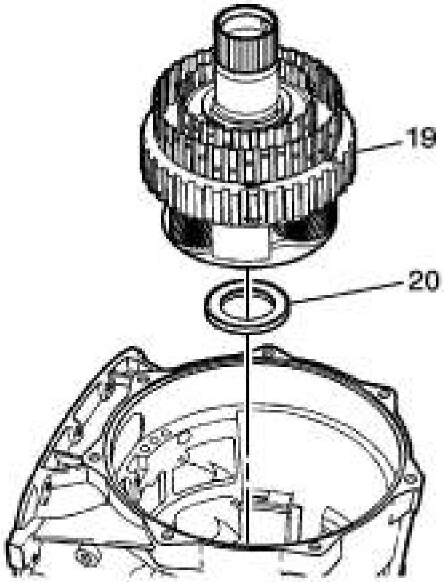
3. Using lubricant install the reaction internal gear flange washer (551).



4. Check that the 2nd clutch sprag rotation freewheels and locks up in the correct direction.



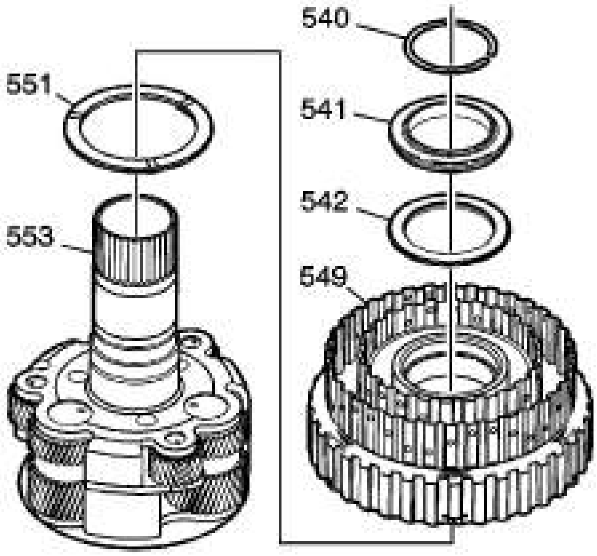
5. Install the 2nd clutch sprag (549) onto the input and reaction carrier (553).
6. Install the 2nd clutch roller inner race bearing (542).
7. Install the input and reaction bearing (541).
8. Install the input and reaction carrier snap ring (540) .



9. Install the input and reaction carrier thrust bearing (20) into the case.
10. Install the input and reaction carrier assembly (19) into the case.

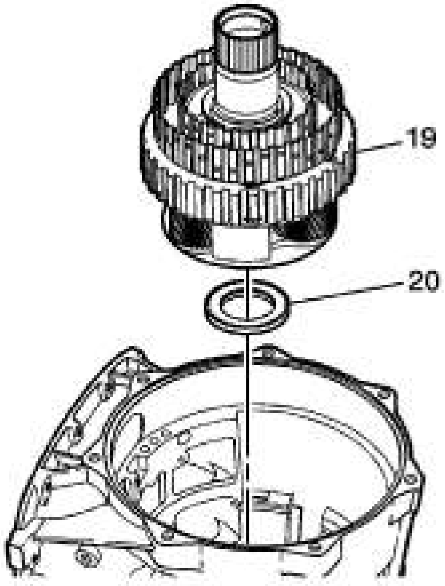
Input and Reaction Carrier Disassemble

Caution: Refer to General Repair Instructions in the Preface section.



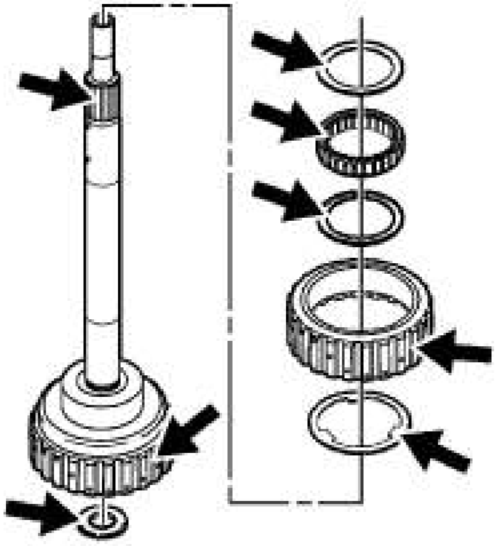
1. Remove the snap ring (540).
2. Remove the input and reaction bearing (541).
3. Remove the 2nd clutch roller inner race bearing (542).
4. Remove the 2nd clutch sprag (549).
5. Remove the reaction internal gear flange washer (551).

Input and Reaction Carrier Removal

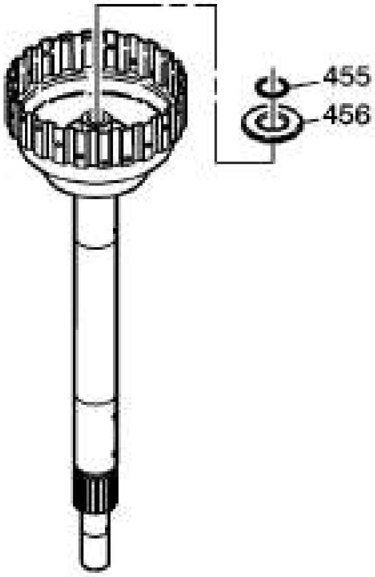


1. Remove the input and reaction carrier (19) from the case.
2. Remove the input and reaction carrier thrust bearing (20) from the case.

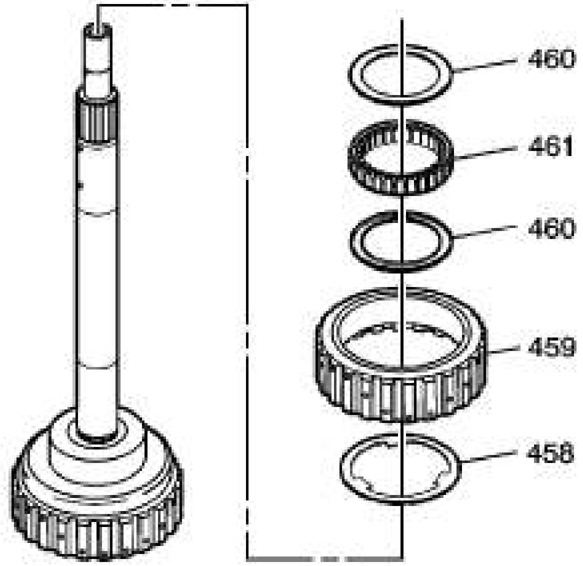
Input Sun Gear Shaft Assemble



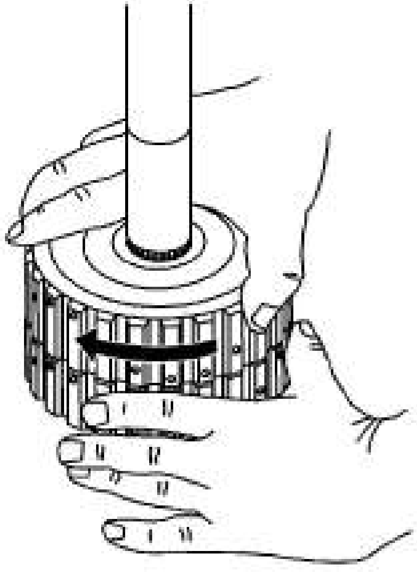
1. Inspect the outer race and input shaft for the following:
   - Damaged or worn splines
   - Scoring inside the diameter of the race
   - Wear or cracks
2. Inspect the sprag elements for flat spots.
3. Inspect the bearing cage for distortion or broken ribbon tabs.
4. Inspect the inner bearing for cracks.



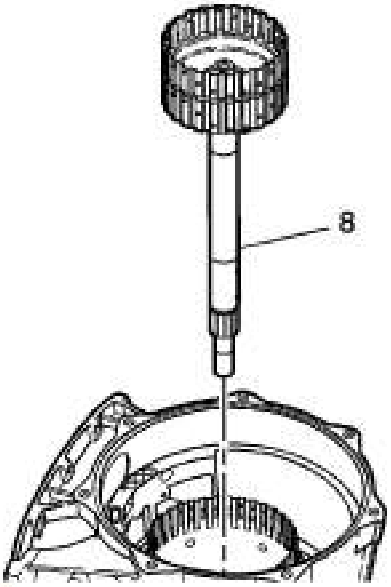
5. Install the inner roller bearing (456).
6. Install the NEW inner race thrust ring (455).



7. Install the outer race washer (458) onto the outer race (459).
8. Install the rataining rings (460) and the forward clutch sprag (461) onto the outer race (459).
9. Install the sprag assembly (460, 461 and 459) onto the sun gear shaft (457).



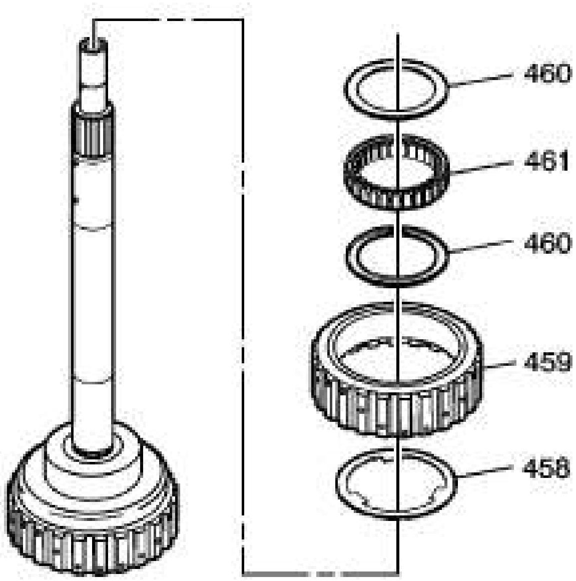
10. Check that the forward clutch sprag rotation freewheels and locks up in the correct direction.



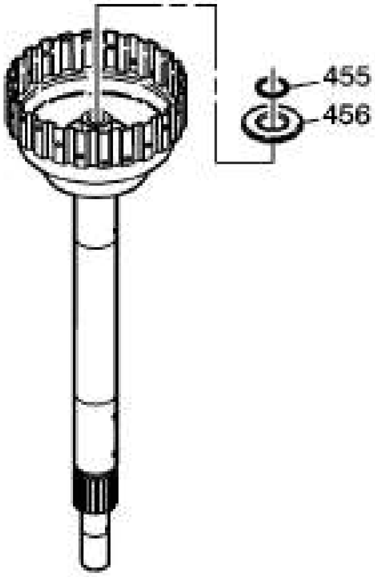
11. Install the input sun gear shaft (8) into the case (24).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 1977461**

Input Sun Gear Shaft Disassemble

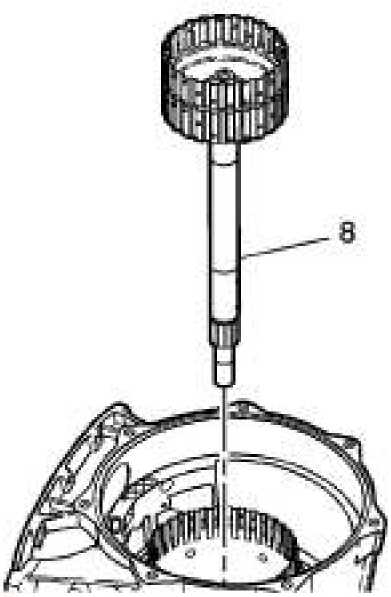


1. Remove the forward clutch sprag outer race (459).
2. Remove the forward clutch outer race washer (458).
3. Remove the forward clutch sprag assembly retaining rings (460).
4. Remove the forward clutch sprag (461).



5. Remove the forward clutch roller inner race thrust ring (455).
6. Remove the inner bearing (456).

Input Sun Gear Shaft Removal

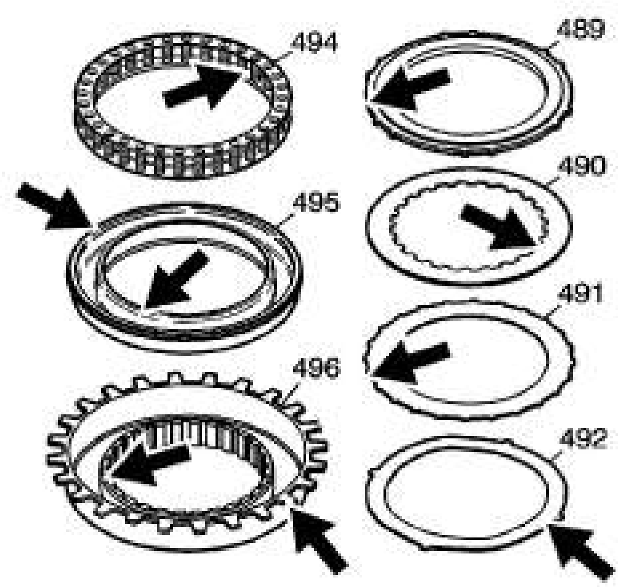


Remove the input sun gear shaft (8) from the case.

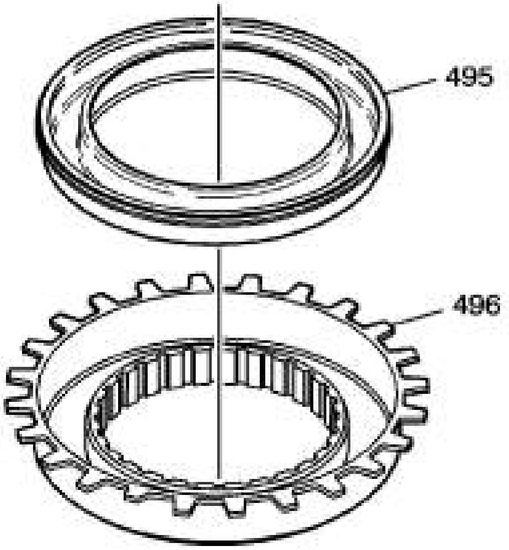
Intermediate and Overdrive and Reverse Clutch Hub Assemble

Tools Required

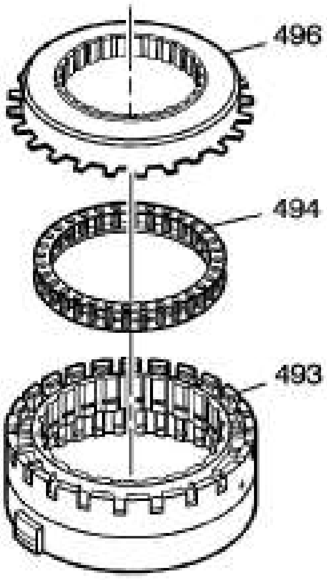
- J 23327 Clutch Spring Compressor
- J 44764 Clutch Spring Compressor
- J 45126 Snap Ring Pliers
- J 45135 Seal Protector



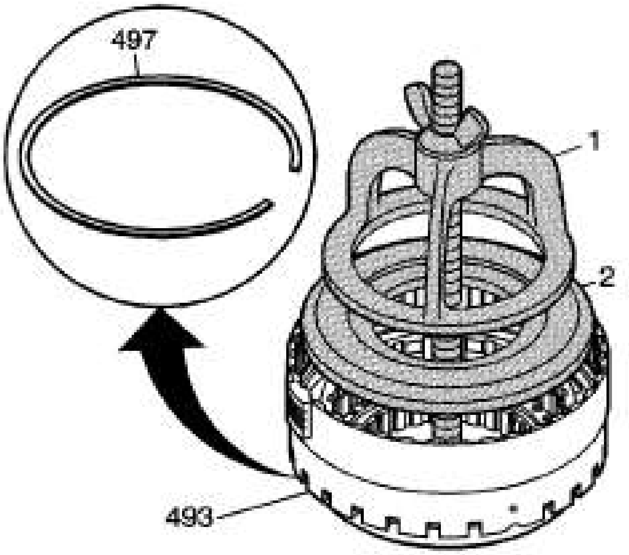
1. Inspect the housing for the following:
   - Plugged feed passages
   - Damaged or worn splines
   - Damaged or worn springs
   - Damaged or worn pistons
   - Damaged or worn clutch plates



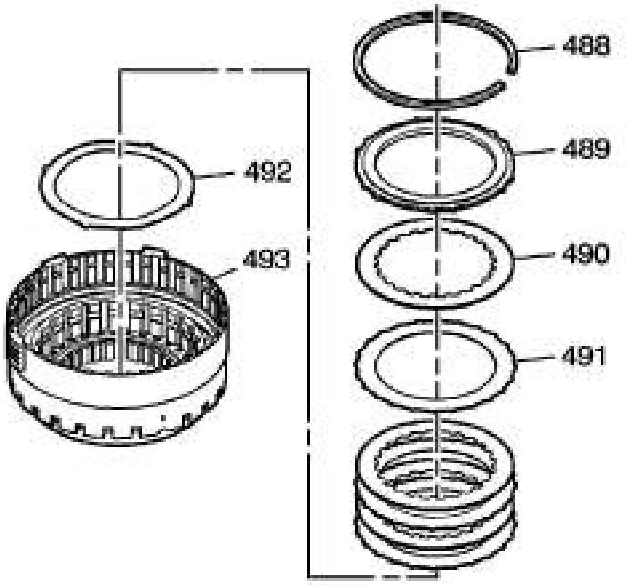
2. Install the intermediate piston (495) into the intermediate clutch housing (496).



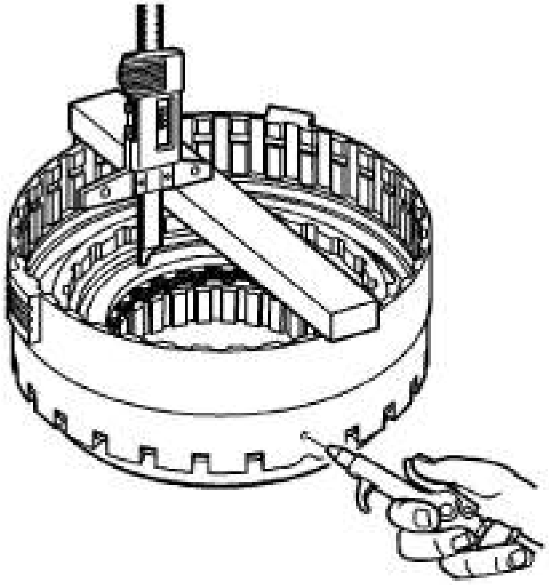
3. Install the intermediate clutch spring (494).
4. Install the intermediate housing (496).



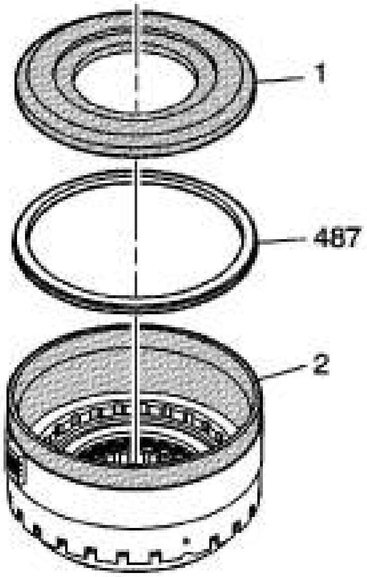
5. Use J 44764 and J 23327 to compress the housing.
6. Install the intermediate clutch housing snap ring (497).
7. Remove J 44764 and J 23327 .



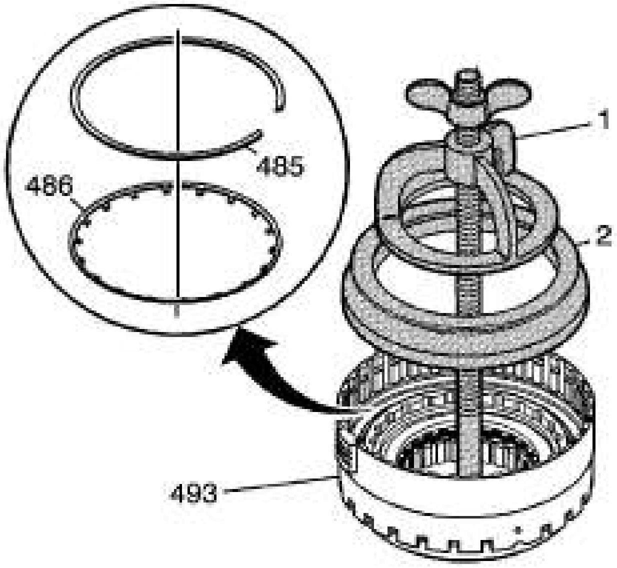
8. Install the intermediate apply plate (492).
9. Install the intermediate clutch plates. Starting with the intermediate clutch plates (491) with external splines. Alternating with the intermediate clutch plates (490) internal splines. Refer to Clutch Plate Selection Specifications.
10. Install the backing plate (489).
11. Install the intermediate backing plate snap ring (488).



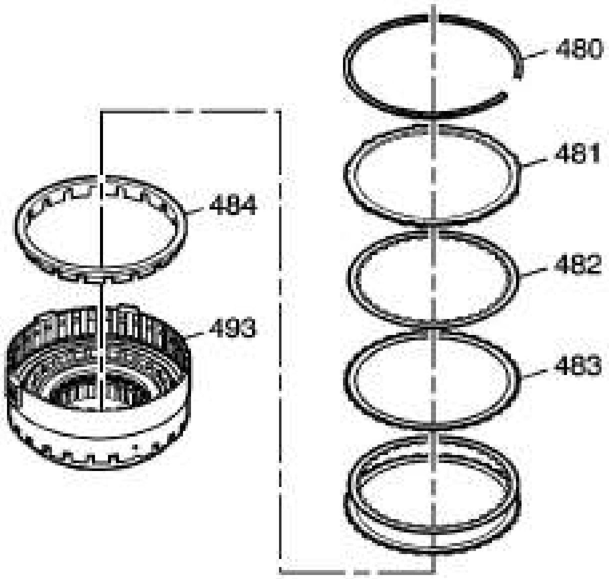
12. Measure the distance between the intermediate clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
13. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the intermediate clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
14. Subtract H2 from H1 this is the clutch pack travel. Refer to Clutch Piston Travel Specifications.



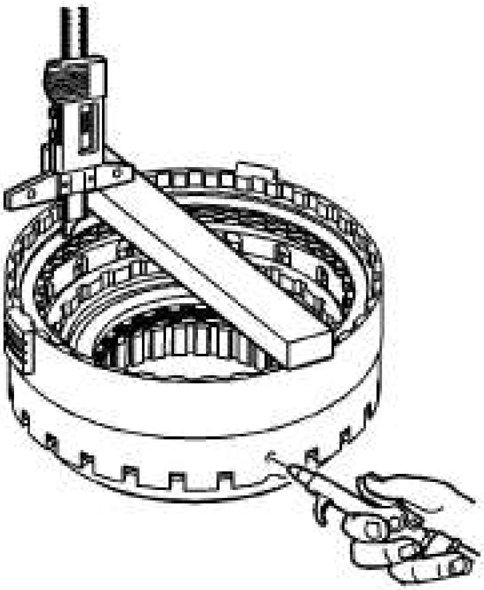
15. Use J 45135 (2) and J 44764 (1) to install the overdrive piston (487).



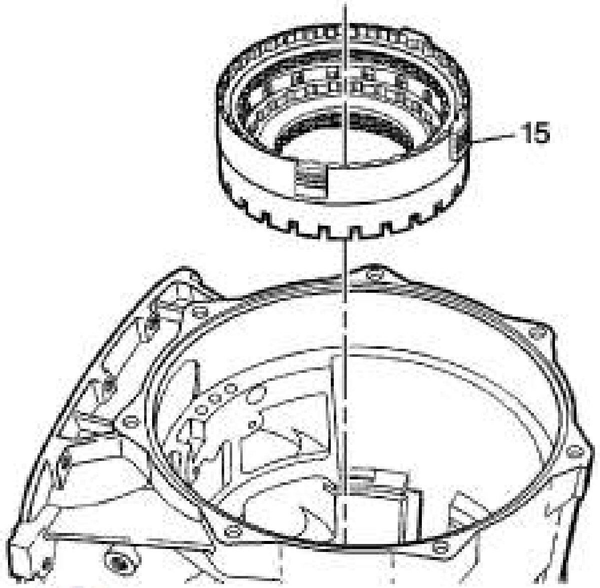
16. Install the overdrive piston spring (486).
17. Use J 44764 and J 23327 to compress the overdrive clutch piston spring (486).
18. Install the overdrive clutch spring snap ring (485).
19. Remove J 44764 and J 23327 .



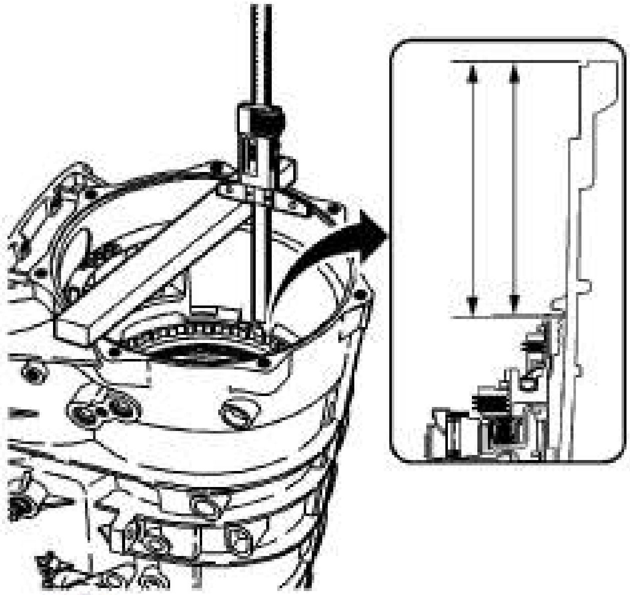
20. Install the overdrive clutch spacer (484).
21. Install the overdrive clutch plates. Starting with the overdrive clutch plates (483) with external splines. Alternating with the overdrive clutch plates (482) with internal splines. Refer to Clutch Plate Selection Specifications.
22. Install the overdrive backing plate (481).
23. Install the overdrive clutch retainer ring (480).



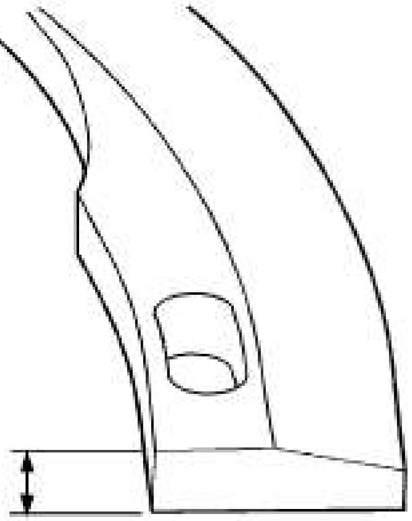
24. Measure the distance between the overdrive clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H1.
25. Apply 65 PSI (448.17 kPa) of air pressure to the specified port. Measure the distance between the overdrive clutch backing plate and the bottom of the gage bar. Measure three times in different locations on the backing plate. Record this as H2.
26. Subtract H2 from H1 this is the clutch pack travel. Refer to Clutch Piston Travel Specifications.



27. Install the overdrive clutch housing (15) into the case.

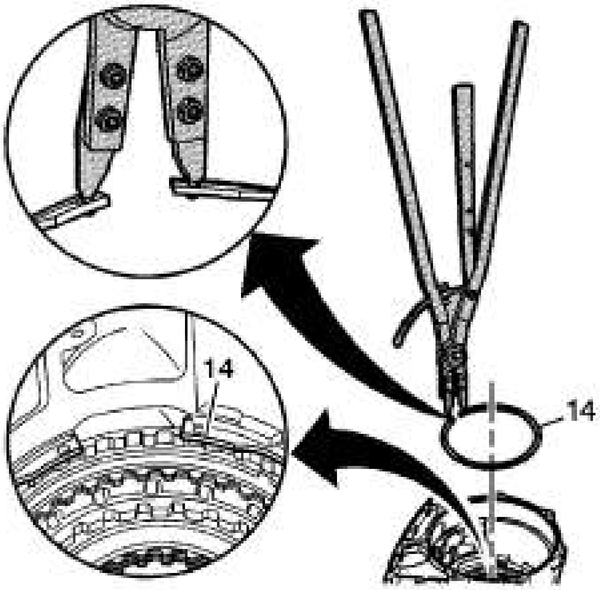


28. Measure the distance from the bottom of the gauge bar to the top of the overdrive and intermediate clutch. Record this as M1.
29. Measure the distance from the bottom of the gage Bar to the bottom of the intermediate and overdrive retainer ring groove in the case. Record this as M2.
30. Subtract M2 from M1. This will be dimension M.



31. Measure the intermediate and overdrive clutch housing retaining ring (14). Refer to Intermediate and Overdrive Clutch Housing Retaining Ring Specifications, for the correct size washer.

Caution: Refer to General Repair Instructions in the Preface section.



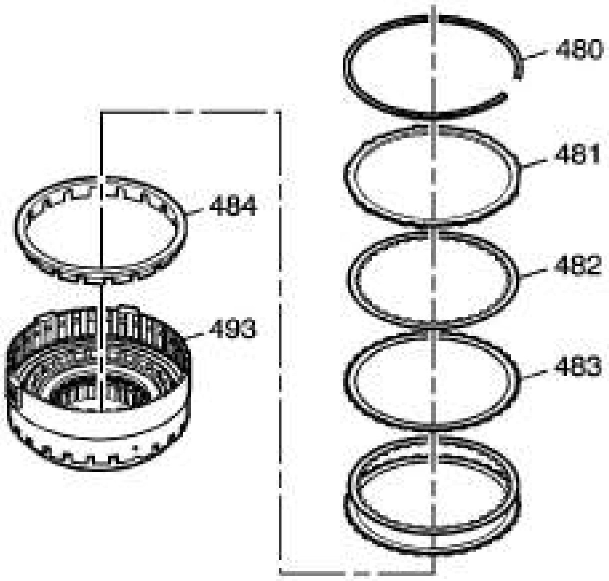
Important: If housings is replaced a measurement must be taken for end play.

32. Using J 45126 install the intermediate and overdrive clutch housing snap ring (14) into the case (24).

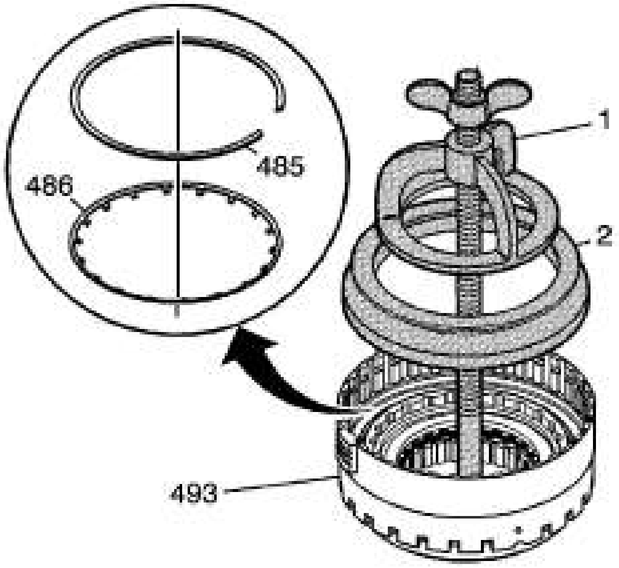
Intermediate and Overdrive and Reverse Clutch Hub Disassemble

Tools Required

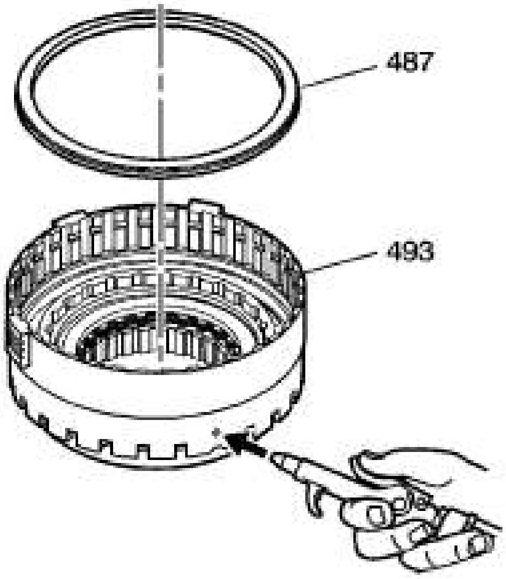
- J 23327 Clutch Spring Compressor
- J 44764 Clutch Spring Compressor



1. Remove the overdrive clutch snap ring (480) from the overdrive clutch housing (493).
2. Remove the overdrive clutch backing plate (481) from the overdrive clutch housing (493).
3. Remove the overdrive clutch plates (482 and 483). Refer to Clutch Plate Selection Specifications.
4. Remove the overdirve clutch spacer (484) from the overdrive clutch housing (493).

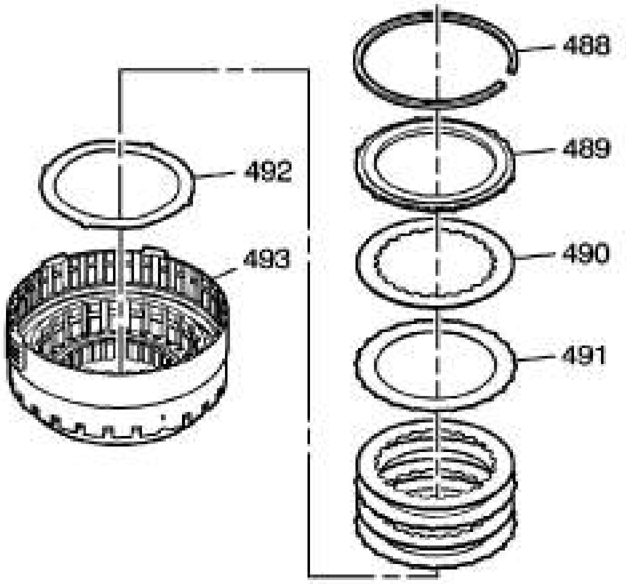


5. Use J 44764 and J 23327 to compress the overdrive clutch piston spring (486).
6. Remove the overdrive clutch piston spring snap ring (485) from the overdrive clutch housing (493).
7. Remove J 44764 and J 23327 from the overdrive clutch housing (493).
8. Remove the overdrive clutch spring (486) from the overdrive clutch housing (493).

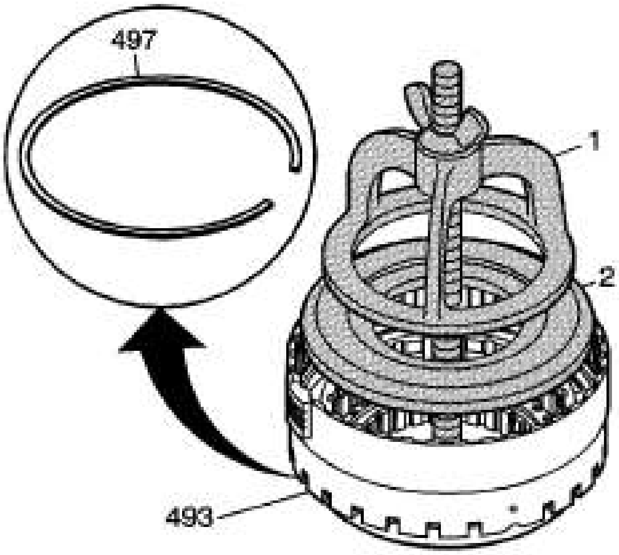


Important: It may be necessary to use air pressure to remove the piston.

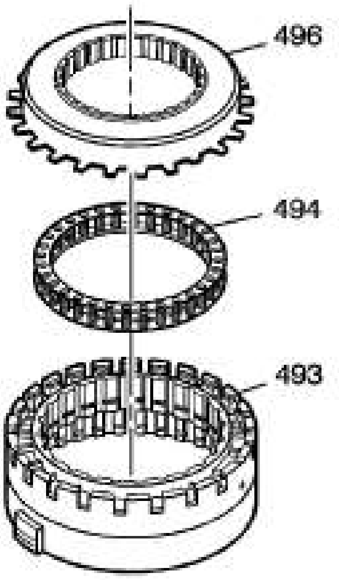
9. Remove the overdrive clutch piston (487) from the overdrive clutch housing (493).



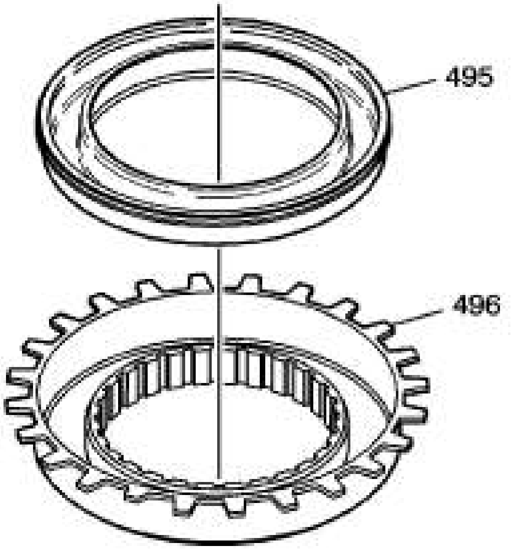
10. Remove the intermediate clutch backing plate snap ring (488) from the overdrive clutch housing (493).
11. Remove the intermediate clutch backing plate (489) from the overdrive clutch housing (493).
12. Remove the intermediate clutch plates (490 and 491) from the overdrive clutch housing (493). Refer to Clutch Plate Selection Specifications.
13. Remove the intermediate clutch apply plate (492) from the overdrive clutch housing (493).



14. Use J 44764 and J 23327 to compress the intermediate clutch housing (496).
15. Remove the intermediate clutch housing snap ring (497) from the overdrive clutch housing (493).

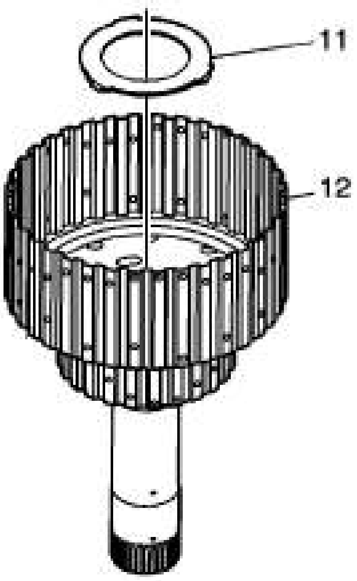


16. Remove J 44764 and J 23327 from the overdrive clutch housing (493).
17. Remove the intermediate clutch housing (496), and the intermediate clutch spring (494) from the overdrive clutch housing (493).

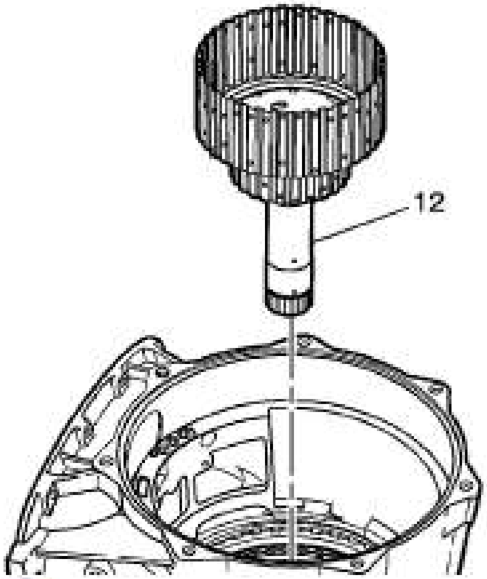


18. Remove the intermediate clutch piston (495) from the overdrive clutch housing (496).

Intermediate Clutch Sprag Assemble

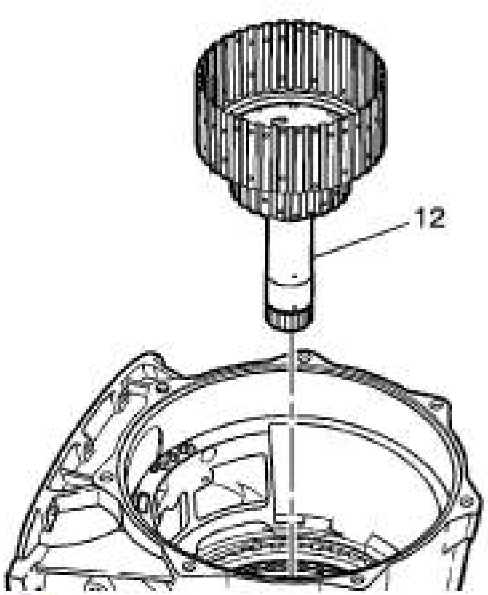


1. Apply J 36850 to the input and reaction carrier inner shaft thrust washer (11) and install into the intermediate sprag clutch assembly (12).



2. Install the intermediate sprag clutch assembly (12) into the case.

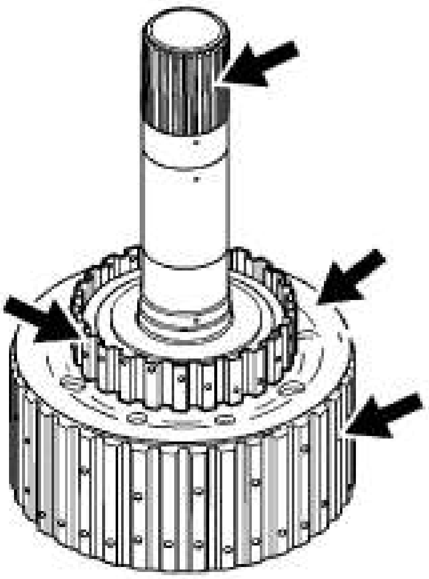
Intermediate Clutch Sprag Assembly Removal



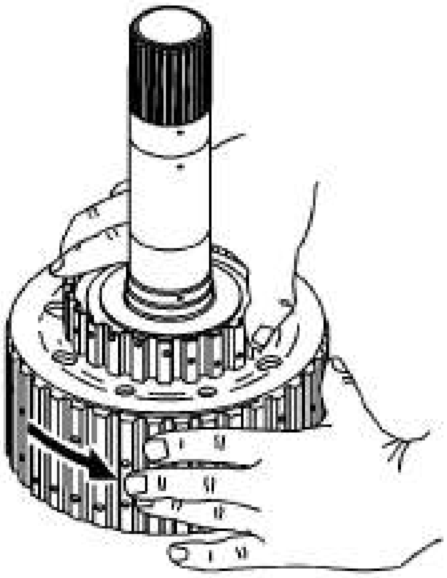
Remove the intermediate clutch sprag assembly (12) from the case.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | Document ID: 1977457

Intermediate Clutch Sprag Inspection

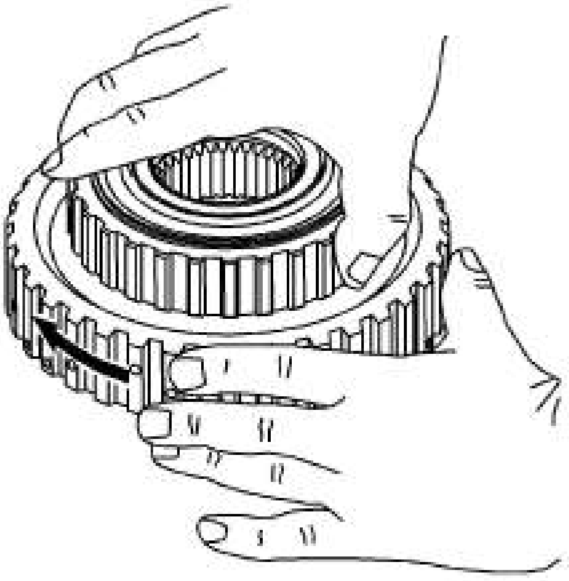


1. Inspect the intermediate sprag clutch for the following conditions:
    - Scoring
    - Wear or cracks

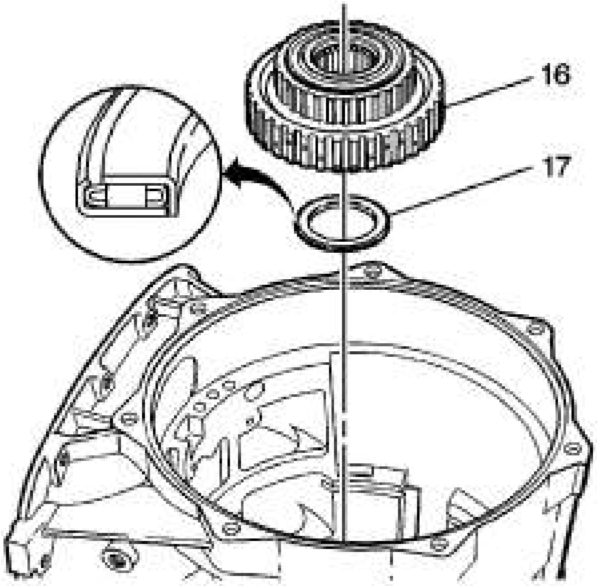


2. Check that the intermediate sprag clutch rotation freewheels and locks up in the correct direction.

Low Clutch Sprag Assemble

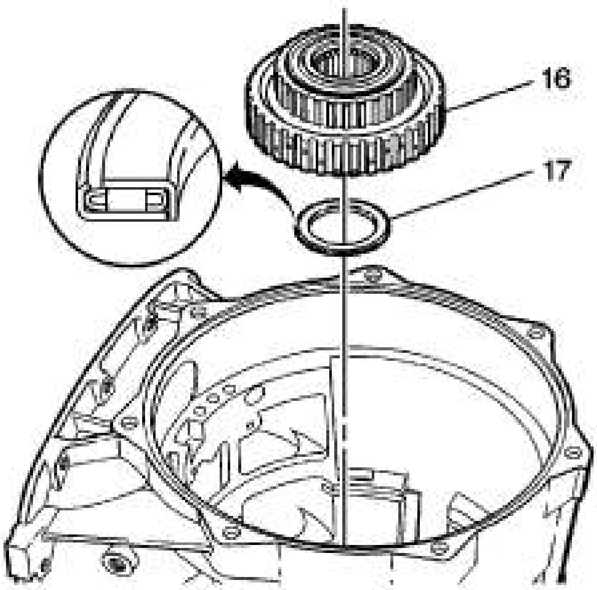


1. Inspect the low clutch sprag for the following:
   - Damaged or worn splines
   - Scoring on the inside diameter of the races
   - Wear or cracks
2. Check that the low clutch sprag rotation freewheels and locks up in the correct direction.



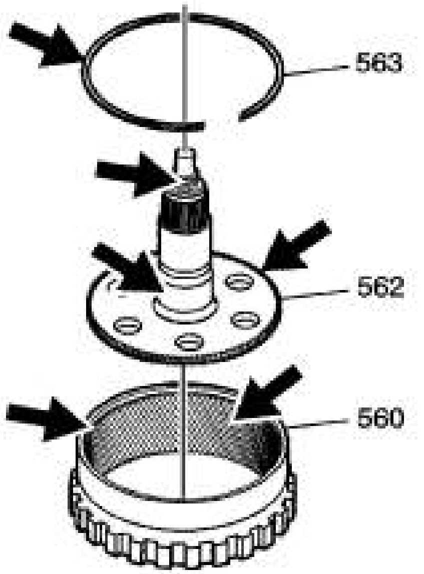
3. Install the low clutch roller thrust bearing (17).
4. Install the low clutch sprag (16) into the case (24).

Low Clutch Sprag Removal

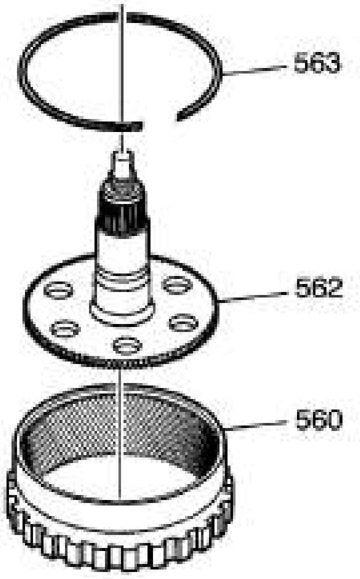


1. Remove the low clutch sprag (16) from the case.
2. Remove the low clutch roller thrust bearing (17).

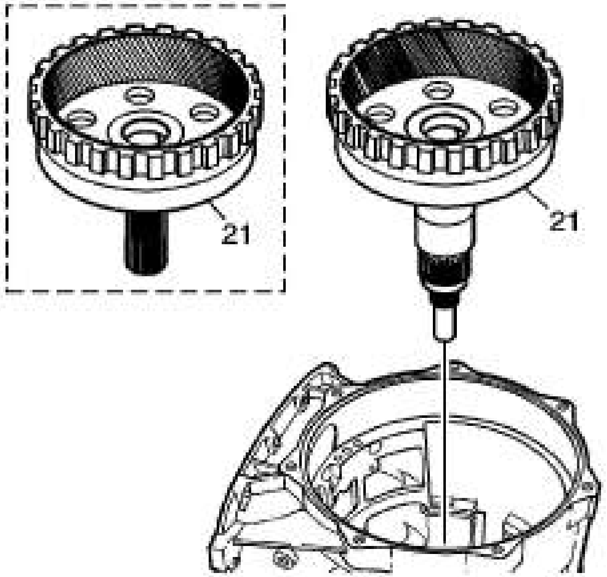
Output Shaft and Rear Internal Ring Gear Assemble



1. Inspect the output shaft (562) and the rear internal gear (560) for the following:
    - Damaged or worn bushings
    - Damaged splines
    - Damaged or worn snap ring (563)
    - Damaged or worn gear teeth
    - Damaged or worn snap ring groove
    - Damaged or cross-threaded threads
    - Damaged or worn bearings

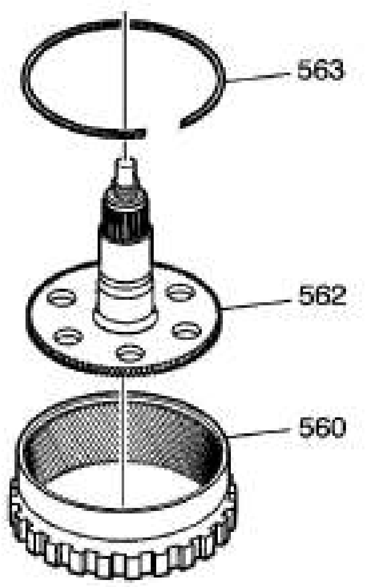


2. Install the output shaft (562) into the rear internal gear (560).
3. Install the snap ring (563) onto the rear internal ring gear (560). Be sure it is seated in the groove.



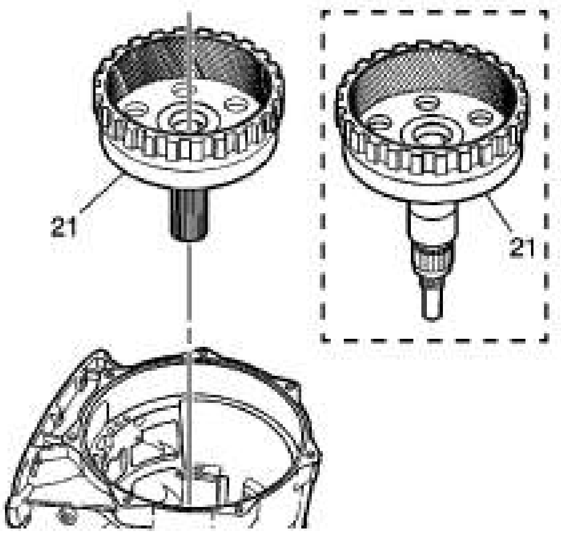
4. Rotate the transmission 90 degrees.
5. Install the ouput shaft assembly (21) into the case.

Output Shaft and Rear Internal Ring Gear Disassemble



1. Remove the snap ring (563).
2. Remove the output shaft (562) from the rear internal gear (560).

Output Shaft Removal



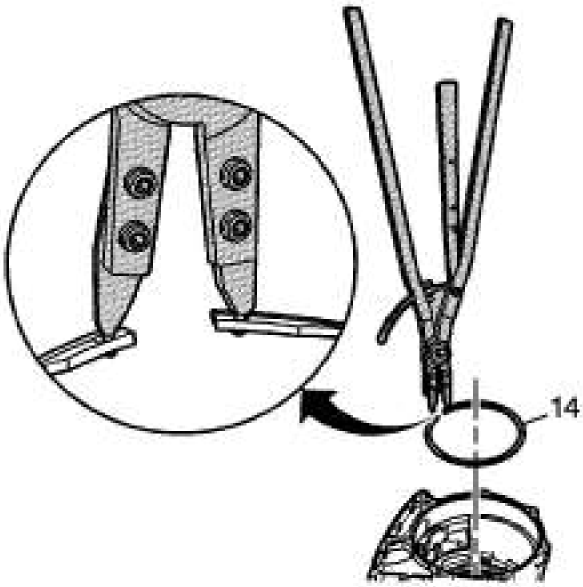
Remove the output shaft assembly (21) from the case (24).

Overdrive Clutch Housing Removal

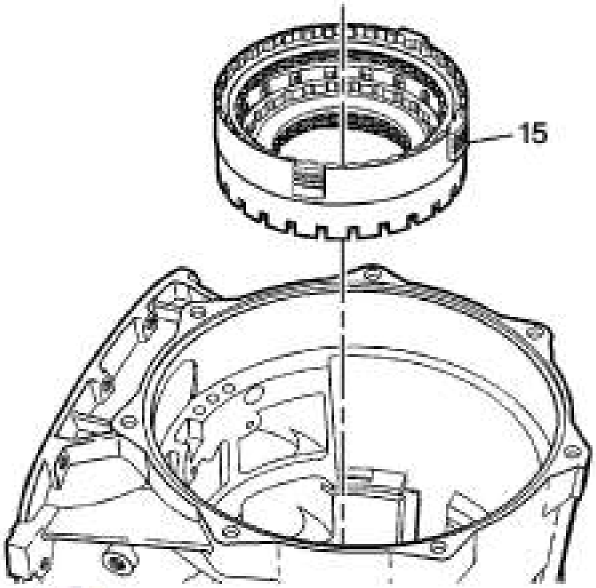
Tools Required

J 45126 Snap Ring Pliers

Caution: Refer to General Repair Instructions in the Preface section.



1. Use J 45126 J 45126 to remove the snap ring (14).

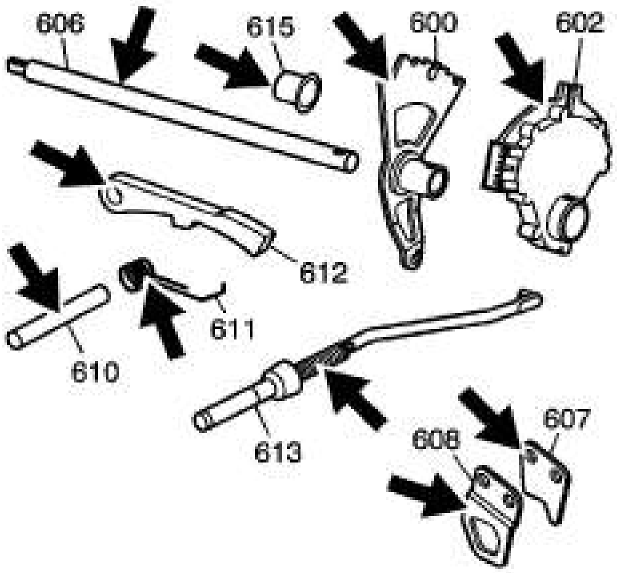


2. Remove the overdrive clutch housing (15) from the case.

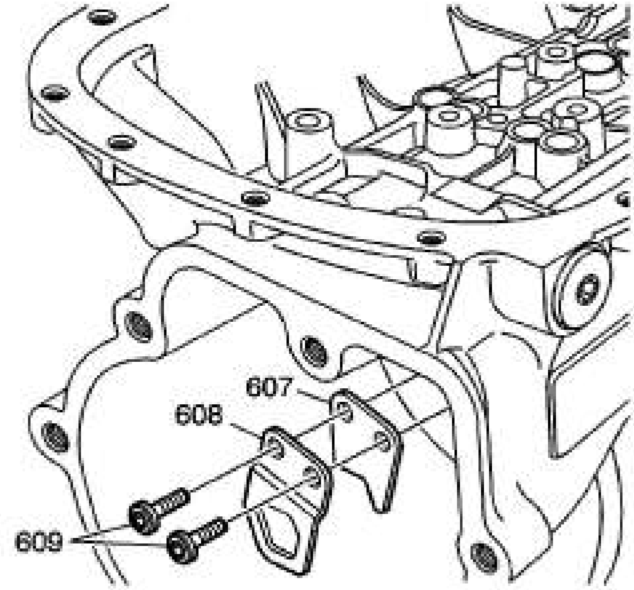
Parking System Components Installation

Tools Required

J 44767 Seal Installer



1. Inspect the park system components for the following:
   - Worn park pawl actuator brackets (607 and 608)
   - A damaged or bent park pawl actuator assembly (613)
   - A damaged manual shaft detent lever (600)
   - A damaged manual shaft shift switch assembly (602)
   - A worn or stripped manual shaft (606)
   - A worn or damaged park pawl shaft (610), park pawl spring (611), and park pawl (612)
   - A worn or damaged spacer (615), - some models.

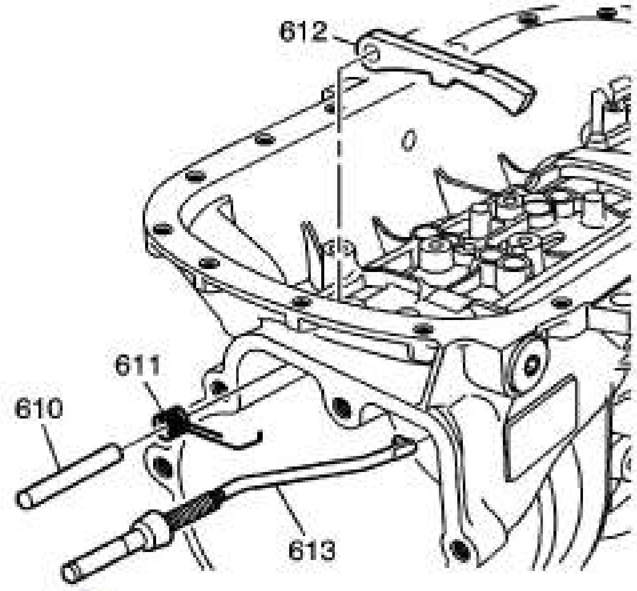


2. Install the park pawl actuator brackets (607 and 608) onto the case.

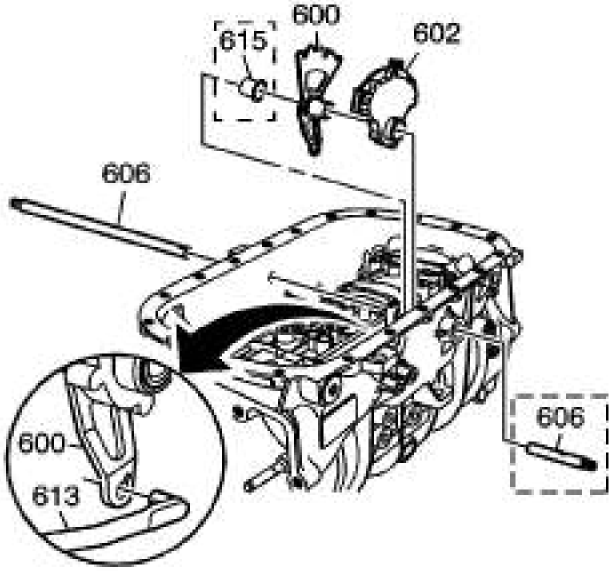
   Notice: Refer to Fastener Notice in the Preface section.

3. Install the bracket retaining bolts (609).

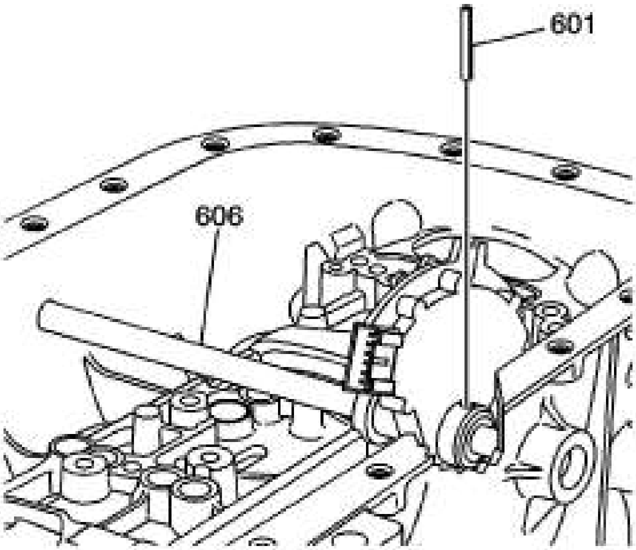
   Tighten
   Tighten the bolts to 22 N·m (16 lb. ft).



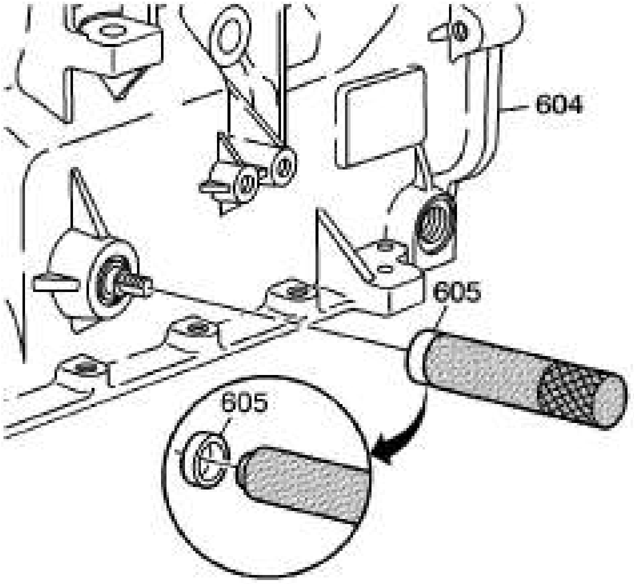
4. Install the park pawl (612), the park pawl spring (611), and the park pawl shaft (610) into the case.
5. Install the park pawl actuator (613) into the case.



6. Install the shift switch assembly (602) and spacer (615) - some models onto the detent lever (600).
7. Install the park pawl actuator (613) into the detent lever (600).
8. Install the shift shaft (606) into the case.



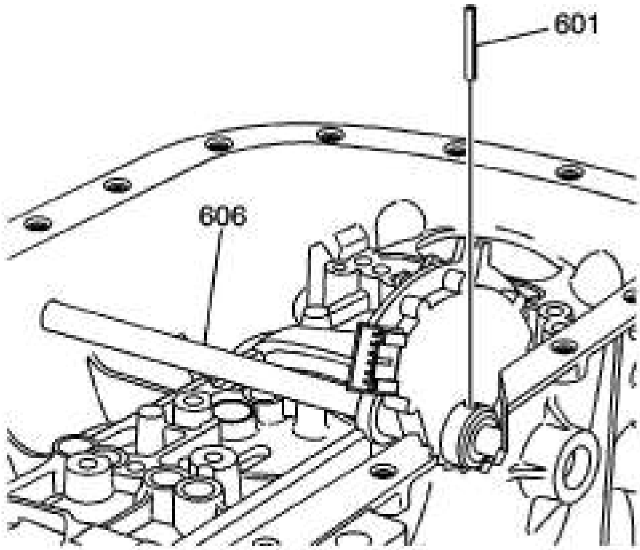
9. Align the groove for the NEW manual shaft pin (601) with the pin hole in the detent lever/shift switch assembly.
10. Install the manual shaft pin (601) into the shift shaft (606).



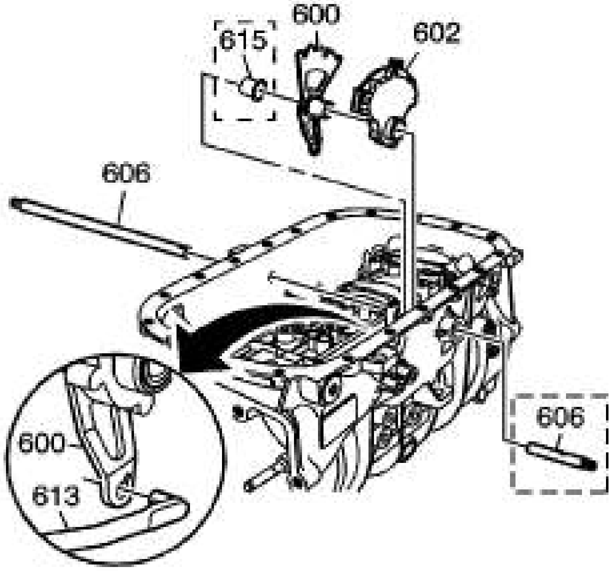
11. Install a NEW manual shaft seal (605) onto J 44767 .
12. Use a J 44767 to install the NEW manual shaft seal (605) into the case (604).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 1977436**

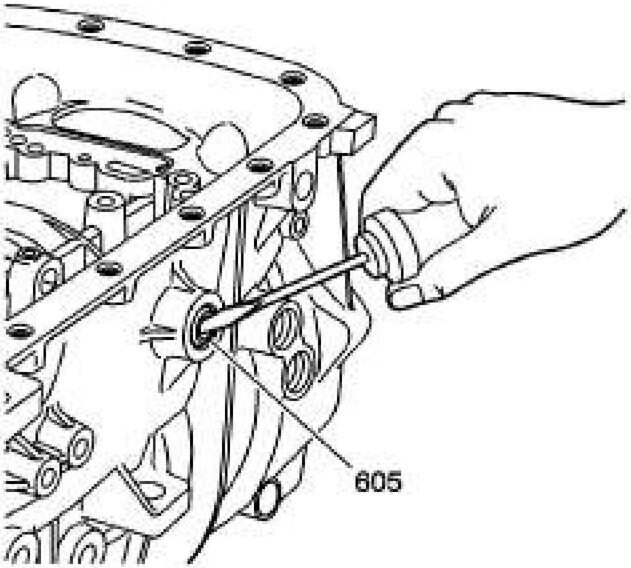
Parking System Components Removal



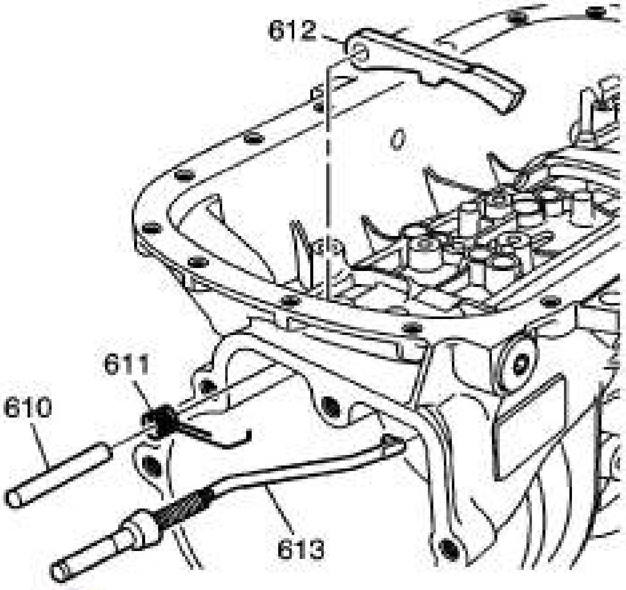
1. Rotate the transmission 90 degrees. Remove the shift shaft detent lever pin (601) from the case.



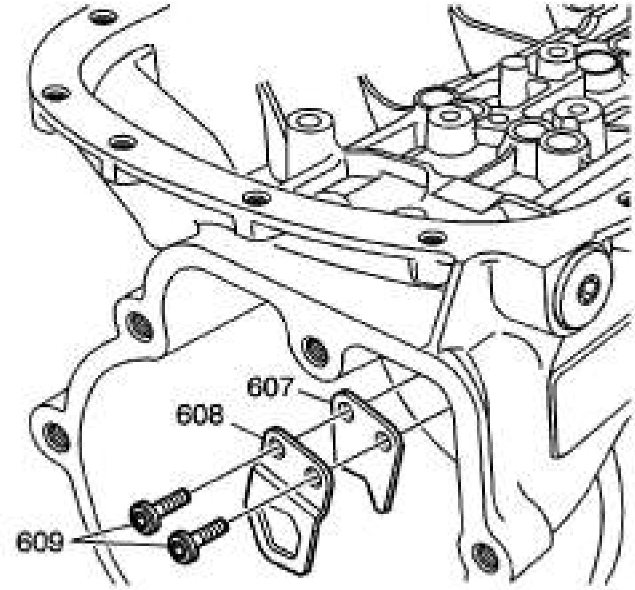
2. Remove the manual shift shaft (606) from the case.
3. Disconnect the park pawl actuator assembly (613) from the manual shaft detent lever (600).
4. Remove the manual shaft detent lever (600), spacer (615) - some models and the manual shaft shift switch assembly (602) from the case.



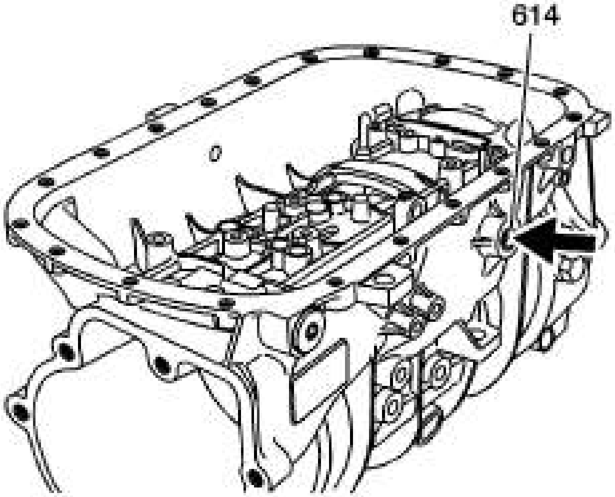
5. Use a suitable tool in order to pry the shift shaft seal (605) from the case.



6. Remove the park pawl actuator assembly (613) from the case.
7. Remove the park pawl shaft (610), park pawl spring (611) and the park pawl (612) from the case.

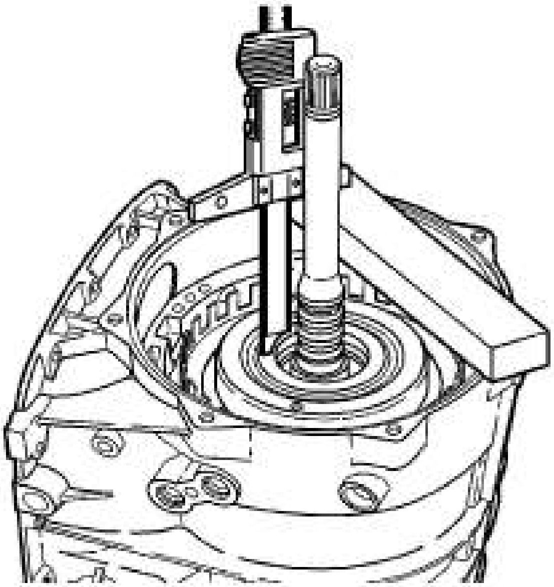


8. Remove the park pawl actuator bracket retaining bolts (609) from the case.
9. Remove the park pawl actuator brackets (607, 608) from the case.

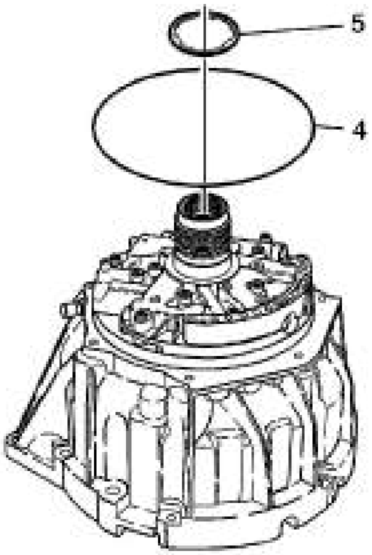


10. Inspect the cup plug (614) for signs of leaks.

Torque Converter Housing Installation

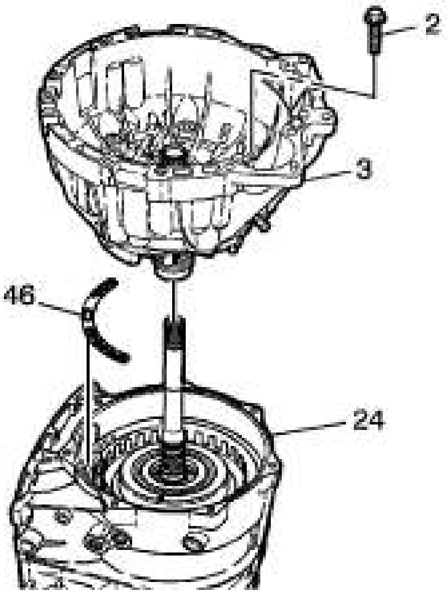


1. Measure the distance from the bottom of the gage bar to the top of the direct and reverse clutch assembly (6). Record this as dimension X. Refer to the Reverse Clutch Housing Selective Thrust Washer Specifications, to determine the correct size to use.



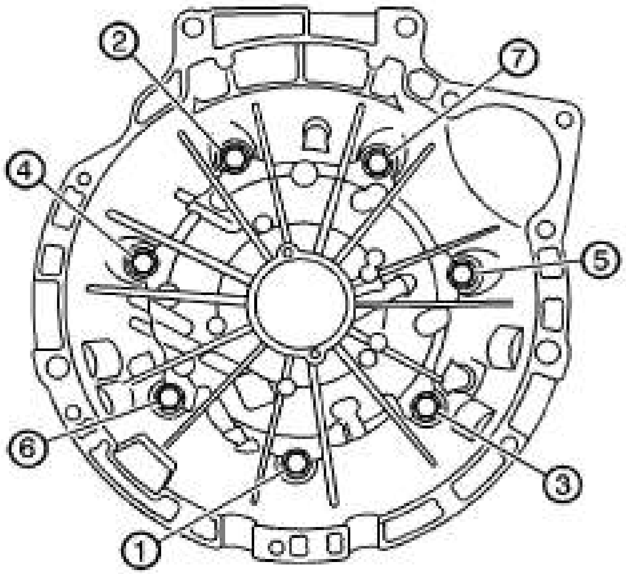
2. Use lubricant to install the NEW torque converter fluid seal (4) onto the torque converter housing.

   Use lubricant to install the reverse clutch housing thrust washer (5).



3. Install the NEW fluid pump cover gasket (46).
4. Install the torque converter housing (3) onto the case (24).
5. Install the torque converter housing retaining bolts (2) and hand tighten.

Notice: Refer to Fastener Notice in the Preface section.

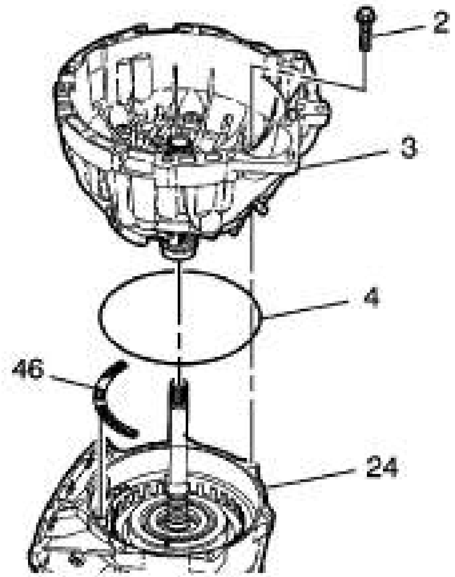


6. Tighten the torque converter housing retaining bolts in sequence.

Tighten
Tighten the bolts to 22 N·m (16 lb. ft).

Torque Converter Housing Removal

1. Remove the transmission. Refer to Transmission Replacement.



2. Rotate the transmission 90 degrees so that the converter housing is facing up. Remove the torque converter housing bolts (2) from the torque converter housing (3).
3. Remove the torque converter housing assembly (3) from the case (24).
4. Remove the torque converter housing fluid seal assembly (4).
5. Remove the fluid pump cover gasket (46).

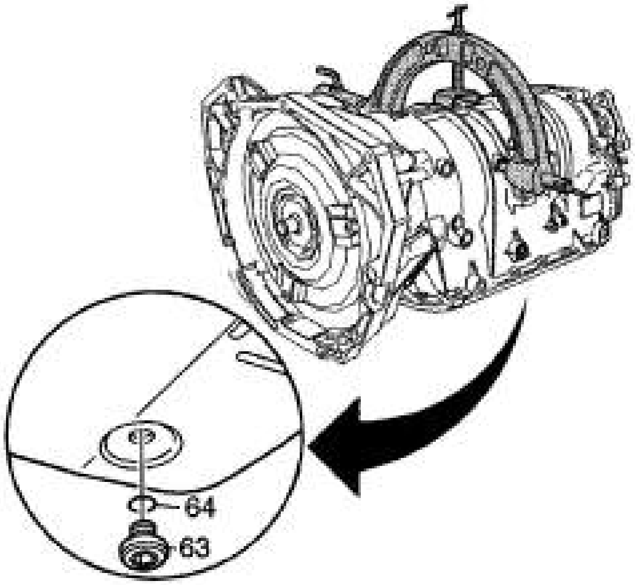
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Repair Instructions - Off Vehicle | **Document ID: 2006951**

Transmission Fluid Draining

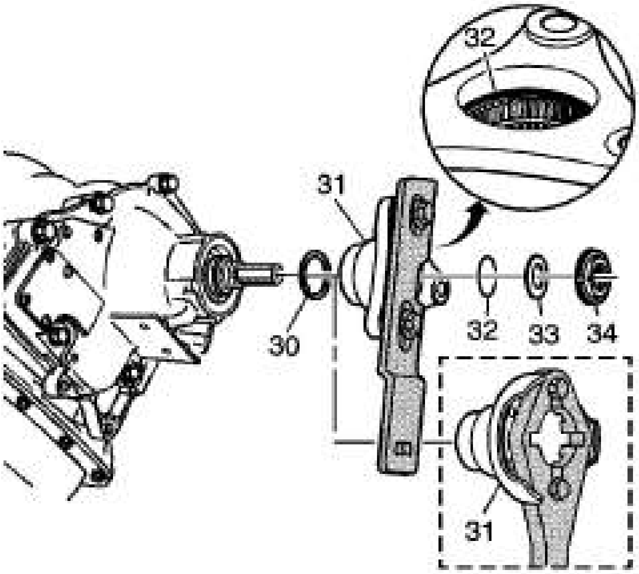
Tools Required

J 45012 Holding Fixture

1. Place a suitable drain tray under the transmission.



2. Remove the fluid pan drain plug (63) and seal (64), and allow the transmission fluid to drain.



3. Put transmission in park.

4. Install either the J 45012 to hold the drive flange.

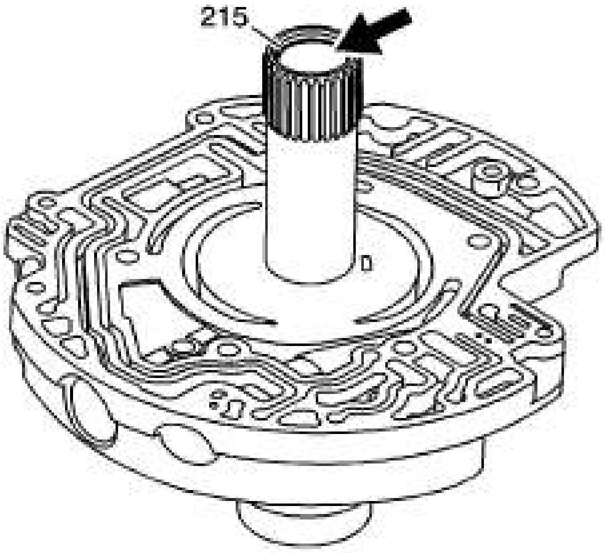
   Important: Discard retainer (30), seal (32), washer (33) and nut (34).

5. Remove the drive flange retaining nut (34).
6. Remove the drive flange washer (33) and seal (32).
7. Remove the drive flange (31) and the output shaft assembly retainer (30).
8. Slowly rotate the transmission to a vertical position, with the bell housing facing up, and allow any excess fluid to drain.

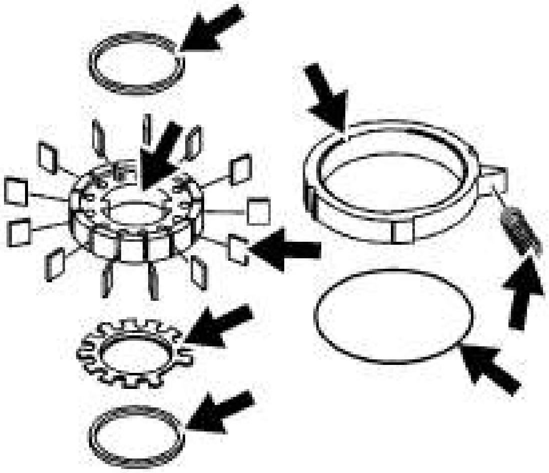
Transmission Fluid Pump Assemble

Tools Required

J 21368 Pump Body Cover Alignment Band

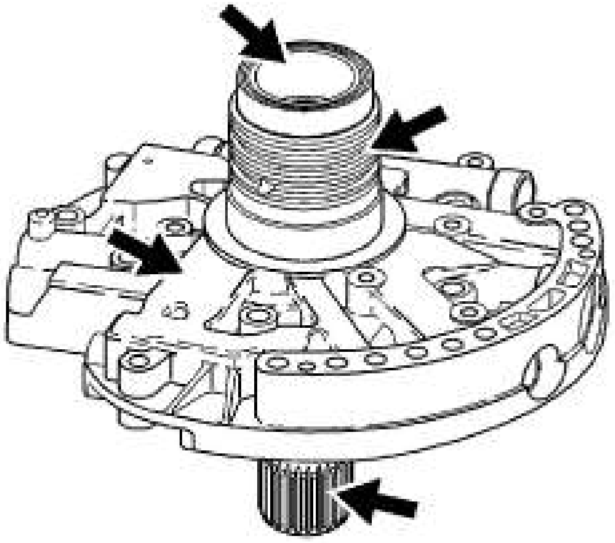


1. Inspect the fluid pump bushing (215) for wear - not serviceable.

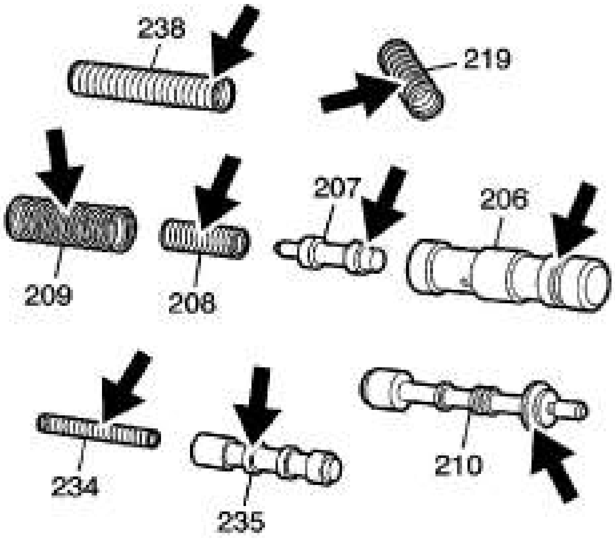


2. Inspect the fluid pump parts for the following:
   - Worn, scored or gouged pump slide

  - Cracks, wear or damage to the rotor or vanes
  - Cuts or damage to the seals
  - Broken priming springs

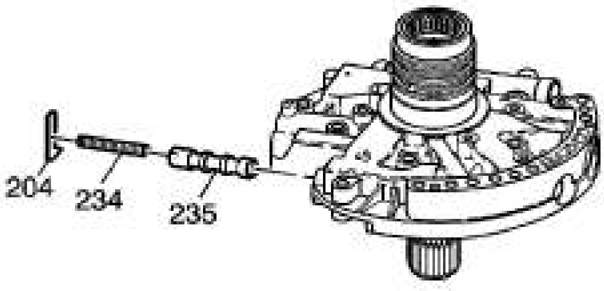


3. Inspect the fluid pump housing for the following:
   - Porosity
   - Interconnected oil passages
   - Damaged machined surfaces

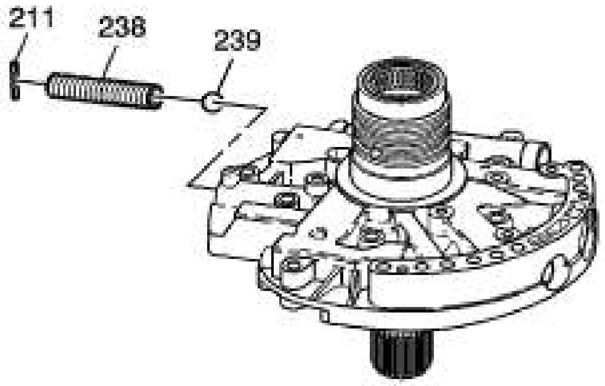


4. Inspect the valves (207, 210 and 235) and springs (208, 209, 234, 238 and 219) for the following:

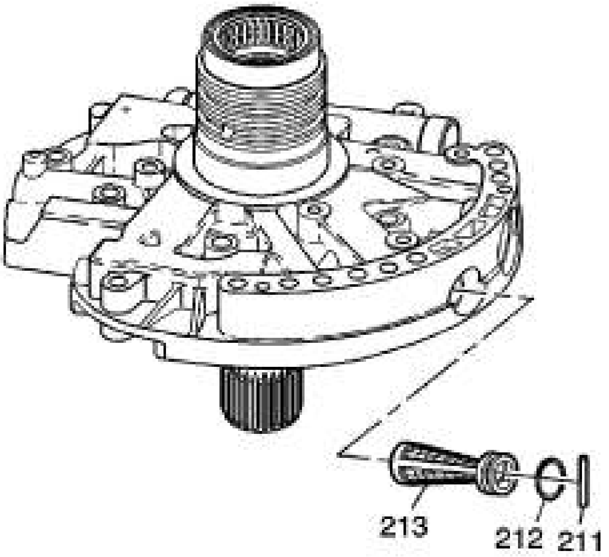
- Nicks or burrs on the valves
- Worn, distorted or cracked springs



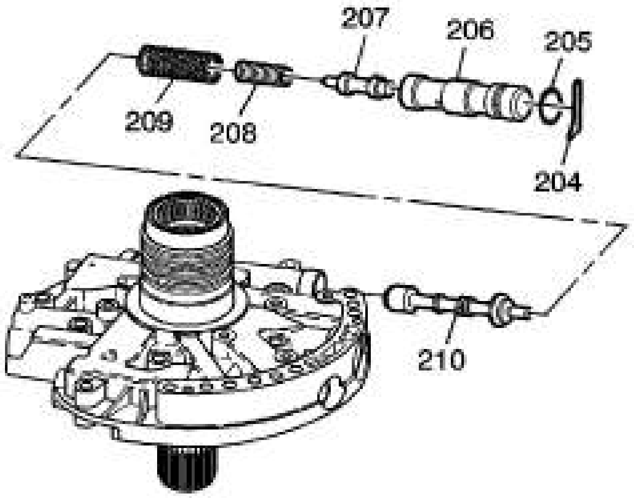
5. Install the tcc control valve (235) and the tcc control valve spring (234).
6. Install the tcc control valve spring retainer (204).



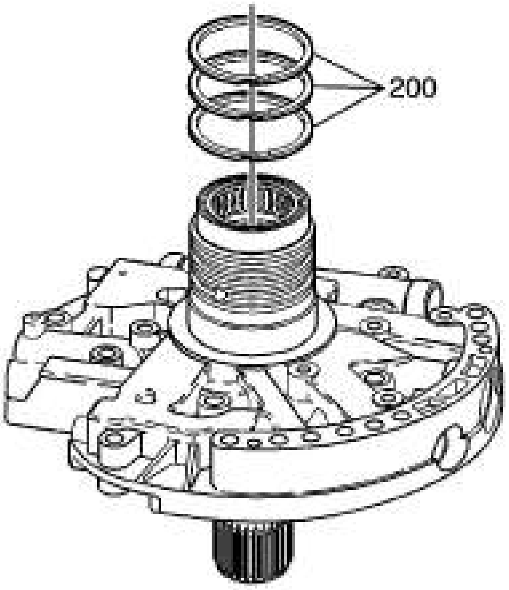
7. Install the pressure relief ball (239) and spring (238).
8. Install the pressure valve spring retainer (211).



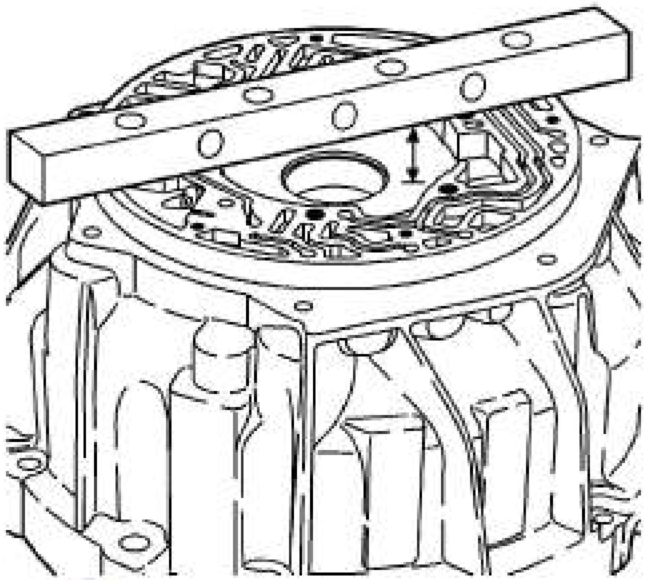
9. Install the fluid pump cover seal (212) onto the new pump cover screen (213).
10. Install the fluid pump cover screen (213).
11. Install the fluid pump cover screen pin (211).



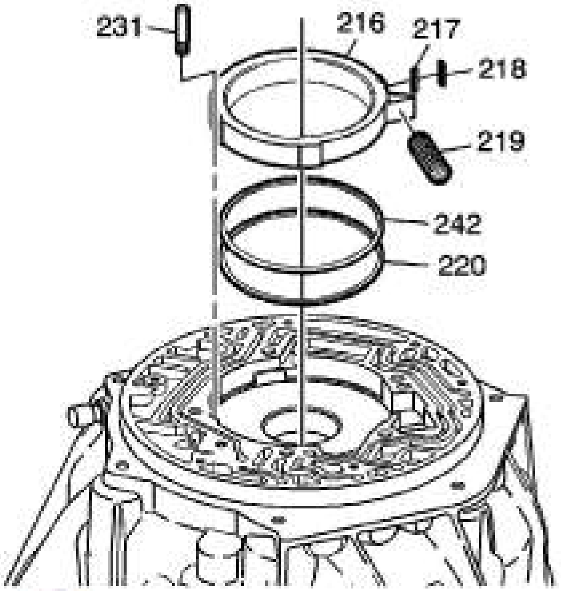
12. Install the pressure regulator valve (210), the pressure regulator valve spring (209), and the line boost valve spring (208).
13. Install the line boost valve bushing seal (205) onto the bushing (206).
14. Install the line boost valve (207) and the bushing (206).
15. Install the line boost valve bushing retainer (204).



16. Install the reverse clutch housing fluid seal rings (200).



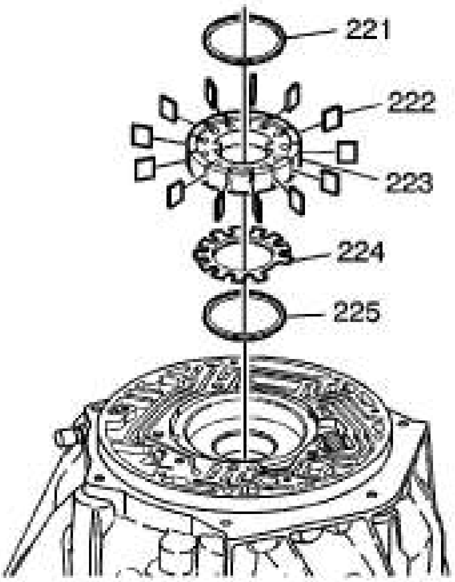
17. Measure the distance from the bottom of the gage bar to the fluid pump body. Refer to Transmission Fluid Pump Specifications.
18. Measure the thickness of pump slide (216).
19. Select the correct size, refer to Transmission Fluid Pump Specifications.
20. Measure the thickness of the pump rotor (223).
21. Select the correct size rotor refer to Transmission Fluid Pump Specifications.



22. Install the fluid pump support (217), the slide seal (218) and the fluid pump slide rings (220), and the fluid pump slide o-ring seal (242) onto the pump slide (216).
23. Install the slide pin (231).

Important: The fluid pump slide (216) is selective.

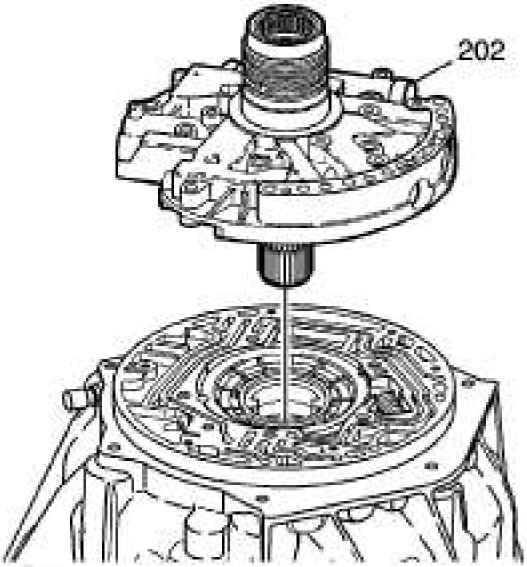
24. Install the fluid pump slide (216).
25. Using a suitable tool install the slide spring (219).



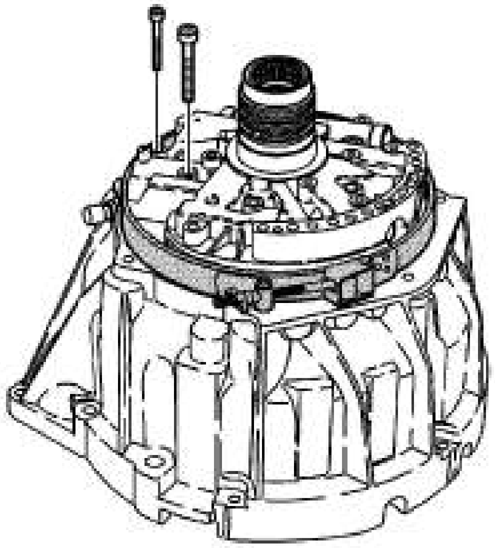
26. Install the fluid pump vane ring (225).
27. Install the fluid pump rotor guide (224).

Important: The fluid pump rotor (223) is selective.

28. Install the fluid pump rotor (223).
29. Install the fluid pump vanes (222).
30. Install the fluid pump vane ring (221).

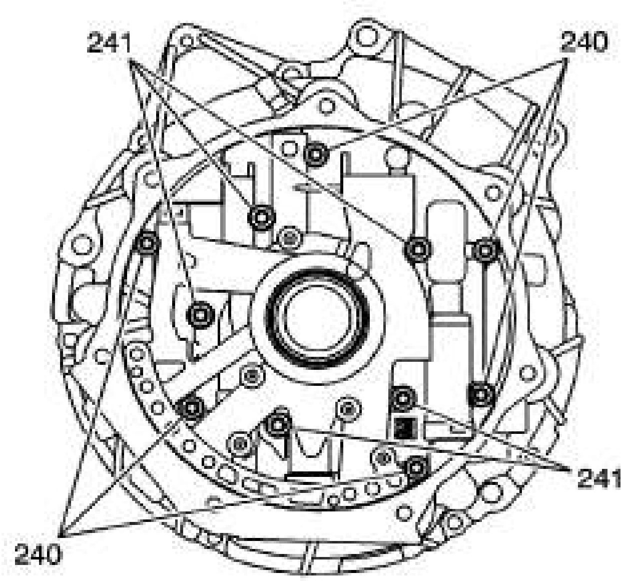


31. Install the fluid pump cover housing (202) onto the converter housing (224).



32. Install J 21368 and tighten.

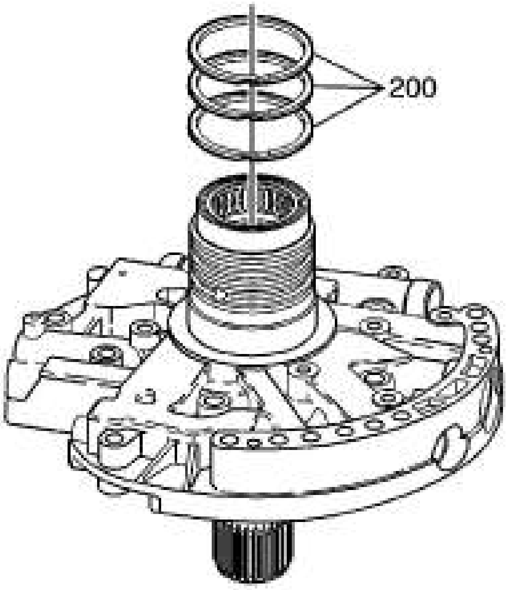
Notice: Refer to Fastener Notice in the Preface section.



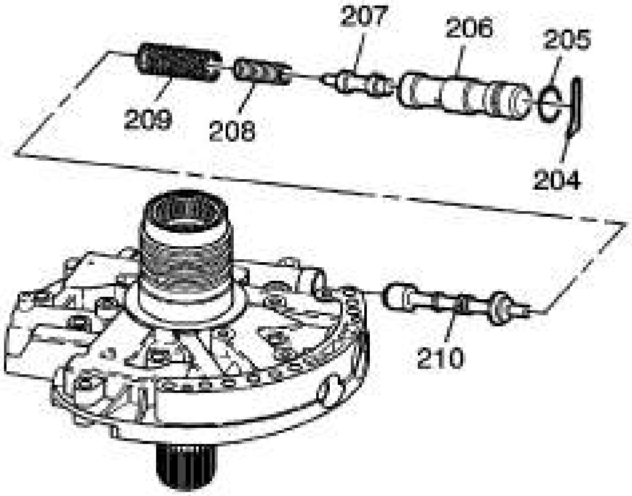
33. Install the fluid pump housing retaining bolts (240, 241).

    Tighten
    - Tighten the fluid pump housing retaining bolts (240) to 11 N·m (8 lb. ft).
    - Tighten the fluid pump housing retaining bolts (241) to 22 N·m (16 lb. ft).
34. Remove J 21368 .

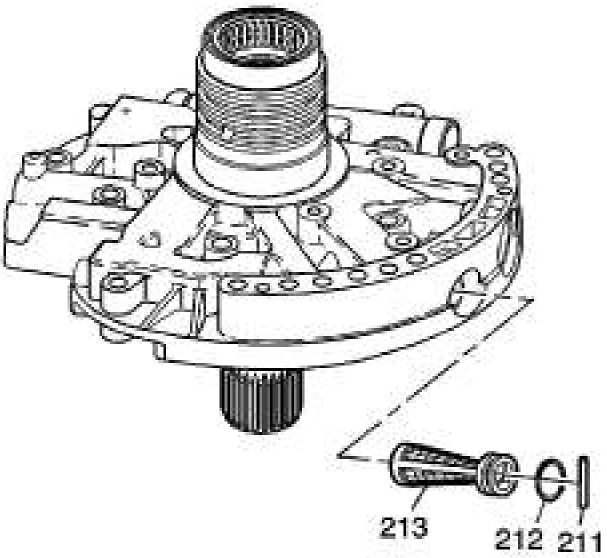
Transmission Fluid Pump Disassemble



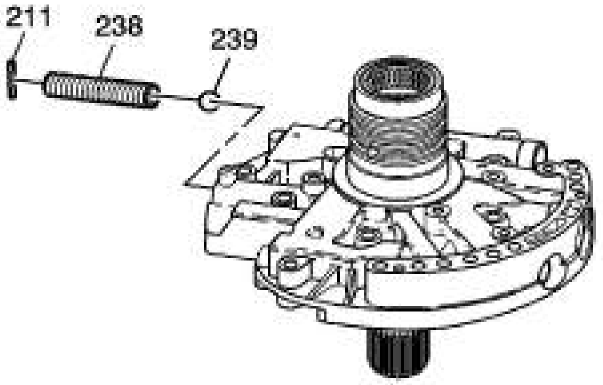
1. Remove the reverse clutch housing seal rings (200).



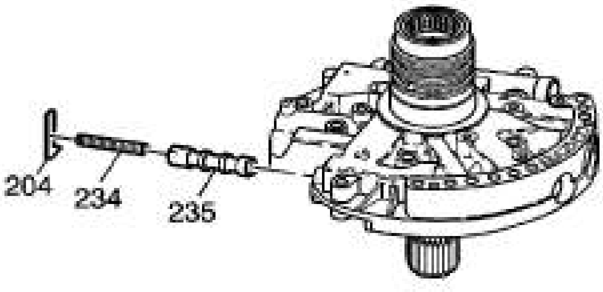
2. Remove the line boost valve retainer (204).
3. Remove the line boost valve bushing (206) and the line boost valve (207).
4. Remove the line boost valve bushing seal (205).
5. Remove the line boost valve spring (208) and the pressure regulator valve spring (209).
6. Remove the pressure regulator valve (210).



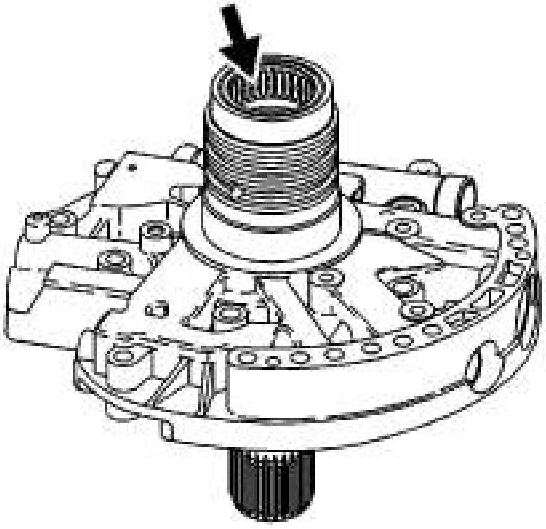
7. Remove the fluid pump cover screen pin (211).
8. Remove the fluid pump cover screen (213).
9. Remove the fluid pump cover seal (212).



10. Remove the pressure relief ball pin (211).
11. Remove the pressure relief spring (238) and the pressure relief ball (239).

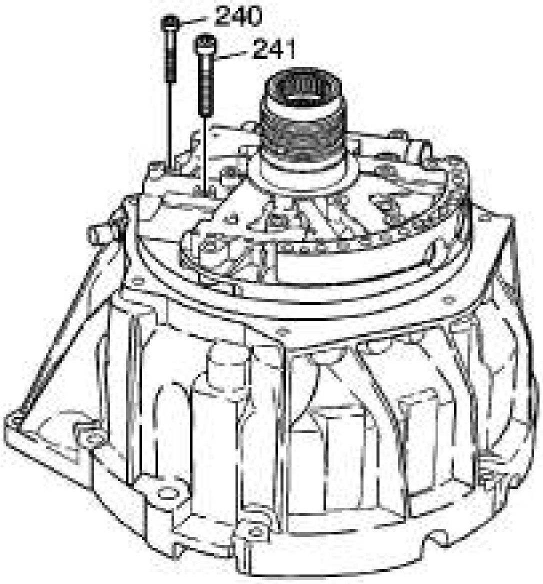


12. Remove the torque converter clutch (TCC) control valve pin (204).
13. Remove the TCC control valve spring (234) and the TCC control valve (235).

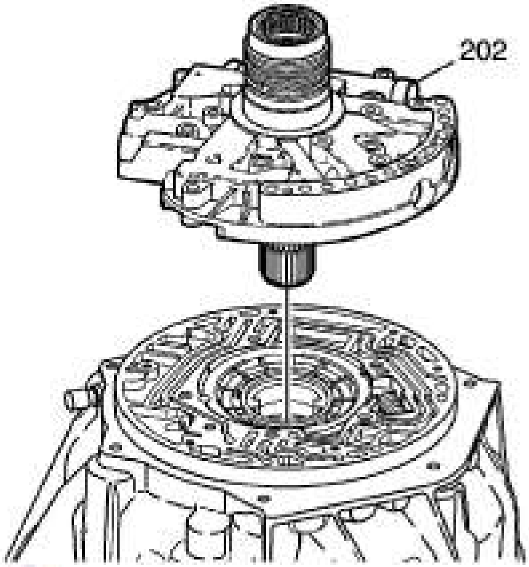


14. Inspect the input shaft bearing (201) for the following:
    - Damaged bearing cage
    - Pitted bearings
    - Scored bearings

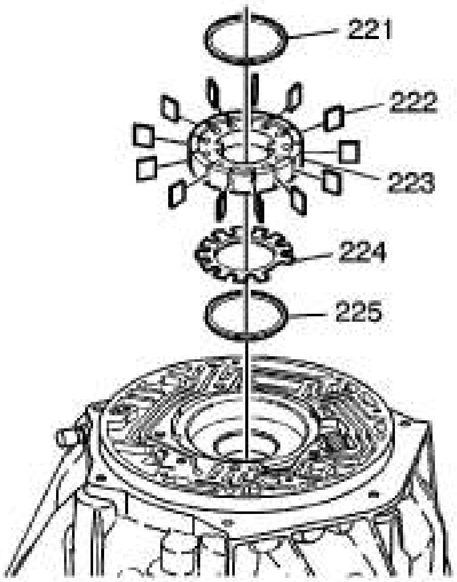
Transmission Fluid Pump Removal



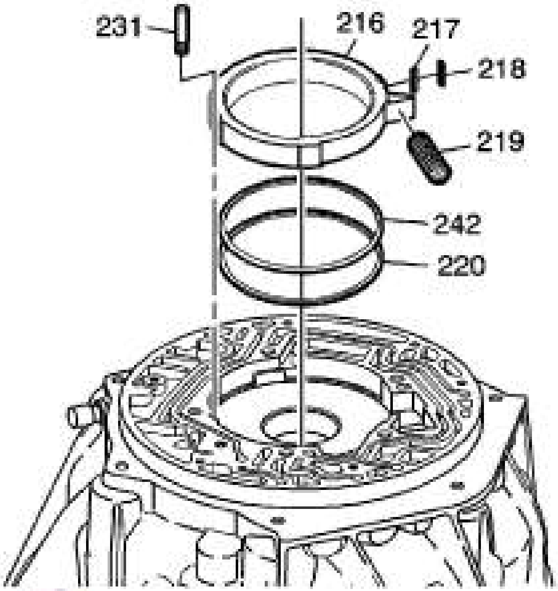
1. Remove the fluid pump to torque converter housing bolts (240, 241).



2. Remove the fluid pump cover (202).

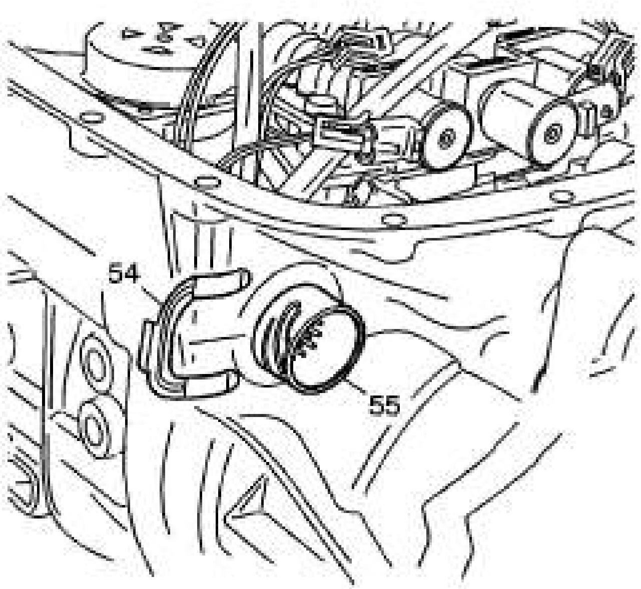


3. Remove the fluid pump vane ring (221).
4. Remove the fluid pump vanes (222).
5. Remove the fluid pump rotor (223).
6. Remove the fluid pump rotor guide (224).
7. Remove the fluid pump vane ring (225).

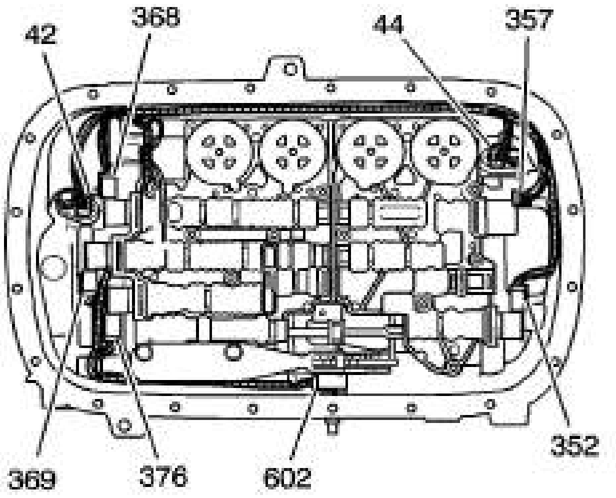


8. Remove the fluid pump slide spring (219).
9. Remove the fluid pump slide (216).
10. Remove the fluid pump slide pin (231).
11. Remove the fluid pump slide ring (220, 242).
12. Remove the fluid pump support (217) and the fluid pump slide seal (218).

Wiring Harness Installation



1. Install the wiring harness connector (55) through the case. Hold the connector and install the wiring harness connector retainer (54).



2. Install the wiring harness to the valve body and connect the following components:
   - Pressure Control Solenoid (357)
   - TCC PWM Solenoid (352)
   - 1-2 Shift Solenoid (368)

- 2-3 Shift Solenoid (369)
- 4-5 Shift Solenoid (376)

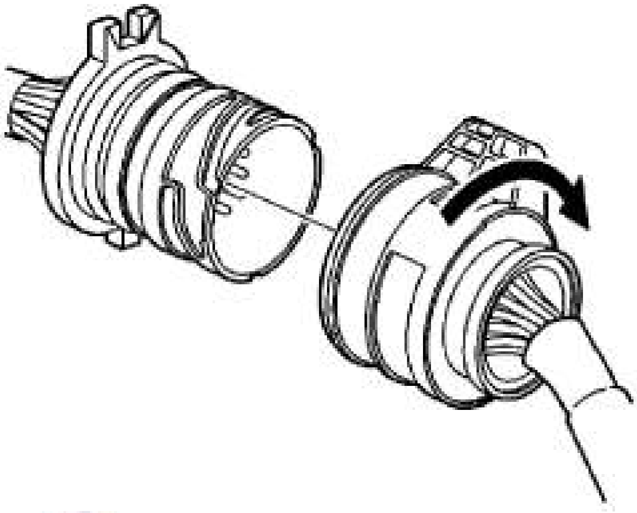
Automatic Transmission Inline 20-Way Connector Description



The transmission electrical connector is an important part of the transmission operating system. Any interference with the electrical connection can cause the transmission to set diagnostic trouble codes (DTC) or affect proper operation.

The following items can affect the electrical connection:

- Bent terminals in the connector from rough handling during connection and disconnection
- Wires backing away from the pins or coming uncrimped, in either the internal or the external wiring harness
- Dirt or moisture contamination entering the connector when disconnected
- Pins in the internal wiring connector backing out of the connector during connection
- Transmission fluid leaking into the connector, wicking up into the external wiring harness and degrading the wire insulation
- Low terminal tension in the external connector from excessive connection and disconnection of the wiring connector assembly
- Terminal corrosion from contamination
- Damaged connector or connector lock assembly

Remember the following points:

- In order to disconnect the connector, turn the connector clockwise and pull.

- Do not pry the connector with a screwdriver or other tool.
- The connector should screw into place with a positive feel and lock when properly installed.
- Whenever the transmission external wiring connector is disconnected from the internal harness and the ignition is ON, transmission DTCs will set. Clear these DTCs after reconnecting the transmission connector.

Definitions and Abbreviations

Throttle Positions

Engine Braking: A condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Full Throttle Detent Downshift: A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle: Approximately 3/4 of accelerator pedal travel - 75 percent throttle position.

Light Throttle: Approximately 1/4 of accelerator pedal travel - 25 percent throttle position.

Medium Throttle: Approximately 1/2 of accelerator pedal travel - 50 percent throttle position.

Minimum Throttle: The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT): Full travel of the accelerator pedal - 100 percent throttle position.

Zero Throttle Coastdown: A full release of the accelerator pedal while the vehicle is in motion and in drive range.

Shift Condition Definitions

Bump: A sudden and forceful apply of a clutch or a band.

Chuggle: A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is similar to the feel of towing a trailer.

Delayed: A condition where a shift is expected but does not occur for a period of time. This may be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LAutomatic transmissionE or EXTENDED.

Double Bump - Double Feel: Two sudden and forceful applies of a clutch or a band.

Early: A condition where the shift occurs before the car has reached proper speed. This condition tends to labor the engine after the upshift.

End Bump: A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm: A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare: A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh - Rough: A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting: A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4-3-4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel: A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late: A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder: A repeating jerking condition similar to CHUGGLE but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping: A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft: A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge: A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up: A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labor with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise: A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise: A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise: A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise: A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Torque Converter Noise: A whine usually noticed when a vehicle is stopped, and the transmission is in DRIVE or REVERSE. The noise will increase with engine RPM.

SS: Shift Solenoid

SOL: Solenoid

TAP: Transmission Adaptive Pressure

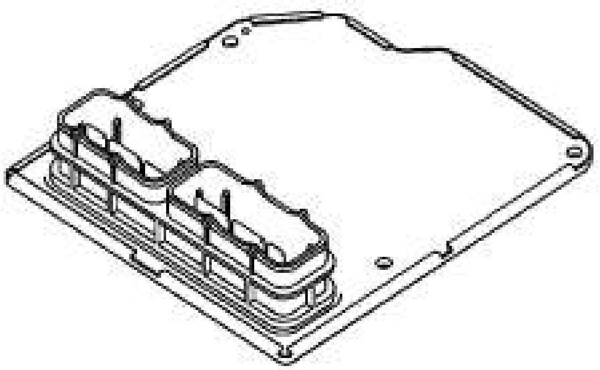
TCC: Torque Converter Clutch

TCM: Transmission Control Module

TFT: Transmission Fluid Temperature

Electronic Component Description

Transmission Control Module (TCM)



The transmission control module (TCM) is mounted in the right hand kick panel and connects directly to the engine wiring harness. A single 42-way connector is used to make the connection between the vehicle wiring and the TCM. The TCM is an electronic control module that receives input or provides output in order to control the operation of the 5L40-E automatic transmission.

The TCM receives the following inputs from the engine control module (ECM):

- Engine speed and torque values
- Engine intake air temperature (IAutomatic transmission), accelerator pedal position (APP) information
- Engine coolant temperature (ECT)
- Kick-down request
- Traction control status
- Driver selected shift mode
- Air-conditioning (A/C) status
- Cruise control status

The ECM provides this data to the TCM through GMLAN. The GMLAN is a 2-wire communication connection between the 2 controllers.

Other TCM inputs are the following:

- Battery and ignition voltage
- Brake switch status
- Transmission manual shift shaft switch assembly
- Transmission fluid temperature (TFT)
- Transmission input shaft speed (ISS) sensor
- Transmission output shaft speed (OSS) sensor

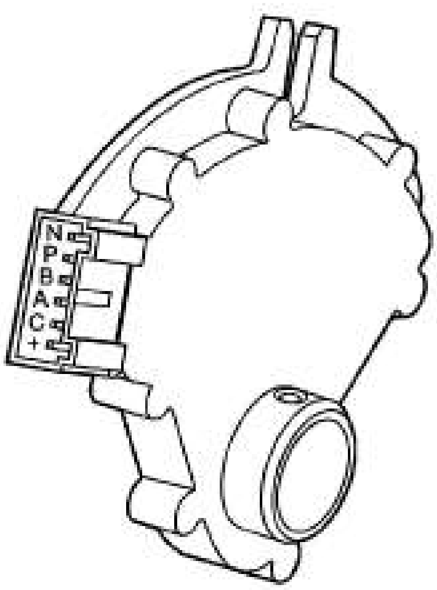
The TCM provides the following outputs in order to control the automatic transmission:

- Shift solenoids to control transmission shifting
- TCC PWM solenoid operation controls the apply and release of the torque converter clutch ASM
- Pressure control solenoid (PCS) regulates transmission line pressure

Other TCM outputs provided to the ECM are the following:

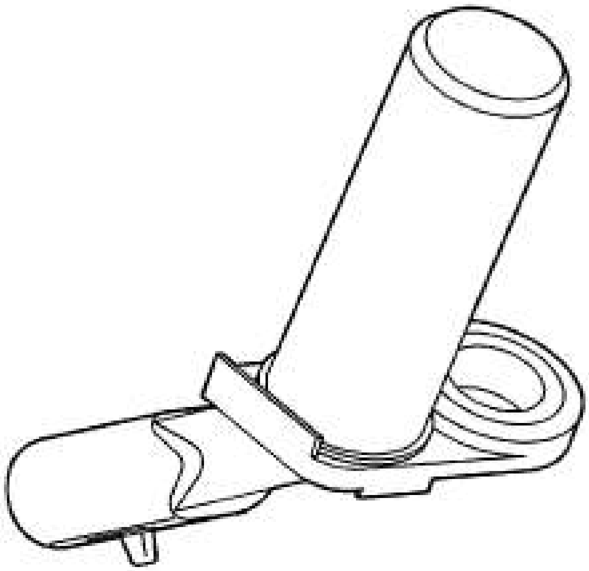
- MIL illumination request
- Vehicle speed
- Transmission input speed
- Transmission fluid temperature
- Commanded gear status
- TCC status
- Torque reduction requests
- Manual shift shaft switch status
- Transmission service status

Transmission Manual Shift Shaft Switch Assembly (602)



The transmission manual shift shaft switch assembly (602) is a sliding contact switch attached to the manual shift shaft inside the transmission case. The five inputs to the TCM from the transmission manual shift shaft switch assembly indicate the transmission gear selector lever position. This information is used for engine controls as well as determining the transmission shift patterns. The state of each input is available for display on the scan tool. The five input parameters represented are Signal A, Signal B, Signal C, Signal P (Parity) and Signal N (P/N Start).

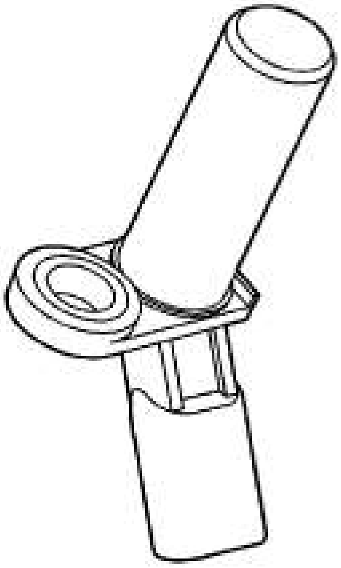
Automatic Transmission Output Speed (A/T OSS) Sensor (42)



The A/T OSS sensor is a variable reluctance magnetic pickup located in the rear of the transmission case. The sensor is mounted in the case (24) opposite the rear internal gear (560). The rear internal gear is splined to the output shaft assembly (562). The sensor consists of a permanent magnet surrounded by a coil of wire. As the output shaft and rear internal gear rotate, an alternate current (AC) is induced in the coil by the 'teeth' on the rear internal gear as they pass by the magnetic pickup. Therefore, whenever the vehicle is moving, the A/T OSS sensor produces an AC voltage signal proportional to vehicle speed.

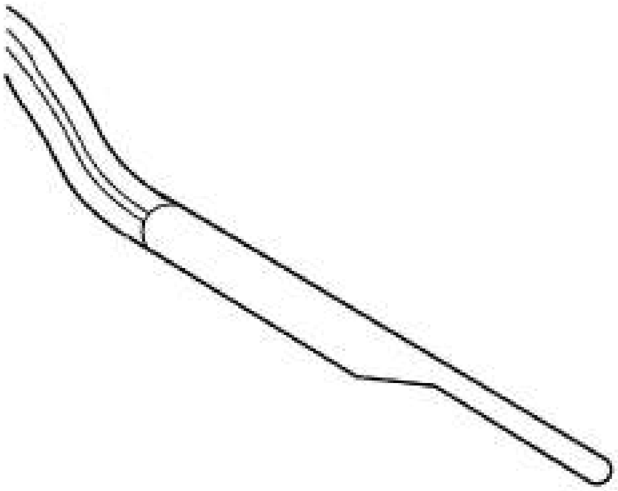
At the TCM, the AC signal is electronically converted to a 5 volt square wave pattern. The square wave pattern can then be interpreted as transmission output speed by the TCM through the frequency of square waves in a given time frame. The square waves can be thought of as a representation of the rear internal gear teeth. Therefore, the more teeth or waves that pass by the magnetic pickup in a given time frame, the faster the vehicle is moving. The square wave pattern is compared to a fixed clock signal internal to the TCM to determine transmission output speed.

Automatic Transmission Input Speed (A/T ISS) Sensor (44)



The A/T ISS sensor operates identically to the A/T OSS sensor except that is uses the stamped teeth on the reverse clutch input housing assembly (401) as the rotor reluctor. Remember that the reverse clutch input housing assembly is driven at converter turbine speed. The A/T ISS sensor square wave pattern is also compared to a fixed clock signal internal to the TCM to determine actual converter turbine speed. The TCM uses transmission input and output speeds to help determine line pressure, transmission shift patterns, TCC apply pressure, gear ratios, and TCC slippage for diagnostic purposes.

Automatic Transmission Fluid Temperature (TFT) Sensor

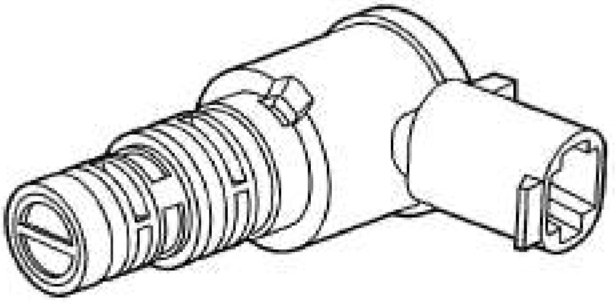


The TFT sensor is part of the transmission wiring harness assembly (55). The TFT sensor is a resistor, or thermistor, which changes value based on temperature. Refer to Transmission Fluid Temperature Sensor Specifications. The sensor has a negative-temperature coefficient. This means that as the temperature increases, the resistance decreases, and as the temperature decreases the resistance increases. The TCM supplies a 5-volt reference signal to the sensor and measures the voltage drop in the circuit. When the transmission fluid is cold the sensor resistance is high and the TCM detects high signal voltage. As the fluid temperature warms to a normal operating temperature, the resistance becomes less and the signal voltage decreases. The TCM uses this information to maintain shift quality and torque converter clutch apply quality over operating temperature range.

If transmission fluid temperatures become excessively high, above approximately 140°C (248°F), the TCM will disable ECCC function and command lock up mode. Applying the TCC serves to reduce transmission fluid temperatures created by the fluid coupling in the torque converter with the TCC released.

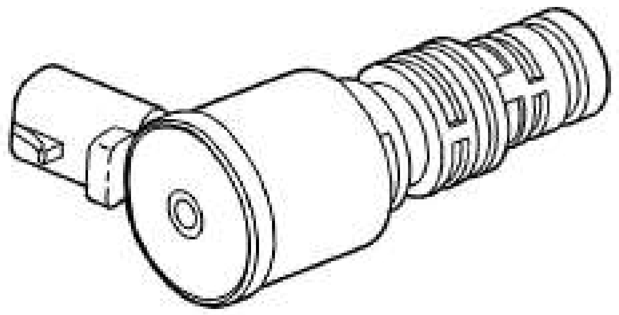
Above approximately 149°C (284°F), the TCM will set a transmission fluid temperature code (P0218). This causes the TCM to use a fixed default value of 135°C (275°F) as the transmission fluid temperature input signal.

Shift Solenoid Valves



The Hydra-matic 5L40-E uses three electromagnetic shift solenoid valves 1-2, 2-3 and 4-5 to control upshifts and downsifts in all forward gear ranges. The shift solenoid valves are all identical, normally closed, 3-port, ON/OFF type solenoids controlled by the TCM. These shift solenoid valves work together in a combination of ON and OFF sequences to control the various shift valves. The TCM uses numerous inputs to determine which solenoid state combination the transmission should be in. Refer to Shift Solenoid Valve State and Gear Ratio.

Torque Converter Clutch Pulse Width Modulation (TCC PWM) Solenoid Valve (352)



The TCC PWM solenoid valve is a normally-closed, pulse width modulated (PWM) solenoid used to control the apply and release of the converter clutch. The TCM operates the solenoid with a negative duty cycle, at a fixed frequency of 32 Hz, to control the rate of TCC apply/release. The solenoid's ability to 'ramp' the TCC apply and release pressures results in a smoother TCC operation.

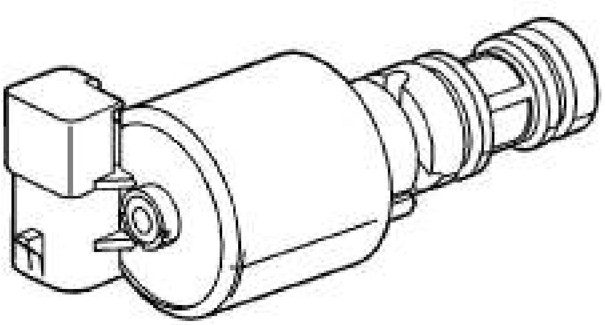
When vehicle operating conditions are appropriate to apply the TCC, the TCM increases the duty cycle to allow the TCC PWM solenoid valve to command TCC signal fluid pressure at a level sufficient to move the TCC enable valve and the TCC control valve to the apply position. Release pressure is directed to exhaust, and regulated apply fluid is directed to the apply side of the converter pressure plate/damper assembly. The TCM then increases the duty cycle to control a slippage of 20-80 RPM between the pressure plate/damper assembly and the converter cover. This provides for improved filtration of engine vibrations and allows the TCC to apply at low engine speeds in 2nd, 3rd, 4th and 5th gear. At high speed, lock up mode is set by activating the TCC PWM solenoid valve at maximum duty cycle.

Release of the TCC is achieved by decreasing the duty cycle to a level low enough to allow spring force to move the TCC enable valve and the TCC control valve to the release position. Apply fluid is directed to exhaust and converter feed fluid is directed into the release circuit to the release side of the pressure plate/damper assembly.

There are also some operating conditions that may prevent or enable TCC apply under various conditions, engine temperature, transmission temperature, or brake switch activation, depending on vehicle application.

TCC PWM solenoid valve resistance should measure between 10.0-11.5 Ω when measured at 20°C (68°F). The resistance should measure approximately 16 Ω at 150°C (300°F).

Pressure Control (PC) Solenoid Valve (357)



The pressure control (PC) solenoid valve is a precision electronic pressure regulator that controls transmission line pressure based on current flow through its coil windings. As current flow is increased, the magnetic field produced by the coil moves the solenoid's plunger further away from the exhaust port. Opening the exhaust port decreases the output fluid pressure regulated by the PC solenoid valve, which ultimately decreases line pressure. The TCM controls the PC solenoid valve based on various inputs including throttle position, transmission fluid temperature and gear state.

Duty Cycle, Frequency and Current Flow

A duty cycle may be defined as the percentage of time current is flowing through a solenoid coil during each cycle. The number of cycles that occur within a specified amount of time, usually measured in seconds, is called 'frequency.' Typically, the operation of an electronically controlled pulse width modulated solenoid is explained in terms of duty cycles and frequency.

The TCM controls the PC solenoid valve on a positive duty cycle at a fixed frequency of 292.5 Hz cycles per second. A higher duty cycle provides a greater current flow through the solenoid. The high positive side of the PC solenoid valve electrical circuit at the TCM controls the PC solenoid valve operation. The TCM provides a ground path for the circuit, monitors average current and continuously varies the PC solenoid valve duty cycle to maintain the correct average current flowing through the PC solenoid valve.

The duty cycle and current flow to the PC solenoid valve are mainly affected by throttle position and engine torque. As the throttle angle engine torque increases, the duty cycle is decreased by the TCM which decreases current flow to the PC solenoid valve. Current flow to the PC solenoid valve creates a magnetic field that moves the solenoid armature against spring force.

Transmission Adapt Function

Programming within the TCM also allows for automatic adjustments in shift pressure that are based on the changing characteristics of the transmission components. As the apply components within the transmission wear, shift time, the time required to apply a clutch, increases. In order to compensate for this wear, the TCM adjusts trim pressure by controlling the PC solenoid valve in order to maintain the originally calibrated shift timing. The automatic adjusting process is referred to as adaptive learning and it is used to provide consistent shift feel plus increase transmission durability. The TCM monitors the A/T ISS and the A/T OSS during commanded shifts to determine if a shift is occurring too fast, harsh or too slow, soft and adjusts the PC solenoid valve signal to maintain a set shift feel.

Limp Home Mode Description

If a major electrical system failure occurs which may affect vehicle safety or damage the transmission during normal operation, the TCM enters a default mode. In the default mode, the transmission operates in the following manner:

- The pressure control solenoid is off and the line pressure is at maximum in order to minimize clutch slippage.
- The TCC solenoid is off. The converter clutch is disabled.
- All three of the shift solenoids are off. The transmission will operate in fifth gear if the vehicle has successfully completed a 1-2 upshift in the current ignition cycle. If the vehicle has not completed a 1-2 upshift in the current ignition cycle, the transmission will operate in fourth gear. If the transmission is operating in fifth gear, fourth gear may be obtained if the engine is stopped briefly and re-started.

In default mode, the gear selector lever is ineffective at selecting forward gear ranges. In fourth or fifth gear, heat builds up in the transmission quickly, particularly in stop and go traffic. Excessive heat build-up may cause transmission failure if the vehicle is driven for extended distances in default mode.

Manual Fourth Gear

Manual Fourth - Fourth Gear - Drive Range may be selected at any time while the vehicle is being operated in a forward gear range. However, TCM control prevents the transmission from shifting into Fifth gear. When the gear selector lever is moved to Drive Range (4) from Overdrive Range (D), the manual valve also moves. Changes to the hydraulic and electrical systems are as follows:

Overdrive Clutch Releases

Manual Valve:: The manual valve moves only to activate the transmission manual shift shaft switch assembly. The transmission manual shift shaft switch assembly signals the TCM that the transmission is in Manual Fourth Range. There is no hydraulic difference between Overdrive Range and Manual Fourth Range at the manual valve.

4-5 Shift Solenoid (SS) Valve:: The 4-5 SS valve is energised, allowing feed limit fluid to enter the 4-5 signal fluid circuit. 4-5 signal fluid overcomes 4-5 shift valve spring (373) force and moves the 4-5 shift control valve (375) and the 4-5 shift valve (374) to the applied position.

4-5 Shift Valve:: 4-5 fluid is blocked at the 4-5 shift valve (374) allowing overdrive clutch feed 2 fluid to exhaust.

Overdrive Clutch Assembly:: Overdrive clutch fluid exhausts from the overdrive clutch piston, allowing the overdrive clutch plates to disengage.

#12 Ball Check Valve:: Overdrive clutch fluid seats the #12 ball check valve against the overdrive clutch feed 1 passage and enters the overdrive clutch feed 2 fluid circuit where it exhausts at the 4-5 shift valve.

Shift Accumulation

Overdrive Clutch Accumulator:: Overdrive clutch fluid also exhausts from the overdrive clutch accumulator assembly. Accumulator fluid moves the overdrive clutch accumulator piston against accumulator spring force in preparation for another application of the overdrive clutch.

Coast Clutch Applies

4-5 Shift Valve:: Coast clutch feed fluid passes through the 4-5 shift valve (374) and into the coast clutch circuit.

Coast Clutch:: Coast clutch fluid is routed to the coast clutch piston to apply the coast clutch plates.

In Manual Fourth - Fourth Gear, the TCC will not release if Manual Fourth was selected while the vehicle was operating in Overdrive Range - Fifth Gear with the TCC applied. Under normal operating conditions, the converter clutch operates the same way in Manual Fourth - Fourth Gear as in Overdrive Range - Fourth Gear.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Description and Operation | **Document ID: 1985240**

Manual Second - First Gear

Manual Second - First Gear is commanded by the TCM, when vehicle speed is low enough not to overrev the engine - calibratable in the TCM, in order to achieve maximum engine braking. Changes to the hydraulic and electrical systems are as follows:

Manual Valve:: Manual Second - First Gear is commanded by the TCM only, there is no movement of the manual valve.

Low and Reverse Clutch Applied

1-2 Shift Solenoid (SS) Valve:: The 1-2 SS valve is de-energised, blocking feed limit fluid from entering the 1-2 signal fluid circuit and 1-2 signal fluid pressure exhausts through the 1-2 SS valve.

1-2 Shift Control Valve:: With 1-2 signal fluid exhausted, 2-3 signal fluid is able to move the 1-2 shift control valve (366) against 1-2 shift control valve spring (367) force to the applied position. This allows feed limit fluid to enter the FDL fluid circuit.

1-2 Shift Valve:: FDL fluid is routed to the 1-2 shift valve (387) and moves the valve against 1-2 shift valve spring (388) force to the applied position. This allows 123 regulated fluid to enter the low and reverse clutch fluid circuit.

#8 Ball Check Valve:: Low and reverse clutch fluid seats the #8 ball check valve against the reverse lockout fluid passage and enters the low and reverse clutch or reverse lockout fluid passage.

Low and Reverse Clutch:: Low and reverse clutch or reverse lockout fluid pressure enters the outer area of the low and reverse clutch piston and moves the piston against spring force to apply the low and reverse clutch plates.

Second Clutch and Second Coast Clutch Release

Second Clutch Assembly:: Second clutch fluid exhausts from the second clutch piston, allowing the second clutch plates to disengage.

Second Coast Clutch Assembly:: Second coast clutch fluid exhausts from the second coast clutch piston, allowing the second coast clutch plates to disengage.

1-2 Shift Valve:: Second coast clutch fluid is routed through the 2-3 shift valve to the 1-2 shift valve where it enters the second clutch fluid circuit. Second clutch fluid is routed through orifice #21 to the 1-2 shift valve where it exhausts.

Shift Accumulation

Second Clutch Accumulator:: Second clutch fluid also exhausts from the second clutch accumulator assembly. Accumulator fluid moves the second clutch accumulator piston against accumulator spring force in preparation for another application of the second clutch.

Manual Second Gear

Manual Second - Second Gear may be selected at any time while the vehicle is being operated in a forward gear range. However, TCM control prevents the transmission from upshifting above Second gear. When the gear selector lever is moved to Manual Second from Manual Third - Third Gear, the manual valve also moves. Changes to the hydraulic and electrical systems are as follows:

Second Coast Clutch Applied

Manual Valve:: The volume of line pressure entering the 32 fluid circuit at the manual valve is increased to accommodate the added torque requirements for engine braking or increased engine load.

2-3 Shift Solenoid (SS) Valve:: The 2-3 SS valve is energised, allowing feed limit fluid to enter the 2-3 signal fluid circuit. 2-3 signal fluid overcomes 2-3 shift valve spring (372) force and moves the 2-3 shift valve (371) to the applied position. This allows 23 regulated fluid to enter the second coast clutch fluid circuit and also opens the overdrive clutch feed 1, intermediate clutch and 345 fluid circuits to exhaust.

3-4 Shift Control Valve:: 2-3 signal fluid is also routed to the 3-4 shift control valve (346) and moves the valve against 1-2 signal fluid pressure to keep the 3-4 shift valve (345) in the applied position.

Second Coast Clutch:: Second coast clutch fluid is directed to the second coast clutch piston to apply the second coast clutch plates.

Important: If the vehicle operating conditions are such that the TCM signals a Third, Fourth or Fifth gear state, the 2-3 solenoid will be de-energised. Thus a downshift will not occur until the vehicle speed is low enough not to overrev the engine - calibratable in the TCM.

Overdrive Clutch Releases

Overdrive Clutch Assembly:: Overdrive clutch fluid exhausts from the overdrive clutch piston, allowing the overdrive clutch plates to disengage.

#12 Ball Check Valve:: Overdrive clutch fluid seats the #12 ball check valve against the overdrive clutch feed 2 passage and enters the overdrive clutch feed 1 fluid circuit.

2-3 Shift Valve:: Exhausting overdrive clutch feed 2 fluid is routed through the 2-3 shift valve into the intermediate clutch fluid circuit.

Intermediate Clutch Releases

Intermediate Clutch Assembly:: Intermediate clutch fluid exhausts from the intermediate clutch piston, allowing the intermediate clutch plates to disengage.

2-3 Shift Valve:: Intermediate clutch fluid is routed through orifice #24 to the 2-3 shift valve where it exhausts.

Shift Accumulation

Intermediate Clutch Accumulator:: Intermediate clutch fluid also exhausts from the intermediate clutch accumulator assembly. Accumulator fluid moves the intermediate clutch accumulator piston against accumulator spring force in preparation for another application of the intermediate clutch.

If the converter clutch was applied when Manual Second was selected it will release during downshifting. Under normal operating conditions the converter clutch will not re-apply in Second gear.

Manual Third Gear

Manual Third - Third Gear may be selected at any time while the vehicle is being operated in a forward gear range. However, TCM control prevents the transmission from shifting above Third gear. When the gear selector lever is moved to Manual Third range from Manual Fourth - Fourth Gear, the manual valve also moves. Changes to the hydraulic and electrical systems are as follows:

Overdrive Clutch Applies

Manual Valve:: Line pressure enters the 32 fluid circuit at the manual valve. 32 fluid is routed to the safety mode valve.

1-2 Shift Solenoid (SS) Valve:: The 1-2 SS valve is energised, allowing feed limit fluid to enter the 1-2 signal fluid circuit. 1-2 signal fluid is routed to the safety mode valve and to the 3-4 shift valve.

3-4 Shift Valve:: 1-2 signal fluid overcomes 3-4 shift valve spring force and moves the 3-4 shift valve to the applied position. This allows D432 fluid to enter the 123 fluid circuit, and allows direct clutch and 45 fluids to exhaust.

#4 Ball Check Valve:: 123 fluid seats the #4 ball check valve and passes through orifice #16 on the way to the 4-5 shift valve.

4-5 Shift Valve:: 123 fluid passes throught the 4-5 shift valve (333) into the 123 braking fluid circuit.

Low Pressure Control Valve:: 123 braking fluid is regulated into the 123 regulated fluid circuit through the low pressure control valve (383).

1-2 Shift Valve:: 123 regulated fluid passes through the 1-2 shift valve into the 23 regulated fluid circuit.

#9 and #11 Ball Check Valve:: 23 regulated fluid seats the #9 and the #11 ball check valves and is forced through orifices #22 and #23.

2-3 Shift Valve:: 23 regulated fluid passes through the 2-3 shift valve into the overdrive clutch feed 1 fluid circuit.

#12 Ball Check Valve:: Overdrive clutch feed 1 fluid seats the #12 ball check valve against the overdrive clutch feed 2 passage and enters the overdrive clutch fluid circuit.

Overdrive Clutch:: Overdrive clutch fluid is then directed to the overdirve clutch piston to apply the overdrive clutch plates.

Direct Clutch Releases

Direct Clutch:: Direct clutch fluid exhausts from the direct clutch piston to release the direct clutch plates.

3-4 Shift Valve:: Direct clutch fluid flows through orifice #26 to the 3-4 shift valve where it exhausts.

Shift Accumulation

Direct Clutch Accumulator:: Direct clutch fluid also exhausts from the direct clutch accumulator assembly. Accumulator fluid moves the direct clutch accumulator piston against accumulator spring force in preparation for another application of the direct clutch.

In Manual Third - Third Gear, the TCC will not release if Manual Third was selected while the vehicle was operating in Overdrive Range - Fifth Gear with the TCC applied. Under normal operating conditions, the converter clutch operates the same way in Manual Third - Third Gear as in Overdrive Range - Third Gear.

Neutral - Engine Running

When the gear selector lever is moved to the Neutral (N) position, the hydraulic and electrical system operation is identical to Park (P) range. However, if Neutral is selected after the vehicle was operating in Reverse (R), the following changes occur in the hydraulic system:

Reverse Clutch Releases

Manual Valve:: The manual valve is moved to the neutral position and blocks line pressure from entering the reverse fluid circuit. The reverse fluid circuit is opened to an exhaust at the manual valve.

Reverse Clutch:: Reverse clutch fluid exhausts from the reverse clutch to the #1 ball check valve allowing the reverse clutch to release.

#1 Ball Check Valve:: Reverse clutch fluid unseats the #1 ball check valve and enters the reverse lockout fluid circuit. Reverse lockout fluid then flows to the reverse lockout valve where it enters the reverse fluid circuit.

Reverse Lockout Valve:: Reverse lockout fluid passes through the reverse lockout valve and into the reverse fluid circuit and on to the manual valve where it exhausts.

Line Boost Valve:: Reverse clutch fluid exhausts from the line boost valve, allowing line pressure to return to the normal operating range as in Park, Neutral and Overdrive gear ranges.

Low and Reverse Clutch Releases

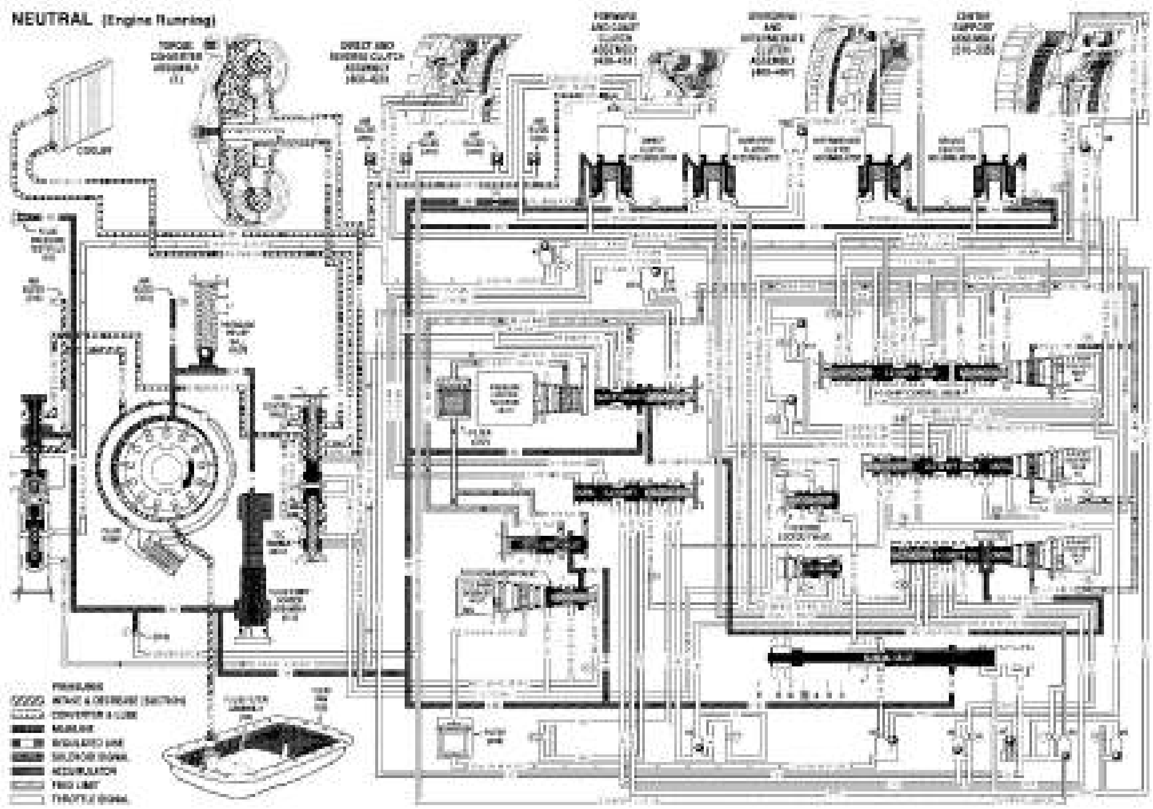
Important: Allowing fluid to bypass an orifice when exhausting makes for a quick release of the clutch. This prevents the friction material from "dragging" and creating excess fluid temperatures or damaging the clutch.

Important: In Park, Reverse and Neutral the shift solenoid valves are shown de-energised. This is the normal operating state when the vehicle is stationary or at low vehicle speeds. However, the TCM will change the shift solenoid valve states depending on vehicle speed. For example, if Neutral range is selected when the vehicle is operating in Second gear, the shift solenoid valves will remain in a Second gear state. But with the manual valve in Neutral, line pressure is blocked, D432 fluid exhausts and the transmission will shift into Neutral.

Low and Reverse Clutch:: Low and reverse clutch or reverse lockout fluid exhausts from the outer area of the low and reverse clutch piston to the #8 ball check valve. Reverse lockout fluid also exhausts from the inner area of the low and reverse clutch piston through orifice #12. The exhaust of these fluids allows the low and reverse clutch to release.

#8 Ball Check Valve:: Low and reverse clutch or reverse lockout fluid seats the #8 ball check valve against the low and reverse clutch fluid circuit and enters the reverse lockout fluid circuit where it exhausts along with reverse clutch fluid past the manual valve.

Neutral Engine Running



NEUTRAL (Engine Running)
COOLER

Overdrive Range, Fifth Gear - Torque Converter Clutch Applied

When the TCC pressure plate is applied, it is held against the torque converter cover. Since it is splined to the converter turbine hub, it provides a mechanical coupling - direct drive of the engine to the transmission gear sets. This mechanical coupling eliminates the small amount of slippage that occurs in the fluid coupling of a torque converter, resulting in a more efficient transfer of engine torque through the transmission and to the drive wheels.

On:: At this time the Torque Converter Clutch is considered to be engaged - ON.

Stage 4:: During this stage, the apply pressure from the TCC Regulator valve is decreased by the TCC PWM solenoid valve duty cycle dropping. Spring force pushes the valve back and reduces the Regulated Apply pressure. This reduces the apply force on the TCC pressure plate to the slip threshold. This gets the TCC pressure plate ready for a smooth release.

Stage 5:: The TCC PWM solenoid valve duty cycle is ramped down through this stage. This action allows the Regulated Apply pressure to start at the slip threshold, and decrease to near "0" pressure over a very short time. The Regulated Apply pressure value from the TCC Regulator valve at this duty cycle should fully release the TCC pressure plate. Slip speed should be at the maximum value.

Stage 6:: The TCM pulses the TCC PWM solenoid valve to a value of "0". Now the TCC Control and TCC Enable valves return to their released positions - away from the spring. Release fluid is now directed back to the torque converter. This stage is designed to move the TCC Control and TCC Enable valves to the released position.

OFF:: At this time the Torque Converter Clutch is considered to be disengaged - OFF.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Description and Operation | **Document ID: 1985231**

Overdrive Range, Fifth Gear - Torque Converter Clutch Released

Overdrive Range - Fifth Gear is used to maximize engine efficiency and fuel economy under most normal driving conditions. In order to shift the transmission into Fifth gear, the TCM receives input signals from both speed sensors, the TP sensor and other vehicle sensors to determine the precise moment to de-energize or "turn OFF" the 4-5 shift solenoid (SS) valve.

Overdrive Clutch Applied

4-5 Shift Solenoid (SS) Valve:: The 4-5 SS valve is de-energised, blocking feed limit fluid from entering the 4-5 signal fluid circuit. 4-5 signal fluid pressure exhausts through the 4-5 SS valve and 4-5 shift valve spring (373) force moves the 4-5 shift valve (374) and the 4-5 shift control valve (375) to the released position.

4-5 Shift Valve:: 45 fluid is routed through the 4-5 shift valve and enters the overdrive clutch feed 2 fluid circuit through orifice #28.

#12 Ball Check Valve:: Overdrive clutch feed 2 fluid seats the #12 ball check valve against the overdrive clutch feed 1 passage and enters the overdrive clutch fluid circuit.

Overdrive Clutch:: Overdrive clutch fluid is then directed to the overdrive clutch piston to apply the overdrive clutch plates and achieve Fifth gear.

4-5 Shift Accumulation

Overdrive Clutch Accumulator:: Overdrive clutch fluid is also sent to the overdrive clutch accumulator assembly. Overdrive clutch fluid, together with accumulator spring force, moves the overdrive clutch accumulator piston against accumulator fluid pressure to cushion the apply of the overdrive clutch.

Coast Clutch Releases

Coast Clutch:: When the 4-5 shift valve is shifted to the released position, coast clutch feed fluid is blocked and coast clutch fluid exhausts through the valve allowing the coast clutch to release.

4-5 Shift Valve:: Coast clutch fluid passes through the 4-5 shift valve and into the 123 circuit and on to the 3-4 shift valve where it exhausts.

Torque Converter Clutch Released

TCC PWM Solenoid Valve:: Filtered 2345 or reverse fluid is still available at the TCC PWM solenoid valve. However, depending on the shift pattern, the TCM keeps the pulse width modulated (PWM) solenoid de-energised blocking filtered 2345 or reverse fluid from entering the TCC signal fluid circuit, thereby keeping the torque converter clutch released.

Overdrive Range, First Gear (After First 1-2 Shift)

When the gear selector lever is moved to the Overdrive range position (D), from the Neutral (N) position, after the first 1-2 shift has occurred, the following changes occur to shift the transmission into Overdrive Range - First Gear.

Manual Valve:: In the Overdrive position the manual valve routes line pressure into the D432 fluid circuit. D432 fluid is routed to the 1-2 shift valve and to the 3-4 shift valve.

Forward Clutch Applies

#6 and #7 Ball Check Valves:: D432 fluid seats the #6 ball check valve and passes through orifice #15 into the forward clutch fluid circuit. D432 fluid also passes by the spring loaded #7 ball check valve to feed the forward clutch circuit as necessary to help control forward clutch apply.

#5 Ball Check Valve:: Forward clutch fluid seats the #5 ball check valve and passes through orifice #17 into the coast clutch feed circuit.

Forward Clutch Assembly:: Forward clutch fluid is routed to the forward clutch piston to apply the forward clutch plates.

Coast Clutch Applies

2-3 Shift Solenoid (SS) Valve:: The 2-3 SS valve is energised, allowing feed limit fluid to enter the 2-3 signal fluid circuit. 2-3 signal fluid overcomes 2-3 shift valve spring (372) force and moves the 2-3 shift valve (371) to the applied position.

1-2 Shift Control Valve and 1-2 Shift Valve:: 2-3 signal fluid is routed to the 1-2 shift control valve (366) and moves the valve against 1-2 shift control valve spring (367) force to the applied position. This allows feed limit fluid to enter the FDL fluid circuit. FDL fluid is routed to the 1-2 shift valve (387) and moves the valve against 1-2 shift valve spring (388) force to the applied position to block D432 fluid at the valve.

3-4 Shift Control Valve and 3-4 Shift Valve:: 2-3 signal fluid is also routed to the 3-4 shift control valve (346) and moves the valve against 3-4 shift valve spring (344) force to the applied position. This allows D432 fluid to enter the 123 fluid circuit at the 3-4 shift valve (345).

#4 Ball Check Valve:: 123 fluid seats the #4 ball check valve and passes through orifice #16. This orifice helps to control coast clutch apply.

4-5 Shift Valve:: Orificed 123 fluid is routed to the 4-5 shift valve (374) where it passes into the coast clutch fluid circuit.

Coast Clutch Assembly:: Coast clutch fluid is routed to the coast clutch piston to apply the coast clutch plates.

Fluid Pressure Directed in Preparation for a Shift to Second Gear

1-2 Shift Valve:: D432 fluid is routed to the 1-2 shift valve (387) where it is blocked by the valve in preparation for an upshift to second gear.

Overdrive Range, First Gear (Before First 1-2 Shift)

When the gear selector lever is moved to the Overdrive range position (D), from the Neutral (N) position, before the first 1-2 shift has occurred, the following changes occur to shift the transmission into Overdrive Range - First Gear.

Manual Valve:: In the Overdrive position the manual valve routes line pressure into the D432 fluid circuit. D432 fluid is routed to the 1-2 shift valve and to the 3-4 shift valve.

Forward Clutch Applies

#6 and #7 Ball Check Valves:: D432 fluid seats the #6 ball check valve and passes through orifice #15 into the forward clutch fluid circuit. D432 fluid also passes by the spring loaded #7 ball check valve to feed the forward clutch circuit as necessary to help control forward clutch apply.

Forward Clutch Assembly:: Forward clutch fluid is routed to the forward clutch piston to apply the forward clutch plates.

Coast Clutch Applies

#5 Ball Check Valve:: Forward clutch fluid seats the #5 ball check valve and passes through orifice #17 into the coast clutch feed circuit. This orifice helps to control coast clutch apply.

Safety Mode Valve:: Before the first 1-2 shift has occurred, the safety mode valve (34)1 remains in the released position, allowing line fluid pressure to enter the line safety mode fluid circuit.

4-5 Shift Valve:: Line safety mode fluid applies the 4-5 shift valve (374) against 4-5 shift valve spring (373) force. This allows coast clutch feed fluid to enter the coast clutch fluid circuit.

Coast Clutch Assembly:: Coast clutch fluid is routed to the coast clutch piston to apply the coast clutch plates.

Low and Reverse Clutch Applies

2-3 Shift Solenoid (SS) Valve:: The 2-3 SS valve is energised, allowing feed limit fluid to enter the 2-3 signal fluid circuit. 2-3 signal fluid overcomes spring force and applies the 2-3 shift valve (371).

3-4 Shift Control Valve and 3-4 Shift Valve:: 2-3 signal fluid is routed to the 3-4 shift control valve (346) and applies the valve against spring force. This allows D432 fluid to enter the 123 fluid circuit.

#4 Ball Check Valve:: 123 fluid seats the #4 ball check valve and passes through orifice #16. This orifice helps to control low and reverse clutch apply.

4-5 Shift Valve:: Orificed 123 fluid is routed to the 4-5 shift valve (374) where it passes into the 123 braking fluid circuit.

Low Pressure Control Valve:: 123 braking fluid is routed to the low pressure control valve (383). This valve regulates 123 braking fluid into the 123 regulated fluid circuit against spring force and orificed 123 regulated fluid pressure.

1-2 Shift Control Valve and 1-2 Shift Valve:: 2-3 signal fluid is also routed to the 1-2 shift control valve (366) and applies the valve against spring force. This allows feed limit fluid to enter the FDL fluid circuit. FDL fluid is routed to the 1-2 shift valve (387) and applies the valve against spring force. 123 regulated fluid is routed through orifice #20 to the 1-2 shift valve where it passes into the low and reverse clutch fluid circuit.

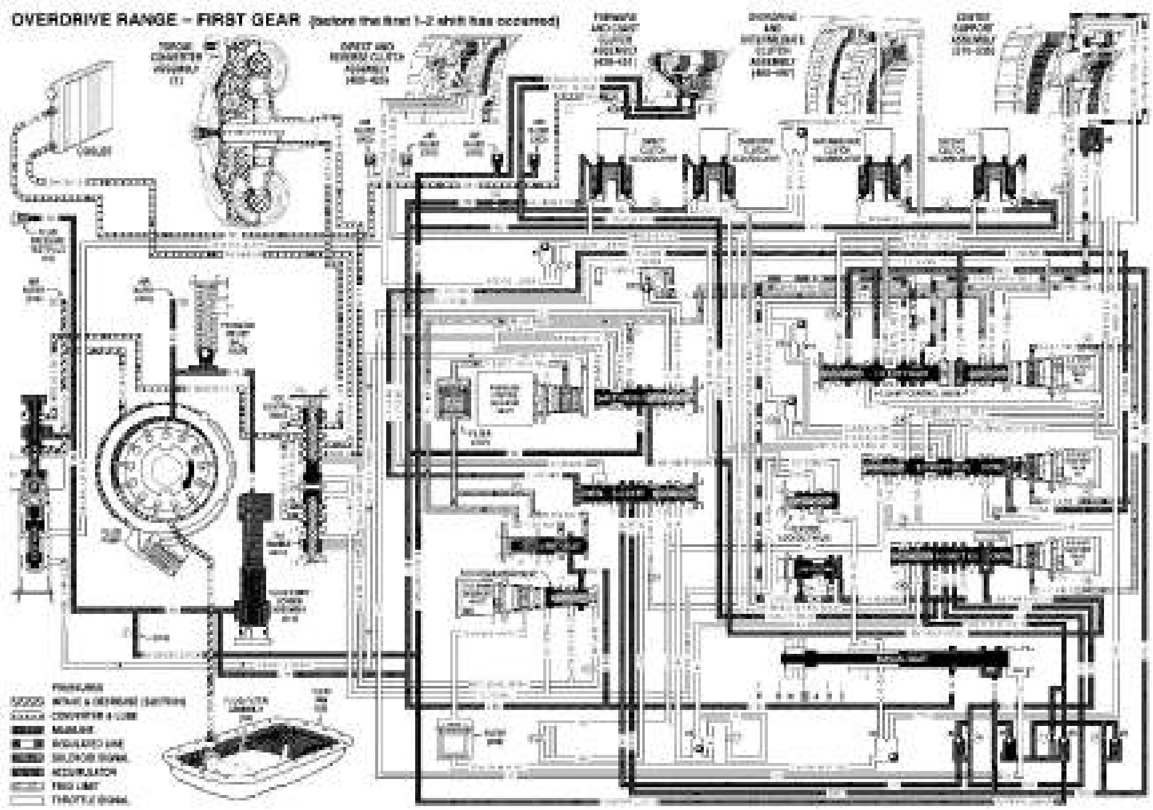
#8 Ball Check Valve:: Low and reverse clutch fluid seats the #8 ball check valve against the reverse lockout fluid passage and enters the low and reverse clutch or reverse lockout fluid passage.

Low and Reverse Clutch:: Low and reverse clutch or reverse lockout fluid pressure enters the outer area of the low and reverse clutch piston and moves the piston against spring force to apply the low and reverse clutch plates.

Fluid Pressure Directed in Preparation for a Shift to Second Gear

1-2 Shift Valve:: D432 fluid is routed to the 1-2 shift valve (387) where it is blocked by the valve in preparation for an upshift to second gear.

Overdrive Range, First Gear



OVERDRIVE RANGE – FIRST GEAR (before the first 1-2 shift has occurred)

Overdrive Range, Fourth Gear

As vehicle speed increases, the TCM receives input signals from both speed sensors, the TP sensor and other vehicle sensors to determine the precise moment to de-energize or "turn OFF'" the 1-2 shift solenoid (SS) valve, and to energize or "turn ON" the 4-5 SS valve.

Direct Clutch Applies

1-2 Shift Solenoid (SS) Valve:: The 1-2 SS valve is de-energised, blocking feed limit fluid from entering the 1-2 signal fluid circuit and 1-2 signal fluid pressure exhausts through the 1-2 SS valve.

3-4 Shift Valve:: When 1-2 signal fluid pressure exhausts from the 3-4 shift valve (345), the 3-4 shift valve spring (344) moves the valve to the released position. 345 fluid from the 2-3 shift valve flows through the 3-4 shift valve and enters the direct clutch circuit.

Direct Clutch:: Direct clutch fluid is routed to the direct clutch piston to apply the direct clutch plates and obtain Fourth gear.

3-4 Shift Accumulation

Direct Clutch Accumulator:: Direct clutch fluid is also sent to the direct clutch accumulator assembly. Direct clutch fluid, together with accumulator spring force, moves the direct clutch accumulator piston against accumulator fluid pressure to cushion the apply of the direct clutch.

Coast Clutch Feed

4-5 Shift Solenoid (SS) Valve:: The 4-5 SS valve is energised, allowing feed limit fluid to enter the 4-5 signal fluid circuit. 4-5 signal fluid overcomes 4-5 shift valve spring (373) force and moves the 4-5 shift control valve (375) and the 4-5 shift valve (374) to the applied position.

4-5 Shift Valve:: In first through third gears, the coast clutch has been fed by 123 fluid. In fourth gear the 4-5 shift valve (374) is applied in preparation for a shift to fifth gear. This causes the coast clutch fluid circuit to be supplied by coast clutch feed fluid, and 123 fluid to exhaust.

Torque Converter Clutch Released

TCC PWM Solenoid Valve:: Filtered 2345 or reverse fluid is still available at the TCC PWM solenoid valve. However, depending on the shift pattern, the TCM keeps the pulse width modulated (PWM) solenoid de-energised blocking filtered 2345 or reverse fluid from entering the TCC signal fluid circuit, thereby keeping the torque converter clutch released.

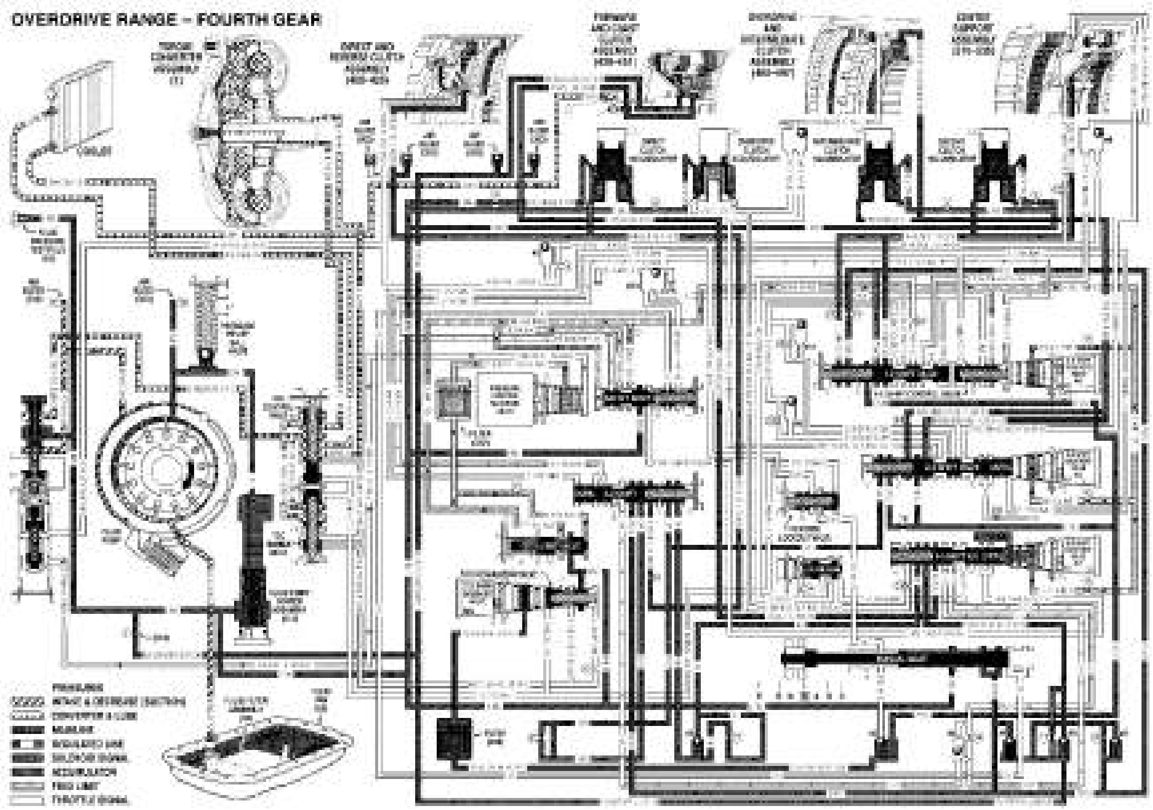
Fluid Pressure Directed in Preparation for a Shift to Fifth Gear

3-4 Shift Valve:: 345 fluid is routed through the 3-4 shift valve (345) into the 45 fluid circuit.

#3 Ball Check Valve:: 45 fluid seats the #3 ball check valve and passes through orifice #27. This orifice helps to control overdrive clutch apply in fifth gear.

4-5 Shift Valve:: 45 fluid is routed to the 4-5 shift valve (374) where it is blocked by the valve in preparation for an upshift to fifth gear.

Overdrive Range, Fourth Gear - Torque Converter Clutch (TCC) Applied



Overdrive Range, Second Gear

As vehicle speed increases, the transmission control module (TCM) receives input signals from both the input and ouput speed sensors, the throttle position (TP) sensor and other vehicle sensors to determine the precise moment to energise or "turn ON" the 1-2 shift solenoid (SS) valve.

Second Clutch Applies

1-2 Shift Solenoid (SS) Valve:: The 1-2 SS valve is energised, allowing feed limit fluid to enter the 1-2 signal fluid circuit. 1-2 signal fluid, together with 1-2 shift control valve spring (367) force, overcomes 2-3 signal fluid pressure and moves the 1-2 shift control valve (366) to the released position. This blocks feed limit fluid from entering the FDL fluid circuit.

1-2 Shift Valve:: FDL fluid is exhausted from the 1-2 shift valve (387) and 1-2 shift valve spring (388) force moves the valve to the released position to allow D432 fluid to enter the second clutch and 2345 fluid circuits.

Second Clutch:: Second clutch fluid is directed to the second clutch piston to apply the second clutch plates and achieve Second gear.

Shift Accumulator

Second Clutch Accumulator:: Second clutch fluid is also sent to the second clutch accumulator assembly. Second clutch fluid, together with accumulator spring force, moves the second clutch accumulator piston against accumulator fluid pressure to cushion the apply of the second clutch.

Fluid Pressure Directed in Preparation for a Shift to Third Gear

2-3 Shift Valve:: 2345 fluid is routed to the 2-3 shift valve (371) where it is blocked by the valve in preparation for an updshift to third gear.

Torque Converter Clutch Released

#2 Ball Check Valve:: 2345 fluid seats the ball check valve against the reverse passage and enters the 2345 or reverse fluid circuit.

TCC PWM Solenoid Valve:: 2345 or reverse fluid is directed through the TCC PWM solenoid valve filter to the TCC PWM solenoid valve. However, depending on the shift pattern, the TCM keeps the pulse width modulated (PWM) solenoid de-energised blocking filtered 2345 or reverse fluid from entering the TCC signal fluid circuit, thereby keeping the torque converter clutch released.

Overdrive Range, Third Gear

As vehicle speed increases, the TCM receives input signals from both speed sensors, the TP sensor and other vehicle sensors to determine the precise moment to de-energize or "turn OFF" the 2-3 shift solenoid (SS) valve. The 2-3 solenoid is OFF when the TCM removes the path to ground for that electrical circuit. This allows 2-3 signal fluid to exhaust at the 2-3 SS valve.

Intermediate Clutch Applies

2-3 Shift Solenoid (SS) Valve:: The 2-3 SS valve is de-energised, blocking feed limit fluid from entering the 2-3 signal fluid circuit. 2-3 signal fluid pressure exhausts through the 2-3 SS valve and 2-3 shift valve spring (372) force moves the 2-3 shift valve (371) to the released position.

2-3 Shift Valve:: 2345 fluid is routed through the 2-3 shift valve and enters the intermediate clutch circuit.

Intermediate Clutch:: Intermediate clutch fluid is directed to the intermediate clutch piston to apply the intermediate clutch plates and achieve Third gear.

Shift Accumulation

Intermediate Clutch Accumulator:: Intermediate clutch fluid is also sent to the intermediate clutch accumulator assembly. Intermediate clutch fluid, together with accumulator spring force, moves the intermediate clutch accumulator piston against accumulator fluid pressure to cushion the apply of the intermediate clutch.

Torque Converter Clutch Released

TCC PWM Solenoid Valve:: Filtered 2345 or reverse fluid is still available at the TCC PWM solenoid valve. However, depending on the shift pattern, the TCM keeps the pulse width modulated (PWM) solenoid de-energised blocking filtered 2345 or reverse fluid from entering the TCC signal fluid circuit, thereby keeping the torque converter clutch released.

Fluid Pressure Directed in Preparation for a Shift to Fourth Gear

2-3 Shift Valve:: 2345 fluid is routed through the 2-3 shift valve (371) into the 345 fluid circuit.

X-4 Ball Check Valve:: 345 fluid is routed through the X-4 ball check valve pocket. In some transmisssion models there is a ball check valve present which will force 345 fluid through orifice #25.

3-4 Shift Valve:: 345 fluid is routed to the 3-4 shift valve (345) where it is blocked by the valve in preparation for an upshift to fourth gear.

Park - Engine Running

When the gear selector lever is in the Park (P) position and the engine is running, fluid is drawn into the oil pump and line pressure is directed to the pressure regulator valve.

Pressure Regulation

Pressure Regulator Valve:: Regulates pump output - line pressure in response to throttle signal fluid pressure acting on the line boost valve, spring force, and line pressure acting on the end of the valve. Line pressure is directed to the manual valve, the TCC regulator valve, feed limit valve, and the safety mode valve. Line pressure also feeds the converter feed circuit through the pressure regulator valve, and the accumulator fluid circuits.

Feed Limit Valve:: Line pressure is routed through the valve and into the feed limit fluid circuit. The valve limits feed limit fluid pressure to a maximum pressure. Feed limit fluid is routed to the pressure control solenoid valve, the safety mode valve, the 1-2 control valve, and also feeds the 1-2 signal, the 2-3 signal, and the 4-5 signal fluid circuits.

Pressure Control (PC) Solenoid Valve:: Controlled by the TCM, the PC solenoid valve regulates filtered feed limit fluid pressure into the throttle signal fluid circuit.

Shift Accumulation

Direct, Overdrive, Intermediate, and Second Clutch Accumulator Assemblies:: Accumulator fluid is routed to each of the accumulator assemblies in preparation for upshifts and downshifts.

Torque Converter - Released Position Only

Pressure Regulator Valve:: Line pressure is routed through the pressure regulator valve and into the converter feed fluid circuit. Converter feed fluid is routed to the TCC control valve and to the TCC enable valve.

TCC Regulator Valve:: Spring force holds the valve in the release position, thereby blocking line pressure from entering the regulated apply fluid circuit.

TCC Enable Valve:: Converter feed fluid is routed through the TCC enable valve and into the converter FDL circuit. Converter FDL fluid is routed to the TCC control valve.

TCC Control Valve:: Spring force holds the valve in the release position allowing converter feed fluid to enter the release circuit.

Torque Converter:: Release fluid pressure is routed to the torque converter to keep the TCC released. Fluid leaves the converter in the apply fluid circuit and returns to the cooler through the TCC control valve.

Safety Mode:

Safety Mode Valve:: When the first 1-2 shift occurs, the safety mode valve shifts from the released position to the applied position and remains there until the engine is switched OFF. If safety mode occures - no TCM signal to the shift solenoid valve, the transmission will shift to safety

- fifth gear. If the engine is then switched OFF and ON, still with no TCM signal, the safety mode valve will return to, and remain in, the released position. Line pressure fluid will pass through the safety mode valve into the line safety mode fluid circuit. Line safety mode fluid is routed to the 4-5 shift valve train.

4-5 Shift Valve and 4-5 Shift Control Valve:: Line safety mode fluid forces the 4-5 shift valve to downshift to the fourth gear position allowing - after the engine has been switched OFF, a fourth gear start - instead of fifth, in the event of safety mode.

Fluid Pressure Directied in Preparation for a Shift

Manual Valve:: Mechanically controlled by the gear selector lever, the manual valve is in the Park (P) position and prevents line pressure from the pressure regulator valve from entering the reverse, D432 and 32 fluid circuits.

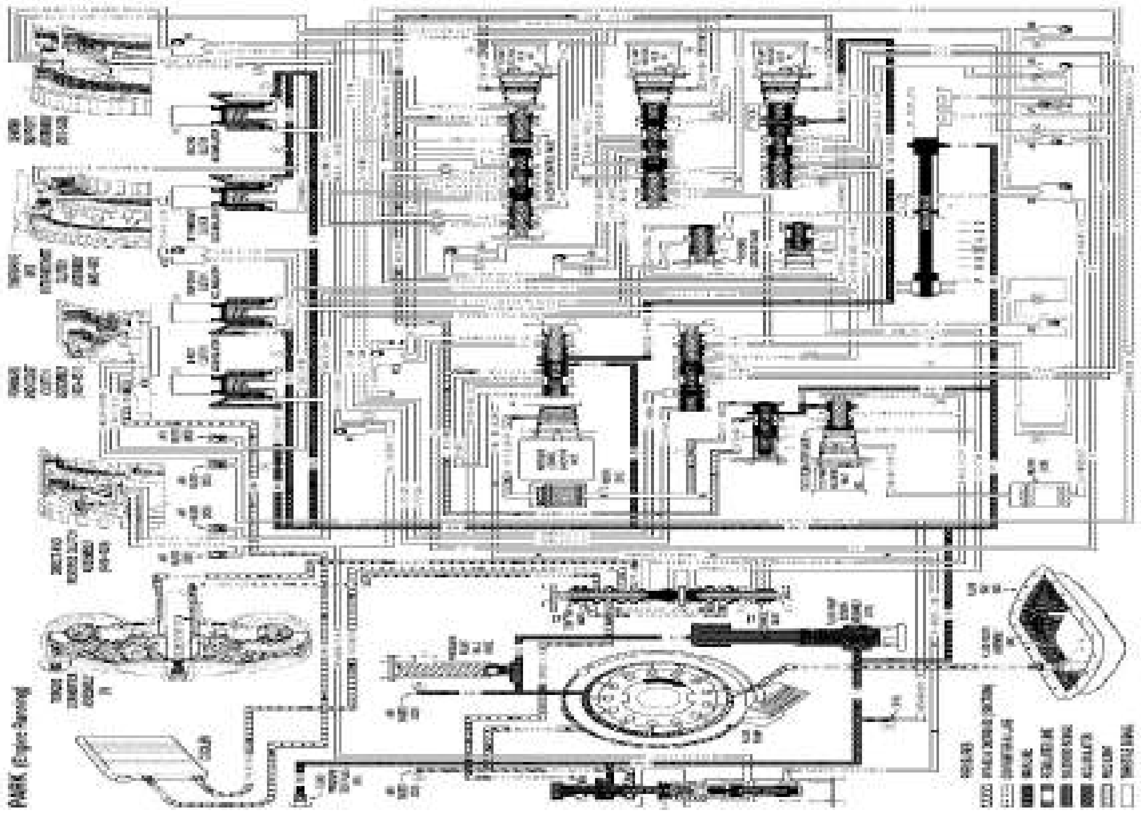
1-2 Shift Solenoid (SS) Valve and 1-2 Shift Control Valve:: Feed limit fluid from the feed limit valve is routed to the 1-2 SS valve and to the 1-2 Shift control valve in preparation for a shift.

2-3 Shift Solenoid (SS) Valve:: Feed limit fluid from the feed limit valve is routed to the 2-3 SS valve in preparation for a shift.

4-5 Shift Solenoid (SS) Valve:: Feed limit fluid from the feed limit valve is routed to the 4-5 SS valve in preparation for a shift.

Direct Clutch, Overdrive Clutch, Intermediate Clutch, and Second Clutch Accumulators:: Line fluid fills the accumulator circuits and accumulator assemblies in preparation for an upshift.

Park Engine Running



PARK (Engine Running)

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 5L40-E/5L50-E | Description and Operation | **Document ID: 1985221**

Reverse

When the gear selector lever is moved to the Reverse (R) position - from the Park position, the following changes occur in the transmission's hydraulic and electrical systems:

Pressure Regulation

Manual Valve:: With the manual valve in the reverse position, line pressure is directed into the reverse fluid circuit.

Reverse Lockout Valve:: Reverse fluid is routed through the reverse lockout valve into the reverse lockout fluid circuit.

Pressure Regulator and Line Boost Valves:: Reverse clutch fluid at the line boost valve boosts line pressure for the additional torque requirements in Reverse. Throttle signal fluid pressure from the pressure control - PC solenoid acting on the line boost valve also helps determine line pressure in Reverse depending on throttle position and other TCM input signals.

Low and Reverse Clutch Applies

#8 Ball Check Valve and Orifice #12:: Located in the bottom channel plate, reverse lockout fluid seats the #8 ball check valve against the low and reverse clutch fluid passage and directs fluid into the low and reverse clutch or reverse lockout fluid passage. Reverse lockout fluid pressure is also orificed, through orifice #12, to provide a controlled apply of the low and reverse clutch.

Low and Reverse Clutch:: Low and reverse clutch or reverse lockout fluid pressure enters the outer area of the low and reverse clutch piston and moves the piston against spring force to apply the low and reverse clutch plates. In addition, reverse lockout fluid pressure is orificed into the inner area of the low and reverse clutch piston and provides additional force to apply the low and reverse clutch plates.

Reverse Clutch Applies

Important: Remember that the function of an orifice is to control the flow rate of fluid and rate of apply or release of a clutch.

#1 Ball Check Valve:: Located in the bottom channel plate, reverse lockout fluid seats the #1 ball check valve and is forced through orifice #13 in the control valve body spacer plate into the reverse clutch fluid passage.

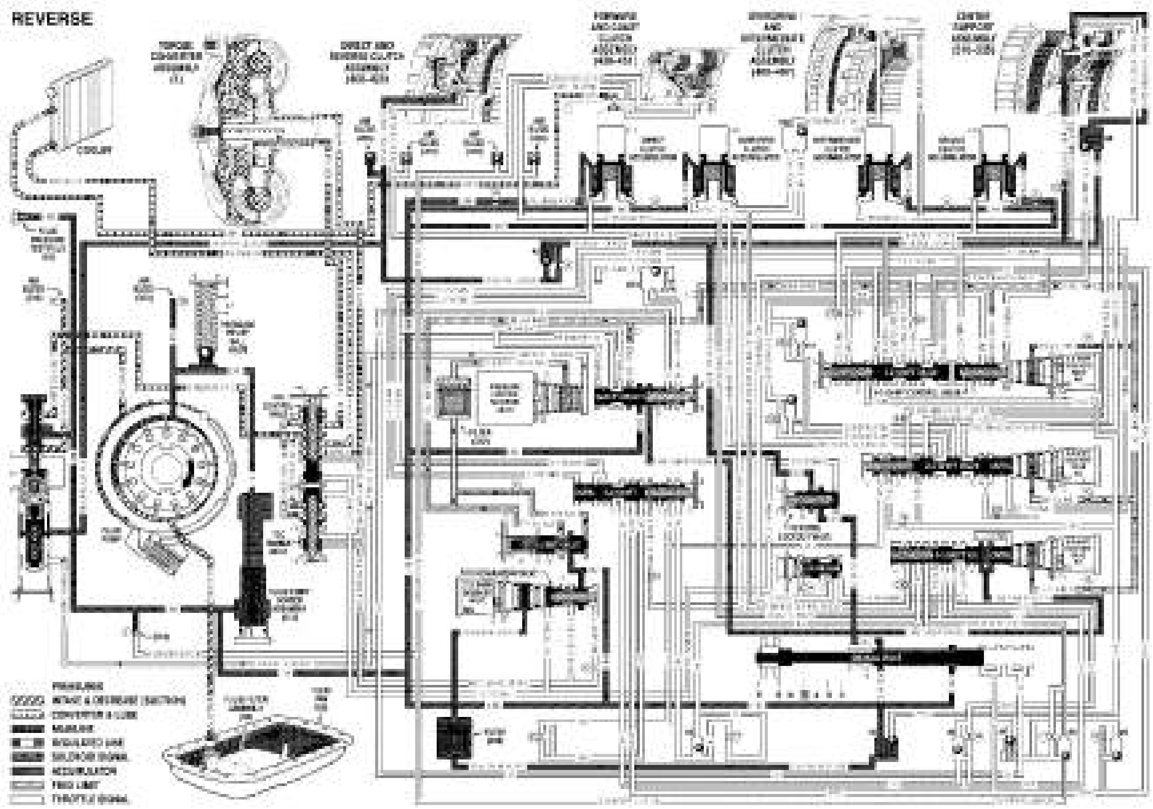
Reverse Clutch:: Reverse clutch fluid enters the reverse clutch housing and acts on the reverse clutch piston to apply the reverse clutch plates.

Fluid Pressure Directed in Preparation for TCC Apply

#2 Ball Check Valve:: Located in the bottom channel plate, reverse fluid seats the #2 ball check valve against the 2345 fluid passage and directs fluid into the 2345 or reverse fluid passage.

Torque Converter Clutch Pulse Width Modulation - TCC PWM Solenoid Valve:: The TCC PWM solenoid valve remains de-energised - OFF. 2345 or reverse fluid is prevented from entering the TCC signal fluid circuit. Under normal circumstances the TCC PWM solenoid valve is not energised. In the event the TCC PWM solenoid valve is energised - when engaging Reverse while driving in Forward above a certain speed, TCC signal fluid will shift the reverse lockout valve to block reverse fluid from entering the reverse lockout circuit and the reverse clutch and the low and reverse clutch will release to prevent damage to the transmission.

Reverse



Sport / Economy Mode Operation

Economy Mode Operation

During economy mode operation, drivers may notice increased powertrain braking after releasing the accelerator pedal. The vehicle will not coast freely when the accelerator pedal is released, but will start to gradually slow down as if the brakes were lightly applied. This feels very similar to what is experienced when releasing the accelerator pedal on a vehicle equipped with a manual transmission.

Sport Mode Operation (Where Fitted)

The sport mode was designed to simulate the performance driving of a manual transmission equipped vehicle. This means that, given certain driving conditions, the vehicle will maintain specific gears longer than a traditional automatic transmission. In addition, if a person is driving in the normal mode in fifth gear, depressing the sport button will cause an immediate 5-4 downshift that will be maintained for ten seconds. If the transmission is in any other gear when sport is engaged, no downshift will take place. No attempt should be made to change or alter these operating characteristics.

Transmission Adaptive Functions

The Hydra-Matic 5L40-E uses a line pressure control system which has the ability to adapt the system line pressure in order to compensate for normal wear of clutch fiber plates, seals, springs, etc. The adapt feature is similar in function to fuel control (integrator/block learn).

The Hydra-Matic 5L40-E transmission uses the adapt function for garage shifts, upshifts, and TCC application. The TCM monitors the input shaft speed in order to determine if the shift is occurring too fast or too slow and adjusts the pressure control solenoid in order to maintain the correct shift feel.

Transmission Component and System Description

The mechanical components of the 5L40-E are as follows:

- A torque converter with an electronically controlled capacity clutch (ECCC)

  This transmission is equipped with an electronically controlled capacity clutch (ECCC). The pressure plate does not fully lock to the torque converter cover. Instead, the pressure plate maintains a small amount of slippage, about 20 RPM, in SECOND, THIRD and FOURTH gears, depending on the vehicle application. ECCC was developed to reduce the possibility of noise, vibration or chuggle caused by TCC apply. Typical apply speeds are 49-52 km/h (30-32 mph) in THIRD gear and 65-73 km/h (40-45 mph) in FOURTH gear. Full lockup is available at highway speeds on some applications.
- Direct and reverse clutch assembly
- Forward and coast clutch assembly
- Input sungear shaft and forward sprag clutch assembly
- Output shaft assembly, with rear internal gear
- Intermediate clutch sprag assembly
- Overdrive clutch housing
- Low clutch sprag
- Centre support
- Input and reaction carrier
- Fluid pump assembly
- Control valve body and accumulator assembly

The electrical components of the 5L40-E are as follows:

- 1-2, 2-3 and 4-5 shift solenoids
- Transmission manual shift shaft switch assembly
- Transmission pressure control (PC) solenoid
- TCC pulse width modulation (PWM) solenoid valve
- Transmission fluid temperature (TFT) sensor
- Input speed sensor (ISS)
- Output speed sensor (OSS)

For more information, refer to Electronic Component Description.

Transmission General Description

The Hydra-matic 5L40-E is a fully automatic, five speed, rear wheel drive, electronically controlled transmission. It consists primarily of a four-element torque converter, one planetary gear set, friction and mechanical clutches and a hydraulic pressurization and control system.

The TCM commands shift solenoids, within the transmission, on and off to control shift timing. The TCM controls shift feel through the pressure control solenoid. The TCM also controls the apply and release of the torque converter clutch which allows the engine to deliver the maximum fuel efficiency without sacrificing vehicle performance. The hydraulic system primarily consists of a vane type pump, two control valve bodies, two channel plates, converter housing and case. The pump maintains the working pressures needed to stroke the clutch pistons that apply or release the friction components. These friction components, when applied or released, support the automatic shifting qualities of the transmission. The friction components used in this transmission consist of nine multiple disc clutches. The multiple disc clutches combine with four mechanical sprag clutches, to deliver six different gear ratios through the gear set. The gear set then transfers torque through the output shaft.

The transmission can be operated in any one of the seven different modes.

- P - Park position enables the engine to be started while preventing the vehicle from rolling either forward or backward. For safety reasons, the vehicle parking brake should be used in addition to the transmission Park position. Since the output shaft is mechanically locked to the case through the parking pawl and rear internal gear, Park position should not be selected until the vehicle has come to a complete stop.
- R - Reverse enables the vehicle to be operated in a rearward direction.
- N - Neutral position enables the engine to start and operate without driving the vehicle. If necessary, this position should be selected to restart the engine while the vehicle is moving.
- OD - Overdrive range should be used for all normal driving conditions for maximum efficiency and fuel economy. Overdrive range allows the transmission to operate in each of the five forward gear ratios. Downshifts to a lower gear, or higher gear ratio are available for safe passing by depressing the accelerator or by manually selecting a lower gear with the shift selector.
- 4 - Manual Fourth can be used for conditions where it may be desirable to use only four gear ratios. These conditions include towing a trailer and driving on hilly terrain as described above. This range is also helpful for engine braking when descending slight grades. Upshifts and downshifts are the same as in Overdrive range for first, second, third and fourth gears except that the transmission will not shift into fifth gear. Manual Fourth can be selected at any vehicle speed but will downshift into fourth gear only if vehicle speed is low enough not to overrev the engine, calibratable in TCM.
- 3 - Manual Third adds more performance for congested traffic and hilly terrain. It has the same starting ratio, first gear, as Manual Fourth but prevents the transmission from shifting above Third gear. Thus, Manual Third can be used to retain third gear for acceleration and engine braking as desired. Manual Third can be selected at any vehicle speed but will downshift into third gear only if vehicle speed is low enough not to overrev the engine, calibratable in TCM.
- 2 - Manual Second adds more performance for congested traffic and hilly terrain. It has the same starting ratio, first gear, as Manual Third but prevents the transmission from shifting above second gear. Thus, Manual Second can be used to retain second gear for acceleration and engine braking as desired. Manual Second can be selected at any vehicle speed but will

downshift into second gear only if vehicle speed is low enough not to overrev the engine, calibratable in TCM.

When the vehicle speed slows down to a speed low enough not to overrev the engine, calibratable in TCM, the transmission will automatically downshift into first gear. This is particularly beneficial for maintaining maximum engine braking when descending steep grades.

Transmission Indicators and Messages

The following transmission-related indicators and messages may be displayed on the Instrument Panel Cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to Indicator/Warning Message Description and Operation.

Change Transmission Fluid: This illuminates when the TCM determines that the transmission fluid life is less than 10%. Once the TCM determines that the transmission fluid life is greater than 10% the light will go OFF.

Service Transmission: This illuminates when the TCM determines that there is a fault in the transmission.

"Trans Hot Idle Engine": This message is displayed when the TCM detects a transmission fluid temperature (TFT) equal to or greater than 132°C (269°F) for 1 minute.

Shift Speed

Maximum Shift Speed (rpm)	Normal Mode
1-2 shift	6500
2-3 shift	6500
3-4 shift	6500
4-5 shift	N/A
5-6 shift	N/A

Important: Shift speed points are affected by many different vehicle and transmission operating conditions. The table above represents shift speed points calibrated at specific throttle angles during normal operating conditions and a temperature range between 0 -130°C (32-266°F). These shift speed points are also based on an axle ratio of 3.42, and assume a production-intent tire size. The table below illustrates a number of different variables that influence these shift speed points. Based on a given operating condition, these variables may override the normal shift speed points. To assist in monitoring the different variables, the respective scan tool data parameter is also listed.

Scan Tool Parameter	Shift Speed Variables
Calculated. Throttle Position	Calculated. Throttle Position (TP) is one of the most important inputs in the transmission shift pattern logic. A very low TP angle will impact the shift pattern by causing upshifts. A very high TP angle will impact the shift pattern by causing downshifts.
Commanded Gear	Based on numerous inputs, the transmission control module (TCM) selects the optimum gear. Once the TCM commands a gear, the pressure control solenoids are activated to hydraulically control engagement of the proper clutch.
Cruise	When cruise control is activated, the shift pattern is altered to reduce excessive shifting.
ECT	Shift speed points may be offset to enhance engine coolant temperature (ECT) warm-up. Also, operating the vehicle at higher engine speeds will reduce the time to warm the ECT and the TFT.
Engine Speed	To protect against an over speed condition, engine speed is monitored. If the engine speed becomes too high, an upshift will occur.
Engine Torque	Engine torque is used to predict vehicle operating conditions, in order to determine the optimum gear and provide for a smoother ride.
IMS	The internal mode switch (IMS) indicates the position of the transmission manual valve. The operator controls this valve by moving the gear range selector. Therefore, the possible gears may be limited by this valve position.
TCC PC Sol. Duty Cycle	The torque converter clutch (TCC) pressure control (PC) solenoid duty cycle indicates when the TCC has been engaged.
TCC Slip Speed	The TCC Slip Speed indicates the difference between engine speed and transmission input speed. The TCC is locked when slip speed is at or near zero, and may be controlling slip when at lower slip speeds.

TFP Switch 1, 3, 4 or 5	The transmission fluid pressure (TFP) switch is used to indicate if fluid pressure to a specific clutch has been applied or released.
Trans. Fluid Temp.	A lower TFT will extend shift speeds, a higher TFT, or hot mode condition, will invoke shorter shift speeds in order to establish a shift pattern required to cool the TFT.
Transmission Hot Mode	If the TFT becomes too hot, a hot mode shift pattern is used. The hot mode shift pattern will invoke lower shift speed points to establish a shift pattern necessary to cool the TFT.
Transmission OSS	The transmission output speed sensor (OSS) is one of the most important inputs into the transmission shift pattern logic. A very low transmission output speed will impact the shift pattern by causing downshifts. A very high transmission output speed will impact the shift pattern by causing upshifts.

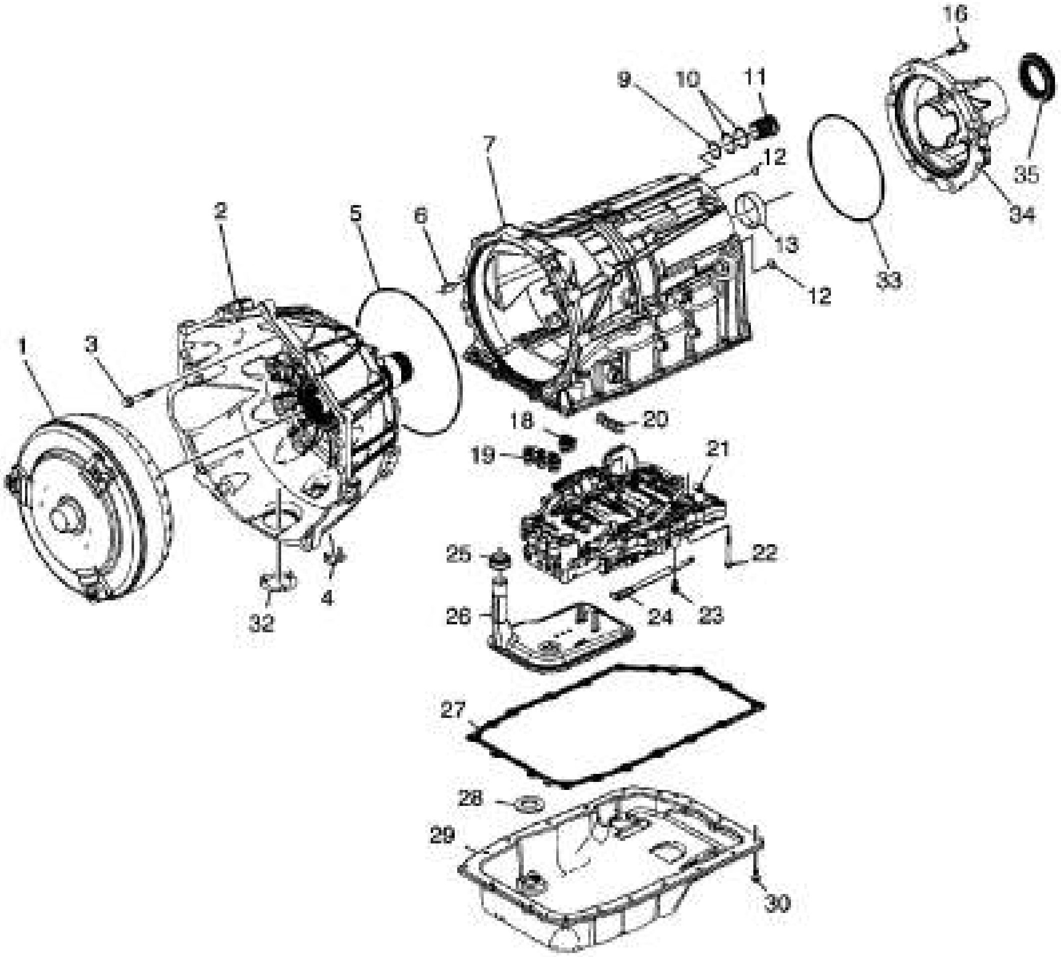
Case and Associated Parts

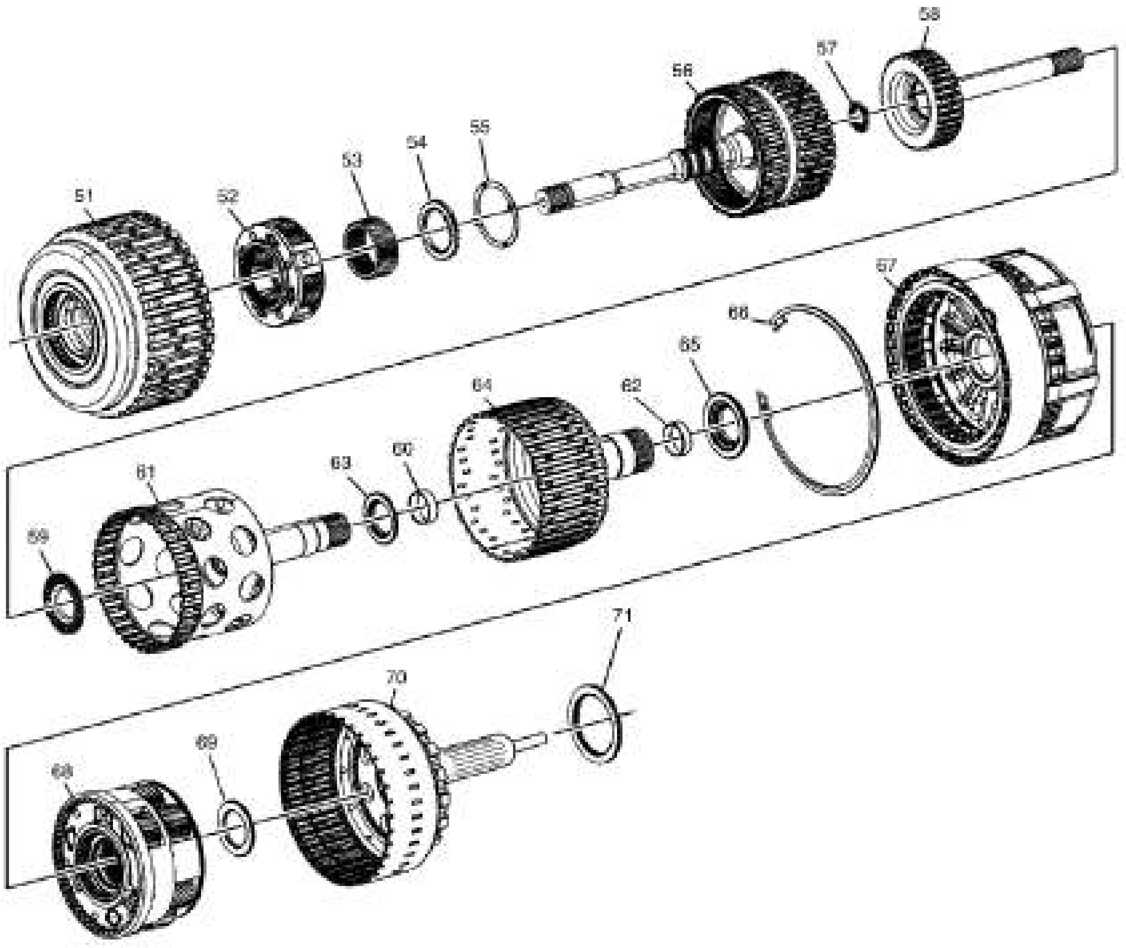


(1) Torque Converter Assembly
(2) Torque Converter (with Fluid Pump) Housing Assembly - Model Dependent
(3) Bolt, M10 x 50 mm
(4) Torque Converter Housing Access Hole Cover - Model Dependent
(5) A/Trans Fluid Pump Seal
(6) Torque Converter Housing Locator Pin
(7) A/Trans Case Assembly
(9) A/Trans Connector Seal
(10) A/Trans Connector (O-ring) Seal
(11) A/Trans Electrical Connector Passage Sleeve
(12) A/Trans Case Plug

(13) Output Shaft Bushing
(16) Bolt, M10 x 40 mm - Model Dependent
(18) A/Trans Fluid Pump Seal Assembly
(19) A/Trans Fluid Pump Seal Assembly
(20) Centre Support Fluid Passage Seal Assembly
(21) Control (with Body and Valve) Valve Assembly
(22) Bolt, M5 x 73 mm
(23) Bolt, M6 x 14.5 mm
(24) Manual Shaft Detent Assembly
(25) A/Trans Fluid Filter Seal Assembly
(26) A/Trans Fluid Filter Assembly
(27) A/Trans Fluid Pan Gasket
(28) A/Trans Fluid Pan Magnet
(29) A/Trans Fluid Pan Assembly
(30) Bolt, M6 x 20 mm
(32) Torque Converter Housing Access Hole Cover
(33) A/Trans Case Extension Seal
(34) A/Trans Case Extension
(35) Prop Shaft Oil Seal

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Component Locator | **Document ID: 1979563**

Clutch Assemblies and Associated Parts

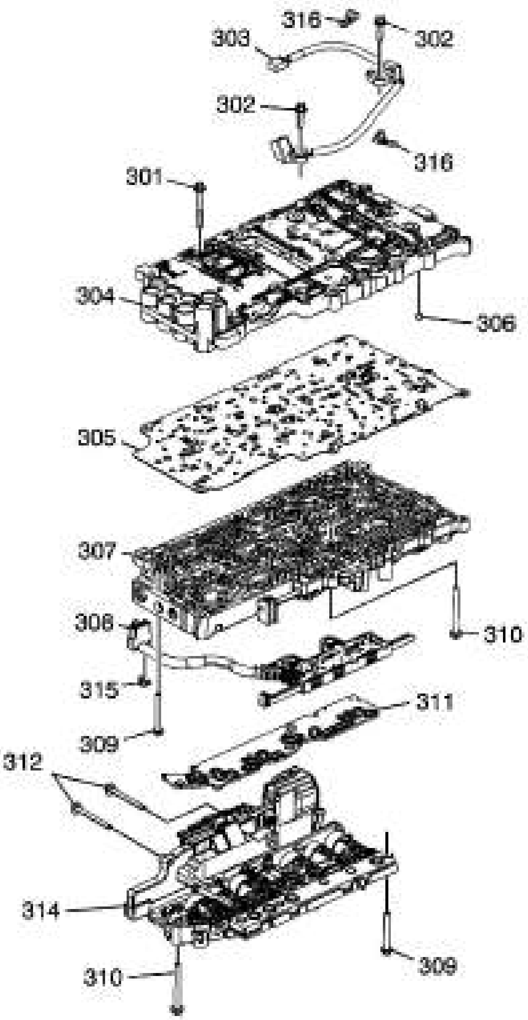


(51) 1-2-3-4 and 3-5 Reverse Clutch Assembly
(52) Input Carrier Assembly
(53) Input Sun Gear
(54) Input Sun Gear Thrust Bearing
(55) Input Sun Gear Thrust Washer
(56) 4-5-6 (w/ Turbine Shaft) Clutch Assembly
(57) Turbine Shaft Thrust Bearing Assembly
(58) 4-5-6 Clutch (w/ Output Carrier Shaft and Dampener) Hub Assembly
(59) 4-5-6 Clutch Hub Thrust Bearing Assembly
(60) Output Carrier Inner Sun Gear Shaft (Front) Bushing
(61) 1-2-3-4 Clutch (w/ Output Carrier Inner Sun Gear Shaft) Hub Assembly

(62) Output Carrier Inner Sun Gear Shaft Bushing
(63) 1-2-3-4 Clutch Hub Thrust Bearing Assembly
(64) 2-6 and 3-5 Reverse Clutch (w/ Output Carrier Outer Sun Gear Shaft) Hub Assembly
(65) 2-6 and 3-5 Reverse Clutch Hub Thrust Bearing Assembly
(66) Centre Support Retaining Ring
(67) Centre (w/ 2-6 Low and Reverse Clutch) Support Assembly
(68) Output Carrier Assembly
(69) Output Carrier Thrust Bearing Assembly
(70) Output Shaft Assembly
(71) Output Shaft Thrust Bearing Assembly

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Component Locator | Document ID: 1537818

Control (with Body and Valve) Valve Assembly



(301) Bolt, M5 x 36 mm

(302) Bolt, M6 x 20 mm

(303) A/Trans Input and Output Speed Sensor Assembly

(304) Control Valve Upper Body Assembly

(305) Control Valve Body Spacer (w/ Gasket) Plate Assembly

(306) Control Valve Body Ball Check Valve

(307) Control Valve Lower Body Assembly

(308) A/Trans Manual Shift Shaft Position Switch Assembly

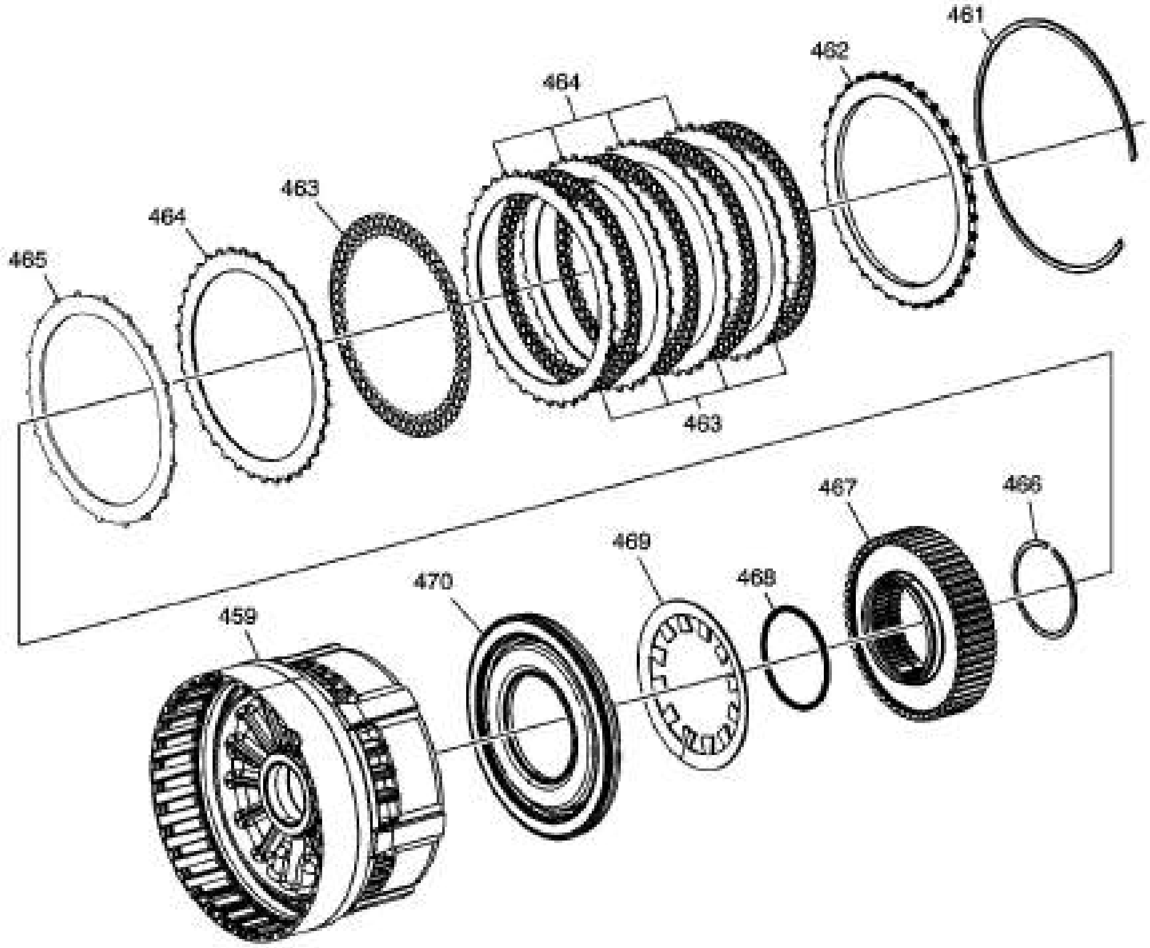
(309) Bolt, M5 x 45 mm

(310) Bolt, M5 x 55 mm

(311) Filter Plate Assembly

(312) Bolt, M5 x 53 mm
(314) Control Solenoid (w/ Body and TCM) Valve Assembly
(315) A/Trans Manual Shaft Position Switch Wiring Harness Clip
(316) A/Trans Input and Output Speed Sensor Wiring Harness Clip

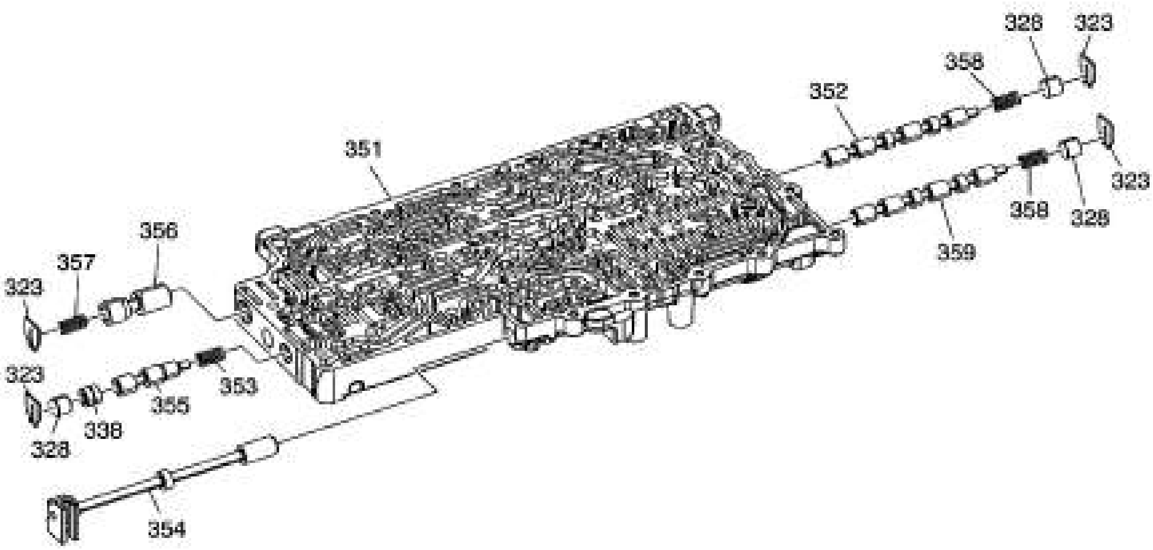
Low and Reverse Clutch Assembly



(459) Center Support Assembly
(461) Low and Reverse Clutch Backing Plate Retaining Ring
(462) Low and Reverse Clutch Backing Plate
(463) Low and Reverse Clutch Plate Assembly
(464) Low and Reverse Clutch Plate
(465) Low and Reverse Clutch (Waved) Plate
(466) Low and Reverse Clutch Spring Retaining Ring
(467) Low Clutch Sprag Assembly
(468) Low Clutch Sprag Seal
(469) Low and Reverse Clutch Spring
(470) Low and Reverse Clutch Piston Assembly

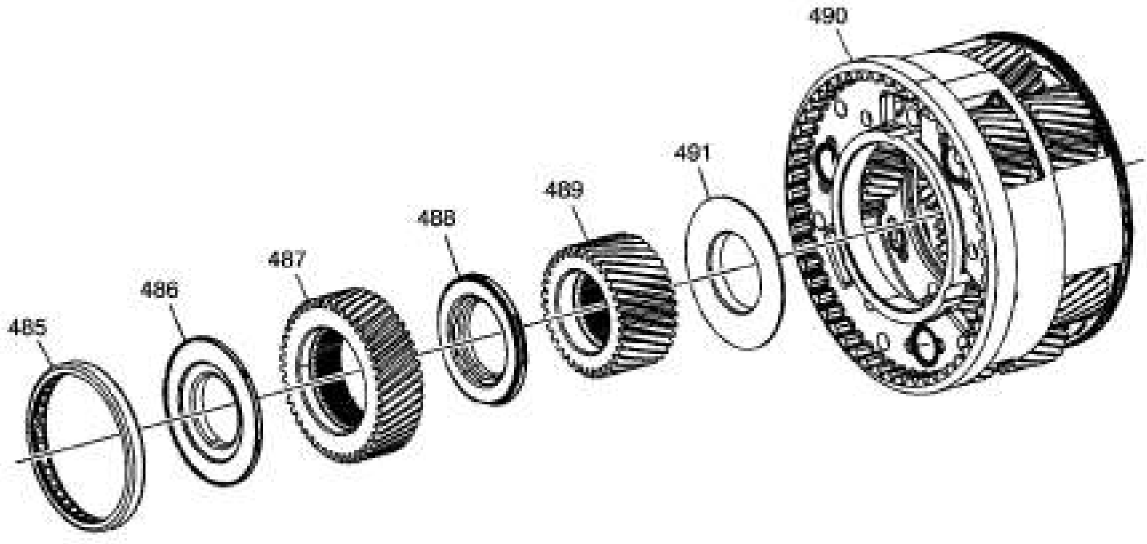
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Component Locator | **Document ID: 1537817**

Lower Control Valve Body Assembly



(323) Retainer
(328) Clutch Regulator Valve Bore Plug
(338) Shuttle Valve
(351) Control Valve Lower Body
(352) Clutch Select Solenoid Valve 3
(353) TCC Regulator Apply Valve Spring
(354) Manual Valve
(355) TCC Regulator Apply Valve
(356) Clutch Piston Dam Feed Regulator Valve
(357) Clutch Piston Dam Feed Regulator Valve Spring
(358) Clutch Select Solenoid Valve Spring
(359) Clutch Select Solenoid Valve 2

Output Carrier Assembly



(485) Center Support Roller Bearing Assembly

(486) Output Carrier Front Sun Gear Thrust Bearing Assembly

(487) Output Carrier Front Sun Gear

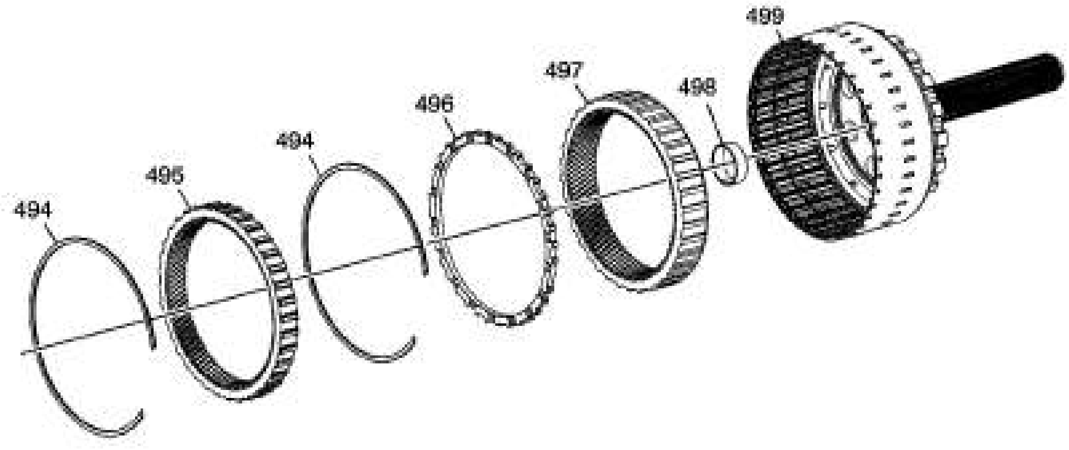
(488) Output Carrier Front Sun Gear Rear Thrust Bearing Assembly

(489) Output Carrier Rear Sun Gear

(490) Output Carrier

(491) Output Carrier Rear Sun Gear Thrust Bearing Assembly - Captured

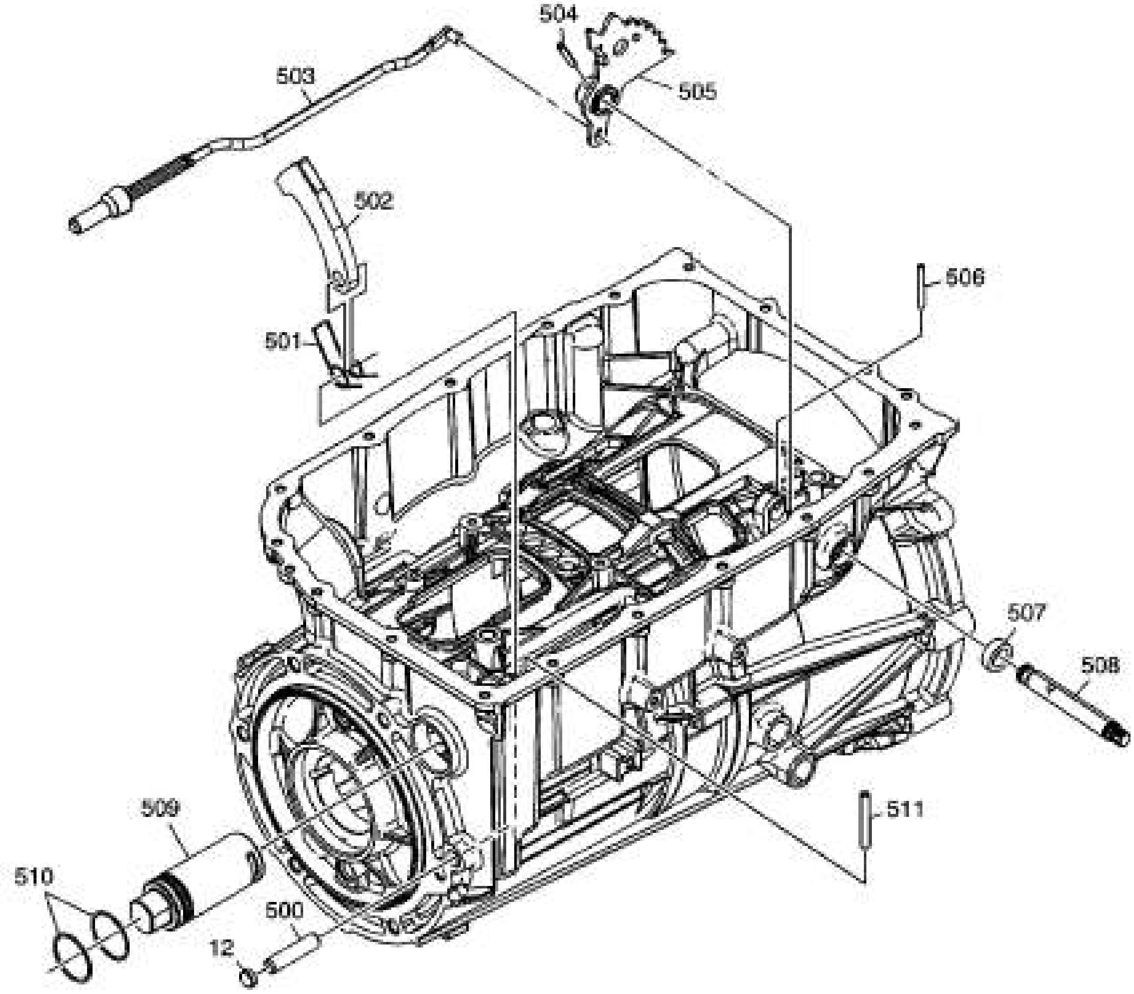
Output Shaft Assembly



(494) Output Carrier Internal Gear Retaining Ring
(495) Output Carrier Internal Front Gear
(496) Output Carrier Internal Gear Spacer
(497) Output Carrier Internal Rear Gear
(498) Output Carrier Bushing
(499) Output Shaft Assembly - Model Dependent

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Component Locator | **Document ID: 1537815**

Park System Components



(12) A/Trans Case Plug
(500) Park Pawl Shaft
(501) Park Pawl Spring
(502) Park Pawl
(503) Park Pawl Actuator Assembly
(504) Manual Shaft Detent Lever Hub Pin
(505) Manual Shaft Detent Lever Assembly
(506) Manual Shift Shaft Pin
(507) Manual Shift Shaft Seal
(508) Manual Shift Shaft
(509) Park Pawl Actuator Guide

(510) Park Pawl Actuator Guide (O-ring) Seal
(511) Park Pawl Actuator Guide Pin

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Component Locator | **Document ID: 1698360**

Fluid Pressure High or Low

Checks	Causes
Torque Converter Housing with Fluid Pump Assembly (2)	• Inspect for worn, sticking, or damaged pressure regulator valve (233). • Inspect for worn, sticking, or damaged pressure regulator valve outer spring (234). • Inspect for worn, sticking, or damaged pressure regulator valve inner spring (235). • Inspect for worn, sticking, or damaged isolator valve (236) and sleeve (237). • Inspect for worn, sticking, or damaged pressure relief ball valve (225). • Inspect for worn, sticking, or damaged pressure relief ball valve spring (224). • Inspect for damaged or porous pump cover assembly (219). Inspect for pump surfaces not flat. • Inspect for excessive fluid pump rotor (217) clearance or damage. Ensure proper selective rotor is being utilized. • Inspect for damaged fluid pump slide (212). Ensure proper selective slide is being utilized. • Inspect for worn, sticking, or damaged fluid pump slide outer spring (211). • Inspect for worn or damaged fluid pump slide seal (213), seal support (214), pivot pin (215), fluid seal ring (209), and O-ring seal (210). • Inspect for worn or damaged fluid pump vane rings (207) and rotor guide (208).
Control Valve Upper Body Assembly (321)	• Inspect for worn, sticking, or damaged actuator feed limit valve (325) and spring (324). • Inspect for worn, sticking, or damaged clutch boost valve (329) and spring (330).
Fluid Filter Assembly (26)	• Inspect for damaged or restricted fluid filter assembly (26). • Inspect for damaged fluid filter seal assembly (25).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Diagnostic Information and Procedures | **Document ID: 1979550**

Harsh, Soft, Delayed or Slipping 1-2-3-4 Shift

Checks	Causes
1-2-3-4 and 3-5-R Clutch Assembly (51)	• Inspect for damaged or worn 1-2-3-4 clutch plates (408-410). • Inspect for damaged 1-2-3-4 clutch piston (414), piston housing (417), spring (413), and dam assembly (412). • Inspect for damaged 1-2-3-4 clutch piston dam retaining ring (411). • Inspect for cut, worn, or damaged 1-2-3-4 clutch piston seal (416), inner seal (423), and housing seals (424 and 425). • Inspect for improper selective 1-2-3-4 clutch backing plate retaining ring (429). • Inspect for damaged 1-2-3-4 clutch backing plate (407). Inspect for worn splines on the backing plate.

Harsh, Soft, Delayed or Slipping 4-5-6 Shift

Checks	Causes
4-5-6 (with Turbine Shaft) Clutch Assembly (56)	• Inspect for damaged or worn clutch plates (433-435). • Inspect for damaged piston (439), piston dam (437), dam retaining ring (436), and clutch spring (438). • Inspect for improper selective 4-5-6 clutch backing plate retaining ring (431). • Inspect for cut, worn, or damaged turbine shaft fluid seal rings (442).

Harsh, Soft, Delayed or Slipping First or Reverse Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for damaged or worn low and reverse clutch plates (463 and 465). • Inspect for damaged low and reverse clutch backing plate (462). Inspect for worn splines on backing plate. • Inspect for damaged low and reverse clutch backing plate retaining ring (461). • Inspect for damaged low and reverse clutch piston assembly (470), spring (469), spring retaining ring (466), and centre support assembly (459). • Inspect for damaged low clutch sprag assembly (467). Holding the sprag assembly with the retaining ring facing up, and the inner race of the sprag assembly fixed, the outer race should freewheel counterclockwise. • Inspect for cut, worn, or damaged low clutch sprag seal (468).

Harsh, Soft, Delayed or Slipping Second or Sixth Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for damaged or worn 2-6 clutch plates (452 and 454). • Inspect for damaged 2-6 clutch backing plate (451). Inspect for worn splines on backing plate. • Inspect for damaged 2-6 clutch backing plate retaining ring (450). • Inspect for damaged 2-6 clutch piston assembly (457), spring (456), retaining ring (455), and centre support assembly (459).

Harsh, Soft, Delayed or Slipping Third, Fifth, or Reverse Gear

Checks	Causes
1-2-3-4 and 3-5-R Clutch Assembly (51)	• Inspect for damaged or worn 3-5-R clutch plates (402-404). • Inspect for damaged 3-5-R clutch piston (421), apply ring (405), and spring (420). • Inspect for cut, worn, or damaged 3-5-R clutch piston dam O-ring seal (418), inner seal (419), and outer seal (422). • Inspect for improper selective 3-5-R clutch backing plate retaining ring (400). • Inspect for damaged 3-5-R clutch backing plate (401). Inspect for worn splines on the backing plate.

No First, Second, Sixth, or Reverse Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for a damaged centre support assembly (459). • Inspect for worn or damaged output carrier outer sun gear shaft front and rear bushing (458 and 460).
Centre Support Retaining Ring (66)	Inspect for damage.
Output Carrier Assembly (68)	Inspect for a worn or damaged centre support roller bearing assembly (485).
2-6 and 3-5-R Clutch Hub Thrust Bearing Assembly (65)	Inspect the bearing for wear or damage.

No First, Second, Third, and Fourth Gear

Checks	Causes
1-2-3-4 and 3-5-R Clutch Assembly (51)	• Inspect for damaged or worn 1-2-3-4 clutch plates (408-410). • Inspect for damaged 1-2-3-4 clutch piston (414), piston housing (417), spring (413), and dam assembly (412). • Inspect for damaged 1-2-3-4 clutch piston dam retaining ring (411). • Inspect for cut, worn, or damaged 1-2-3-4 clutch piston seal (416), inner seal (423), and housing seals (424 and 425). • Inspect for improper selective 1-2-3-4 clutch backing plate retaining ring (429). • Inspect for damaged 1-2-3-4 clutch backing plate (407). Inspect for worn splines on the backing plate.
1-2-3-4 Clutch (with Output Carrier Inner Sun Gear Shaft) Hub Assembly (61)	Inspect for damaged splines on the hub assembly.

No First, Second, Third, Fourth, Fifth, or Reverse Gear

Checks	Causes
1-2-3-4 and 3-5-R Clutch Assembly (51)	• Inspect for improper selective 3-5-R clutch backing plate retaining ring (400). • Inspect for improper selective 1-2-3-4 clutch backing plate retaining ring (429). • Inspect for worn or damaged clutch bearing (428).

No Fourth, Fifth, and Sixth Gear

Checks	Causes
4-5-6 (with Turbine Shaft) Clutch Assembly (56)	• Inspect for damaged or worn clutch plates (433-435). • Inspect for damaged piston (439), piston dam (437), dam retaining ring (436), and clutch spring (438). • Inspect for improper selective 4-5-6 clutch backing plate retaining ring (431). • Inspect for cut, worn, or damaged turbine shaft fluid seal rings (442). • Inspect for damaged or distorted turbine shaft.
Control Valve Upper Body Assembly (304)	Inspect the 1/Reverse band and 4-5-6 clutch regulator valve (327) and spring (326) for wear or damage.
4-5-6 Clutch (with Output Carrier Shaft and Dampener) Hub Assembly (58)	Inspect the hub assembly (475), dampener (476), and apply plate (477) for wear or damage.
Output Carrier Assembly (68)	Inspect for damaged or stripped internal splines on the output carrier assembly.

No Reverse Gear

Checks	Causes
Control Valve Upper Body Assembly (304)	• Inspect for worn, damaged, or sticking 3-5 reverse regulator valve (336) and valve spring (326). • Inspect for damaged or missing #5 checkball.
Control Valve Lower Body Assembly (307)	Inspect for worn, damaged, or sticking clutch select solenoid valve 3 (352) and valve spring (353).

No Second and Sixth Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for damaged or worn 2-6 clutch plates (452 and 454). • Inspect for damaged 2-6 clutch backing plate (451). Inspect for worn splines on backing plate. • Inspect for damaged 2-6 clutch backing plate retaining ring (450). • Inspect for damaged 2-6 clutch piston assembly (457), spring (456), retaining ring (455), and centre support assembly (459).

No Third, Fifth, and Reverse Gear

Checks	Causes
1-2-3-4 and 3-5-R Clutch Assembly (51)	• Inspect for damaged or worn 3-5-R clutch plates (402-404). • Inspect for damaged 3-5-R clutch piston (421), apply ring (405), and spring (420). • Inspect for cut, worn, or damaged 3-5-R clutch piston dam O-ring seal (418), inner seal (419), and outer seal (422). • Inspect for improper selective 3-5-R clutch backing plate retaining ring (400). • Inspect for damaged 3-5-R clutch backing plate (401). Inspect for worn splines on the backing plate.

No Torque Converter Clutch Apply

Checks	Causes
Torque Converter Assembly (1)	Diagnose torque converter for possible internal damage.
Fluid Pump Cover Assembly (219)	• Inspect for worn, damaged, or sticking converter feed limit valve (220) and spring (221). • Inspect for worn, damaged, or sticking TCC control valve (227) and spring (226). • Inspect for damaged stator shaft.
Control Valve Lower Body Assembly (307)	Inspect for worn, damaged, or sticking torque converter clutch (TCC) regulator apply valve (355).
4-5-6 (with Turbine Shaft) Clutch Assembly (56)	• Inspect for damaged turbine shaft. • Inspect for damaged turbine shaft O-ring seal.

No Torque Converter Clutch Release

Checks	Causes
Torque Converter Assembly (1)	Diagnose torque converter for possible internal damage.
Fluid Pump Cover Assembly (219)	• Inspect for worn, damaged, or sticking converter feed limit valve (220) and spring (221). • Inspect for worn, damaged, or sticking torque converter clutch (TCC) control valve (227) and spring (226).
Control Valve Lower Body Assembly (307)	Inspect for worn, damaged, or sticking TCC regulator apply valve (355).

Shift Lever Can Be Moved without Brake Pedal Depressed

Step	Action	Yes	No
Schematic Reference: Diagnostic Starting Point - Automatic Transmission Shift Lock Control DEFINITION: Transmission shift lever does not lock in the PARK position with the ignition ON and the brake pedal not pressed.			
1	Did you perform the Symptoms - Automatic Transmission Shift Lock Control tests and perform all the necessary inspections?	Go to Step 2	Go to Symptoms - Automatic Transmission Shift Lock Control
2	1. Apply the parking brake and block the wheels. 2. Turn ON the ignition, with the engine OFF. 3. Attempt to move the shift lever out of the PARK position. Does the shift lever move out of the PARK position?	Go to Step 3	Go to Testing for Intermittent Conditions and Poor Connections
3	1. Disconnect the shift lock control relay. 2. Attempt to move the shift lever out of the PARK position. Does the shift lever move out of the PARK position?	Go to Step 6	Go to Step 4
4	Test the shift lock control relay brake switch input circuit for an open or a high resistance. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 11	Go to Step 5
5	Test the shift lock control relay ground circuit for an open or a high resistance. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 11	Go to Step 7
6	Test the shift lock control solenoid feed circuit for a short to voltage. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 11	Go to Step 8
7	Inspect for poor connections at the shift lock control relay. Refer to Circuit Testing and Connector Repairs. Did you find and correct the condition?	Go to Step 11	Go to Step 9
	Inspect for poor connections at the shift lock control solenoid. Refer to Circuit Testing and		

8	Connector Repairs. Did you find and correct the condition?	Go to Step 11	Go to Step 10
9	Replace the shift lock control relay. Refer to Relay Replacement. Did you complete the repair?	Go to Step 11	--
10	Replace the shift lock control solenoid. Refer to Automatic Transmission Shift Lock Control Actuator Replacement. Did you complete the repair?	Go to Step 11	--
11	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Diagnostic Information and Procedures | **Document ID: 2060228**

Shift Lever Does Not Move with Brake Pedal Depressed

Step	Action	Yes	No
Schematic Reference: Diagnostic Starting Point - Automatic Transmission Shift Lock Control . DEFINITION: Transmission shift lever does not move with ignition ON and the brake pedal pressed.			
1	Did you perform the Symptoms - Automatic Transmission Shift Lock Control tests and perform all necessary inspections?	Go to Step 2	Go to Symptoms - Automatic Transmission Shift Lock Control
2	1. Turn ON the ignition, with the engine OFF. 2. Press and hold the brake pedal. 3. Attempt to move the shift lever out of the PARK position. Does the shift lever move out of the PARK position?	Go to Testing for Intermittent Conditions and Poor Connections	Go to Step 3
3	Do the stop lamps operate properly?	Go to Step 4	Go to Diagnostic Starting Point - Lighting
4	1. Connect a test lamp between the shiftlock control solenoid feed circuit of the shiftlock control relay (terminal 4) and ground. 2. Turn ON the ignition, with the engine OFF. 3. Press and hold the brake pedal. Does the test lamp illuminate?	Go to Step 7	Go to Step 5
5	Test the shift lock control relay supply voltage circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 9	Go to Step 6
6	Test the shift lock control relay brake switch input circuit for a short to B+. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 14	Go to Step 10
7	Test the shift lock control solenoid feed circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs.		

	Did you find and correct the condition?	Go to Step 14	Go to Step 8
8	Test the shift lock control solenoid supply voltage circuit for an open or high resistance. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 14	Go to Step 9
9	Test the shift lock control solenoid ground circuits for an open or high resistance. Refer to Circuit Testing and Wiring Repairs. Did you find and correct the condition?	Go to Step 14	Go to Step 11
10	Inspect for poor connections at the shift lock control relay. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	Go to Step 14	Go to Step 12
11	Inspect for poor connections at the shift lock control solenoid. Refer to Testing for Intermittent Conditions and Poor Connections and Connector Repairs. Did you find and correct the condition?	Go to Step 14	Go to Step 13
12	Replace the shift lock control relay. Refer to Relay Replacement. Did you complete the replacement?	Go to Step 14	--
13	Replace the shift lock control solenoid. Refer to Automatic Transmission Shift Lock Control Actuator Replacement. Did you complete the replacement?	Go to Step 14	--
14	Operate the system in order to verify the repair. Did you find and correct the condition?	System OK	Go to Step 2

Stuck in First or Reverse Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for damaged or worn low and reverse clutch plates (463 and 465). • Inspect for damaged low and reverse clutch backing plate (462). Inspect for worn splines on backing plate. • Inspect for damaged low and reverse clutch backing plate retaining ring (461). • Inspect for damaged low and reverse clutch piston assembly (470), spring (469), spring retaining ring (466), and centre support assembly (459). • Inspect for damaged low clutch sprag assembly (467). Holding the sprag assembly with the retaining ring facing up, and the inner race of the sprag assembly fixed, the outer race should freewheel counterclockwise. • Inspect for cut, worn, or damaged low clutch sprag seal (468).

Stuck in Second or Sixth Gear

Checks	Causes
Centre (with 2-6 Low and Reverse Clutch) Support Assembly (67)	• Inspect for damaged or worn 2-6 clutch plates (452 and 454). • Inspect for damaged 2-6 clutch backing plate (451). Inspect for worn splines on backing plate. • Inspect for damaged 2-6 clutch backing plate retaining ring (450). • Inspect for damaged 2-6 clutch piston assembly (457), spring (456), retaining ring (455), and centre support assembly (459).

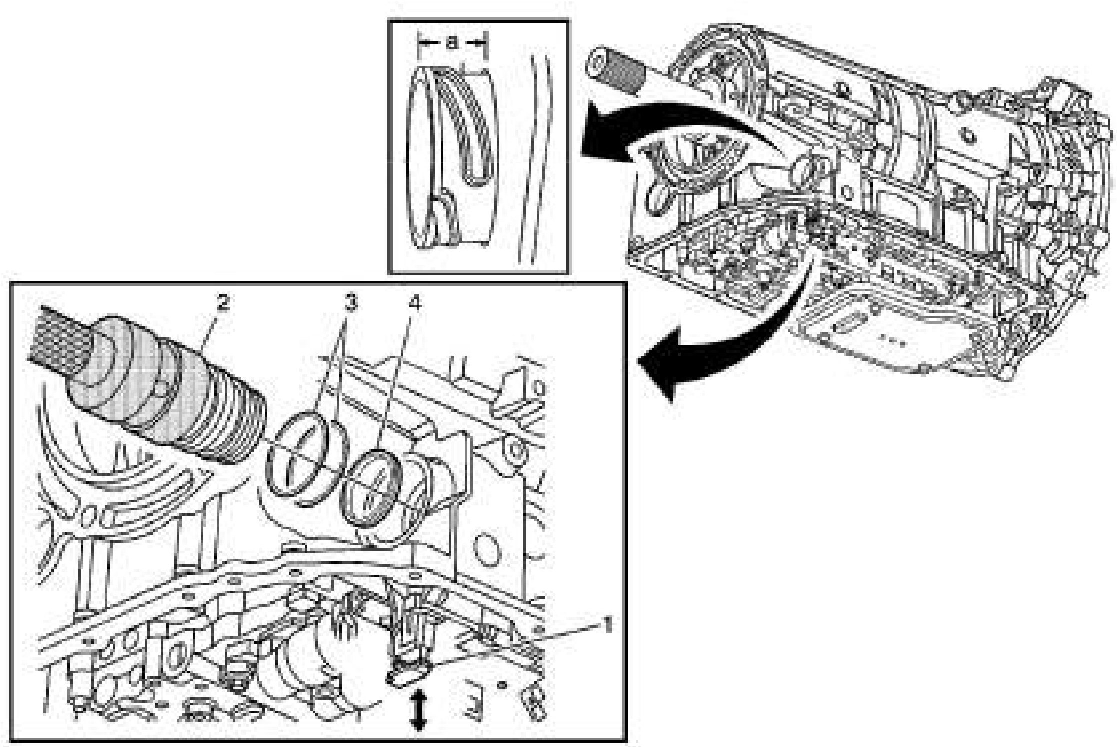
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Diagnostic Information and Procedures | **Document ID: 1979556**

Vibration in Second, Third, Fourth, Fifth, or Sixth Gear

Checks	Causes
4-5-6 Clutch (with Output Carrier Shaft and Dampener) Hub Assembly (58)	Inspect hub assembly (475), dampener (476), and apply plate (477) for wear or damage.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1993941**

Automatic Transmission Electrical Connector Passage Sleeve Replacement



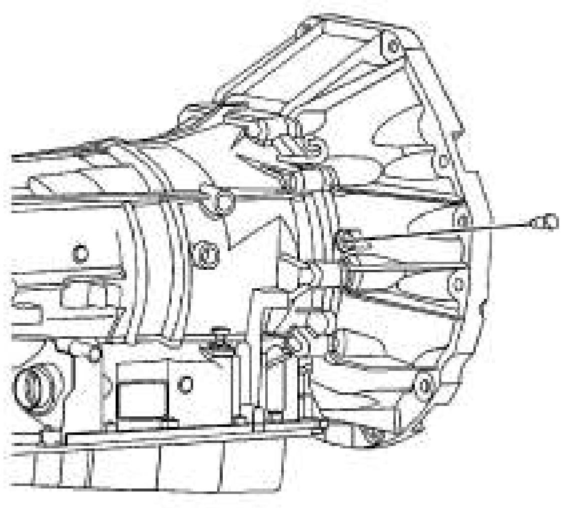
Callout	Component Name
Notice: Refer to General Repair Instructions in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission oil pan. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement . 3. Disconnect the vehicle wire harness electrical connector from the transmission electrical connector passage sleeve. Refer to Automatic Transmission Inline 16-Way Connector Description .	
1	Electrical Connector Slide Lock **Tip** Pull down on the slide lock to remove the sleeve. Push up on the slide lock after sleeve installation.
	Electrical Connector Passage Sleeve

2	**Tip** Use the DT 47715 DT 47715 and J 42183 J 42183 to remove and install the electrical connector passage sleeve.
3	NEW O-Ring Seals (Qty: 2)
4	NEW Lip Seal

Automatic Transmission Fluid Pressure Test Hole Plug Replacement (SWB LWB RHD)

Removal Procedure

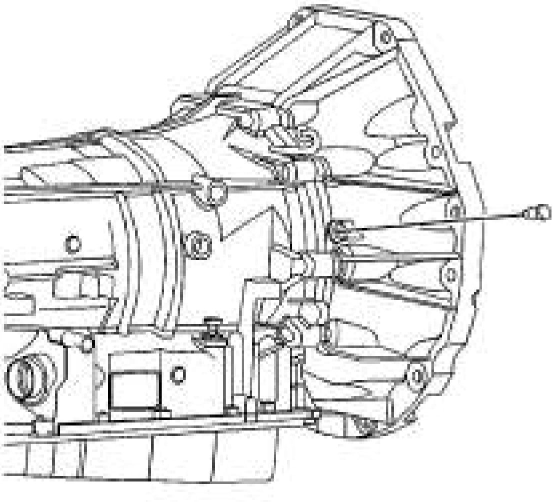
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Clean the surrounding area of the oil pressure test plug.
3. Remove the oil pressure test plug.

Installation Procedure

Notice: Refer to Fastener Notice in the Preface section.



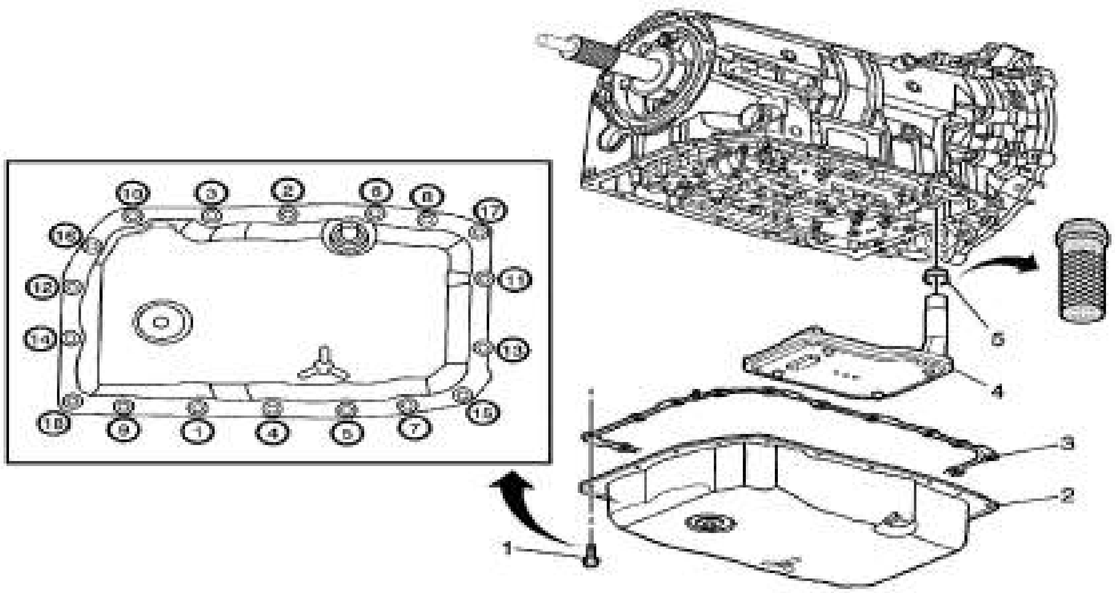
1. Install the oil pressure test plug.

   Tighten
   Tighten the oil pressure test plug to 11 N·m (97 lb. in).

2. Check the transmission fluid level (fill if necessary). Refer to Transmission Fluid Check.
3. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | Document ID: 1993943

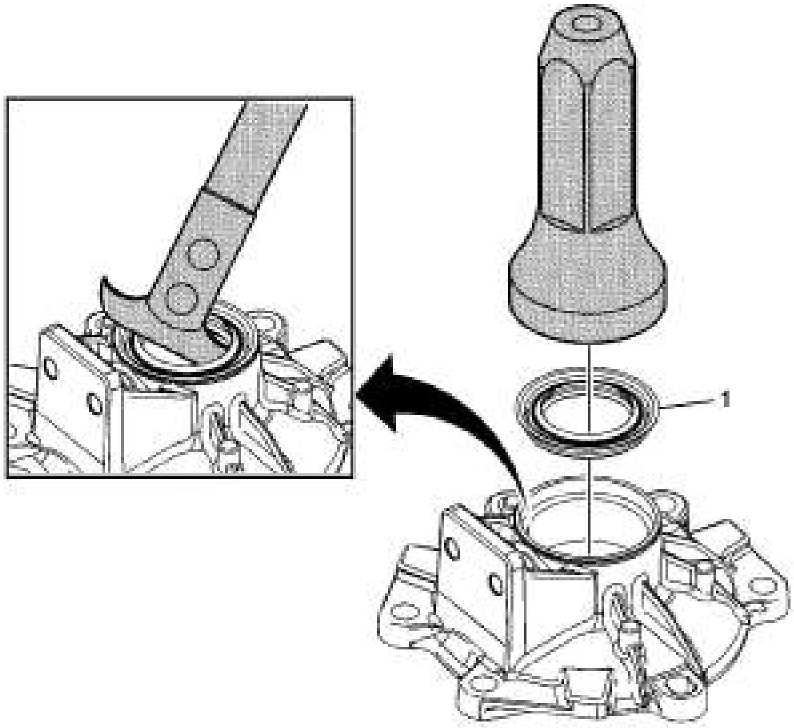
Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement



Callout	Component Name
Notice: Refer to General Repair Instructions in the Preface section. **Notice:** Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Place a suitable drain pan under the transmission.	
1	Transmission Fluid Pan Bolt (Qty: 18) **Tip** Tighten the bolts in the sequence shown. **Tighten** 9 N·m (80 lb. in)
	Transmission Fluid Pan Assembly

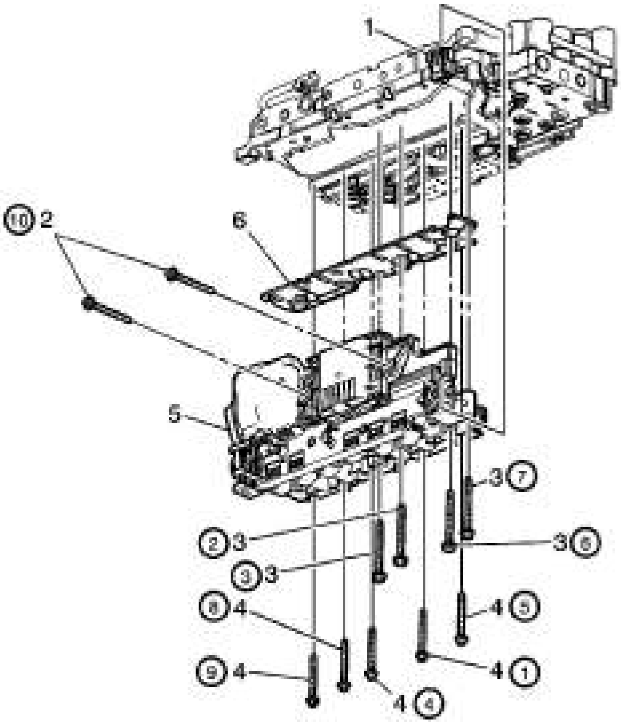
2	- Check the condition of the draining fluid. Refer to Transmission Fluid Check . - Fill the transmission with the proper fluid. Refer to Transmission General Specifications . - Fill the transmission with the proper amount of transmission fluid. Refer to Fluid Capacity Specifications and Transmission Fluid Check .
3	Transmission Fluid Pan Gasket **Tip** The fluid pan gasket is reusable. Inspect the gasket to determine if it may be reused.
4	NEW Fluid Filter Assembly **Tip** Pull the fluid filter assembly straight out. Do not bend or twist the filter neck.
5	NEW Fluid Filter Seal Assembly **Notice:** Refer to Fastener Notice in the Preface section. **Notice:** Refer to General Repair Instructions in the Preface section. - Use a screwdriver or snap ring pliers to remove the filter seal. - Use the DT 47848 and the J 42183 to install the filter seal. - Lubricate the filter seal with transmission fluid before installing the filter.
6	- DT 47848 . - J 42183 .

Case Extension and Seal Replacement



Callout	Component Name
1	Output Shaft Seal Assembly **Special Tools** • J 37212 Front Output Shaft Seal Installer • J 45000 Seal Remover

Control Solenoid Valve and Transmission Control Module Assembly Replacement



Callout	Component Name
	Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications. **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle. 2. Remove the transmission control valve assembly. Refer to Control Valve Lower Body and Upper Body Replacement.
1	Manual Shift Shaft Position Switch Assembly Electrical Connector **Tip** Release the connector lock before disconnecting. Engage the connector lock after connecting.
2	Control Module Assembly Heat Sink Bolt (Qty: 2) **Tighten** 8 N·m (71 lb. in)

	Tip Tighten in specified sequence.
3	Control Solenoid Valve Assembly Bolt (Qty: 4) **Tighten** 8 N·m (71 lb. in) **Tip** Tighten in specified sequence.
4	Control Solenoid Valve Assembly Bolt (Qty: 5) **Tighten** 8 N·m (71 lb. in) **Tip** Tighten in specified sequence.
5	Control Solenoid Valve and Module Assembly Refer to Control Module References. **Tip** • Inspect the 4 filter plate retaining tabs. A broken tab may not adequately secure the filter plate to the control solenoid valve assembly. • Align the control solenoid valve assembly with the lower valve body locator pin when assembling.
6	Filter Plate **Tip** Discard filter plate and replace with new.

Following the replacement of the TCM, a harsh upshift may occur between 4th and 5th gear.

If this occurs the following procedure should be followed.

- Make sure both the Scan Tool and TCM calibrations are the latest versions availble for reprogramming.
- Check and clear all DTCs that may have set as a result of the programming process.
- Drive maneuvers should be performed at transmission oil temperatures of at least 40°C (104°F).
- Transmission oil levels should be set correctly prior to the starting drive cycles.
- Initial upshifts may have an erratic feel for the first several cycles. They should improve significantly with repeated maneuvers.
- At the start of the drive cycles, no ECM or TCM DTCs should be set. The MIL should not be illuminated.

A drive cycle requires five light throttle accelerations to 40 km/h (25 mph) and five light throttle accelerations to 64 km/h (40 mph).

1. From a complete stop, lightly accelerate at a relatively constant throttle pedal position up to 40 km/h (25 mph) or 64 km/h (40 mph).
2. Brake the vehicle to a complete stop.
3. Repeat five times to 40 km/h (25 mph) and five times to 64 km/h (40 mph). Maneuvers can be performed in any combination.

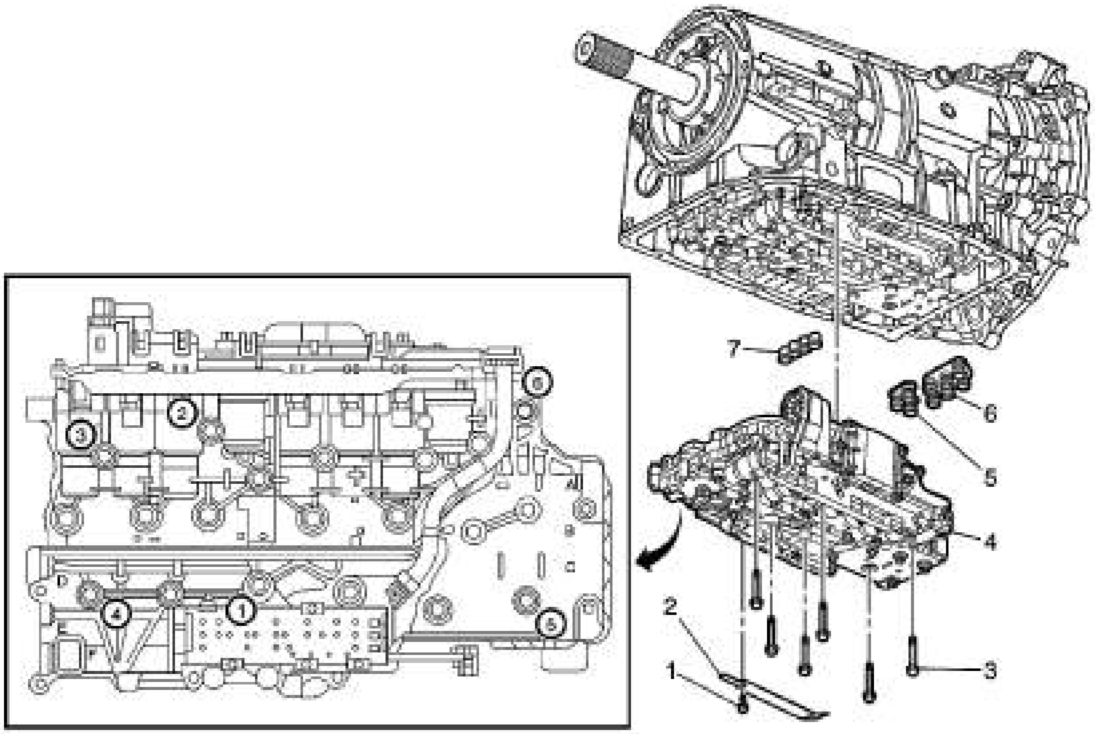
If the garage shifts (Park to Reverse, Park to Drive, Reverse to Drive, Drive to Reverse) feel like they are delayed, garage shifts adapts can also be performed. All garage shifts should be performed with the vehicle stopped, foot on the brake and engine at idle.

1. Shift the transmission from Reverse to Drive leaving the shift lever in Drive for three seconds. After three seconds, shift back to Reverse, leaving the shift lever in Reverse for three seconds. Perform the procedure 10 times (R-D-R-D-R-D...). The transitions need to be directly to Drive and Reverse, without stopping in Neutral.
2. Shift the transmission from Neutral to Drive leaving the shift lever in Drive for three seconds. After three seconds, shift back to Neutral, leaving the shift lever in Neutral for three seconds. Perform the procedure 10 times (N-D-N-D-N-D...).
3. Shift the transmission from Neutral to Reverse leaving the shift lever in Reverse for three seconds. After three seconds, shift back to Neutral, leaving the shift lever in Neutral for three seconds. Perform the procedure 10 times (R-N-R-N-R-N..).

At the end of these maneuvers, the vehicle may still experience some minor driveability issues, but should learn improved shifting performance over the next several key cycles and driving time. Coach the customer about the transmission's ability to self-correct shifting issues or concerns. The transmission adapts are always functional and operate at transmission oil temperatures above 40° C (104°F).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 2006996**

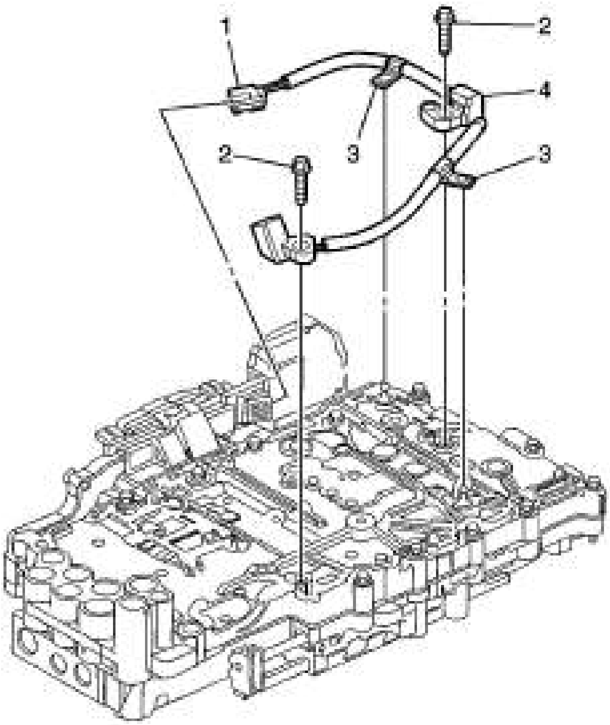
Control Valve Lower Body and Upper Body Replacement (SWB LWB RHD)



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement. 3. Remove the transmission electrical connector. Refer to Automatic Transmission Electrical Connector Passage Sleeve Replacement.	
1	Manual Shaft Detent Bolt **Tighten** 12 N·m (106 lb. in)
2	Manual Shaft Detent Assembly
	Control Valve Assembly Bolt (Qty: 6)

3	- Do not remove all the bolts in the control valve body assembly. Remove only the bolts indicated. - Tighten in specified sequence. **Tighten** 8 N·m (71 lb. in)
4	Control Valve Assembly
5	Fluid Pump Seal Discard seal and replace with new.
6	Fluid Pump Seal Discard seal and replace with new.
7	Centre Support Fluid Passage Seal Discard seal and replace with new.

Input and Output Speed Sensor Replacement

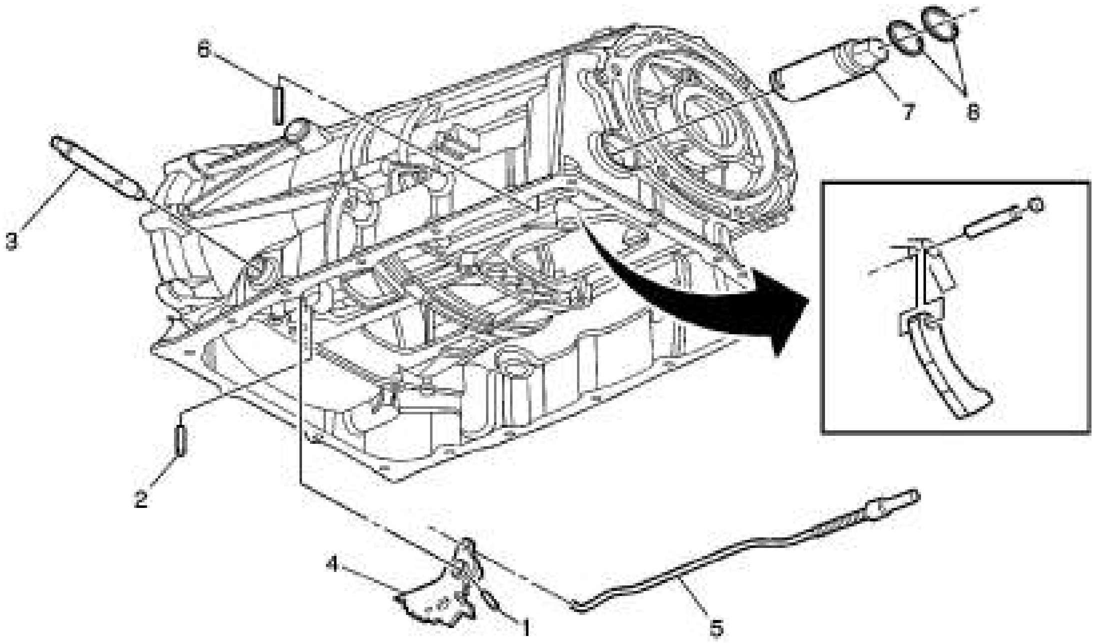


Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement . 3. Remove the upper and lower valve body assembly. Refer to Control Valve Lower Body and Upper Body Replacement .	
1	Speed Sensor Electrical Connector
2	Input and Output Speed Sensor Assembly Bolts (Qty: 2) **Tighten** 12 N·m (106 lb. in)
3	Input and Output Speed Sensor Assembly Clips (Qty: 2) **Tip**

	Inspect the wiring harness clips for damage replace if necessary.
4	Input and Output Speed Sensor Assembly

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1993944**

Manual Shift Detent Lever and Park Pawl Actuator Replacement

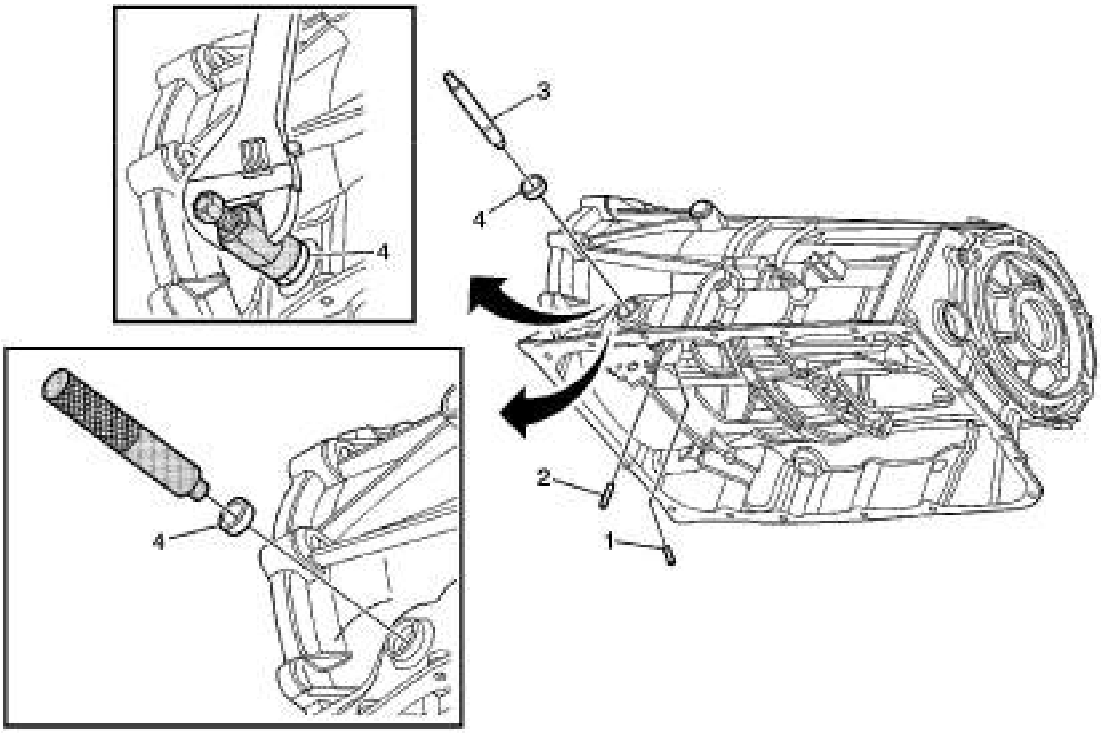


<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Notice: Refer to Fastener Notice in the Preface section.
Important: Do not remove the park pawl or park pawl spring. The park pawl and park pawl spring are not serviceable components.
<i>Fastener Tightening Specifications:</i> Refer to Fastener Tightening Specifications .
Preliminary Procedures
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement .
3. Remove the manual shaft detent assembly roller. Refer to Control Valve Lower Body and Upper Body Replacement</td></tr>
<tr><td>1</td><td>Manual Shaft Detent Lever Hub Pin
Tip
• Discard the pin. Replace with NEW pin.</td></tr>
</table>

	- "Walk" the pin out using side cutters.
2	Manual Shift Shaft Pin **Tip** - Discard the pin. Replace with NEW pin. - "Walk" the pin out using side cutters.
3	Manual Shift Shaft
4	Manual Shaft Detent Lever Assembly
5	Park Pawl Actuator Assembly
6	Park Pawl Actuator Guide Pin **Tip** - Discard the pin. Replace with NEW pin. - "Walk" the pin out using side cutters.
7	Park Pawl Actuator Guide
8	Park Pawl Actuator Guide (O-Ring) Seals (Qty: 2) **Tip** Discard the seals. Replace with NEW seals.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | Document ID: 1997869

Manual Shift Shaft and Seal Replacement

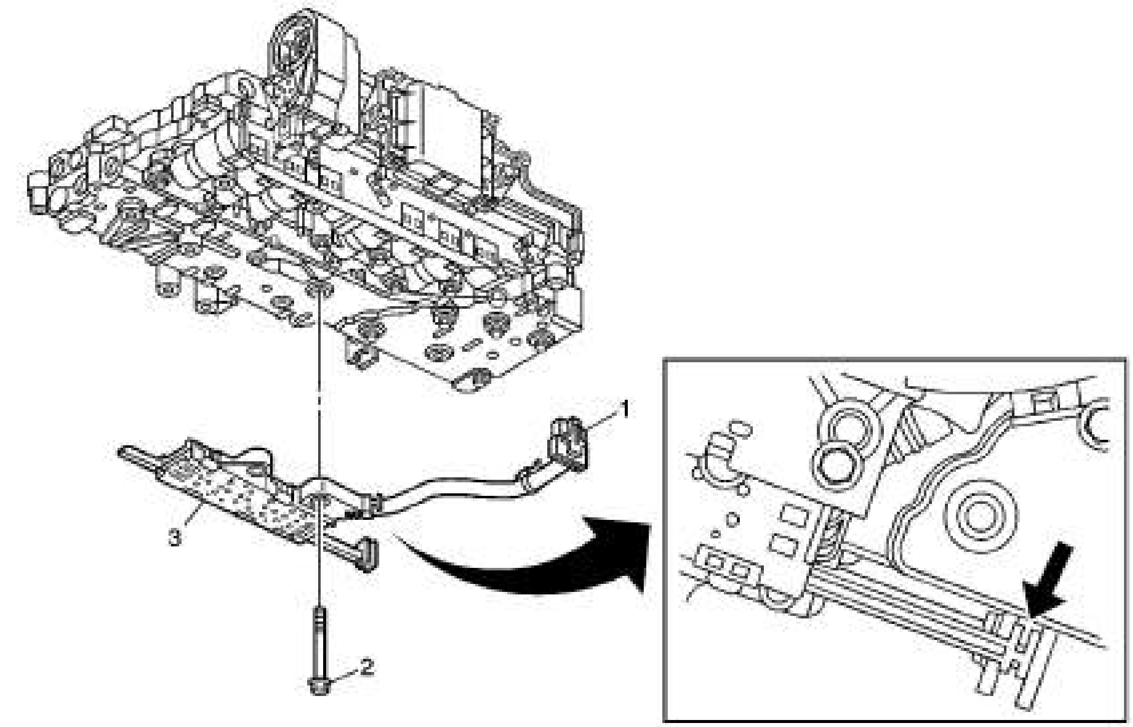


Callout	Component Name
	Notice: Refer to Fastener Notice in the Preface section. **Important:** The manual shaft must be removed to replace the manual shaft seal. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission from the vehicle. Refer to Transmission Replacement . 3. Remove the transmission fluid pan. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement . 4. Remove the control valve body. Refer to Control Valve Lower Body and Upper Body Replacement
1	Manual Shift Shaft Pin **Tip** • Discard the pin. Replace with NEW pin.

	- "Walk" the pin out using side cutters.
2	Manual Shaft Detent Lever Hub Pin **Tip** - Discard the pin. Replace with NEW pin. - "Walk" the pin out using side cutters.
3	Manual Shift Shaft
4	Manual Shift Shaft Seal **Tip** - Use the J 45201 to remove the seal from the transmission case. - Use the J 43909 to install the seal into the transmission case.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1660263**

Manual Shift Shaft Position Switch Replacement



Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement .	
1	Manual Shift Shaft Position Switch Assembly Electrical Connector **Tip** - Release the connector lock before disconnecting. Engage the connector lock after connecting. - The wiring harness clip near the connector does not need to be replaced if broken or missing. The clip is used during manufacturing to keep the wire harness clear during an automated bolt installation process. If the clip is damaged, simply remove and discard.
2	Manual Shift Shaft Position Switch Assembly Bolt **Notice:** Refer to Fastener Notice in the Preface section. **Tighten**

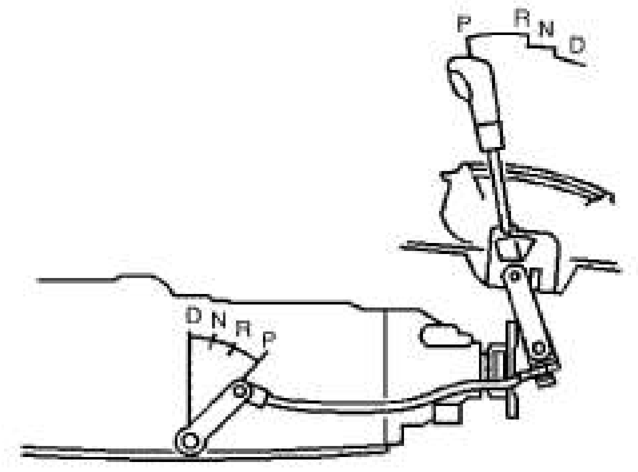
	8 N·m (71 lb in)
3	Manual Shift Shaft Position Switch Assembly **Procedure** Align the switch activator slide with the manual valve link.

Range Selector Lever Link Adjustment

1. Ensure that the shift lever is in the park (P) position.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
3. Loosen the selector rod on selector retaining bolt.
4. Ensure that the transmission manual shaft lever is in the park (P) position.
5. Hold the selector lever on transmission against the rear stop to eliminate any play.

   Tighten
   Tighten the selector lever adjustment nut to 9 N·m (80 lb. in).

6. Lower the vehicle.



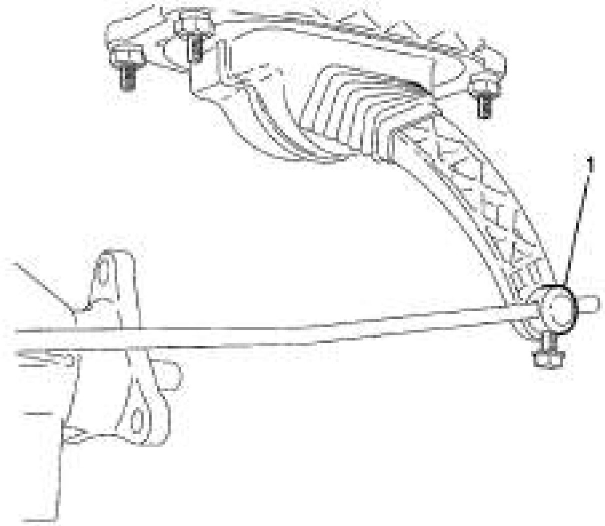
7. Inspect the operation of the starting system with the shift lever in each position. The engine should only crank when the lever is in the PARK or NEUTRAL position.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1975765**

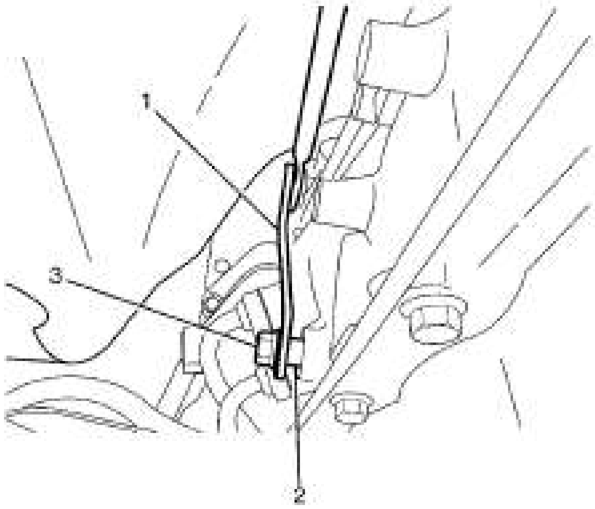
Shift Control Linkage Replacement

Removal Procedure

1. Position the shift lever in PARK.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .

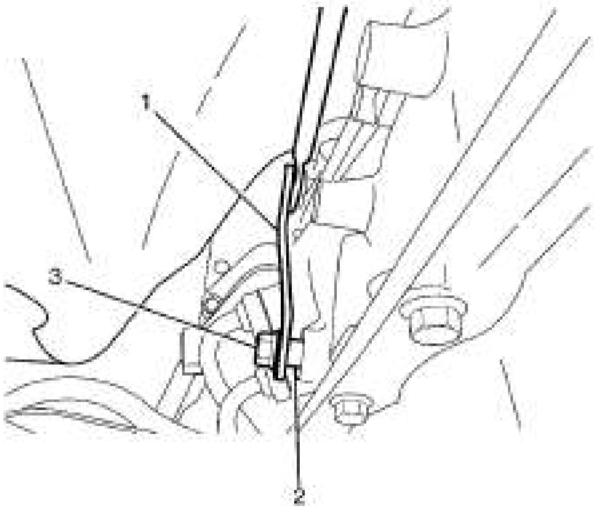


3. Remove the shift control linkage rod retaining bolt.
4. Disconnect the shift control linkage rod from the shift control assembly (1).



5. Remove the manual shift shaft retaining nut (3).
6. Remove the shift control linkage (1) from the transmission selector shaft (2).

Installation Procedure

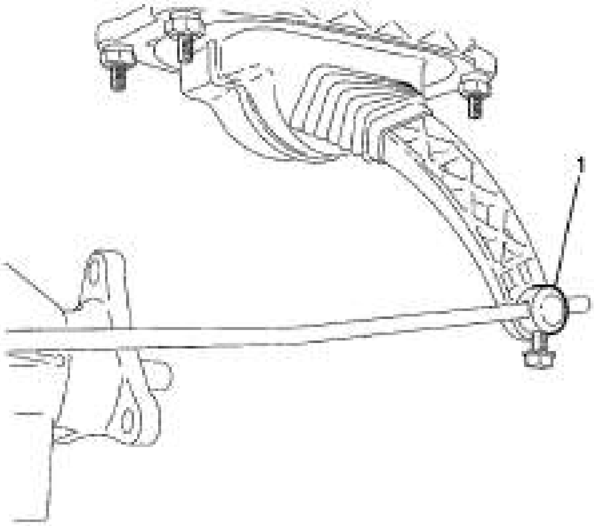


1. Install the shift control linkage (1) to the transmission selector shaft (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the manual shift shaft retaining nut (3).

   Tighten
   Tighten the manual shift shaft retaining nut to 9 N·m (80 lb. in).



3. Connect the shift control linkage rod to the shift control assembly (1).
4. Install the shift control linkage rod retaining bolt.
5. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment .
6. Lower the vehicle.

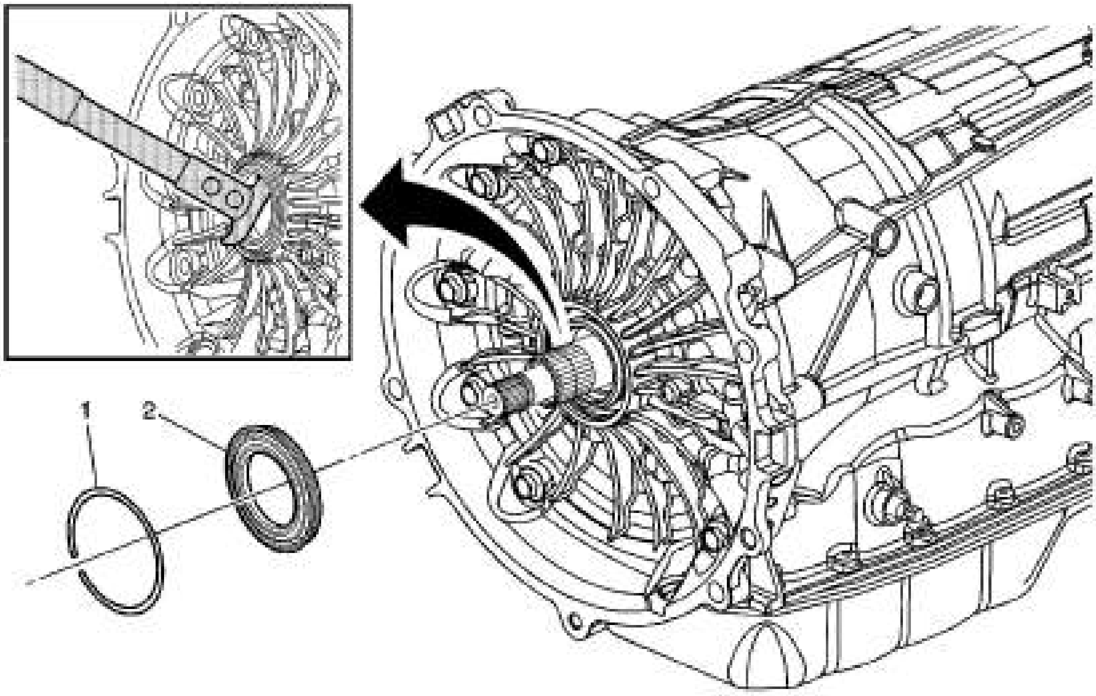
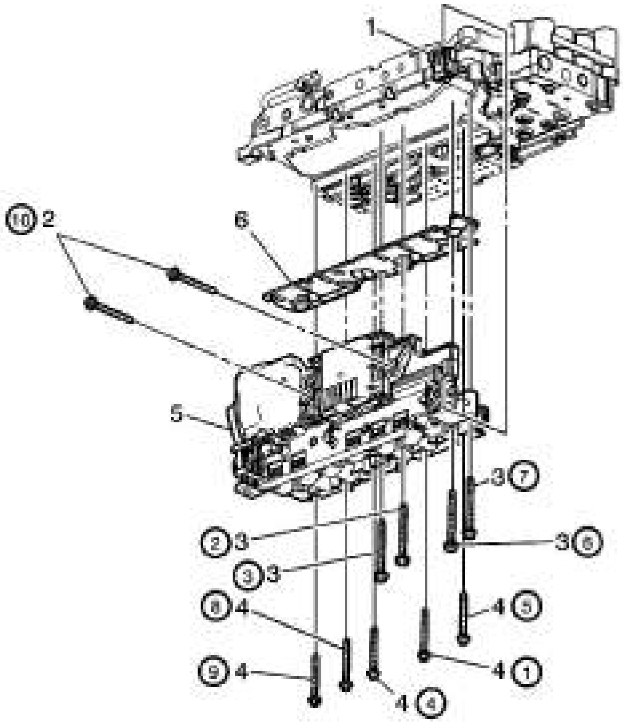
Torque Converter Fluid Seal Replacement



Callout	Component Name
Fastener Tightening Specifications: Refer to Fastener Tightening Specifications . **Preliminary Procedures** Remove the torque converter. Refer to Torque Converter Replacement .	
1	Torque Converter Fluid Seal Retaining Ring
2	Torque Converter Fluid Seal **Tip** Remove seal using J 45000

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1975787**

Torque Converter Replacement



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the transmission fluid pan and filter. Refer to Automatic Transmission Fluid, Fluid Pan and/or Filter Replacement.	
1	Manual Shift Shaft Position Switch Assembly Electrical Connector **Tip** Release the connector lock before disconnecting. Engage the connector lock after connecting.
2	Control Module Assembly Heat Sink Bolt (Qty: 2) **Tighten** 8 N·m (71 lb. in)

	Tip Tighten in specified sequence.
3	Control Solenoid Valve Assembly Bolt (Qty: 4) **Tighten** 8 N·m (71 lb. in) **Tip** Tighten in specified sequence.
4	Control Solenoid Valve Assembly Bolt (Qty: 5) **Tighten** 8 N·m (71 lb. in) **Tip** Tighten in specified sequence.
5	Control Solenoid Valve and Module Assembly Refer to Control Module References. **Tip** • Inspect the 4 filter plate retaining tabs. A broken tab may not adequately secure the filter plate to the control solenoid valve assembly. • Align the control solenoid valve assembly with the lower valve body locator pin when assembling.
6	Filter Plate **Tip** Discard filter plate and replace with new.

Following the replacement of the TCM, a harsh upshift may occur between 4th and 5th gear.

If this occurs the following procedure should be followed.

- Make sure both the Scan Tool and TCM calibrations are the latest versions availble for reprogramming.
- Check and clear all DTCs that may have set as a result of the programming process.
- Drive maneuvers should be performed at transmission oil temperatures of at least 40°C (104°F).
- Transmission oil levels should be set correctly prior to the starting drive cycles.
- Initial upshifts may have an erratic feel for the first several cycles. They should improve significantly with repeated maneuvers.
- At the start of the drive cycles, no ECM or TCM DTCs should be set. The MIL should not be illuminated.

A drive cycle requires five light throttle accelerations to 40 km/h (25 mph) and five light throttle accelerations to 64 km/h (40 mph).

1. From a complete stop, lightly accelerate at a relatively constant throttle pedal position up to

40 km/h (25 mph) or 64 km/h (40 mph).
2. Brake the vehicle to a complete stop.
3. Repeat five times to 40 km/h (25 mph) and five times to 64 km/h (40 mph). Maneuvers can be performed in any combination.

If the garage shifts (Park to Reverse, Park to Drive, Reverse to Drive, Drive to Reverse) feel like they are delayed, garage shifts adapts can also be performed. All garage shifts should be performed with the vehicle stopped, foot on the brake and engine at idle.

1. Shift the transmission from Reverse to Drive leaving the shift lever in Drive for three seconds. After three seconds, shift back to Reverse, leaving the shift lever in Reverse for three seconds. Perform the procedure 10 times (R-D-R-D-R-D...). The transitions need to be directly to Drive and Reverse, without stopping in Neutral.
2. Shift the transmission from Neutral to Drive leaving the shift lever in Drive for three seconds. After three seconds, shift back to Neutral, leaving the shift lever in Neutral for three seconds. Perform the procedure 10 times (N-D-N-D-N-D...).
3. Shift the transmission from Neutral to Reverse leaving the shift lever in Reverse for three seconds. After three seconds, shift back to Neutral, leaving the shift lever in Neutral for three seconds. Perform the procedure 10 times (R-N-R-N-R-N..).

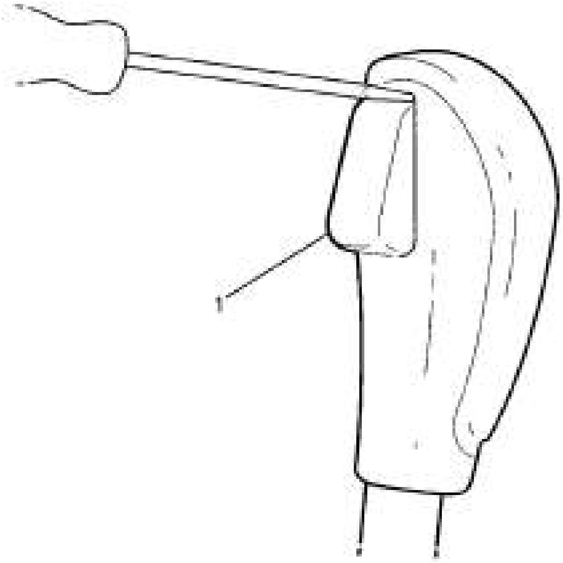
At the end of these maneuvers, the vehicle may still experience some minor driveability issues, but should learn improved shifting performance over the next several key cycles and driving time. Coach the customer about the transmission's ability to self-correct shifting issues or concerns. The transmission adapts are always functional and operate at transmission oil temperatures above 40° C (104°F).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1992273**

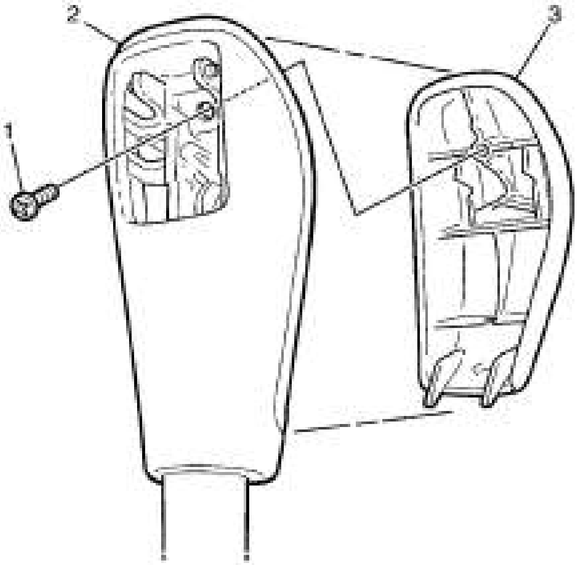
Transmission Control Lever Knob Replacement

Removal Procedure

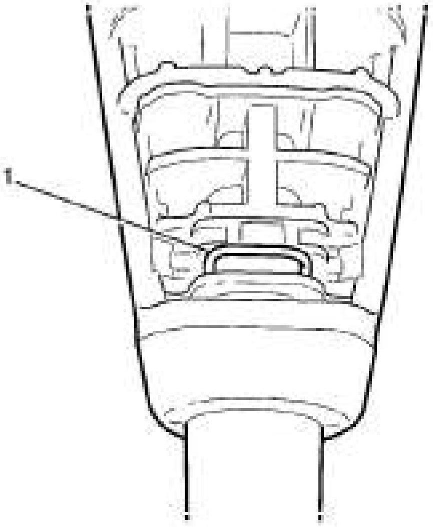
1. Remove transmission control lever assembly. Refer to Transmission Control Replacement.



2. Using a suitable tool release the selector lever knob (1) from the control lever assembly.

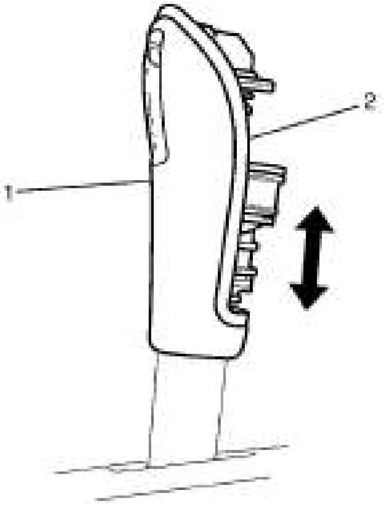


3. Remove the selector lever retaining screw (1) and lever backing (3).

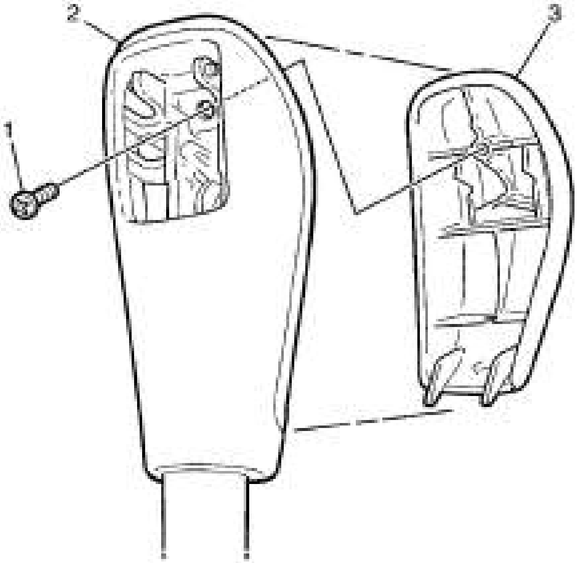


4. Remove the selector lever metal retaining clip (1).
5. Remove the selector lever spacer
6. Remove the selector lever by sliding upwards off assembly

Installation Procedure



1. Install the selector lever (1) by sliding down on the assembly.
2. Install the selector lever spacer (2).
3. Install the selector lever metal retainer clip.

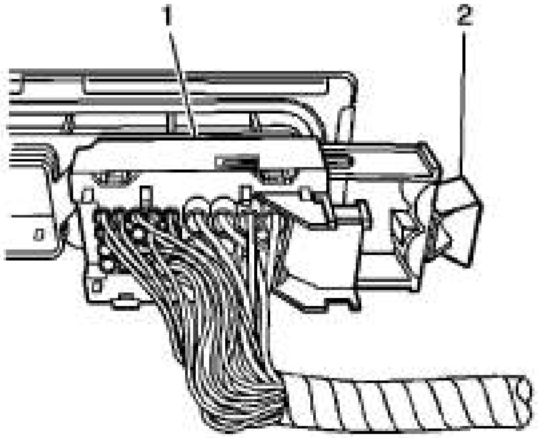


4. Install the selector lever backing (3) and retaining screw (1).
5. Install the selector lever release knob into selector lever.
6. Install the transmission control lever assembly. Refer to Transmission Control Replacement.

Transmission Control Module Replacement

Removal Procedure

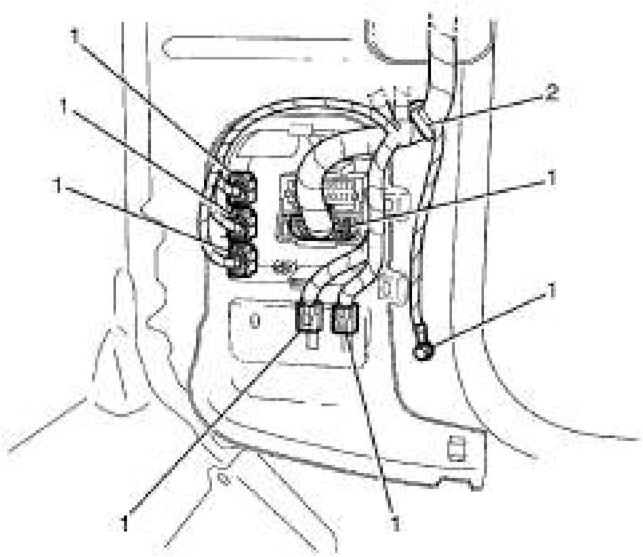
1. Remove the hinge pillar trim from the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
2. Remove the knee bolster assembly. Refer to Knee Bolster Replacement .



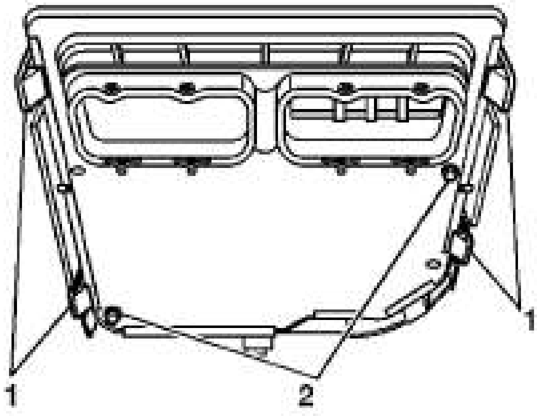
3. Unlock the transmission control module electrical connector by pulling the retainer (2) away from the electrical connector (1).

   Important: Twisting or tilting of the transmission control module electrical connector while disconnecting may result in bent or misaligned electrical terminal pins.

4. Carefully disconnect the electrical connector (1) from the transmission control module.

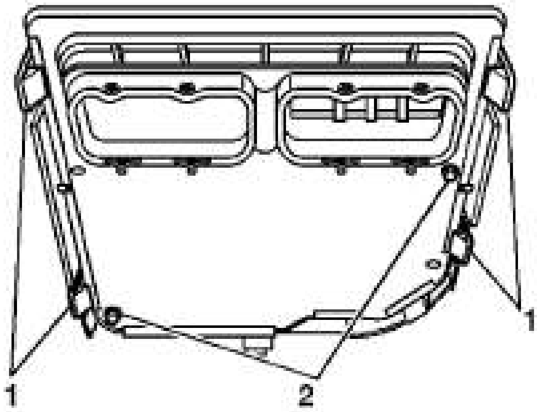


5. Disconnect the electrical connectors (1) from right hand side junction box and position loom toward cowl

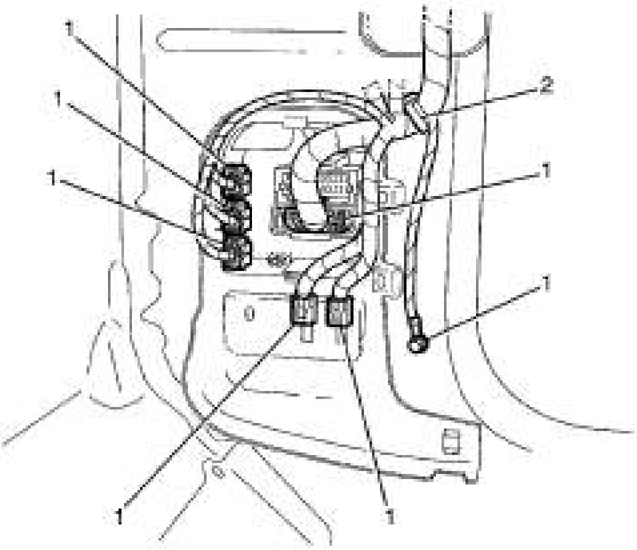


6. Remove the transmission control module from the mounting bracket by pulling back on the retaining tabs (1) to release the control module .

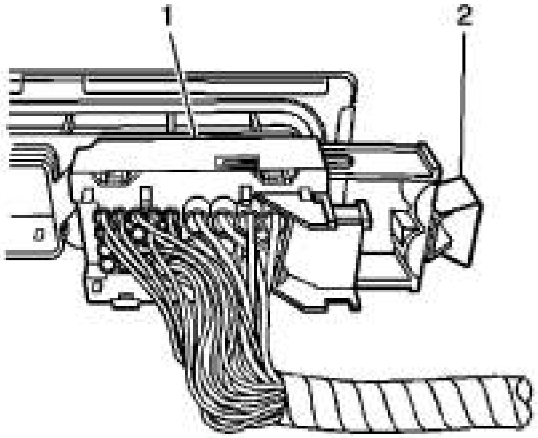
Installation Procedure



1. Align the transmission control module with the locating pins (2) on the module mounting bracket.
2. Install the transmission control module by seating it fully into the bracket until all of the retaining tabs (1) have engaged the edge of the module edge.



3. Install connectors into the right hand side junction box



Important: Twisting or tilting of the transmission control module electrical connector while connecting may result in bent or misaligned electrical terminal pins.

4. Carefully connect the transmission control module electrical connector (1) to the transmission control module.
5. Lock the transmission control module electrical connector securely to the transmission control module by pushing the retainer (2) toward the electrical connector (1) until fully seated.
6. Install the hinge pillar trim on the vehicle. Refer to Body Hinge Pillar Trim Panel Replacement .
7. Install the knee bolster assembly. Refer to Knee Bolster Replacement .
8. The transmission control module must be programmed with the proper software/calibrations. Refer to Service Programming System (SPS) .

Important: It is recommended that transmission adaptive pressure (TAP) information be reset.

Resetting the TAP values using a scan tool will erase all learned values in all cells. As a result, The ECM or TCM will need to relearn TAP values. Transmission performance may be affected as new TAP values are learned.

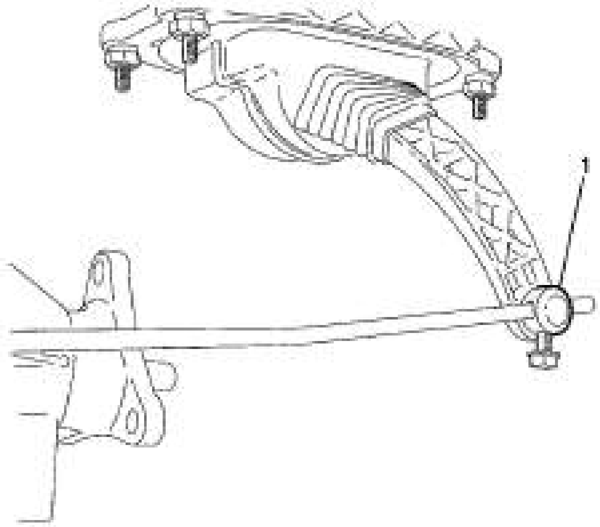
9. Reset the TAP values. Refer to Transmission Adaptive Functions .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1993886**

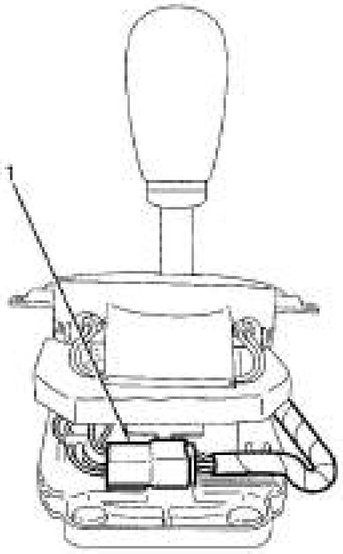
Transmission Control Replacement

Removal Procedure

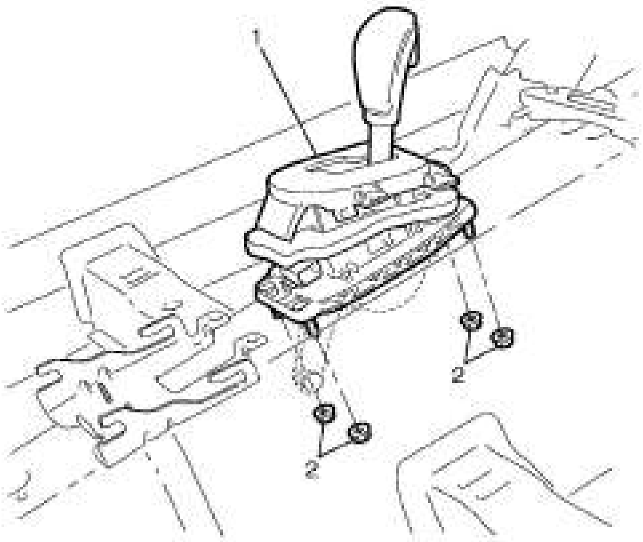
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove the shift control linkage adjustment nut.
3. Disconnect the shift control linkage rod from the shift control assembly (1).
4. Lower the vehicle.
5. Remove the center console assembly. Refer to Front Floor Console Replacement.

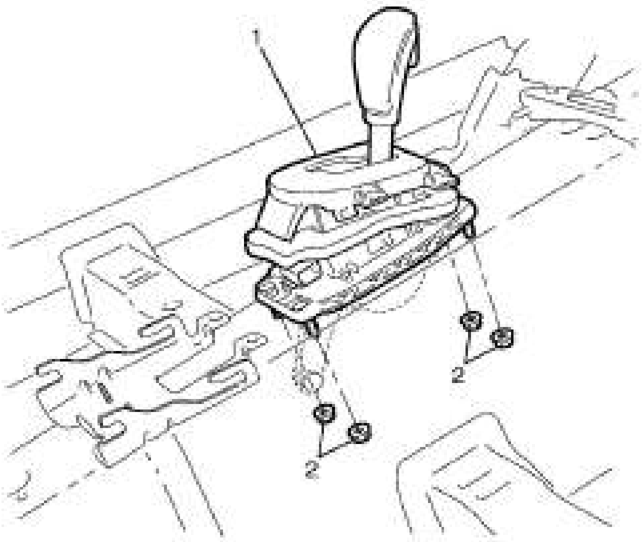


6. Remove the electrical connector (1) from the shift control assembly.



7. Remove the shift control assembly to tunnel reinforcement retaining nuts (2).
8. Remove the shift control assembly (1) from the tunnel reinforcement.

Installation Procedure

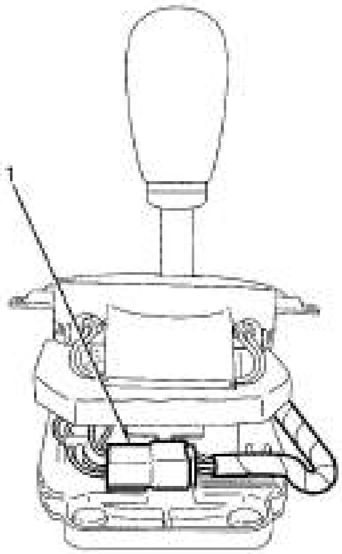


1. Install the shift control assembly (1) to the tunnel reinforcement.

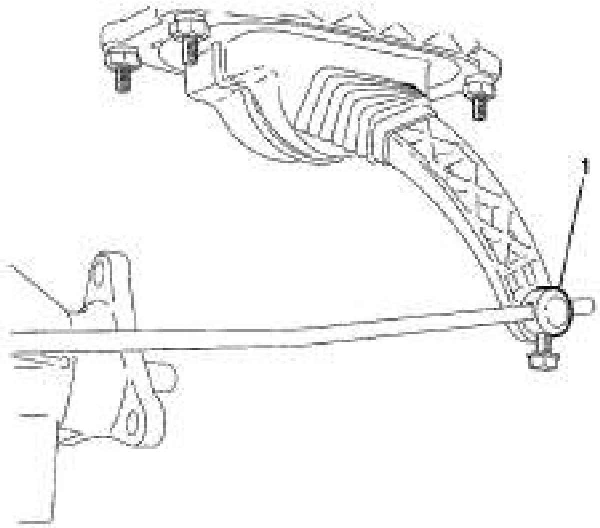
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the shift control assembly to tunnel reinforcement retaining nuts (2).

Tighten
Tighten the nuts to 12 N·m (106 lb. in).



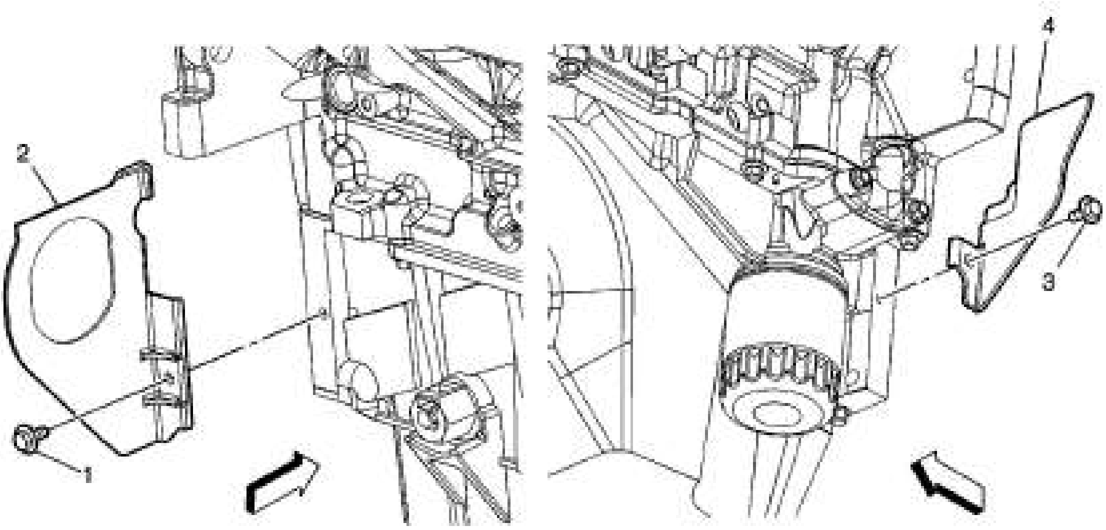
3. Install the electrical connector (1) to the shift control assembly.
4. Install the centre console assembly. Refer to Front Floor Console Replacement.
5. Install the shift control trim plate by inserting the front retaining tabs to the console. Press down on the rear of the trim plate to engage the rear retaining tabs.
6. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



7. Connect the shift control linkage rod to the shift control assembly (1).
8. Install the shift control linkage adjustment nut finger tight.
9. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment.
10. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1993898**

Transmission Converter Cover Replacement

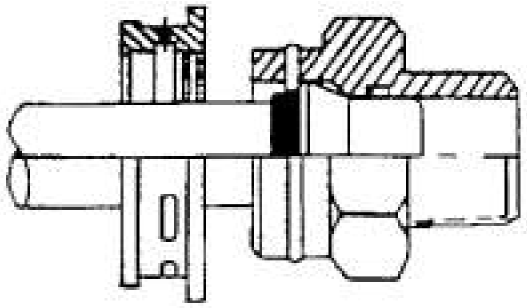


Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** Raise the vehicle. Refer to Lifting and Jacking the Vehicle .	
1	Torque Converter Cover Bolt **Tighten** 10 N·m (89 lb. in).
2	Torque Converter Cover **Tip** Remove the starter. Refer to Starter Motor Replacement.
3	Torque Converter Cover Bolt **Tighten** 10 N·m (89 lb. in).

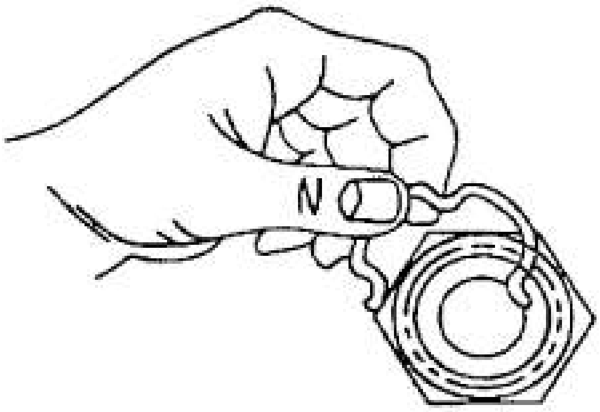
4	Torque Converter Cover

Transmission Fluid Cooler Hose / Pipe Quick-Connect Fitting Disconnection and Connection (SWB LWB RHD)

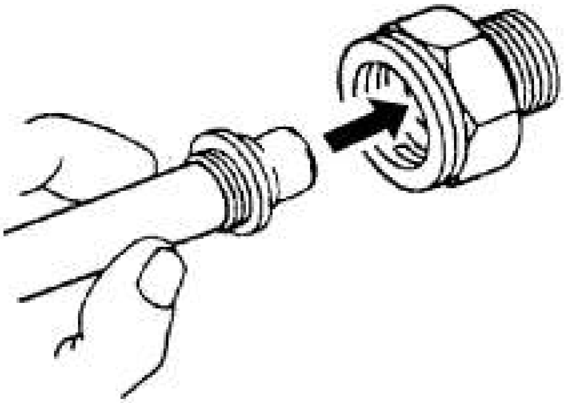
Removal Procedure



1. Remove the plastic cap from the quick connect fitting.



2. Remove the retaining ring from the quick connect fitting.



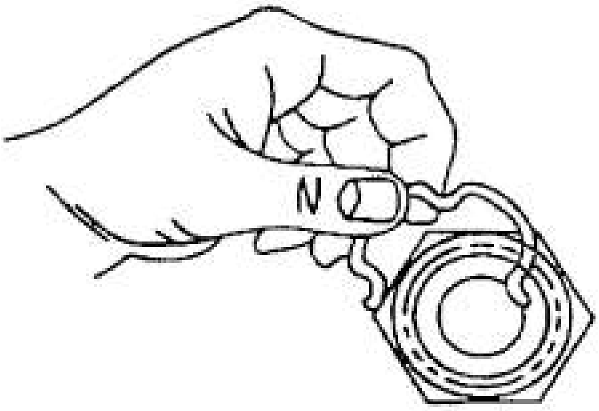
3. Remove the cooler line from the quick connect fitting.

Installation Procedure

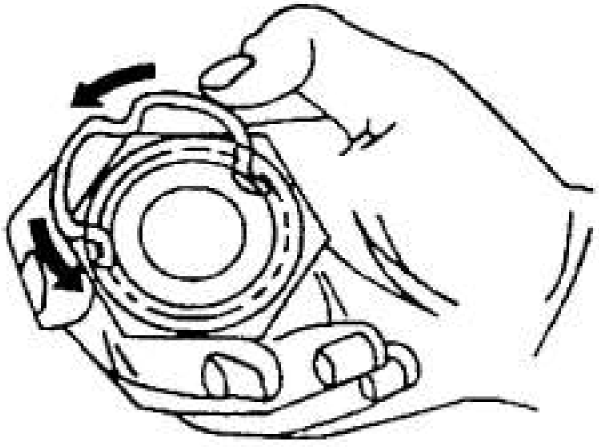
Important:

- Do not reuse any of the existing oil lines or oil line fittings if there is excessive corrosion.
- Do not reuse any of the existing retaining rings that were removed from the existing quick connect fittings. Install new retaining rings.
- Ensure the following procedures are performed when installing the new retaining rings onto the fittings.

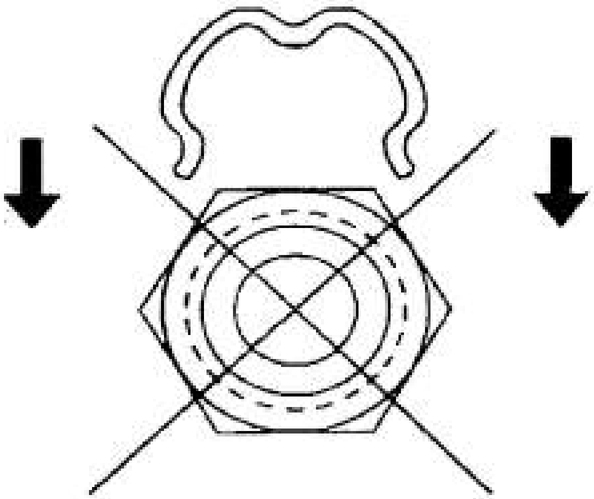
1. Install a new retaining ring into the quick connect fitting using the following procedure:



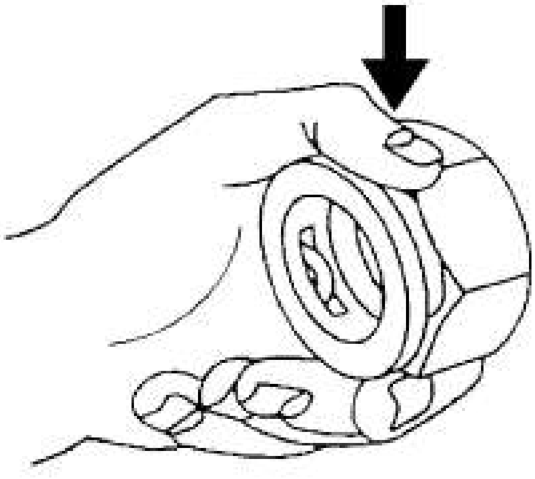
2. Hook one of the open ends of the retaining ring in one of the slots on the quick connect fitting.



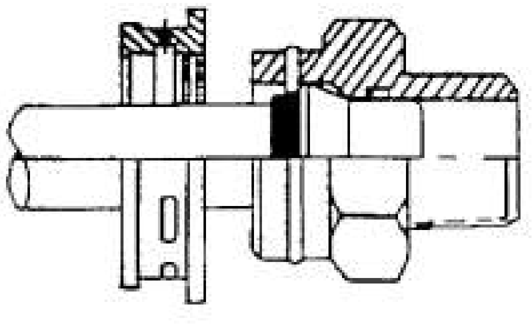
3. Rotate the retaining ring around the fitting until the retaining ring is positioned with all three ears through the three slots on the fitting.



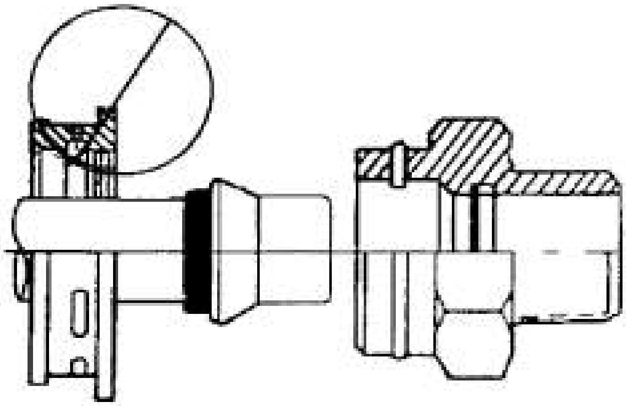
4. Do not install the new retaining ring onto the fitting by pushing the retaining ring.



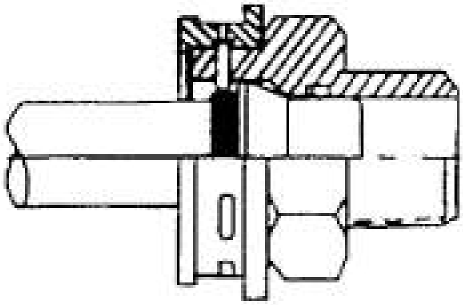
5. Ensure that the three retaining ring ears are seen from inside the fitting and that the retaining ring moves freely in the fitting slots.



6. Install the cooler line into the quick connect fitting.
7. Insert the cooler line end into the quick connect fitting until a click is either heard or felt.

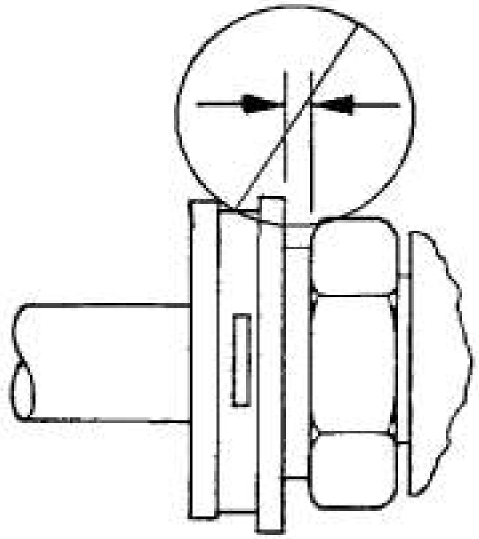


8. Do not use the plastic cap on the cooler line in order to install the cooler line into the fitting.
9. Pull back sharply on the cooler line in order to make sure that the cooler line is fastened into the quick connect fitting.

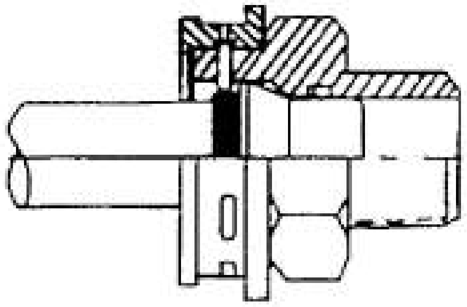


Important: Do not manually depress the retaining clip when installing the plastic cap.

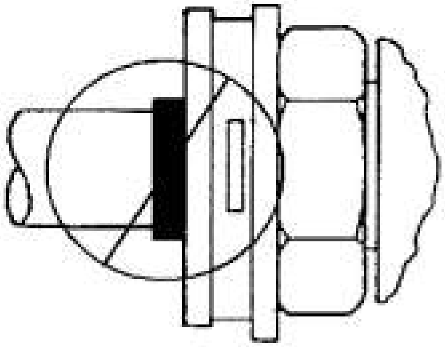
10. Position (snap) the plastic cap onto the fitting. Do not manually depress the retaining ring when installing the plastic cap onto the quick connect fitting.
11. Ensure that the plastic cap is fully seated against the fitting.



12. Ensure that no gap is present between the cap and the fitting.



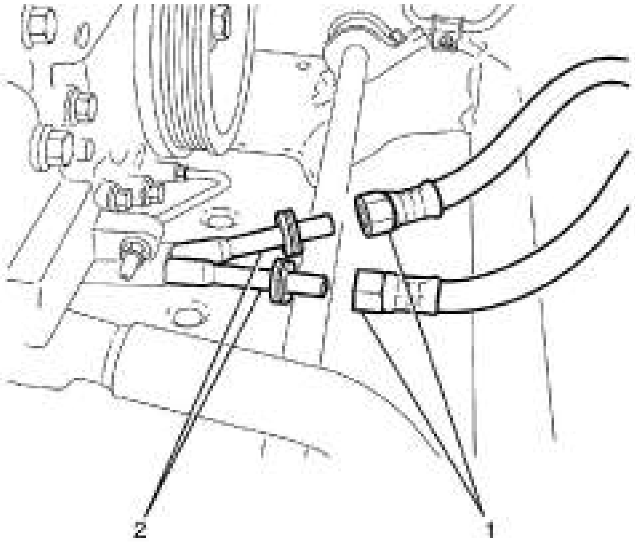
13. Ensure that the yellow identification band on the tube is hidden within the quick connect fitting.



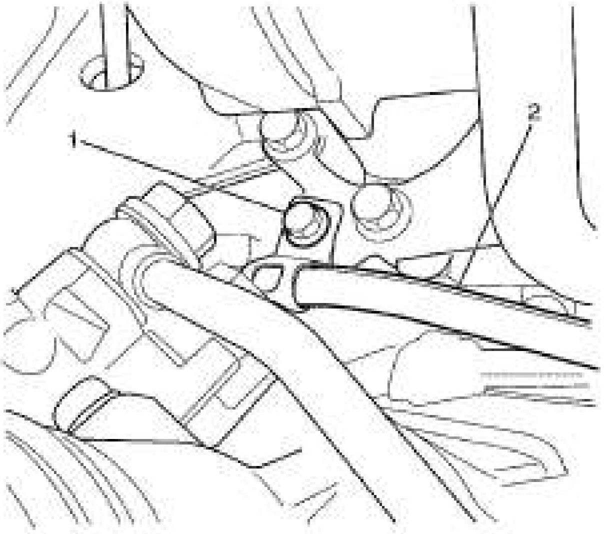
14. A hidden yellow identification band indicates proper joint seating.
15. Fill the transmission to the proper level with DEXRON® VI transmission fluid. Refer to Transmission Fluid Check.

Transmission Fluid Cooler Hose/Pipe Replacement

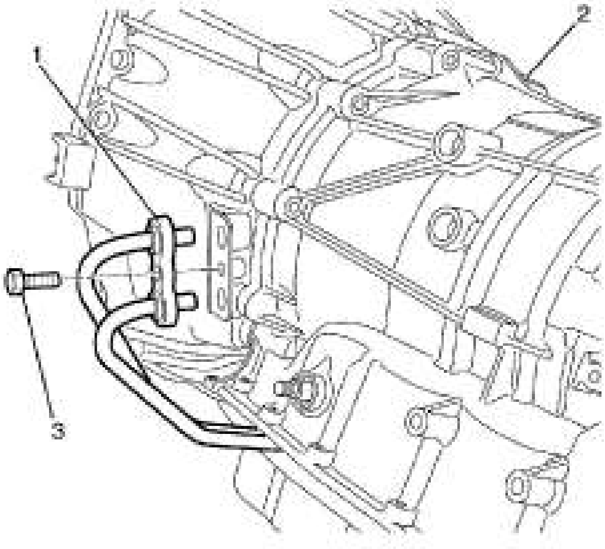
Removal Procedure



1. Disconnect the automatic transmission cooler pipe (2) from the flexible hose (1) at the quick connect fitting using tool AU525.
   - Open release tool AU525 then close and clip around the hose to be disconnected.
   - While holding the flexible hose (1) push the hose inwards with one hand, then pull back to separate from the steel hose piping (2).
   - Repeat for the second fitting.
2. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



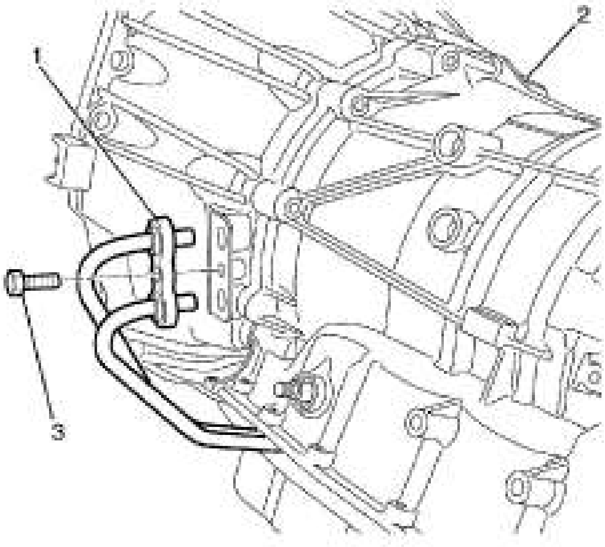
3. Remove the automatic transmission cooler pipe clamp to A/C bracket retaining bolt (1).
4. Position the automatic transmission cooler pipes (2) aside.



5. Remove the automatic transmission cooler pipe retaining bolt (3).
6. Remove the automatic transmission cooler pipes (1) from the transmission (2).
7. Remove the automatic transmission cooler pipes from the vehicle.

Installation Procedure

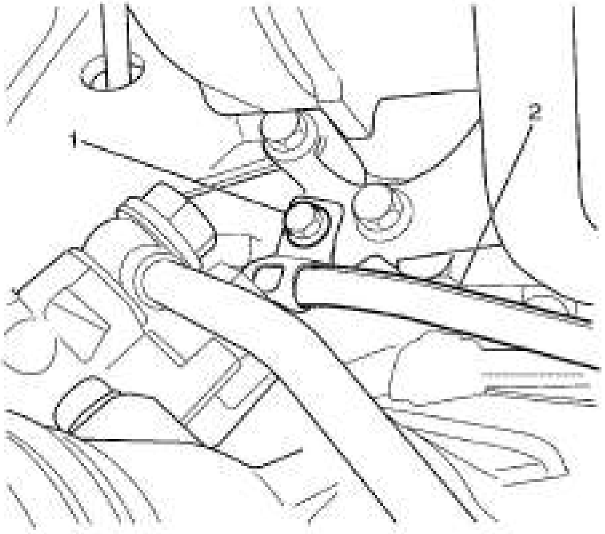
1. Install the automatic transmission cooler pipes to the vehicle.



2. Install the automatic transmission cooler pipes (1) to the transmission (2).

3. Install the automatic transmission cooler pipe retaining bolt (3).

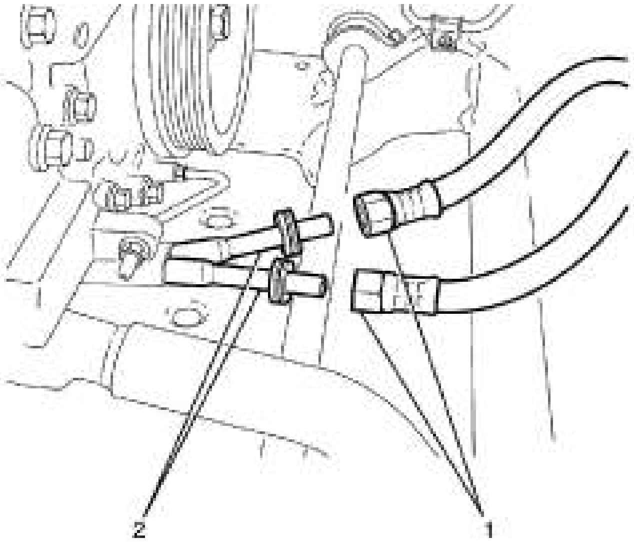
   Tighten
   Tighten the bolt to 20 N·m (15 lb ft).



4. Position the automatic transmission cooler pipes (2) to the engine.
5. Install the automatic transmission cooler pipe clamp to A/C bracket retaining bolt (1).

   Tighten
   Tighten the bolt to 22 N·m (16 lb ft).

6. Lower the vehicle



Important: The flexible hoses are not serviced separately. Therefore if the hose's require replacement, then the hose and radiator to hose cooler hose assembly must be fitted.

7. Align both flexible hose's (1) with both steel cooler lines (2).

   Important: Listen for an audible click to confirm fitting.

8. Hold the cooler line (2) and connect the flexible hose (1) by pushing together. Repeat procedure for other hose.

   Important: When adding or changing transmission fluid only use recommended automatic transmission fluid.

9. Check automatic transmission fluid level. Refer to Transmission Fluid Check.

Transmission Mount Inspection

Notice: Refer to General Repair Instructions in the Preface section.

1. Raise the transmission in order to remove the weight from the transmission mount and create slight tension in the rubber.
2. Observe the transmission mount while raising the transmission. Replace the transmission mount if the transmission mount exhibits any of the following conditions:

   Important: Black paint on the rubber will crack with time, this does no constitute a failure.

   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the transmission mount.
   - The rubber is split through the centre of the transmission mount.
3. If there is movement between the metal plate of the transmission mount and its attaching points, lower the transmission on to the transmission mount. Tighten the bolts or nuts attaching the transmission mount to the frame or transmission mount bracket.

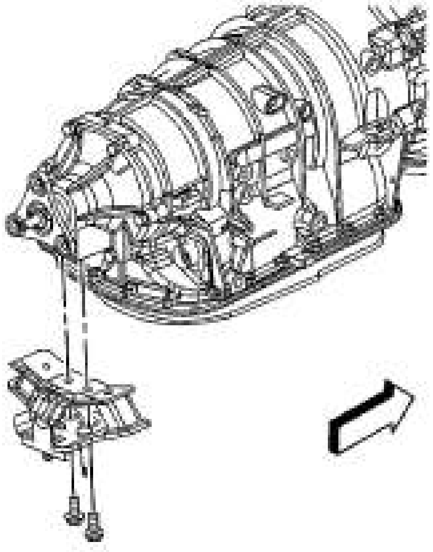
Transmission Mount Replacement (SWB LWB RHD)

Removal Procedure

1. Remove the exhaust system. Refer to Exhaust System Replacement.

   Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

2. Support the transmission with a suitable jack and a block of wood.
3. Remove the transmission support. Refer to Transmission Support Replacement.



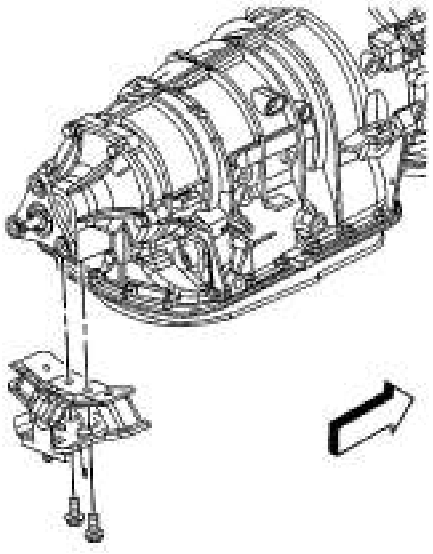
4. Remove the transmission mount bolts.
5. Remove the transmission mount from the vehicle.

Installation Procedure

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

1. Install the transmission mount to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



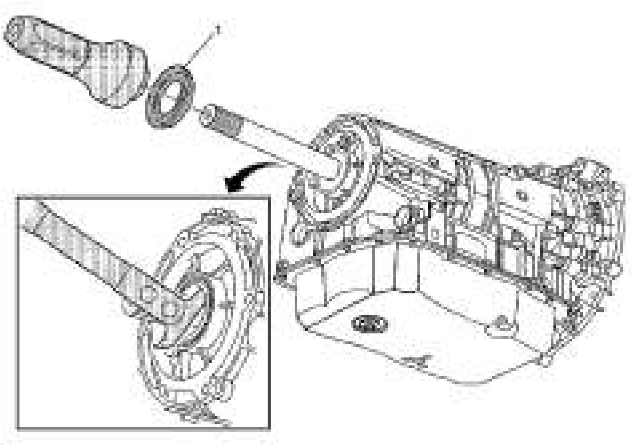
2. Install the transmission mount bolts.

   Tighten
   Tighten the bolts to 60 N·m (44 lb. ft).

3. Install the transmission support. Refer to Transmission Support Replacement.
4. Remove the support from under the transmission.
5. Install the exhaust system.
6. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | Document ID: 1993968

Transmission Output Shaft Seal Replacement



Callout	Component Name
	Notice: Refer to Fastener Notice in the Preface section. *Fastener Tightening Specifications:* Refer to Fastener Tightening Specifications . **Preliminary Procedures** 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle . 2. Remove the propeller shaft. Refer to Propeller Shaft Replacement . 3. Support the transmission with a suitable jack. 4. Remove the transmission mount assembly. Refer to Transmission Mount Replacement . 5. Remove the transmission extension housing assembly. Refer to Output Shaft Seal Replacement .
1	Output Shaft Seal - Use the J 45000 to remove the seal. Use care in order to avoid damaging the output shaft bushing. - Lubricate the seal with clean transmission fluid. - Use the J 38693 to install the seal.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - On Vehicle | **Document ID: 1993946**

Transmission Replacement

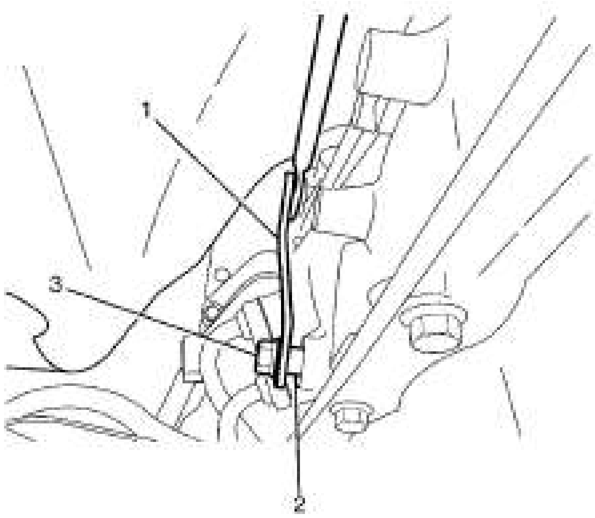
Tools Required

- J 42386-A Flywheel Holding Tool
- EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

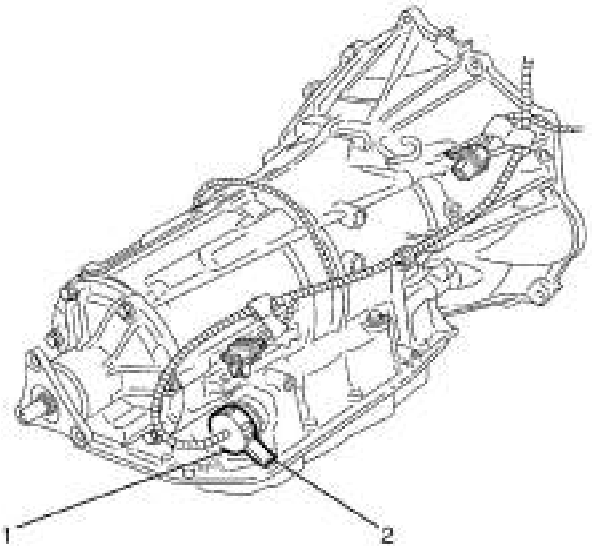
Removal Procedure

Important: NEW torque converter bolts will be required each time the torque converter bolts are removed.

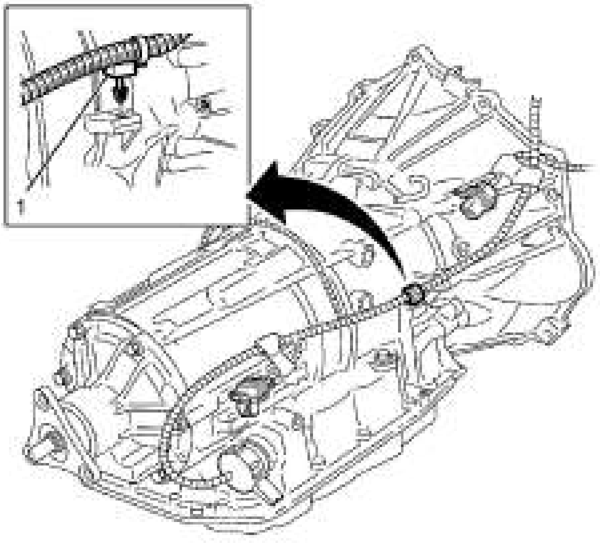
1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
2. Remove air intake ducting from engine.
3. Remove radiator retaining clips.
4. Disconnect the EVAP purge pipe.
5. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
6. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
7. Remove the air deflector front (1). Refer to Front Air Deflector Replacement .
8. Remove the splash shield.



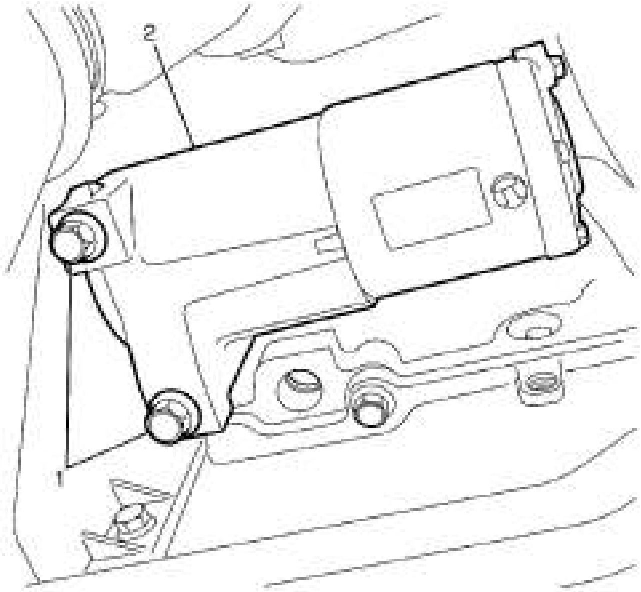
9. Remove the transmission manual shift shaft nut (3).
10. Disconnect the shift linkage (1) from the transmission shift shaft (2).



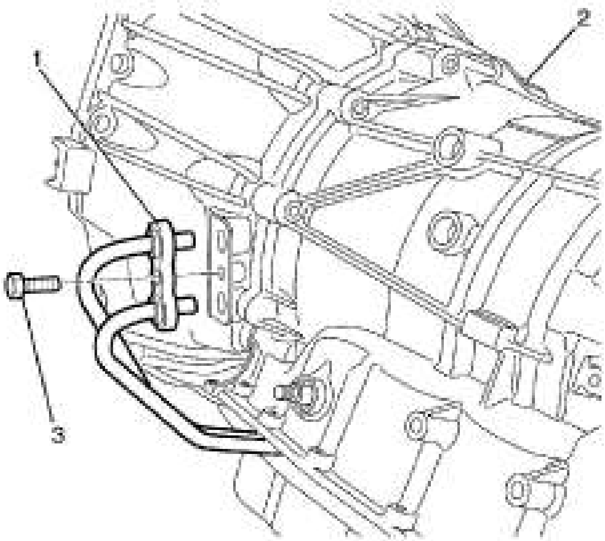
11. Disconnect the transmission wiring harness connector (1) from the transmission by rotating the locking latch (2) counter-clockwise.



12. Disconnect the wiring harness clips from the transmission, and position the wiring harness aside.

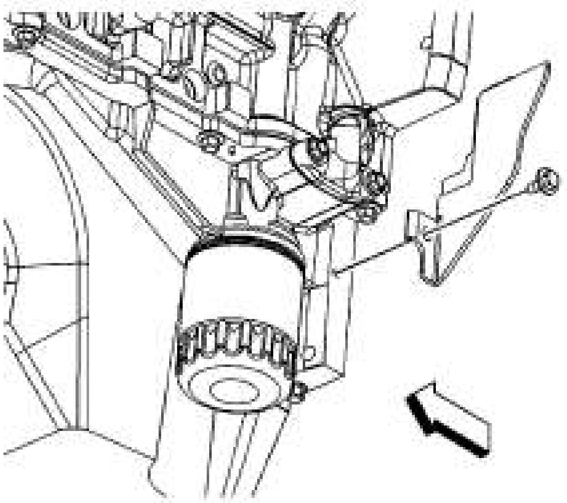


13. Remove the starter motor (2) to gain access to the torque converter bolts. Refer to Starter Motor Replacement .
14. Mark the torque converter to flexplate/flywheel orientation to make sure proper realignment.
15. Repeat the following steps for all 3 torque converter bolts:
    - 15.1. Rotate the harmonic balancer centre bolt clockwise ONLY, in order to align the torque converter bolt with the starter motor opening in the engine block.
    - 15.2. Remove and discard the torque converter bolt. The bolt is self locking and is NOT reusable.
16. Using inspection hole push torque converter back towards transmission pump
17. Place an oil drain pan under the transmission fluid cooler pipes.
18. Remove the bolt securing the transmission fluid cooler pipes brace to the engine.



19. Disconnect the fluid cooler pipes from the transmission.
20. Plug the open outlet ports to prevent fluid loss and contamination.

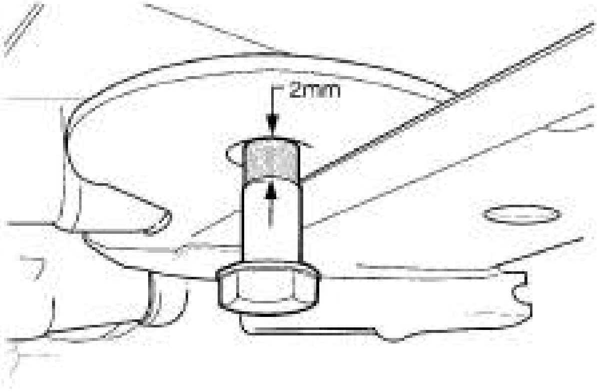
21. Disconnect the steering shaft from the steering rack



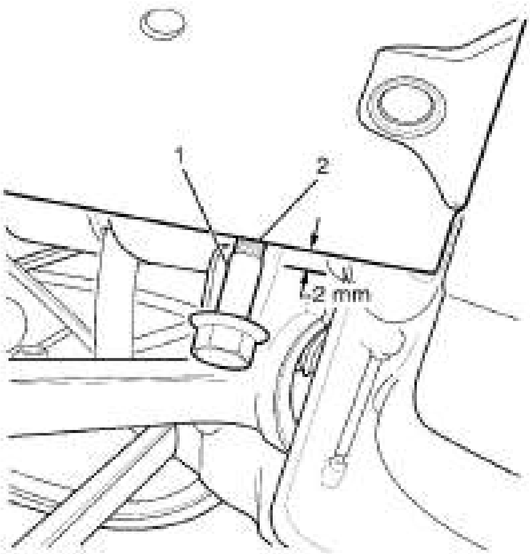
22. Remove the engine close out cover studs and cover.

Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

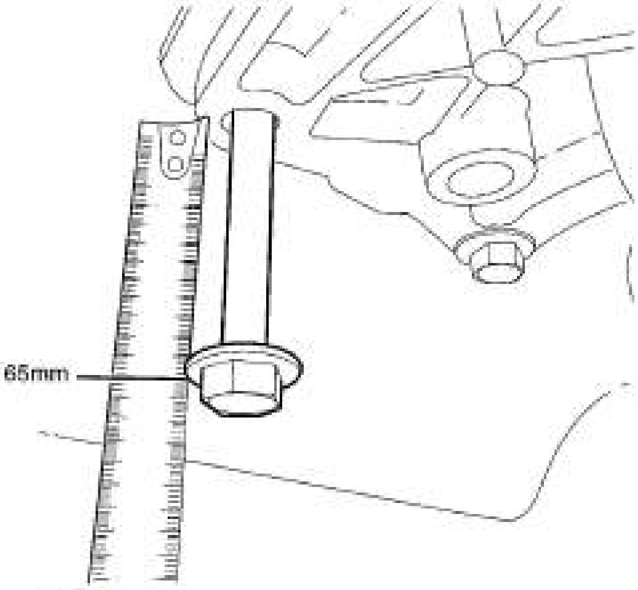
23. Support the power train with a suitable jack or table.
24. Using special tool XX lower engine and transmission assembly 65mm.
25. Support the transmission with a suitable jack.



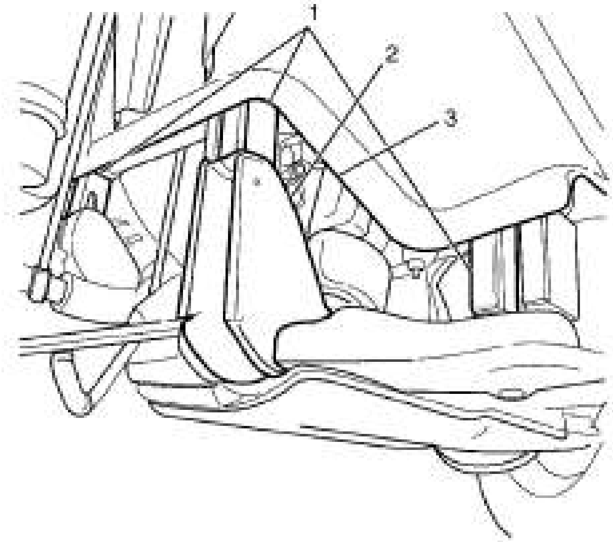
26. Replace the front sub frame rear bolts and fit bolts from special tool kit EN-48536
27. Install bolt till stepped shank (1) is 2mm below sub frame (2).



28. Replace the front sub frame front bolts and fit bolts from special tool kit EN-48536
29. Install bolt till stepped shank (1) is 2mm below chassis rail flange (2).



30. Remove all four transmission mount to body bolt and install two bolts from special tool kit in diagonal holes e.g Left hand front and Right hand rear.
31. Install in till 65mm is measured between bolt heads (1) and transmission mount (2).
32. Remove front sub frame middle bolts.
33. Lower power train slowly until the subframe and transmission mount are resting on bolts.



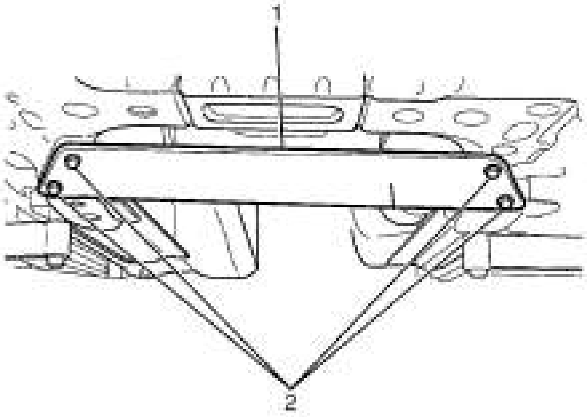
34. Insert 65mm spacer blocks (1) between subframe (2) and chassis rails (3).
35. Tension front sub frame front and rear bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

36. Install and tension middle sub frame bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

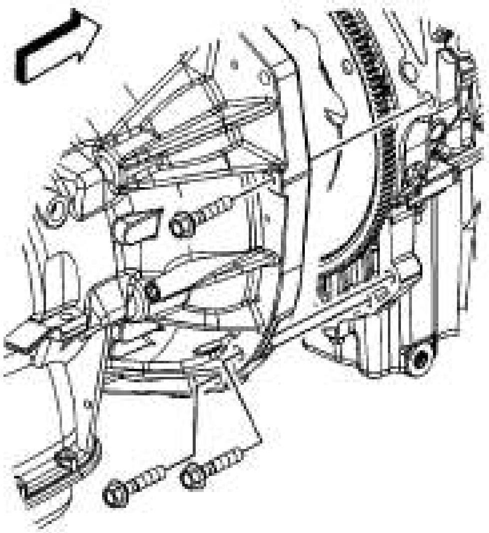
37. Remove supporting jack or table



38. Install engine support plate (1) to front sub frame (2).

39. Tension plate securing bolts (3).

    Tighten
    Tighten the bolts to 10 N·m (89 lb. in).



40. Remove the transmission bolts.
41. Pull the transmission free from the engine dowels.

    Important: Ensure clearance is maintained between the transmission and the following:
    - The catalytic converters
    - The wiring harnesses
    - The cooler pipes
    - The propeller shaft

42. Carefully lower the transmission from the vehicle.
43. Flush the transmission oil cooler. Refer to Transmission Fluid Cooler Flushing and Flow Test

Installation Procedure

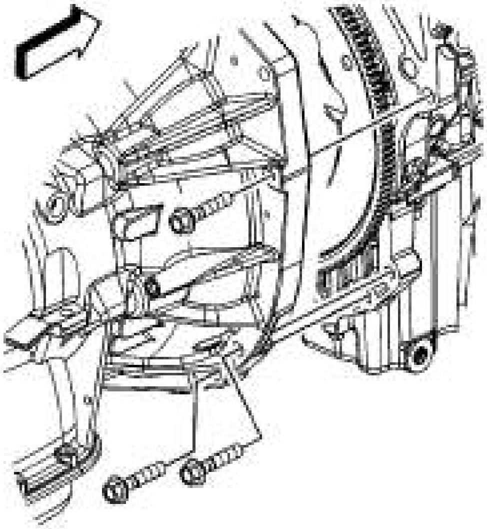
Important: The engine mounts must NOT bend or deflect from the vertical position, damage to the mount will occur.

Important: Ensure clearance is maintained between the transmission and the following:
- The catalytic converters
- The wiring harnesses
- The cooler pipes
- The propeller shaft

1. Using the transmission jack, carefully raise the transmission to the vehicle.

2. Align the transmission with the engine dowels.

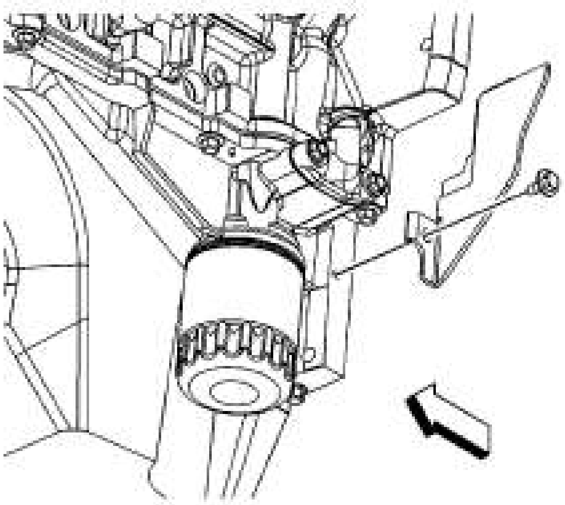
   Notice: Refer to Fastener Notice in the Preface section.



3. Install the side transmission bolts.

   Tighten
   Tighten the bolts to 50 N·m (37 lb. ft).

4. Install transmission bolts.



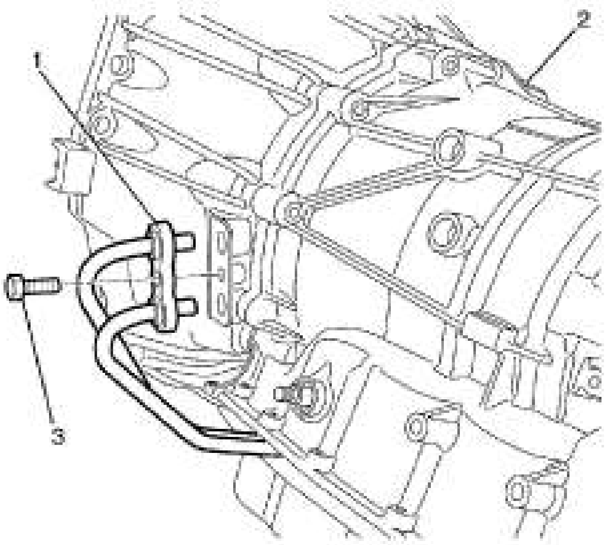
5. Install the engine close out cover and studs.

Tighten
Tighten the studs to 10 N·m (89 lb. in).

6. Raise the powertrain back up into the engine bay and tighten front sub frame retaining bolts.

   Tighten
   Tighten the retaining bolts to 160 N·m (118 lb. ft.) for the front four bolts and 240 N·m (177 lb. ft)

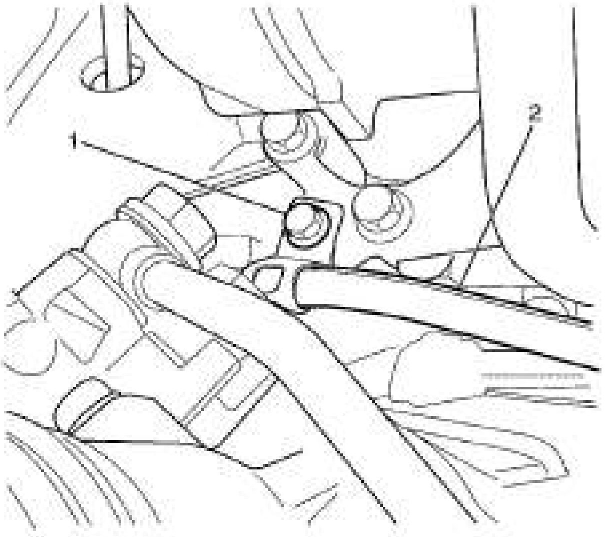
7. Install the steering shaft to the steering rack.



Important: Replace the O-rings if cracked, cut, or distorted.

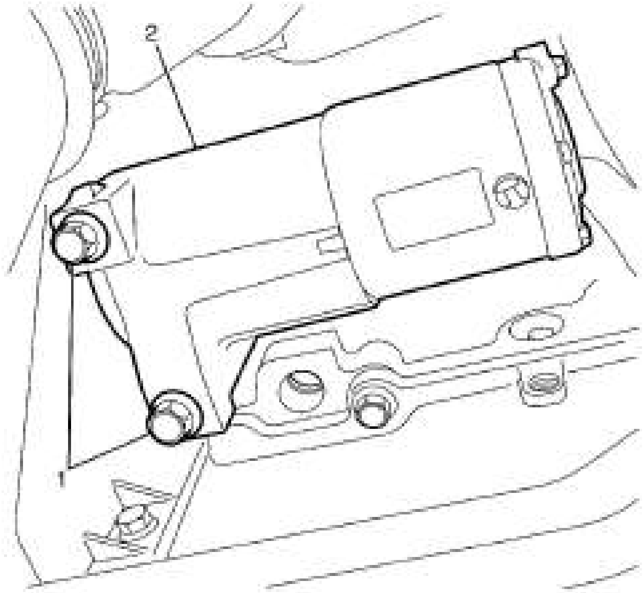
8. Lubricate the O-rings with automatic transmission fluid.
9. Install the O-rings onto the cooler pipes prior to inserting the cooler pipes into the transmission.
10. Insert the transmission fluid cooler pipes into the transmission.
11. Install the bolt securing the transmission fluid cooler pipe retainer to the transmission.

    Tighten
    Tighten the bolt to 25 N·m (18 lb. ft).



12. Install the bolt securing the transmission fluid cooler pipes brace to the engine.

    Tighten
    Tighten the bolt to 22 N·m (17 lb. ft)



13. Align the torque converter to flexplate/flywheel orientation marks made during the removal procedure.

    Important: Torque converter bolts are self locking and must be replaced with NEW torque converter bolts every time the bolts are removed.

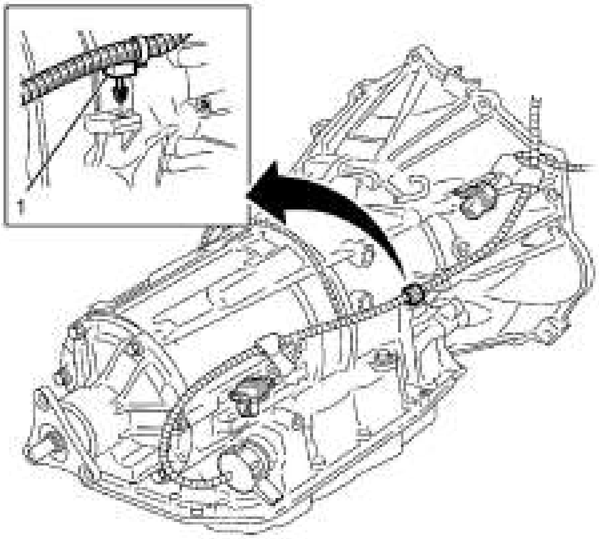
14. Repeat the following steps for all 3 torque converter bolts:

14.1. Rotate the harmonic balancer centre bolt clockwise ONLY, in order to align the torque converter bolt holes in the flexplate/flywheel with the starter motor opening in the engine block.

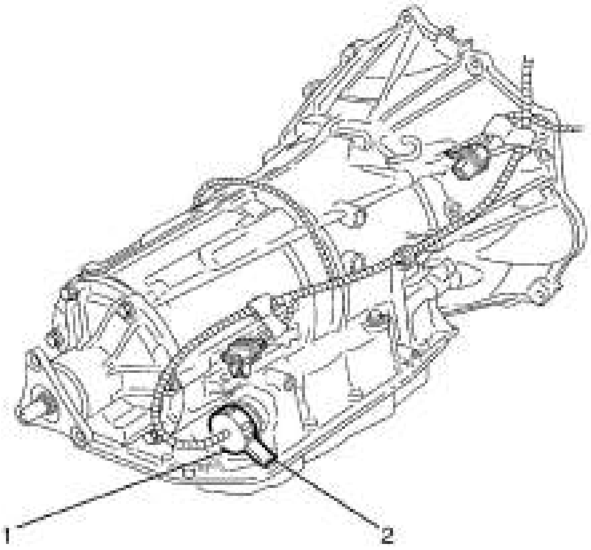
14.2. To aid in alignment of the torque converter to the flexplate/flywheel. Install all 3 NEW torque converter bolts before fully tightening.

Tighten
Tighten the bolts to 63 N·m (46 lb. ft)

15. Install the starter motor (2). Refer to Starter Motor Replacement .
16. Install the air deflector front (1). Refer to Front Air Deflector Replacement .



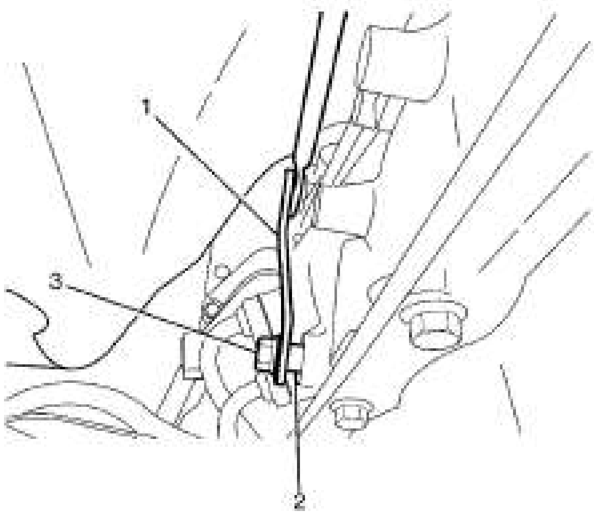
17. Connect the wiring harness clips to the transmission.



18. Connect the transmission wiring harness connector (1) to the transmission by rotating the

locking latch (2) clockwise.

19. Install the propeller shaft coupler to the transmission flange. Refer to Propeller Shaft Replacement .



20. Place the transmission in the park position by rotating the shift shaft fully counter clockwise.
21. Connect the shift linkage to the transmission.
22. Install the transmission manual shift shaft nut.

    Tighten
    Tighten the nut to 15 N·m (11 lb. ft)

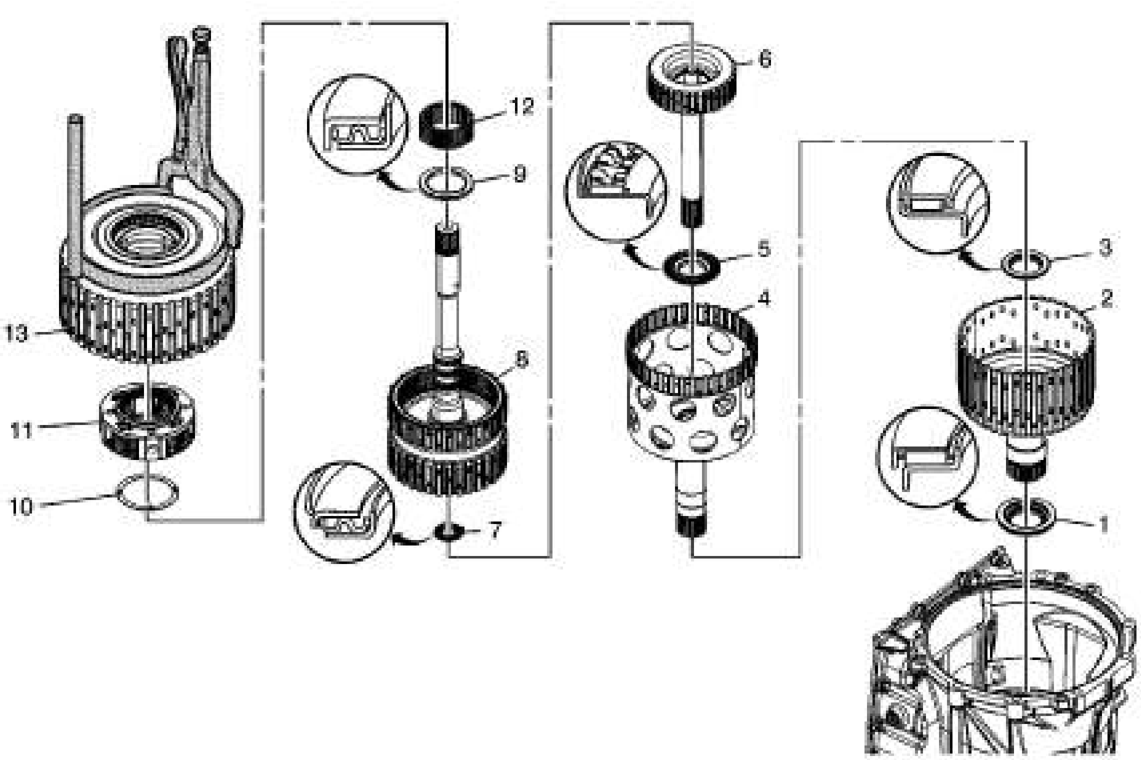
23. Check the transmission fluid level (fill if necessary). Refer to Transmission Fluid Check .
24. Adjust the shift control linkage. Refer to Shift Control Linkage Adjustment .
25. Lower the vehicle.
26. Connect the EVAP purge pipe.
27. Install radiator retaining clips.
28. Install air intake ducting from engine.
29. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection .
30. The transmission control module must be programmed with the proper software/calibrations. Refer to Service Programming System (SPS) .

Transmission Final Test and Inspection

Complete the following procedure after the transmission is installed in the vehicle:

1. With the ignition OFF or disconnected, crank the engine several times. Listen for any unusual noises or evidence that any parts are binding.
2. Start the engine and listen for abnormal conditions.
3. While the engine continues to idle raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Inspect for fluid leaks while the engine is idling.
5. Lower the vehicle.
6. Perform a final inspection for the proper fluid level.
7. Road test the vehicle.

1-2-3-4 and 3-5 Reverse Clutch Assembly and 4-5-6 Clutch Assembly Installation

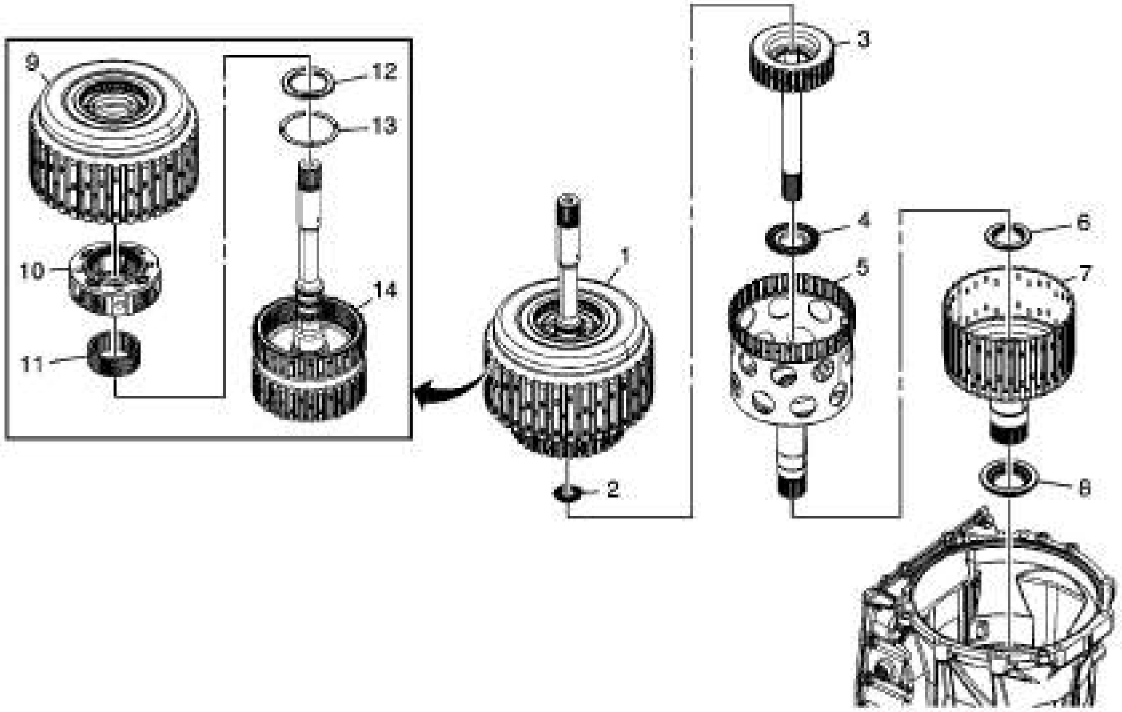


Callout	Component Name
1	2-6 and 3-5 Reverse Clutch Hub Thrust Bearing Assembly
2	2-6 and 3-5 Reverse Clutch (with Output Carrier Outer Sun Gear Shaft) Hub Assembly
3	1-2-3-4 Clutch Hub Thrust Bearing Assembly
4	1-2-3-4 Clutch (with Output Carrier Inner Sun Gear Shaft) Hub Assembly
5	4-5-6 Clutch Hub Thrust Bearing Assembly
6	4-5-6 Clutch (with Output Carrier Shaft and Dampener) Hub Assembly **Tip** Refer to 4-5-6 Clutch Dampener Overhaul .
7	Turbine Shaft Thrust Bearing Assembly
8	4-5-6 (with Turbine Shaft) Clutch Assembly
9	Input Sun Gear Thrust Bearing **Tip** Thrust bearing snaps onto input carrier assembly.

10	Input Sun Gear Thrust Washer
11	Input Carrier Assembly
12	Input Sun Gear
13	1-2-3-4 and 3-5 Reverse Clutch Assembly **Tip** Wiggle the DT 47781 in order to align the 1-2-3-4 and 3-5 reverse clutch plates with the external splines of the 4-5-6 clutch assembly. To verify that the 1-2-3-4 and 3-5 reverse clutch assembly is fully installed, lift up on the turbine shaft. There should not be any noticeable slack. **Special Tool** DT 47781 C1234 35R Clutch Assembly Installer

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | Document ID: 1985237

1-2-3-4 and 3-5 Reverse Clutch Assembly and 4-5-6 Clutch Assembly Removal



Callout	Component Name
1	1-2-3-4 and 3-5 Reverse Clutch Assembly and 4-5-6 (With Turbine Shaft) Clutch Assembly
2	Turbine Shaft Thrust Bearing Assembly

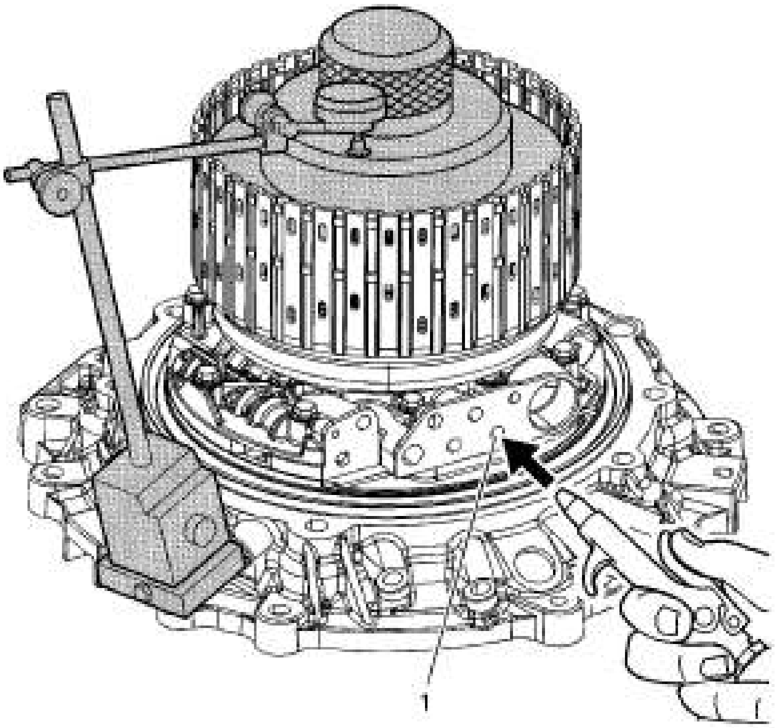
1-2-3-4 Clutch Backing Plate Retaining Ring Measurement



Callout	Component Name

Preliminary Procedures

1. Install the 1-2-3-4 and 3-5 reverse clutch housing with the 1-2-3-4 clutch plates installed, onto the torque converter housing.
2. Install the DT 47868-2 onto the torque converter housing.
3. Install DT 47868-1 D onto the 1-2-3-4 clutch backing plate.
4. Install the J 26900-13 J onto DT 47868-2 .
5. Attach the J 8001 to the J 26900-13 and zero out the dial indicator on the DT 47868-1 .

Special Tools

- DT 47868-1 Clutch Pack Travel Weight
- DT 47868-2 Magnetic Base Adapter
- J 8001 Dial Indicator Set
- J 26900-13 Magnetic Base

	1-2-3-4 Clutch Apply Passage

1	**Tip** Apply compressed air to the apply passage hole, at least 3 times and observe the dial indicator measurement each time. This action "fluffs" the clutch plates to make sure an accurate measurement. Refer to Clutch Backing Plate Retaining Ring Specifications .

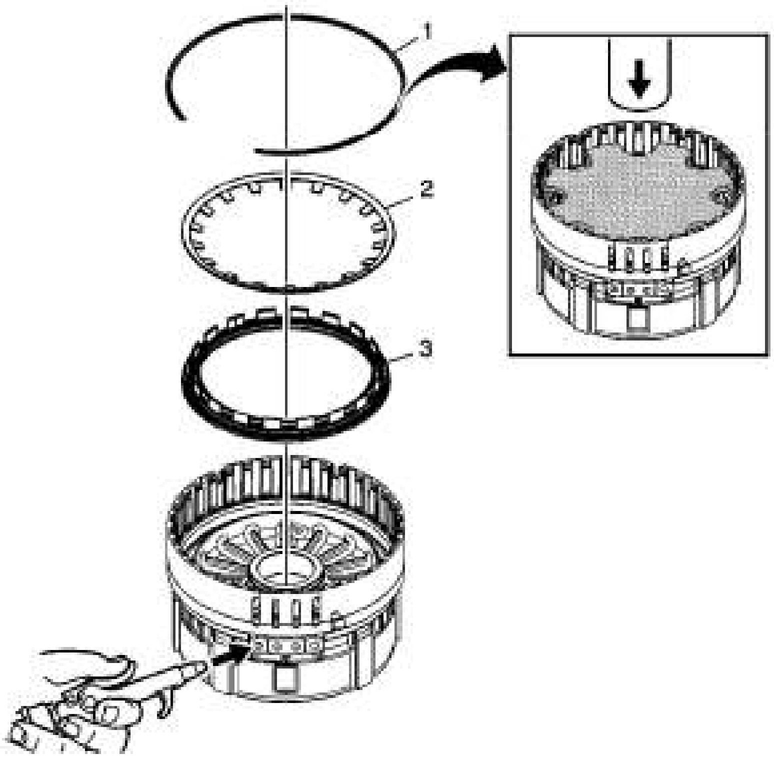
5	2-6 Clutch (Waved) Plate

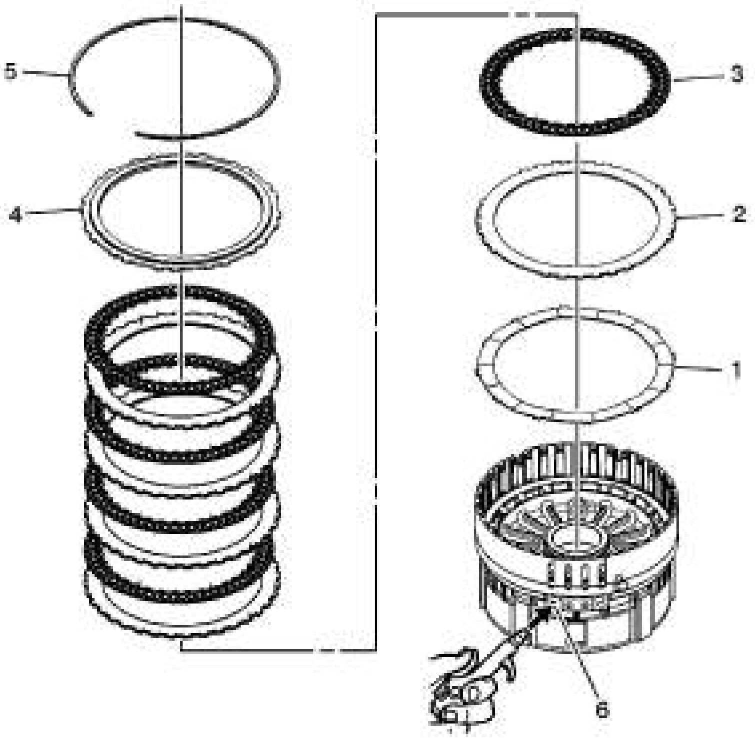
2-6 Clutch Piston Replacement



2-6 Clutch Piston Replacement

Callout	Component Name
1	2-6 Clutch Spring Retaining Ring **Tip** Ensure the DT 47761 is centred over the clutch spring. **Special Tool** DT 47761
2	2-6 Clutch Spring **Notice:** Refer to General Repair Instructions in the Preface section.
3	2-6 Clutch Piston Assembly **Tip** It may be necessary to apply air to the apply passage in order to unseat the piston.

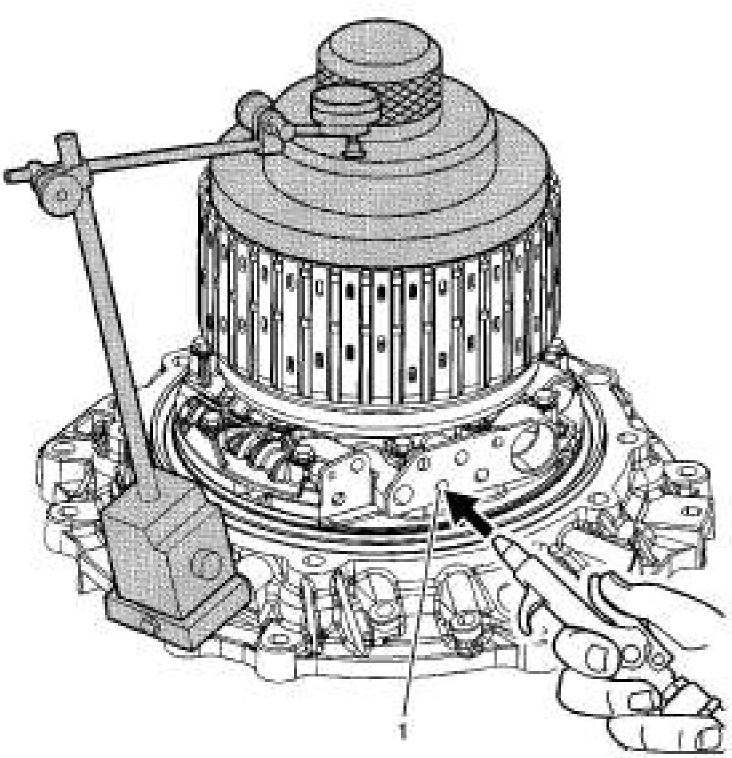
2-6 Clutch Plates Installation



2-6 Clutch Plates Installation

Callout	Component Name
1	2-6 Clutch (Waved) Plate
2	2-6 Clutch Plates (Quantity: 5) **Tip** Alternate between steel and fibre clutch plates.
3	2-6 Clutch Plate Assembly (Quantity: 5) **Tip** Alternate between steel and fibre clutch plates.
4	2-6 Clutch Backing Plate
5	2-6 Clutch Backing Plate Retaining Ring
6	2-6 Clutch Apply Passage **Tip** Apply air to verify proper installation of all 2-6 clutch components.

3-5 Reverse Clutch Backing Plate Retaining Ring Measurement

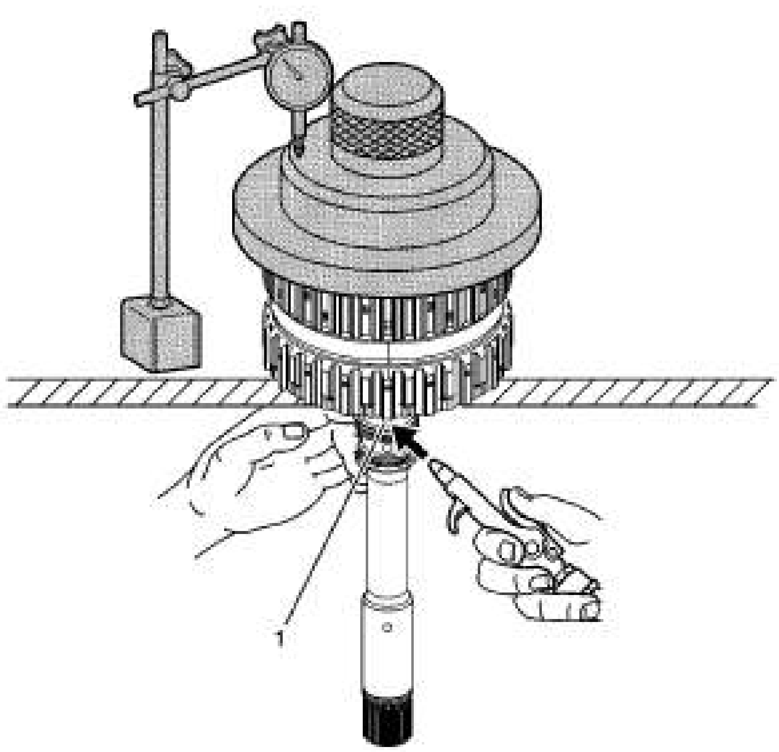


Callout	Component Name
Preliminary Procedures 1. Install the 1-2-3-4 and 3-5 reverse clutch housing with the 1-2-3-4 and 3-5 reverse clutch plates installed, onto the torque converter housing. 2. Install the DT 47868-2 onto the torque converter housing. 3. Install DT 47868-1 onto the 3-5 reverse clutch backing plate. 4. Install the J 26900-13 onto DT 47868-2 . 5. Attach the J 8001 to the J 26900-13 and zero out the dial indicator on the DT 47868-1 . **Special Tools** • DT 47868-1 Clutch Pack Travel Weight • DT 47868-2 Magnetic Base Adapter • J 8001 Dial Indicator Set • J 26900-13 Magnetic Base	
	3-5 Reverse Clutch Apply Passage

1	**Tip** Apply compressed air to the apply passage hole, and observe the dial indicator measurement. Refer to Clutch Backing Plate Retaining Ring Specifications .

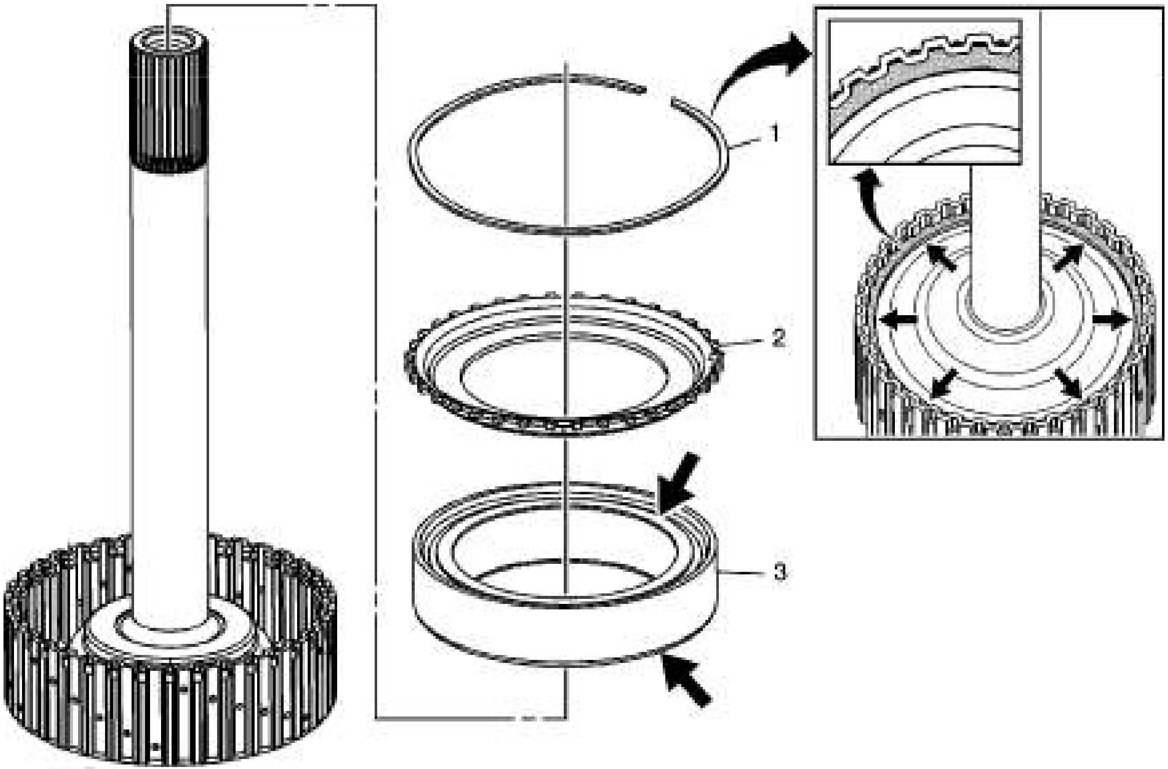
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1975774**

4-5-6 Clutch Backing Plate Retaining Ring Measurement



Callout	Component Name
Preliminary Procedures 1. Install the clutch assembly into a hole in the workbench 2. Zero out the dial indicator on the DT 47868-1 . **Special Tools** • DT 47868-1 Pack Travel Weight • J 8001 Dial Indicator Set • J 26900-13 Magnetic Base	
1	4-5-6 Clutch Apply Passage **Tip** While using one finger to block the top passage hole on the turbine shaft, apply compressed air to the opposite top passage hole (1), and observe the dial indicator measurement. Refer to Clutch Backing Plate Retaining Ring Specifications .

4-5-6 Clutch Dampener Overhaul



Callout	Component Name
1	4-5-6 Clutch Dampener Retaining Ring **Notice:** Refer to General Repair Instructions in the Preface section.
2	4-5-6 Clutch Dampener Apply Plate
3	4-5-6 Clutch Dampener **Tip** Dry and inspect the clutch dampener for the following conditions: • Pitting • Flaking • Delamination • Wear • Glazing • Cracking If any of these conditions are found, replace the dampener.

4-5-6 Clutch Overhaul

Table 1: 4-5-6 Clutch Plates Removal

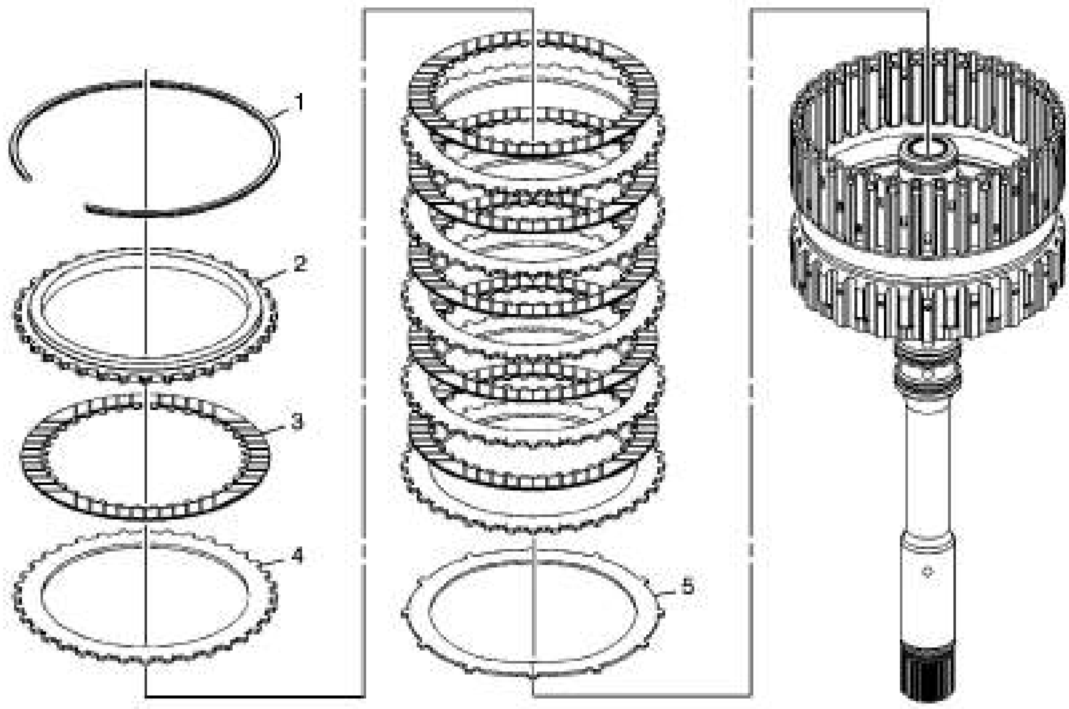
Table 2: 4-5-6 Clutch Piston Removal

Table 3: Turbine Shaft Fluid Seal Ring Replacement

Table 4: 4-5-6 Clutch Piston Installation

Table 5: 4-5-6 Clutch Plates Installation

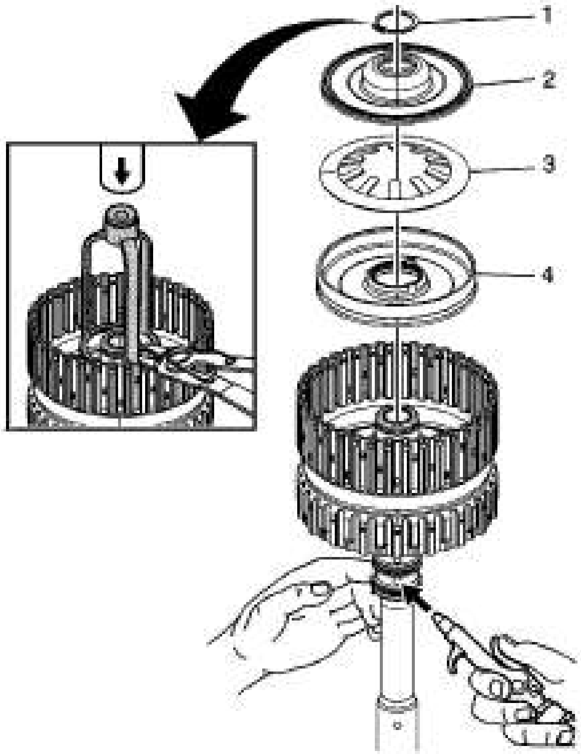
4-5-6 Clutch Plates Removal



4-5-6 Clutch Plates Removal

Callout	Component Name
1	4-5-6 Clutch Backing Plate Retaining Ring
2	4-5-6 Clutch Backing Plate
3	4-5-6 Clutch Plate Assembly (Quantity: 6)
4	4-5-6 Clutch Plate (Quantity: 6)
5	4-5-6 Clutch (Waved) Plate

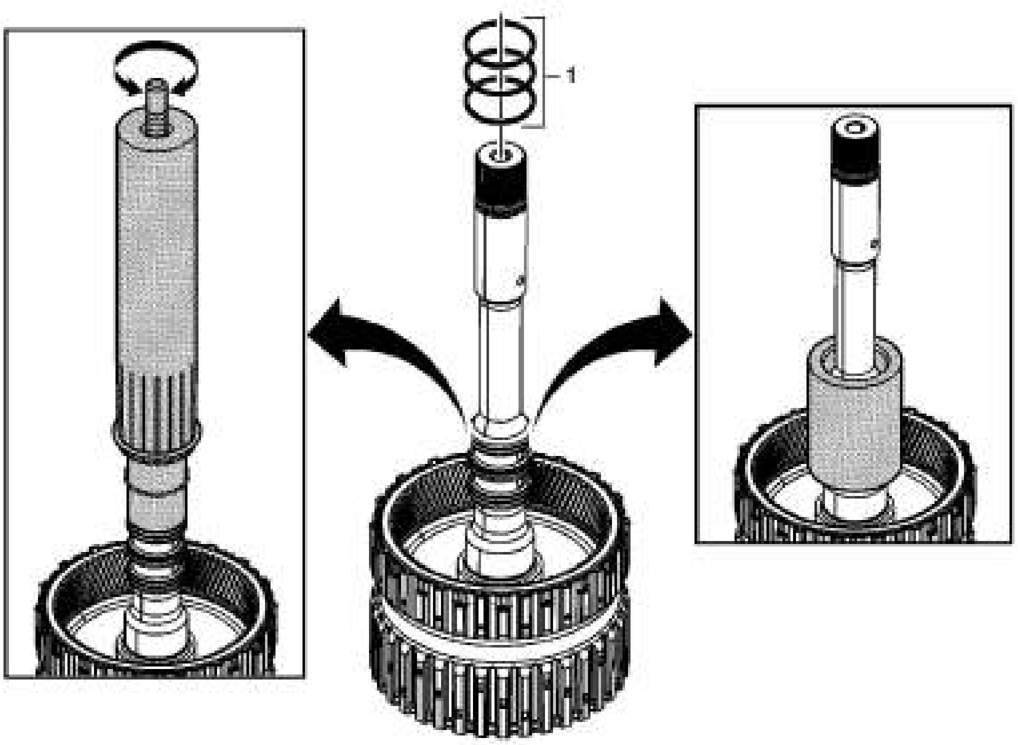
4-5-6 Clutch Piston Removal



4-5-6 Clutch Piston Removal

Callout	Component Name
1	4-5-6 Clutch Piston Dam Retaining Ring **Notice:** Refer to General Repair Instructions in the Preface section. **Notice:** Do not reuse the retaining ring. Install a NEW retaining ring. Reusing the old retaining ring may cause damage to the clutch assembly. **Special Tool** J 43074 .
2	4-5-6 Clutch Piston Dam Assembly **Tip** It may be necessary to apply air pressure to remove the dam and piston.
3	4-5-6 Clutch Spring
4	4-5-6 Clutch Piston Assembly **Tip** It may be necessary to apply air pressure to remove the piston.

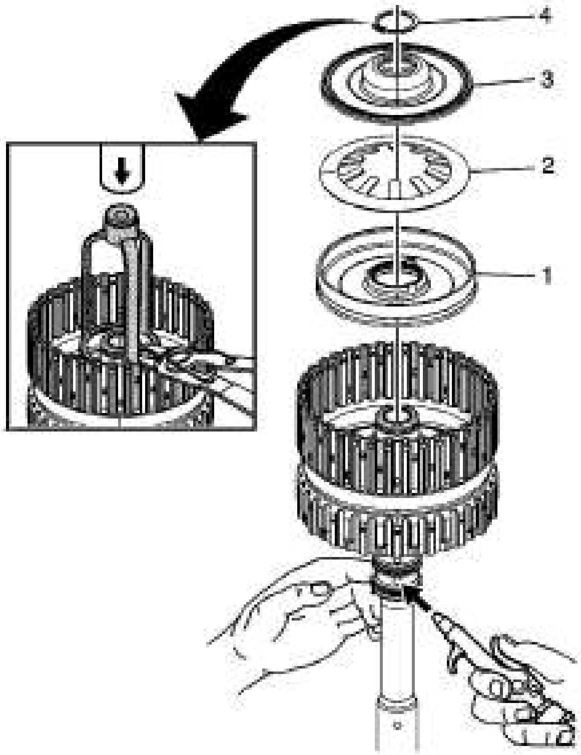
Turbine Shaft Fluid Seal Ring Replacement



Turbine Shaft Fluid Seal Ring Replacement

Callout	Component Name
Preliminary Procedures - Inspect the turbine shaft fluid passages and splines. - Clean any plugged passages.	
1	Turbine Shaft Fluid Seal Ring (Quantity: 3) **Notice:** Do not reuse the seals. Replace with NEW seals. Reusing old seals may cause transmission damage. **Notice:** Refer to General Repair Instructions in the Preface section. **Tip** Adjust the turn screw on the DT 47768-1 and install the bottom seal ring first. **Special Tools** - DT 47768-1 Seal Protector - DT 47768-2 Seal Pusher - DT 47768-3 Seal Sizer

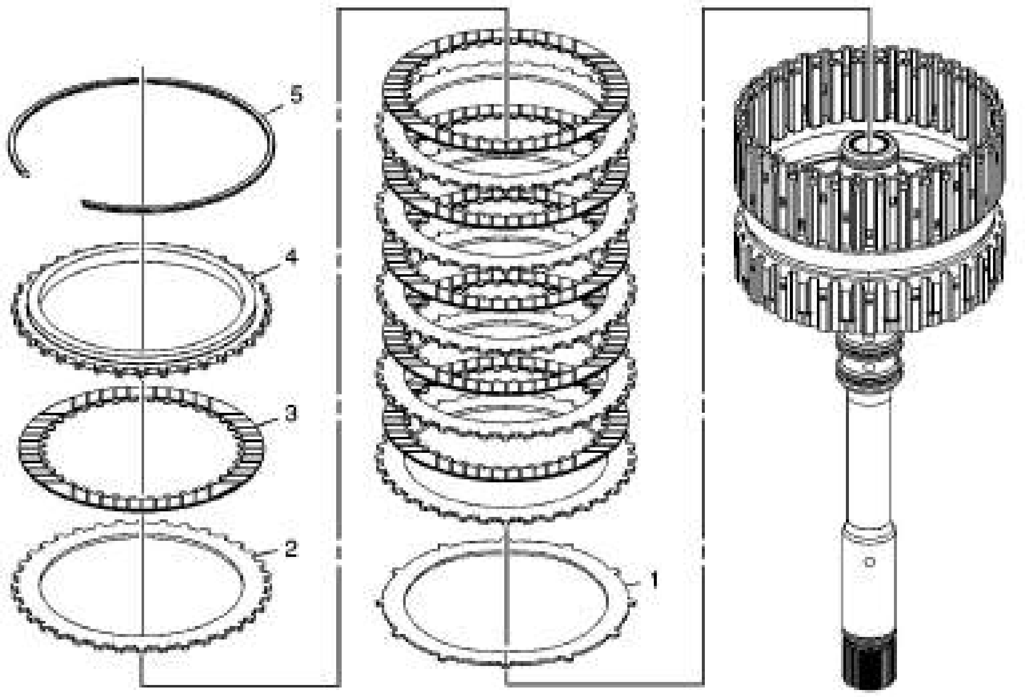
4-5-6 Clutch Piston Installation



4-5-6 Clutch Piston Installation

Callout	Component Name
1	4-5-6 Clutch Piston Assembly
2	4-5-6 Clutch Spring **Notice:** Refer to General Repair Instructions in the Preface section.
3	4-5-6 Clutch Piston Dam Assembly **Tip** Lubricate the inner and outer sealing surfaces of the dam assembly with automatic transmission fluid (ATF) in order to ease installation into the piston.
4	4-5-6 Clutch Piston Dam Retaining Ring **Notice:** Refer to General Repair Instructions in the Preface section. **Notice:** Do not reuse the retaining ring. Install a NEW retaining ring. Reusing the old retaining ring may cause damage to the clutch assembly. **Tip** Apply air to verify proper installation of all 4-5-6 clutch components. Piston should apply and release smoothly. **Special Tool** J 43074 J 43074 Clutch Spring Compressor

4-5-6 Clutch Plates Installation

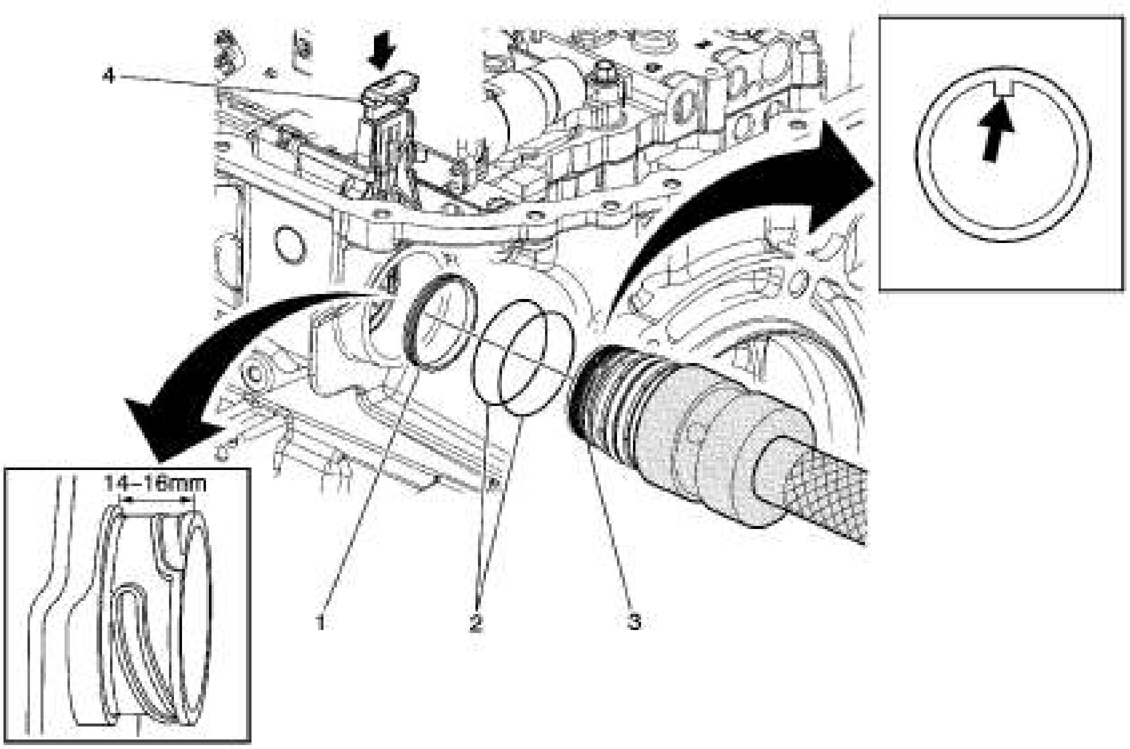


4-5-6 Clutch Plates Installation

Callout	Component Name
1	4-5-6 Clutch (Waved) Plate
2	4-5-6 Clutch Plate (Quantity: 6)
3	4-5-6 Clutch Plate Assembly (Quantity: 6)
4	4-5-6 Clutch Backing Plate
5	4-5-6 Clutch Backing Plate Retaining Ring **Tip** After the retaining ring is installed, determine clutch piston travel in order to verify if the correct selective retaining ring is being used. Refer to 4-5-6 Clutch Backing Plate Retaining Ring Measurement .

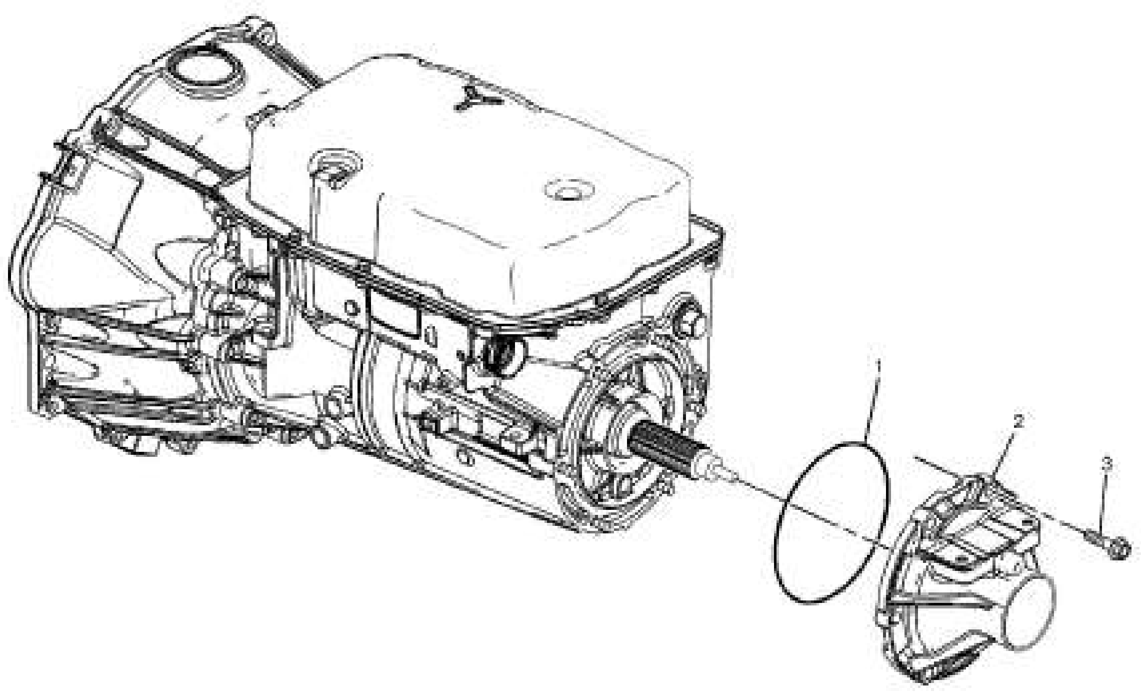
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993883**

Automatic Transmission Electrical Connector Passage Sleeve Installation



Callout	Component Name
1	NEW Lip Seal
2	NEW O-Ring Seals (Quantity: 2)
3	Electrical Connector Passage Sleeve **Special Tools** • DT 47715 Electrical Connector Passage Sleeve Remover/Installer • J 42183 Driver Handle **Notice:** Refer to General Repair Instructions in the Preface section. Push down on the electrical connector slide lock to make sure proper installation.
4	Electrical Connector Slide Lock

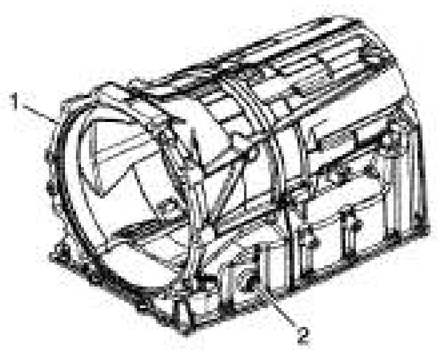
Case Extension Assembly Removal

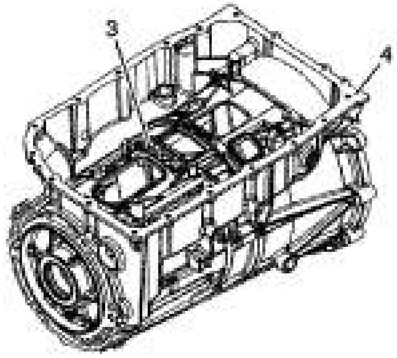


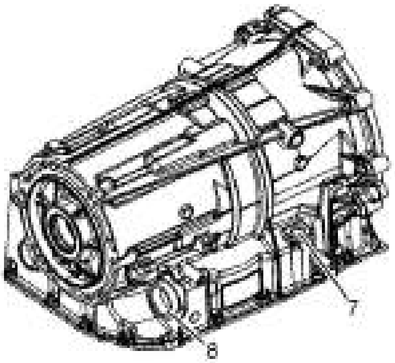
Callout	Component Name
1	Bolt M10 x 40 (Quantity: 6)
2	Case Extension
3	Case Extension Seal

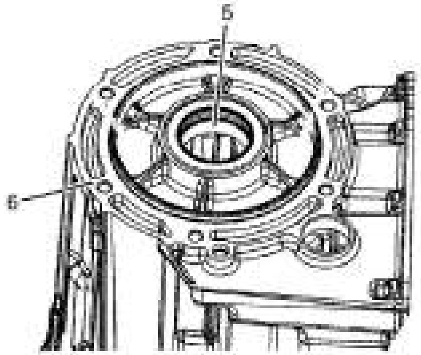
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993950**

Case Inspection









<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Notice: Refer to General Repair Instructions in the Preface section.
Notice: Refer to General Repair Instructions in the Preface section.
Preliminary Procedures
1. Thoroughly clean the transmission case assembly, including case threads, with clean solvent.
2. Clean gasket sealing surfaces. Remove all residual gasket material.
3. Inspect all threaded holes. If necessary, repair any thread damage.</td></tr>
<tr><td>1</td><td>Front Case Sealing Surface</td></tr>
<tr><td>2</td><td>Manual Shift Shaft Seal
Tip
Refer to Manual Shift Shaft Seal Replacement.</td></tr>
<tr><td>3</td><td>Center Support Fluid Passage Seal Bores</td></tr>
<tr><td>4</td><td>Fluid Pan Sealing Surface</td></tr>
<tr><td>5</td><td>Output Shaft Bushing</td></tr>
</table>

6	Rear Case Sealing Surface

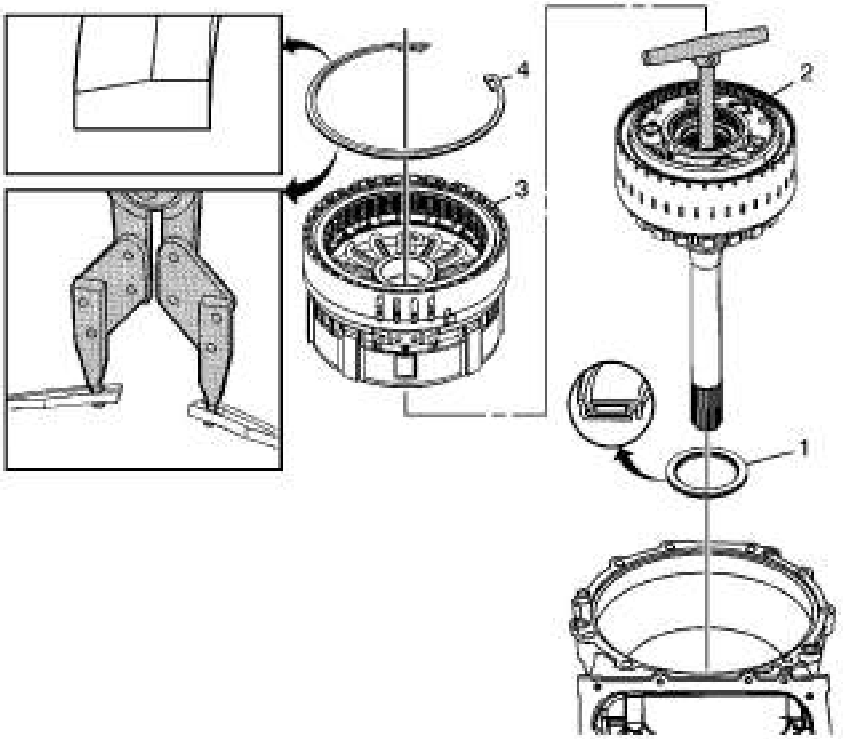
8	Electrical Connector Passage Sleeve Bore

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993882**

Center Support, Output Carrier and Output Shaft Installation

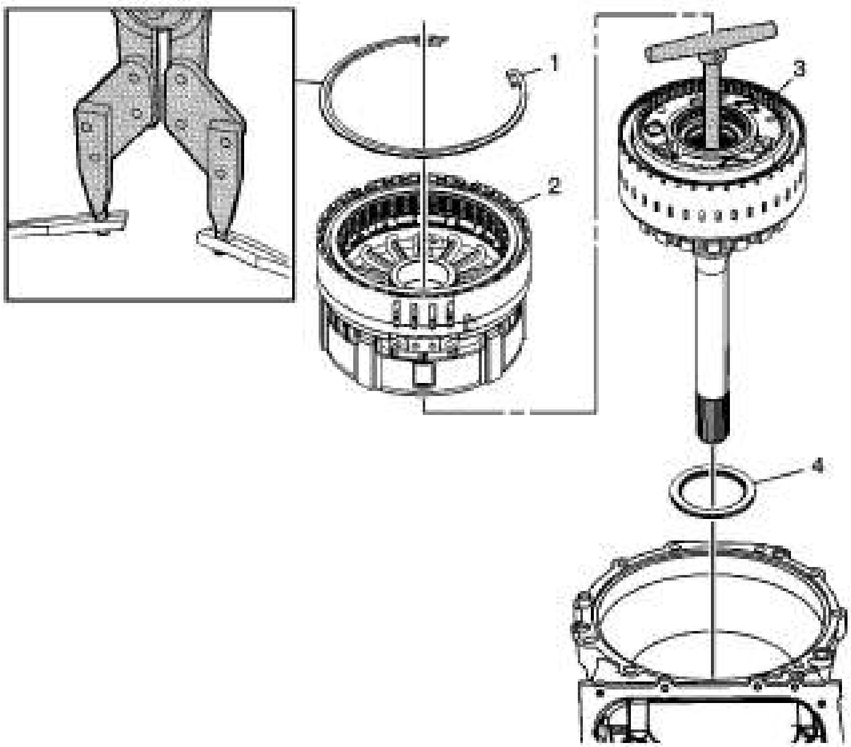


Callout	Component Name
1	Output Shaft Thrust Bearing Assembly
2	Output Carrier Assembly and Output Shaft Assembly **Notice:** Refer to General Repair Instructions in the Preface section. **Notice:** Refer to General Repair Instructions in the Preface section. **Special Tool** DT 47786 Output Carrier/Shaft Lifting Tool
3	Center Support Assembly • When the center support assembly is properly installed, the fluid passages should align with the fluid passage seal bores in the case assembly. • It may be necessary to rotate the output shaft by hand in order to fully install the center support assembly.
	Center Support Retaining Ring

4	**Caution:** Refer to General Repair Instructions in the Preface section. **Notice:** Refer to General Repair Instructions in the Preface section. **Special Tools** • DT 47773 Snap Ring Pliers Adapter Set • J 45126 Snap Ring Pliers

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993948**

Center Support, Output Carrier and Output Shaft Removal



Callout	Component Name
1	Center Support Retaining Ring **Caution:** Refer to General Repair Instructions in the Preface section. **Tip** To release tension on the retaining ring, place the retaining ring flat on the floor and step on it, then remove the tool. **Special Tools** • DT 47773 Snap Ring Pliers Adapter Set • J 45126 Snap Ring Pliers
2	Center (with 2-6 Low and Reverse Clutch) Support Assembly
3	Output Carrier Assembly and Output Shaft Assembly **Notice:** Refer to General Repair Instructions in the Preface section.

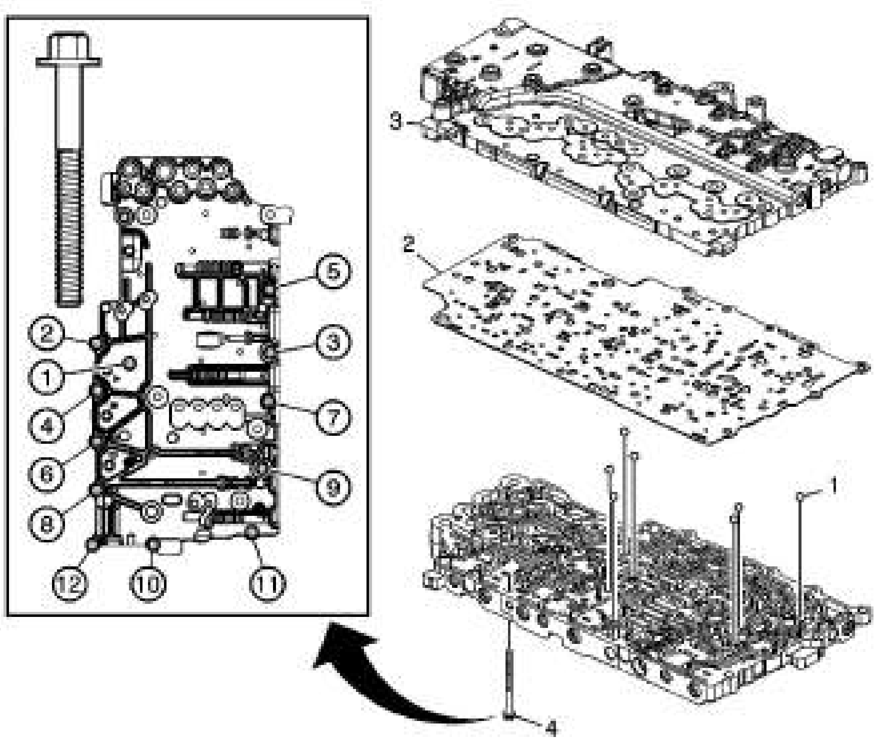
	Special Tool DT 47786 Output Carrier/Shaft Lifting Tool
4	Output Shaft Thrust Bearing Assembly

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993966**

Control Valve Body Assembly Assemble

Table 1: Upper to Lower Control Valve Body Assemblies Assemble
Table 2: Filter Plate Installation
Table 3: Control Solenoid Valve Assembly Installation
Table 4: Manual Shift Shaft Position Switch Installation
Table 5: Valve Body, Control Solenoid Torque Sequence
Table 6: Control Solenoid Valve Assembly Contact Gap Inspection
Table 7: Input and Output Speed Sensor Assembly Installation

Upper to Lower Control Valve Body Assemblies Assemble

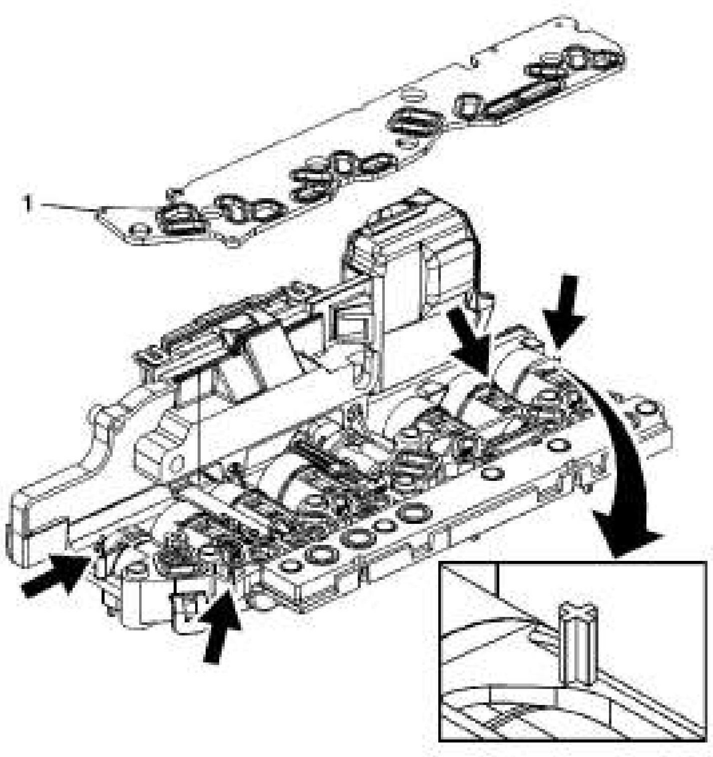


Upper to Lower Control Valve Body Assemblies Assemble

Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. Fastener Tightening Specifications: Refer to Fastener Tightening Specifications .	
1	Control Valve Body Ball Check Valve (Quantity: 7) **Tip** Refer to Ball Check Valve Locations.

2	Control Valve Body Spacer (w/Gasket) Plate Assembly **Notice:** Refer to General Repair Instructions in the Preface section.
3	Control Valve Lower Body Assembly **Tip** Turn the valve body assembly over after installing to upper body.
4	Bolt M5 x 36 (Quantity: 12) **Tighten** Tighten the bolts in the sequence shown to 8 N·m (71 lb. in).

Filter Plate Installation

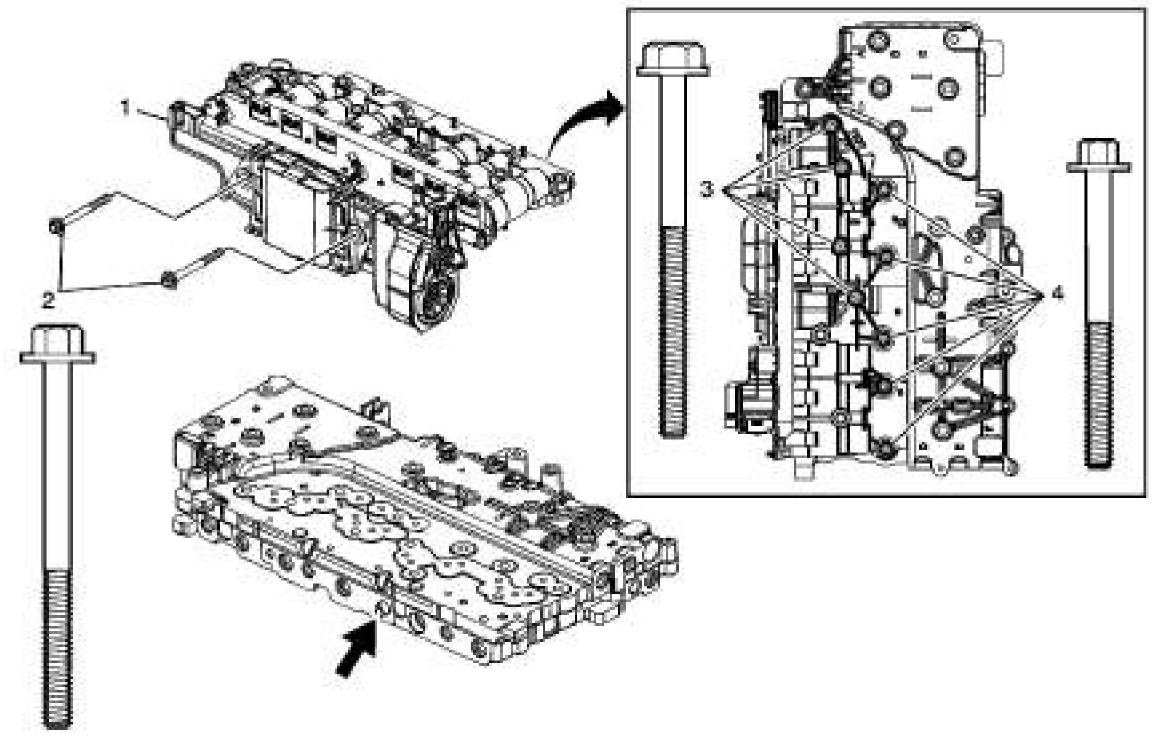


Filter Plate Installation

Callout	Component Name
1	Filter Plate Assembly **Notice:** Refer to General Repair Instructions in the Preface section. **Notice:** Refer to General Repair Instructions in the Preface section. **Tip** Use care when removing or installing the filter plate assembly. However, if a

	retaining tab is broken or missing, DO NOT replace the control solenoid valve assembly. The filter plate assembly can still be adequately aligned.

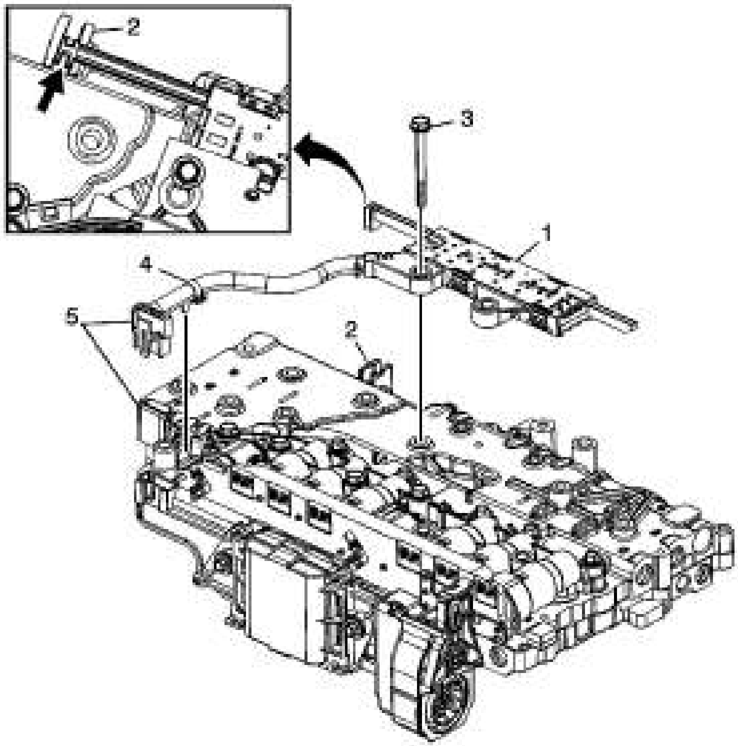
Control Solenoid Valve Assembly Installation



Control Solenoid Valve Assembly Installation

Callout	Component Name
1	Control Solenoid (w/Body and TCM) Valve Assembly **Tip** Note the locator pin on the control valve lower body assembly while aligning the control solenoid valve assembly.
2	Bolt M5 x 53 (Quantity: 2) **Tip** Hand tighten only.
3	Bolt M5 x 55 (Quantity: 4) **Tip** Hand tighten only.
4	Bolt M5 x 45 (Quantity: 5) **Tip** Hand tighten only.

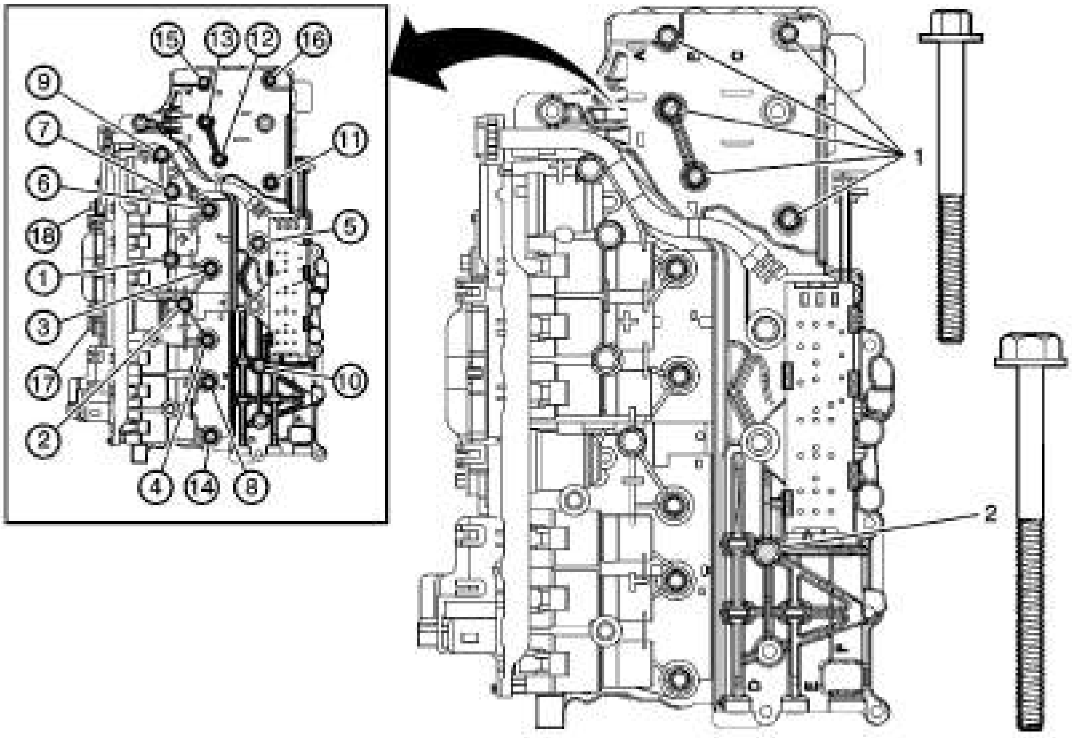
Manual Shift Shaft Position Switch Installation



Manual Shift Shaft Position Switch Installation

Callout	Component Name
1	A/Trans Manual Shift Shaft Position Switch Assembly
2	Manual Valve Link **Tip** Align the switch activator slide with the manual valve link.
3	Bolt M5 x 55 **Tip** Hand tighten only.
4	A/Trans Manual Shift Shaft Position Switch Harness Clip **Tip** The wiring harness clip on the manual shift shaft position switch does not need to be replaced if damaged or missing. The clip functions only as a manufacturing assembly aid to keep the harness clear during an automated bolt installation process. If the clip is damaged, simply remove and discard.
5	A/Trans Manual Shift Shaft Position Switch Electrical Connector **Tip** Connect and lock the manual shift shaft position switch electrical connector to the control solenoid valve assembly.

Valve Body, Control Solenoid Torque Sequence



Valve Body, Control Solenoid Torque Sequence

<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Notice: Refer to Fastener Notice in the Preface section.

Fastener Tightening Specifications: Refer to Fastener Tightening Specifications .

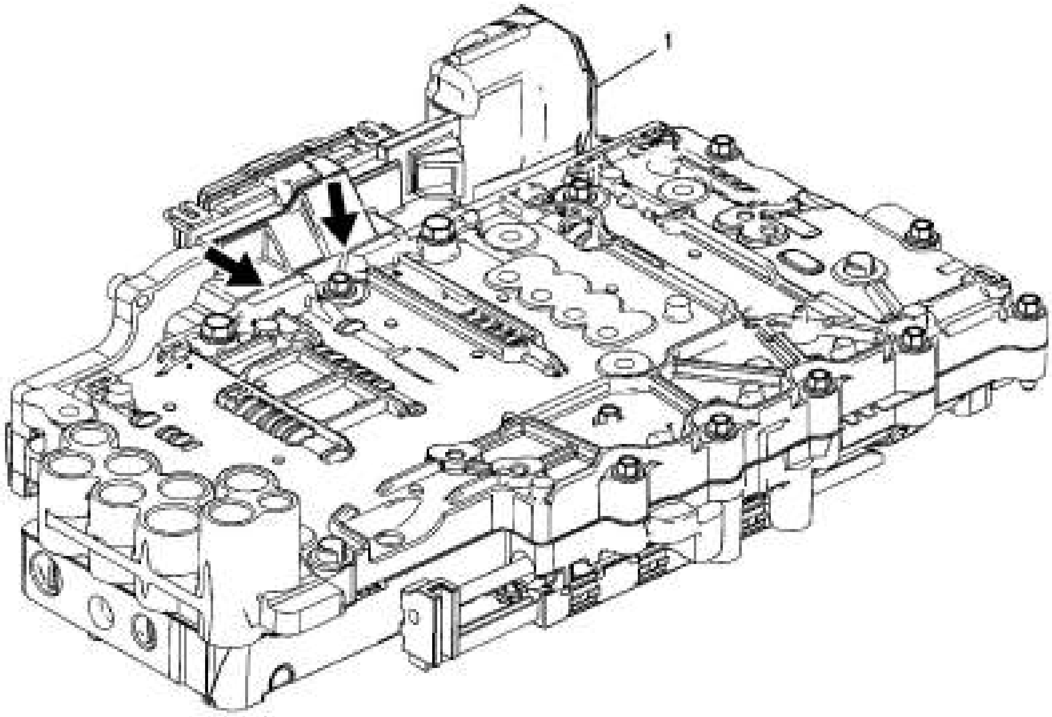
Notice: Refer to General Repair Instructions in the Preface section.

Tip

1. Hand tighten the last 6 bolts before final torque sequence.
2. The 2 "heat sink" bolts must be tightened last.</td></tr>
<tr><td>1</td><td>Bolts M5 x 45 (Quantity: 5)</td></tr>
<tr><td>2</td><td>Bolt M5 x 55

Tighten
Tighten all 18 bolts in the sequence shown to 8 N·m (71 lb. in).</td></tr>
</table>

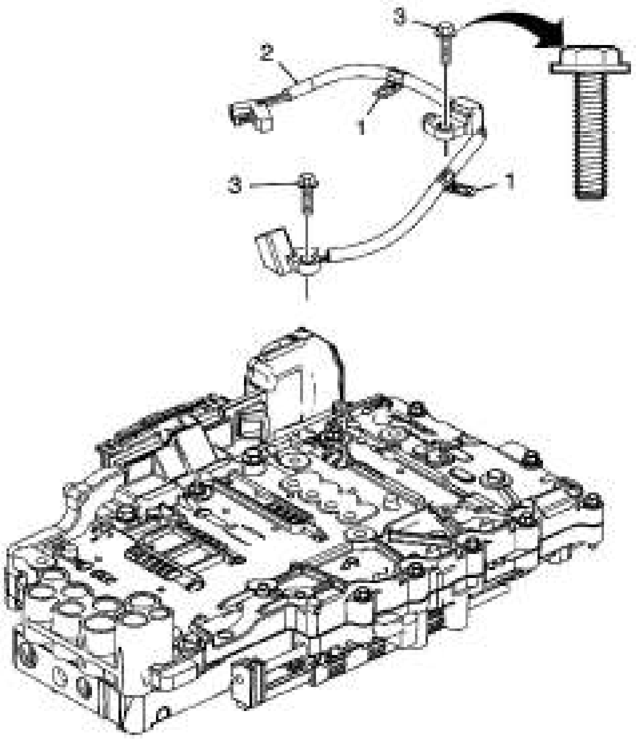
Control Solenoid Valve Assembly Contact Gap Inspection



Control Solenoid Valve Assembly Contact Gap Inspection

Callout	Component Name
1	Control Solenoid (w/Body and TCM) Valve Assembly **Tip** Inspect the contact area between the "heat sink" area of the control solenoid valve assembly and the valve body. There should be no visible gap. If a gap exists, loosen all 18 bolts and retighten in the required sequence.

Input and Output Speed Sensor Assembly Installation



Input and Output Speed Sensor Assembly Installation

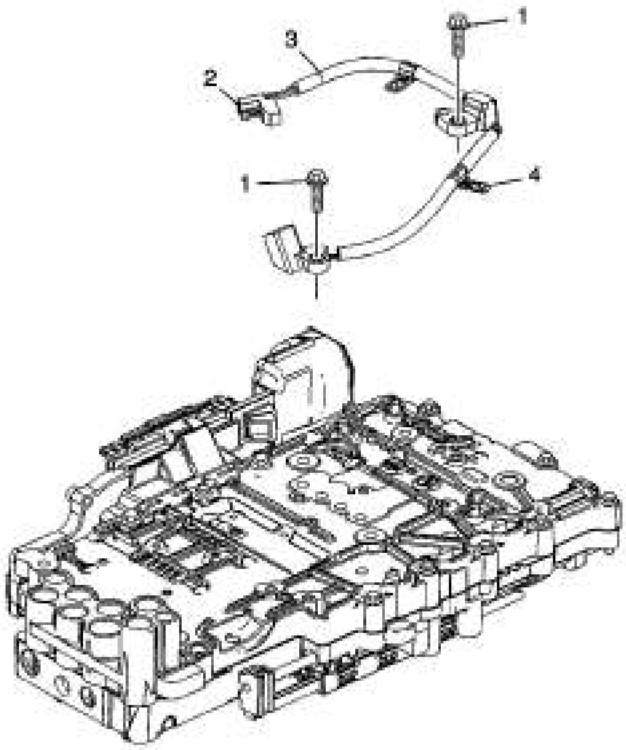
Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. Fastener Tightening Specifications: Refer to Fastener Tightening Specifications .	
1	A/Trans Input and Output Speed Sensor Wiring Harness Clip (Quantity: 2) **Tip** Inspect the 2 wiring harness clips for damage. Replace if damaged.
2	A/Trans Input and Output Speed Sensor Assembly
3	Bolt M6 x 20 (Quantity: 2) **Tighten** Tighten bolts to 12 N·m (106 lb. in)

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1996899**

Control Valve Body Assembly Disassemble

Table 1: Input and Output Speed Sensor Assembly Removal
Table 2: Manual Shaft Detent Assembly and Manual Shift Shaft Position Switch Removal
Table 3: Control Solenoid Valve Assembly Removal
Table 4: Upper and Lower Valve Bodies Disassemble

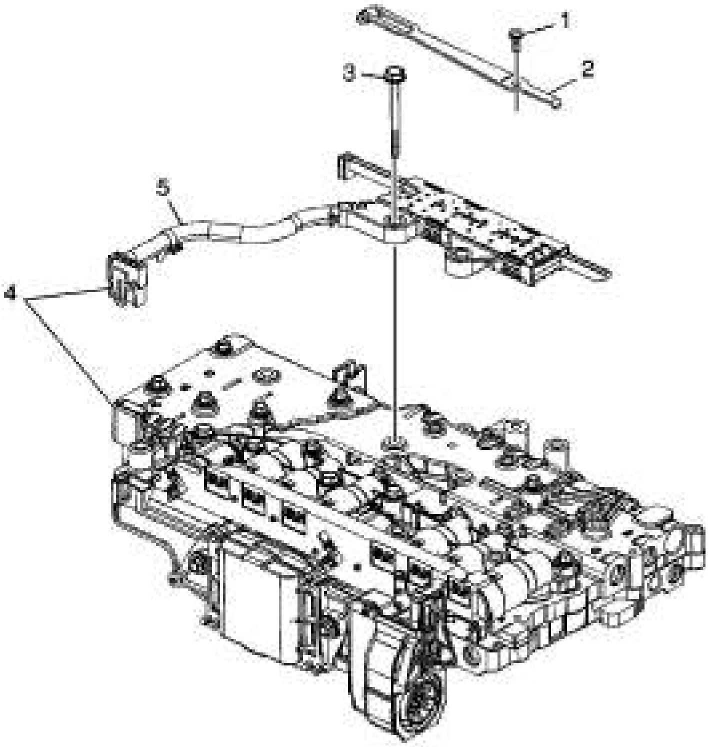
Input and Output Speed Sensor Assembly Removal



Input and Output Speed Sensor Assembly Removal

Callout	Component Name
1	Bolt M6 x 20 (Quantity: 2)
2	Speed Sensor Electrical Connector Release the connector lock before disconnecting.
3	A/Trans Input and Output Speed Sensor Assembly
4	A/Trans Input and Output Speed Sensor Wiring Harness Clip (Quantity: 2) Inspect the clips and replace if damaged.

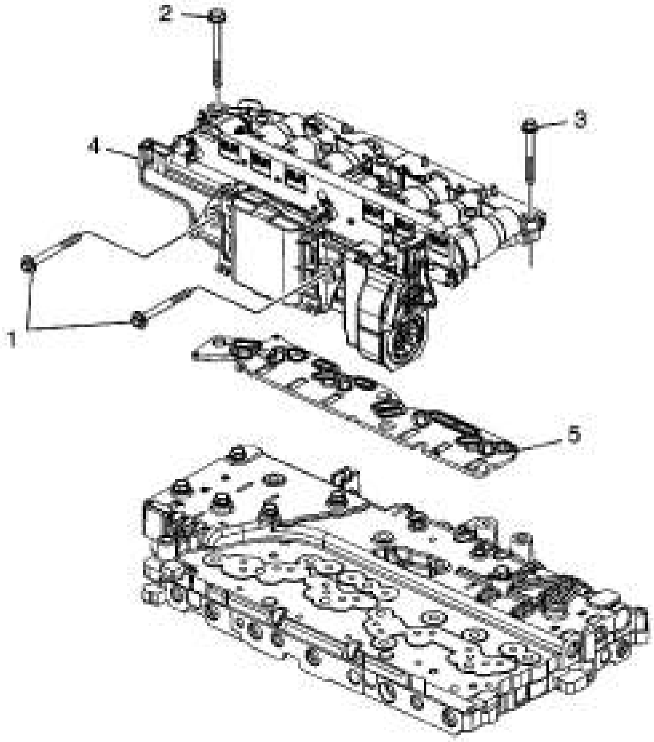
Manual Shaft Detent Assembly and Manual Shift Shaft Position Switch Removal



Manual Shaft Detent Assembly and Manual Shift Shaft Position Switch Removal

Callout	Component Name
1	Bolt M6 x 14.5
2	Manual Shaft Detent Assembly
3	Bolt M5 x 55
4	A/Trans Manual Shift Shaft Position Switch Assembly Electrical Connector Release the connector lock before disconnecting.
5	A/Trans Manual Shift Shaft Position Switch Assembly

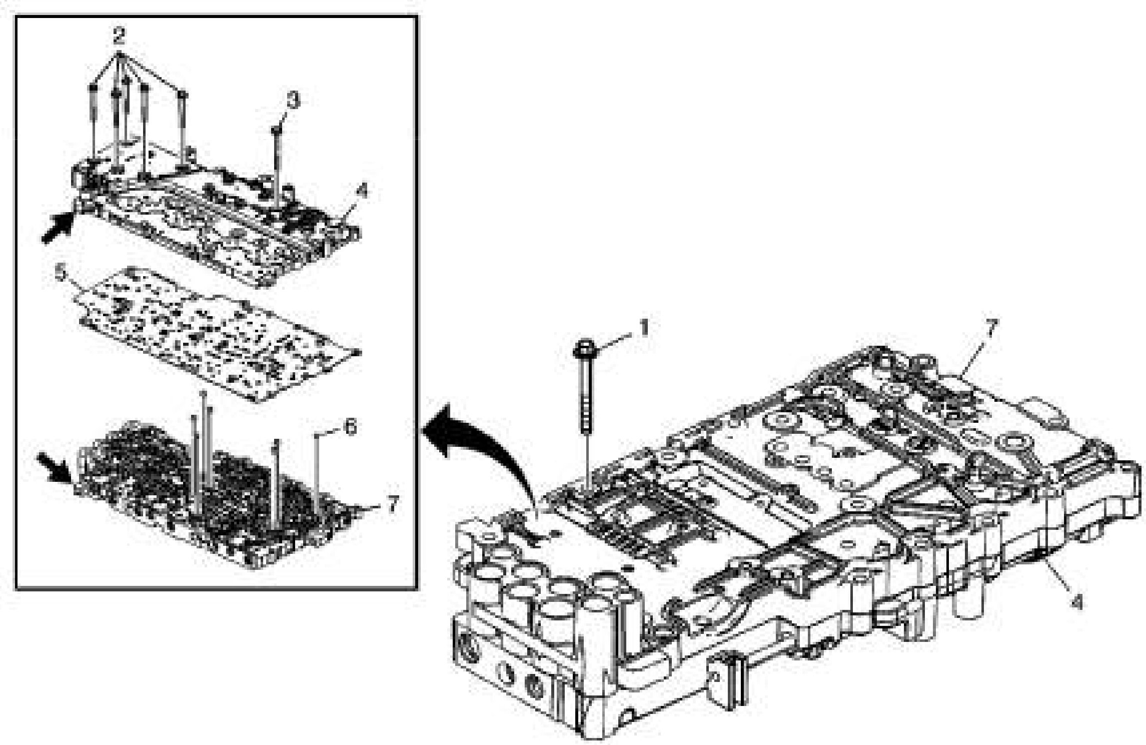
Control Solenoid Valve Assembly Removal



Control Solenoid Valve Assembly Removal

Callout	Component Name
1	Bolt M5 x 53 (Quantity: 2)
2	Bolt M5 x 55 (Quantity: 4)
3	Bolt M5 x 45 (Quantity: 5)
4	Control Solenoid (w/Body and TCM) Valve Assembly **Notice:** Refer to General Repair Instructions in the Preface section.
5	Filter Plate Assembly **Notice:** Refer to General Repair Instructions in the Preface section. **Notice:** Refer to General Repair Instructions in the Preface section.

Upper and Lower Valve Bodies Disassemble

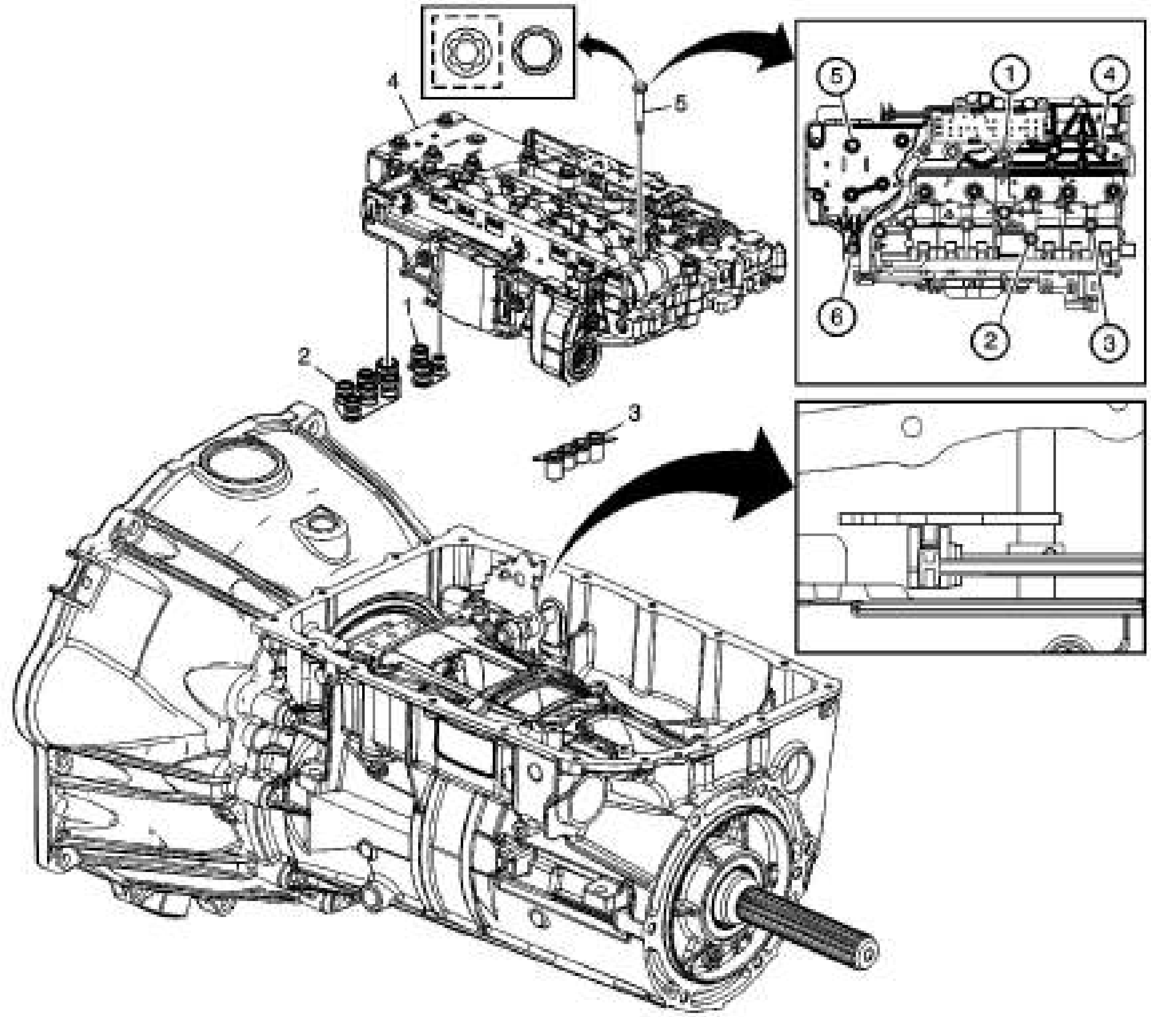


Upper and Lower Valve Bodies Disassemble

Callout	Component Name
1	Bolt M5 x 36 (Quantity: 12)
2	Bolt M5 x 45 (Quantity: 5)
3	Bolt M5 x 55
4	Control Valve Lower Body Assembly • Separate the upper and lower valve bodies by carefully prying at the point indicated. • Refer to Control Valve Lower Body Assembly Cleaning and Inspection.
5	Control Valve Body Spacer (w/Gasket) Plate Assembly **Notice:** Refer to General Repair Instructions in the Preface section.
6	Control Valve Body Ball Check Valve (Quantity: 7) Note the position of the ball check valves.
7	Control Valve Upper Body Assembly Refer to Control Valve Upper Body Assembly Cleaning and Inspection.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1985276**

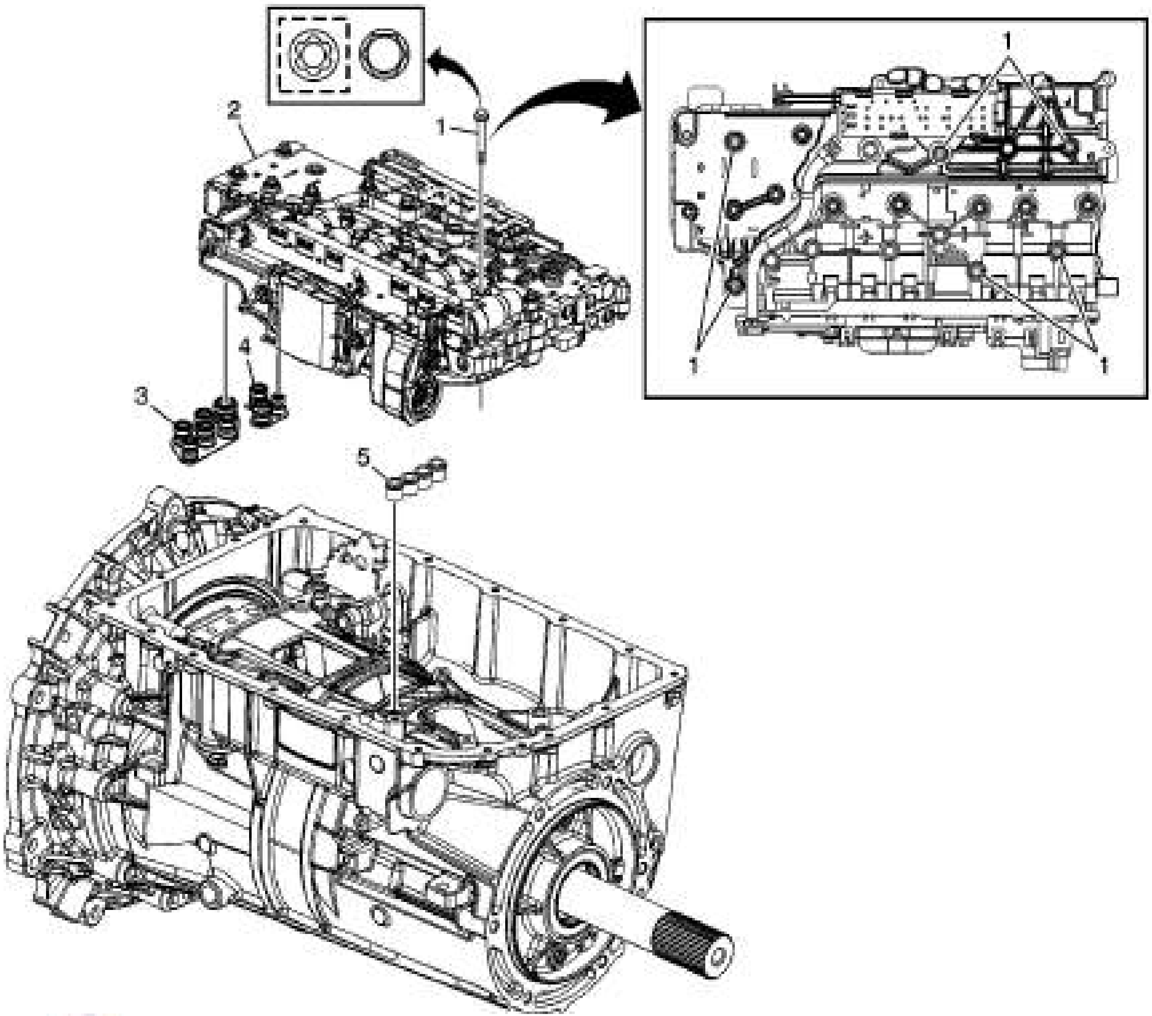
Control Valve Body Assembly Installation



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section.	
1	NEW Fluid Pump Seal Assembly
2	NEW Fluid Pump Seal Assembly
3	NEW Centre Support Fluid Passage Seal Assembly
4	Control Valve Body Assembly **Tip** Align the manual shift shaft position switch activator slide with the detent lever guide pin.

5	Bolts M5 x 73 (Quantity: 6) **Tighten** 8 N·m (71 lb. in) in the sequence shown.

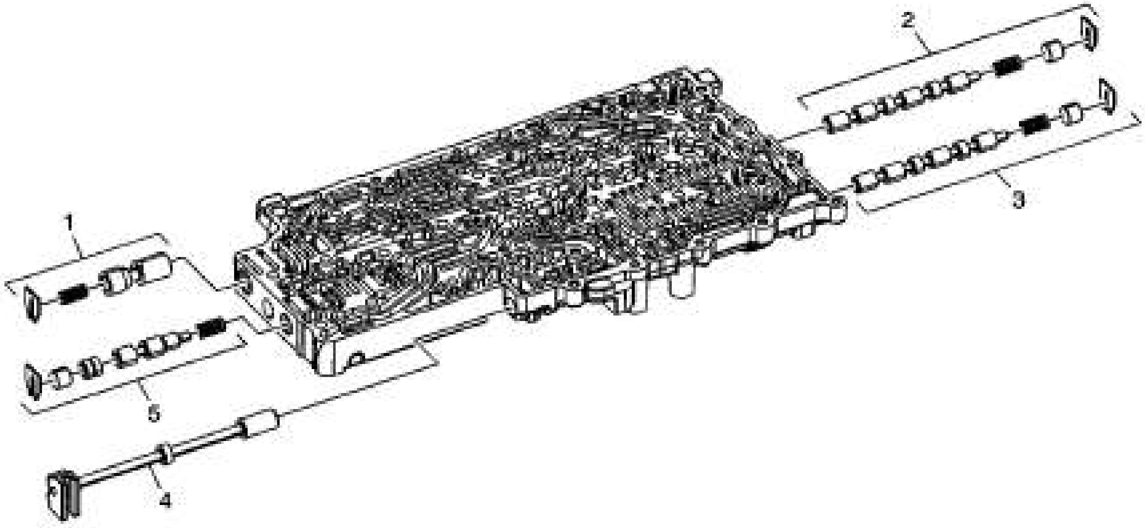
Control Valve Body Assembly Removal



Callout	Component Name
1	Bolt M5 x 73 (Qty: 6) **Important:** Do not remove all the bolts in the control valve body assembly. Remove only the bolts indicated. **Special Tool** DT-48285 Valve Body Torx Plus Socket (if applicable)
2	Control Valve Body Assembly **Notice:** Use care when handling the control valve body assembly. If dropped, damage to the control solenoid valve body assembly internal components, including

	the transmission control module (TCM), may result.
3	**Important:** Do not reuse the seals. Replace with NEW seals. Reusing old seals may cause transmission damage. Fluid Pump Seal Assembly
4	**Important:** Do not reuse the seals. Replace with NEW seals. Reusing old seals may cause transmission damage. Fluid Pump Seal Assembly
5	**Important:** Do not reuse the seals. Replace with NEW seals. Reusing old seals may cause transmission damage. Center Support Fluid Passage Seal Assembly

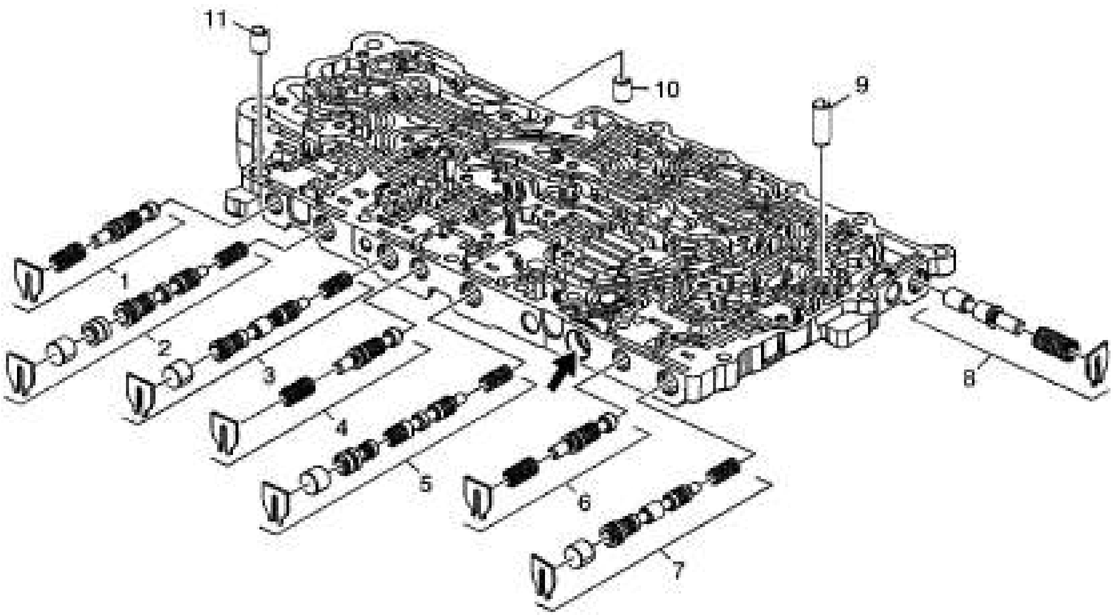
Control Valve Lower Body Assembly Cleaning and Inspection



Callout	Component Name
Caution: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result. **Important:** Clean and inspect all valve components and the valve body. The control valve lower body is replaceable only as an assembly.	
1	Clutch Piston Dam Feed Regulator Valve Train
2	Clutch Select Solenoid Valve Train
3	Clutch Select Solenoid Valve Train
4	Manual Valve
5	TCC Regulator Apply Valve Train

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993887**

Control Valve Upper Body Assembly Cleaning and Inspection

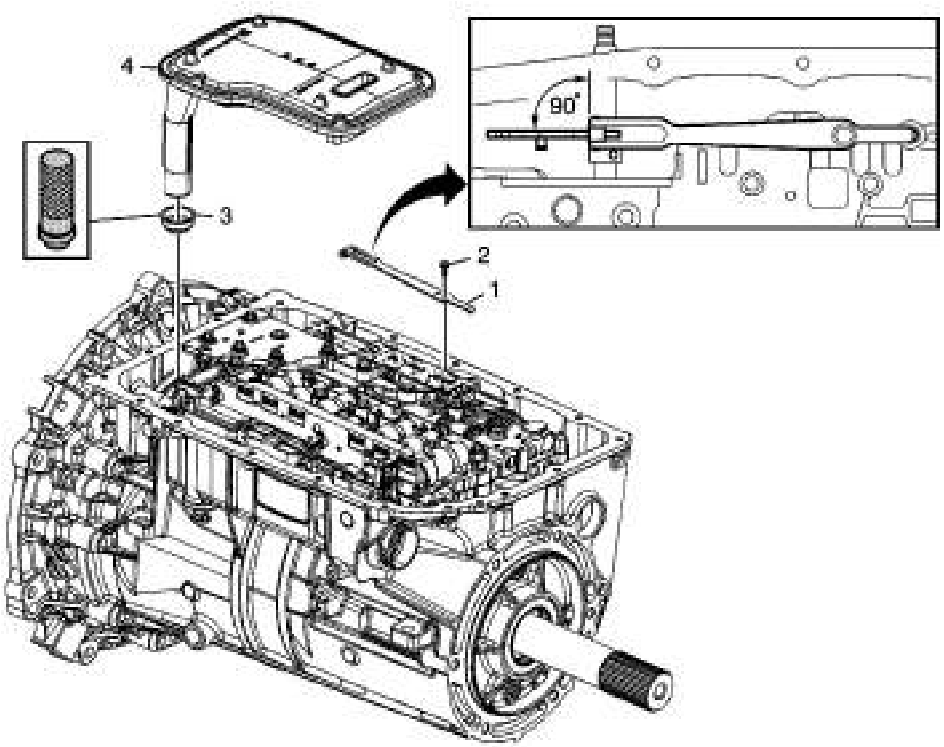


Callout	Component Name
Caution: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result. **Notice:** Refer to General Repair Instructions in the Preface section. **Important:** Clean and inspect all valve components, locating pins, and the valve body. The control valve upper body is replaceable only as an assembly.	
1	Clutch Boost Valve Train
2	1-2-3-4 Clutch Regulator Valve Train
3	3-5 Reverse Clutch Regulator Valve Train
4	Clutch Boost Valve Train
5	2-6 Clutch Regulator Valve Train
6	Clutch Boost Valve Train
7	1/Reverse Band and 4-5-6 Clutch Regulator Valve Train
8	Actuator Feed Limit Valve Train
9	Control Valve Body Locator Pin

10	Control Valve Body Locator Pin
11	Control Valve Body Locator Pin

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993884**

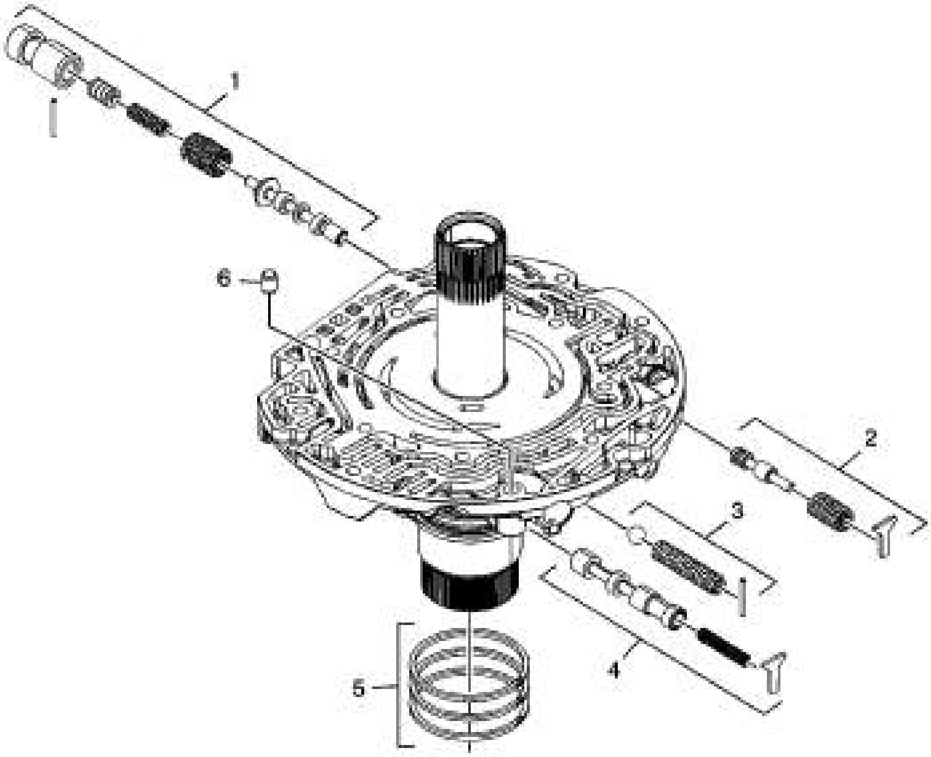
Fluid Filter and Manual Shift Detent Assembly Installation



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. Fastener Tightening Specifications: Refer to Fastener Tightening Specifications .	
1	Manual Shaft Detent Assembly **Notice:** Refer to General Repair Instructions in the Preface section.
2	Bolt M6 x 14.5 **Tighten** 12 N·m (106 lb. in).
3	NEW Fluid Filter Seal Assembly **Special Tools** • DT 47848 Seal Installer • J 42183 Driver Handle
4	NEW Fluid Filter Assembly

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993962**

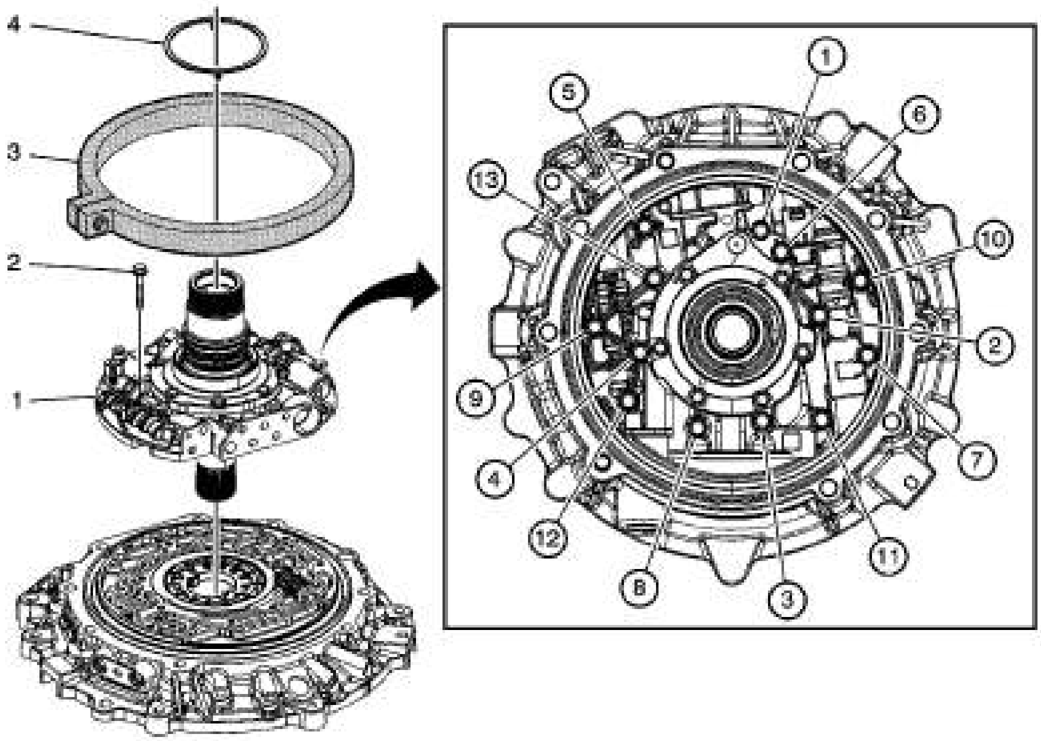
Fluid Pump Cover Cleaning and Inspection



Callout	Component Name
Caution: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result. **Tip** Clean and inspect all components and machined surfaces.	
1	Pressure Regulator Valve Train
2	Converter Feed Limit Valve Train
3	Pressure Relief Ball Valve and Spring
4	TCC Control Valve and Spring
5	1-2-3-4 and 3-5 Reverse Clutch Fluid Seal Rings (Quantity: 3) **Notice:** Refer to General Repair Instructions in the Preface section.
6	A/Trans Fluid Pump Locator Pin

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993964**

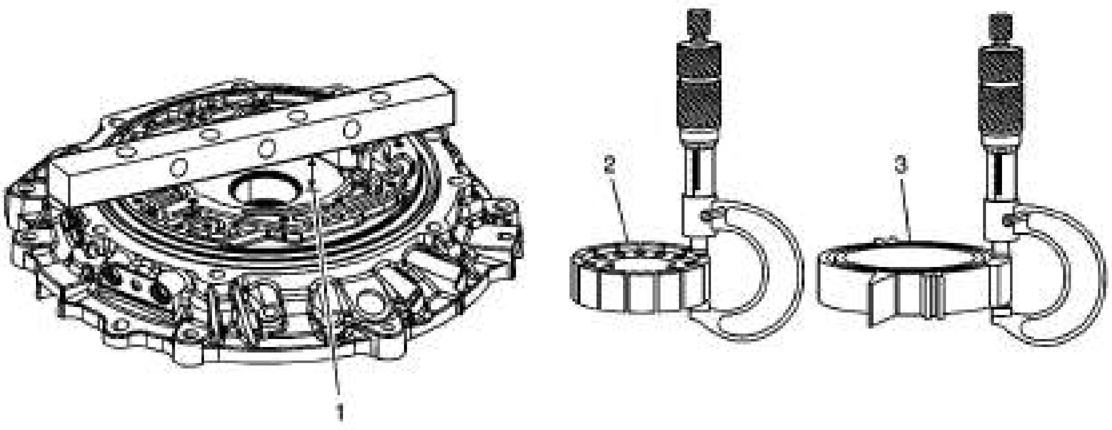
Fluid Pump Cover Installation



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section. Fastener Tightening Specifications: Refer to Fastener Tightening Specifications .	
1	Fluid Pump Cover Assembly
2	Fluid Pump Cover Bolts M6 x 40 (Quantity: 13) **Tip** Hand tighten only.
3	Alignment Tool and Bolt **Tip** 1. Center the J 46664 around the fluid pump cover assembly in the 9 o'clock position and tighten the alignment bolt. 2. Tighten the fluid pump cover bolts in the sequence shown. **Tighten** 11 N·m (97 lb in)

	Special Tool J 46664 Pump Cover Alignment Tool
4	NEW 1-2-3-4 and 3-5 Reverse Clutch Housing Thrust Washer

Fluid Pump Selective Measurement



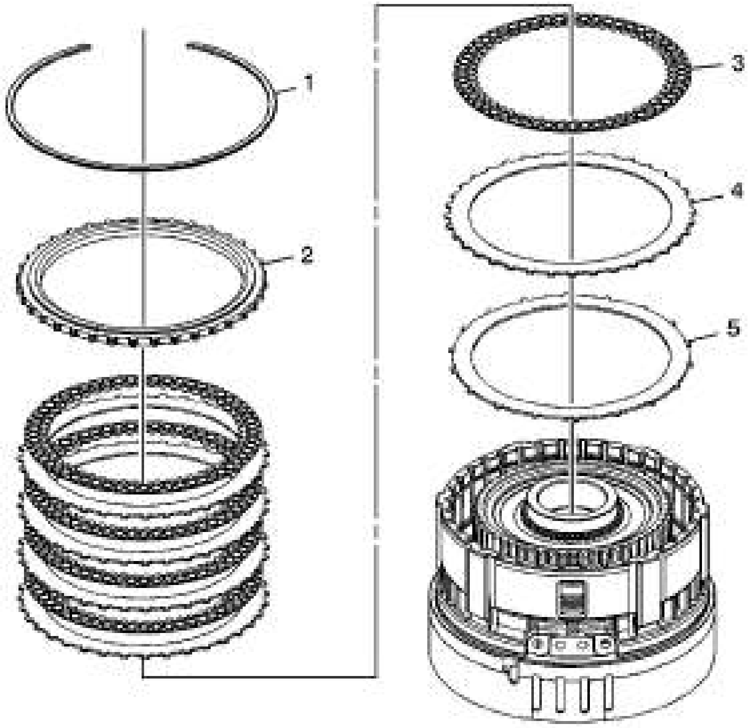
Callout	Component Name
1	Pump Rotor Cavity **Tip** Measure the distance from the bottom of the gauge bar to the bottom of the pump rotor cavity. Refer to Fluid Pump Selective Specifications.
2	A/Trans Fluid Pump Rotor **Tip** Refer to Fluid Pump Selective Specifications.
3	A/Trans Fluid Pump Slide **Tip** Refer to Fluid Pump Selective Specifications.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1996891**

Low and Reverse Clutch Overhaul

Table 1: Low and Reverse Clutch Plate Removal
Table 2: Low and Reverse Clutch Piston Removal
Table 3: Low and Reverse Clutch Piston Installation
Table 4: Low and Reverse Clutch Plate Installation

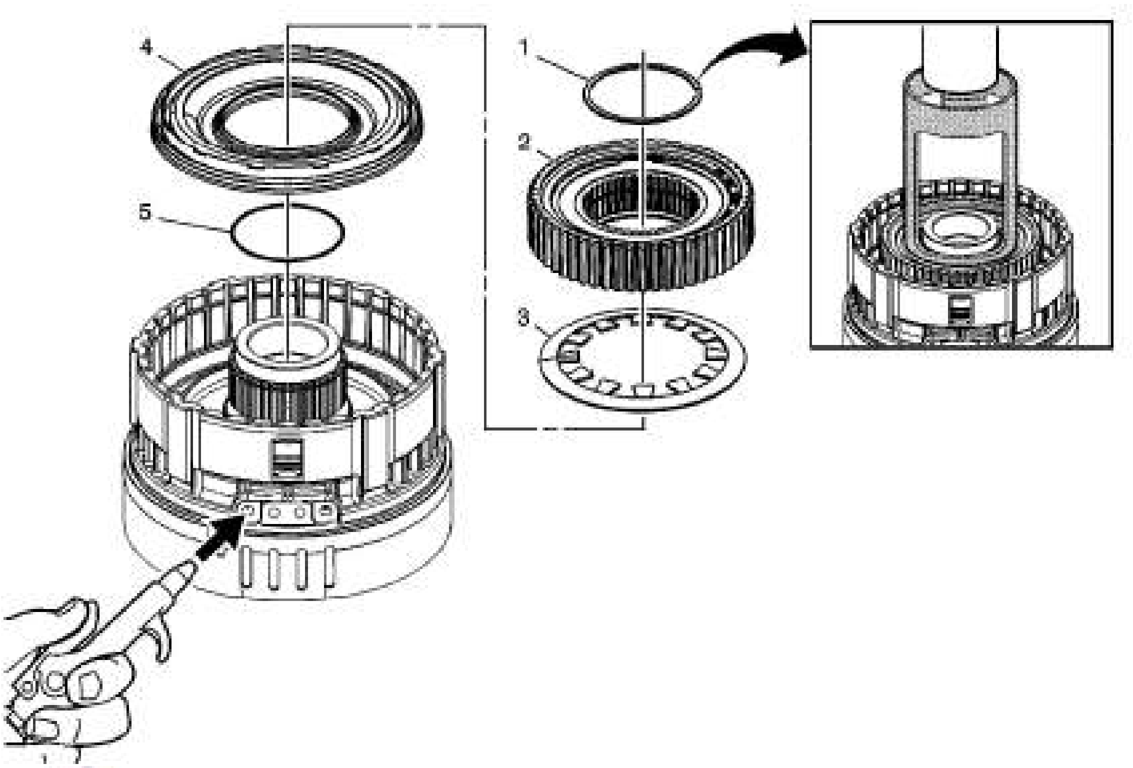
Low and Reverse Clutch Plate Removal



Low and Reverse Clutch Plate Removal

Callout	Component Name
1	Low and Reverse Clutch Backing Plate Retaining Ring
2	Low and Reverse Clutch Backing Plate
3	Low and Reverse Clutch Plate Assembly (Quantity: 5)
4	Low and Reverse Clutch Plate (Quantity: 5)
5	Low and Reverse Clutch (Waved) Plate

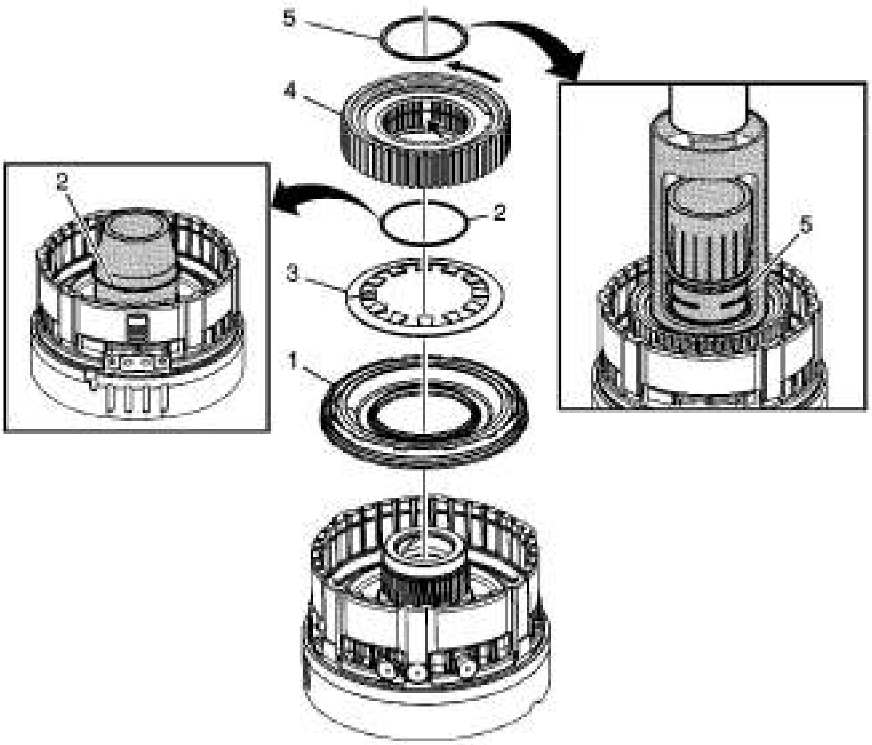
Low and Reverse Clutch Piston Removal



Low and Reverse Clutch Piston Removal

Callout	Component Name
1	Low and Reverse Clutch Spring Retaining Ring **Important:** Ensure the DT47779 contacts the sprag assembly and not the sprag retaining ring. Damage to the sprag may result. **Special Tool** DT 47779 Clutch Spring Compressor
2	Low Clutch Sprag Assembly
3	Low and Reverse Clutch Spring
4	Low and Reverse Clutch Piston Assembly It may be necessary to apply air to the apply passage in order to unseat the piston.
5	Low Clutch Sprag Seal

Low and Reverse Clutch Piston Installation

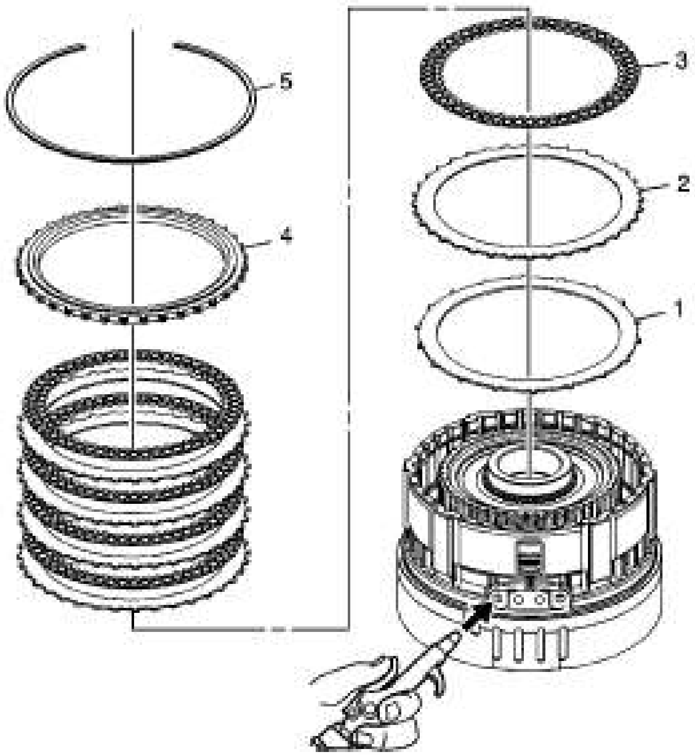


Low and Reverse Clutch Piston Installation

Callout	Component Name
1	Low and Reverse Clutch Piston Assembly Lubricate the inner and outer sealing surfaces of the piston assembly with automatic transmission fluid (ATF) in order to ease installation into the center support assembly.
2	Low Clutch Sprag Seal Apply ATF to the DT 47780 to ease seal installation. **Special Tool** DT 47780 Low Clutch Sprag Seal Cone
3	Low and Reverse Clutch Spring **Important:** Ensure the spring tabs are facing up during installation. Failure to do so may cause damage to the clutch assembly.
4	Low Clutch Sprag Assembly • Verify that the low clutch sprag is operating correctly. Refer to the illustration for proper freewheel direction. • Ensure the missing splines on the sprag assembly are aligned with the missing splines on the center support hub.
	Low and Reverse Clutch Spring Retaining Ring

5	**Important:** Ensure the DT47779 contacts the sprag assembly and not the sprag retaining ring. Damage to the sprag may result. **Important:** The retaining ring gap must be aligned with the 3 missing splines on the center support hub. Failure to do so may cause damage to the clutch assembly **Special Tools** • DT 47778-1 Low Clutch Sprag Retaining Ring Cone • DT 47778-2 Low Clutch Sprag Retaining Ring Pusher • DT 47779 Clutch Spring Compressor

Low and Reverse Clutch Plate Installation



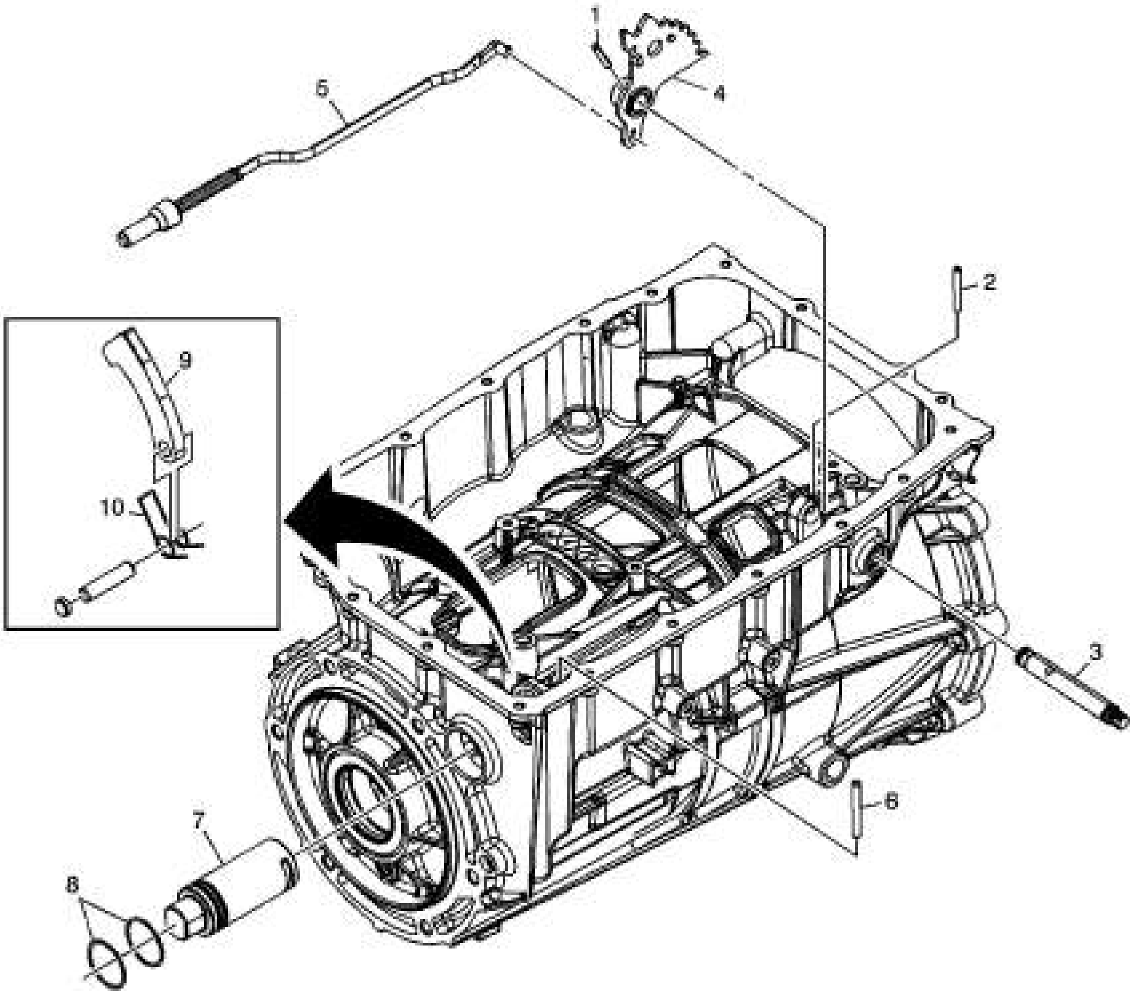
Low and Reverse Clutch Plate Installation

Callout	Component Name
1	Low and Reverse Clutch (Waved) Plate
2	Low and Reverse Clutch Plate (Quantity: 5)
3	Low and Reverse Clutch Plate Assembly (Quantity: 5)
4	Low and Reverse Clutch Backing Plate
5	Low and Reverse Clutch Backing Plate Retaining Ring

	Apply air to verify proper installation of all low and reverse clutch components.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1985277**

Manual Shift Shaft and Parking System Components Overhaul

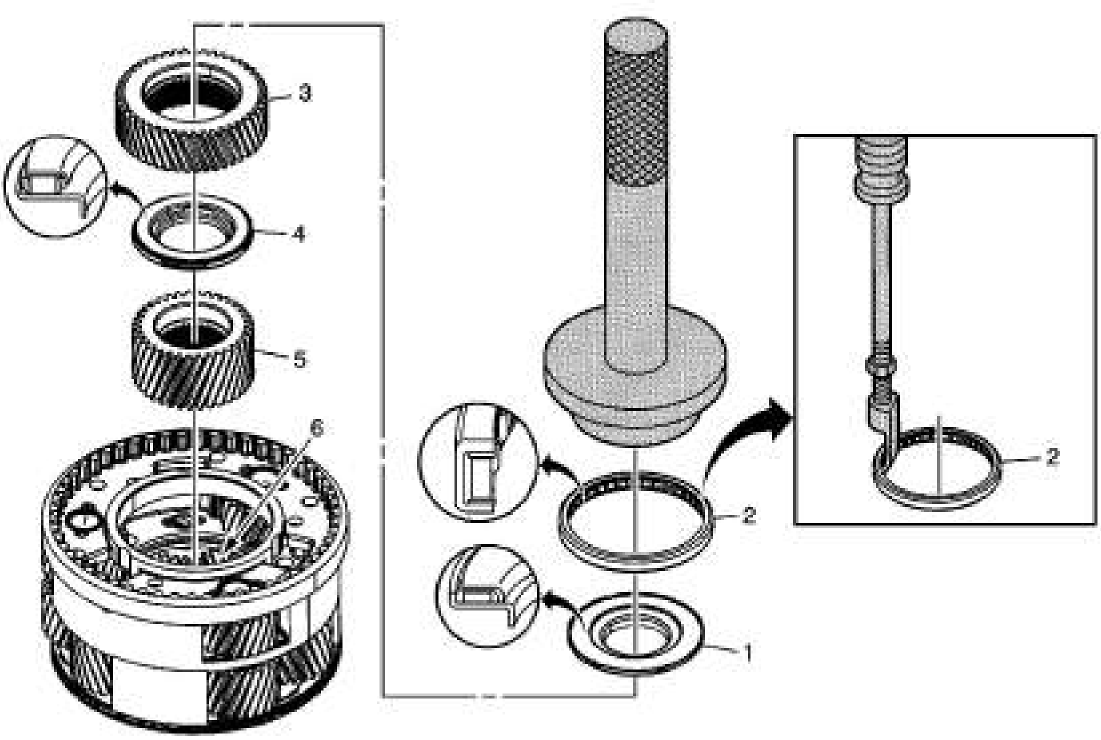


Callout	Component Name
1	Manual Shaft Detent Lever Hub Pin **Important:** Discard the pin. Replace with NEW pin.
2	Manual Shift Shaft Pin **Important:** Discard the pin. Replace with NEW pin.
3	Manual Shift Shaft **Important:** Ensure the manual shift shaft seal is replaced before installing the shaft. Refer to Manual Shift Shaft Seal Replacement.

4	Manual Shaft Detent Lever Assembly
5	Park Pawl Actuator Assembly
6	Park Pawl Actuator Guide Pin **Important:** Discard the pin. Replace with NEW pin. **Tip** Use a large pair of side cutters to "walk" the pin out.
7	Park Pawl Actuator Guide
8	Park Pawl Actuator Guide (O-ring) Seals **Important:** Discard seals. Replace with NEW seals.
9	Park Pawl **Important:** Inspect for damage only. Do not remove. The park pawl is not a serviceable component.
10	Park Pawl Spring **Important:** Inspect for damage only. Do not remove. The park pawl spring is not a serviceable component.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993953**

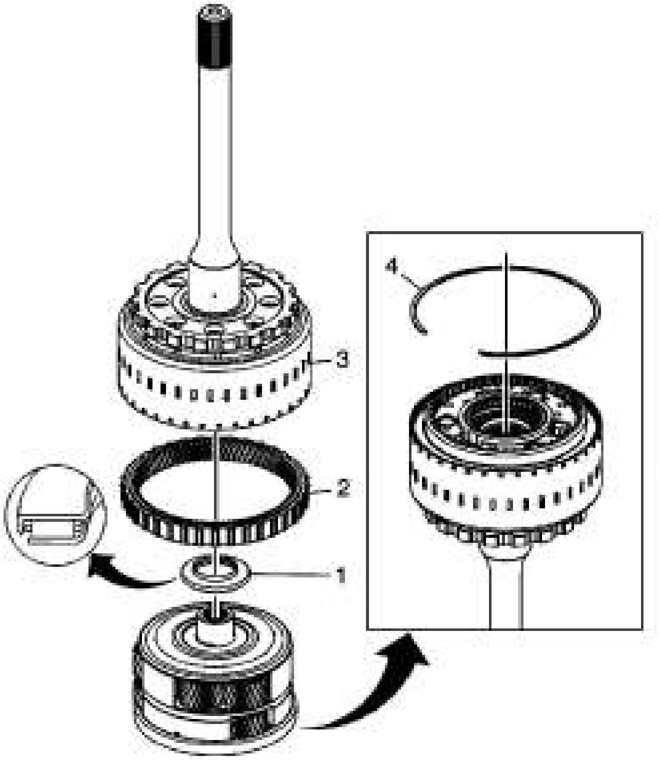
Output Carrier Assembly Overhaul



Callout	Component Name
1	Output Carrier Front Sun Gear Thrust Bearing Assembly
2	Center Support Roller Bearing **Notice:** Refer to General Repair Instructions in the Preface section. **Tip** The thick side of the bearing shell faces up. **Special Tools** • DT 47857 Bearing Installer • J 6125-B Slide Hammer • J 8092 Driver Handle • J 23129 Universal Seal Remover
3	Output Carrier Front Sun Gear **Notice:** Refer to General Repair Instructions in the Preface section.
4	Output Carrier Front Sun Gear Rear Thrust Bearing Assembly

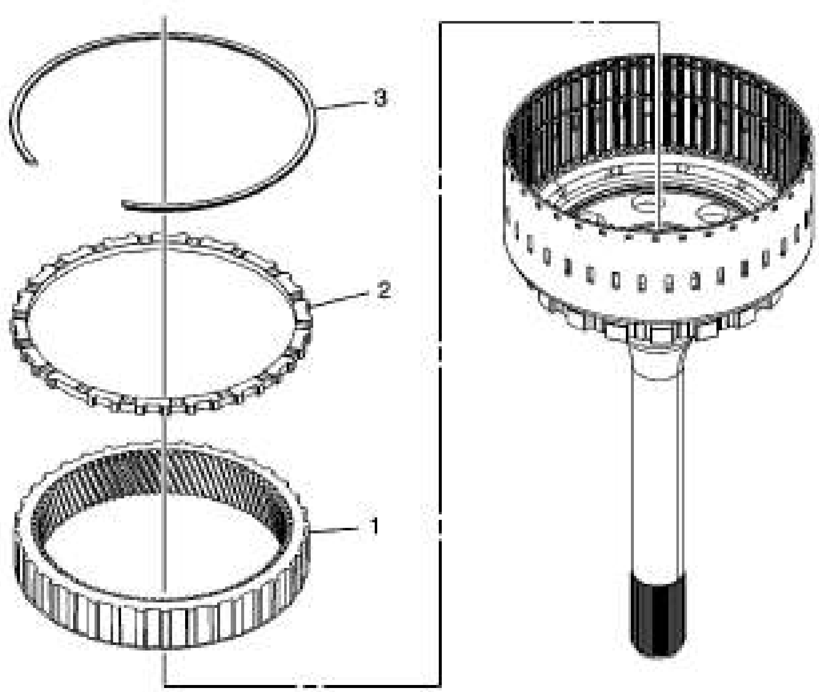
5	Output Carrier Rear Sun Gear **Notice:** Refer to General Repair Instructions in the Preface section.
6	Output Carrier Rear Sun Gear Bearing Assembly **Tip** Inspect for damage only. Do not remove. The bearing assembly is not a serviceable component.

Output Carrier to Output Shaft Assemble



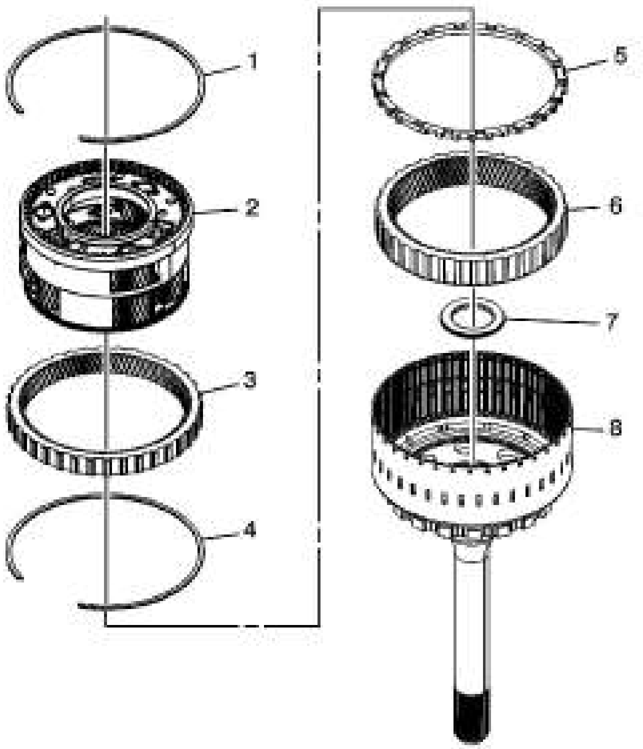
Callout	Component Name
1	Output Carrier Thrust Bearing Assembly
2	Output Carrier Internal Front Gear **Notice:** Refer to General Repair Instructions in the Preface section.
3	Output Shaft Assembly
4	Output Carrier Internal Gear Retaining Ring **Tip** Grasp the output shaft and carrier with both hands to turn over.

Output Shaft Assemble



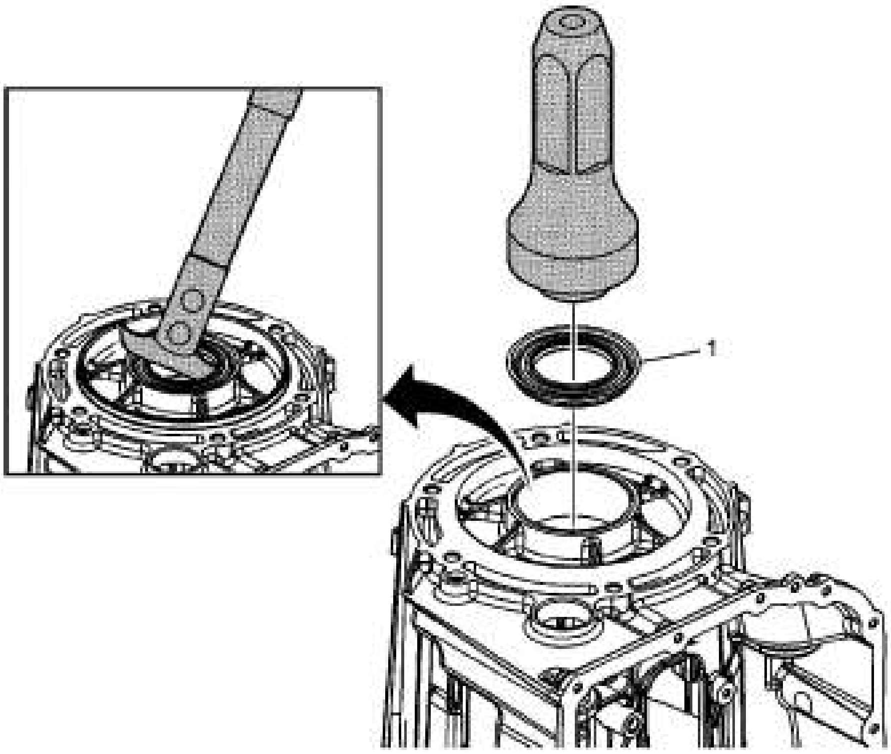
Callout	Component Name
1	Output Carrier Internal Rear Gear **Notice:** Refer to General Repair Instructions in the Preface section.
2	Output Gear Internal Gear Spacer
3	Output Carrier Internal Gear Retaining Ring **Tip** Do not install the output carrier internal front gear and retaining ring yet. These components will be installed during assembly of the output carrier to the output shaft.

Output Shaft Disassemble



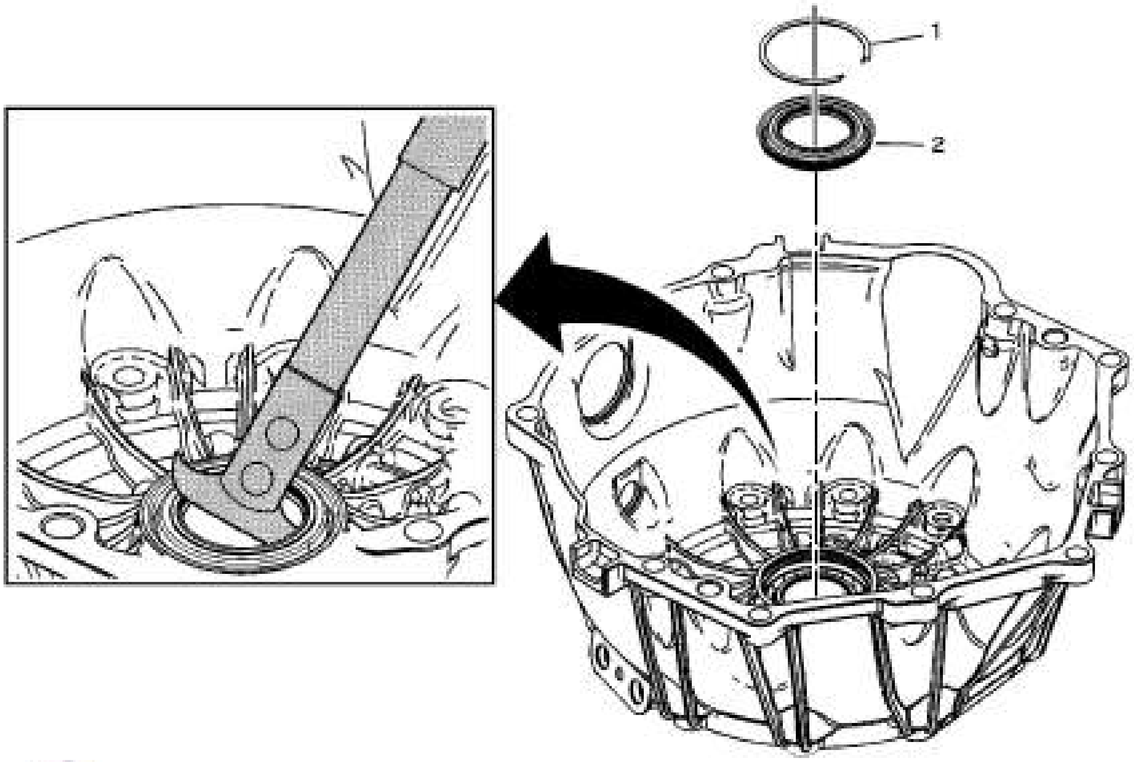
Callout	Component Name
Tip Inspect each component and replace as necessary.	
1	Output Carrier Internal Gear Retaining Ring
2	Output Carrier Assembly
3	Output Carrier Internal Front Gear
4	Output Carrier Internal Gear Retaining Ring
5	Output Carrier Internal Gear Spacer
6	Output Carrier Internal Rear Gear
7	Output Carrier Thrust Bearing Assembly
8	Output Shaft Assembly

Output Shaft Seal Replacement



Callout	Component Name
1	Output Shaft Seal **Important:** Use care not to damage the output shaft bushing with the J 45000 **Special Tools** - J 38693 Seal Installer - J 45000 Seal Remover

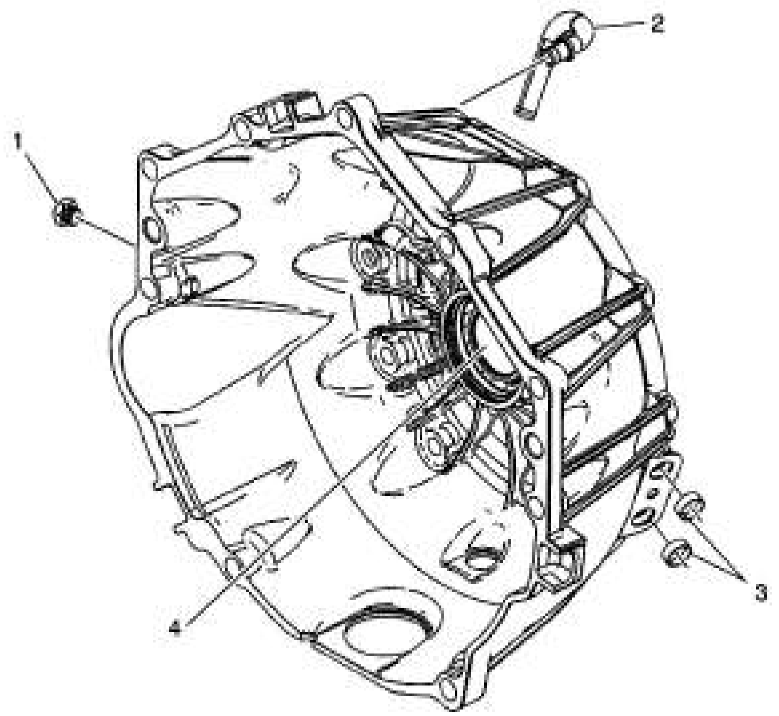
Torque Converter Fluid Seal Replacement



Callout	Component Name
1	Torque Converter Fluid Seal Retaining Ring
2	Torque Converter Fluid Seal Assembly. **Special Tool** J 45000 Seal Remover

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Automatic Transmission - 6L50/6L80/6L90 | Repair Instructions - Off Vehicle | **Document ID: 1993891**

Torque Converter Housing Cleaning and Inspection



Callout	Component Name
Preliminary Procedures 1. Thoroughly clean the torque converter housing assembly, including threads, with clean solvent. 2. Clean sealing surfaces. 3. Inspect all threaded holes. If necessary, repair any thread damage.	
1	Line Pressure Test Hole Plug
2	A/Trans Vent Pipe
3	Trans Fluid Cooler Pipe Fitting Seal **Important:** Seals must be replaced. Refer to Transmission Fluid Cooler Pipe Seal Replacement .
4	Torque Converter Bushing

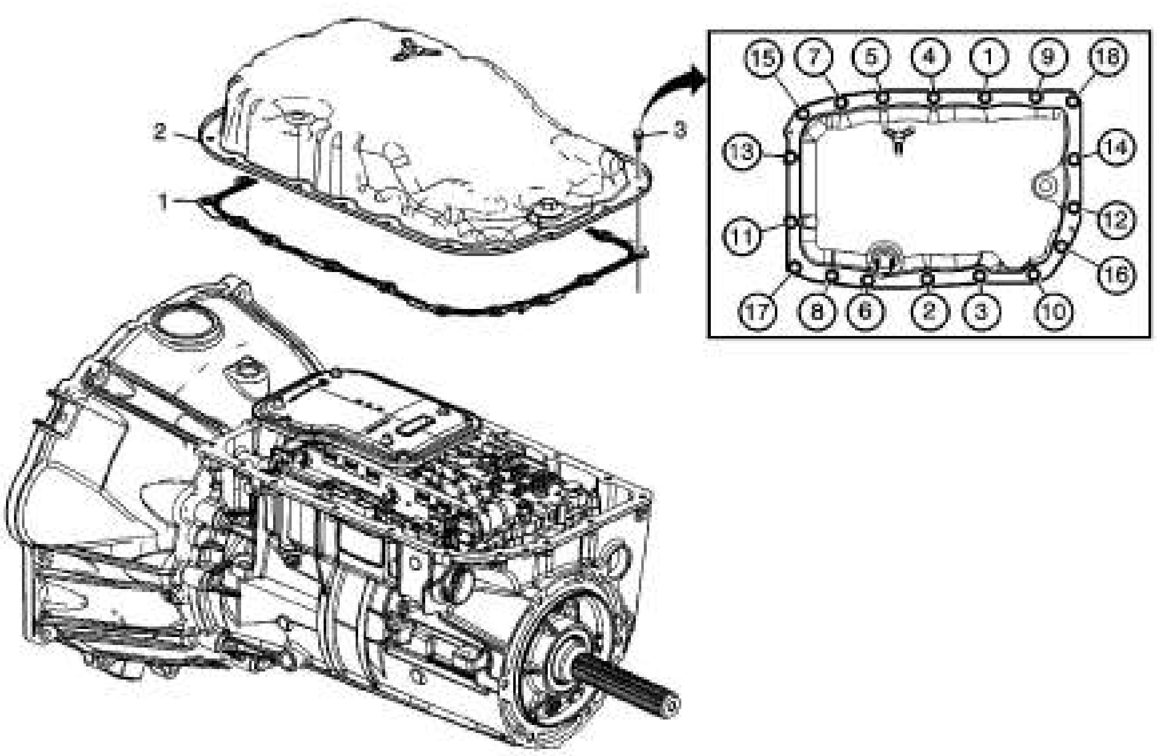
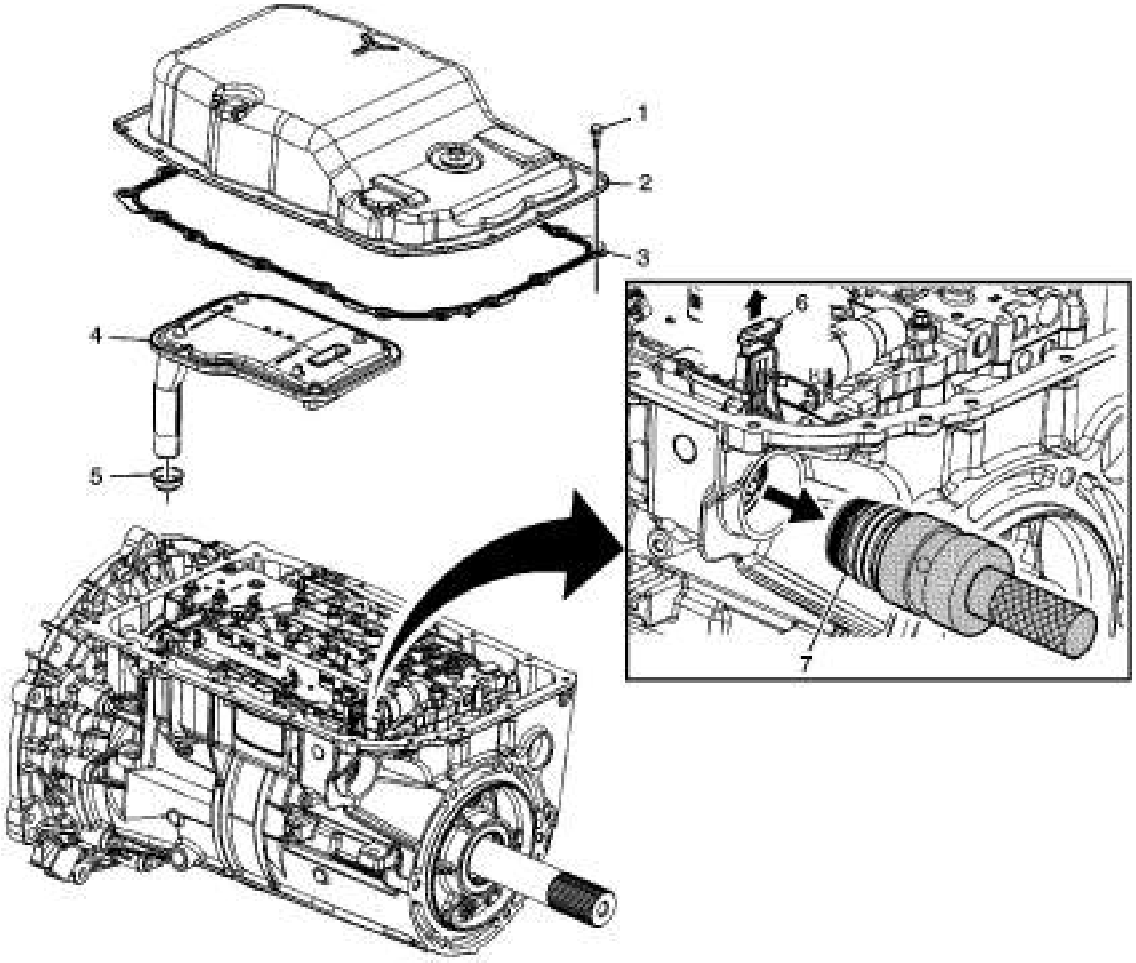
Transmission Fluid Pan Installation



Callout	Component Name
Notice: Refer to Fastener Notice in the Preface section.	
1	Fluid Pan Gasket **Important:** The fluid pan gasket is reusable. Inspect the gasket to determine if it may be reused. If the gasket is stuck to the case or pan, it should be replaced.
2	Fluid Pan Assembly.
3	Fluid Pan Bolts M6 x 20 (Quantity: 18) **Tighten** 9 N·m (80 lb. in) in sequence shown.

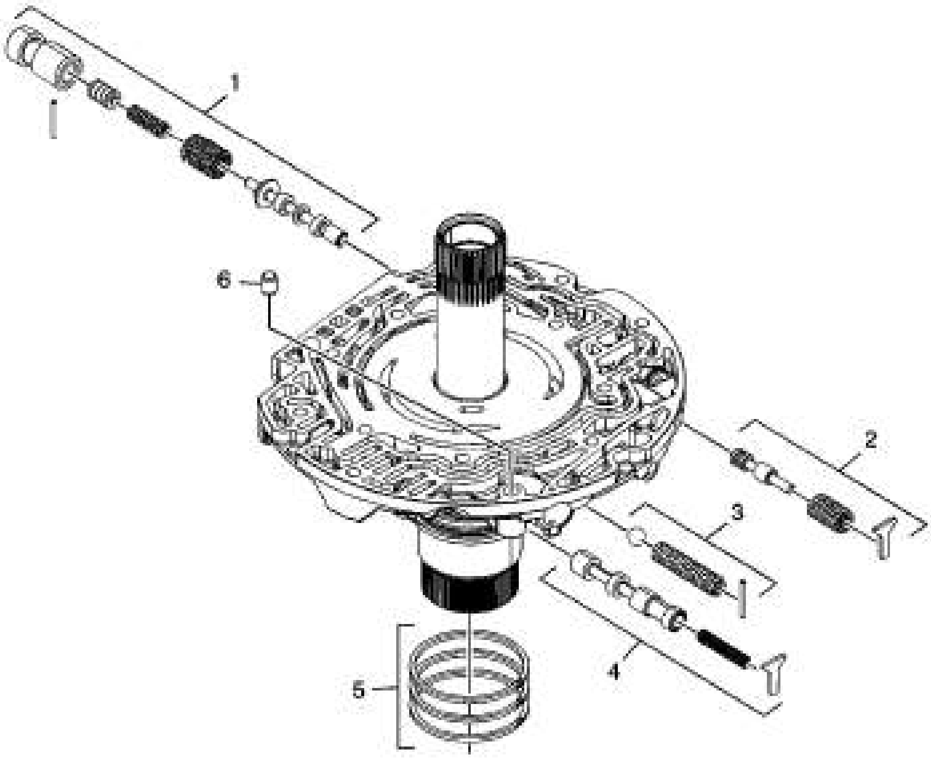
Transmission Fluid Pan, Filter and Electrical Connector Passage Sleeve Removal



Callout	Component Name
1	Bolt M6 x 20 (Quantity: 18)
2	Fluid Pan Assembly
3	Fluid Pan Gasket **Tip** The fluid pan gasket is reusable. Inspect the gasket to determine if it may be reused. If the gasket is stuck to the case or pan, it should be replaced.
4	Fluid Filter Assembly **Notice:** Refer to General Repair Instructions in the Preface section.

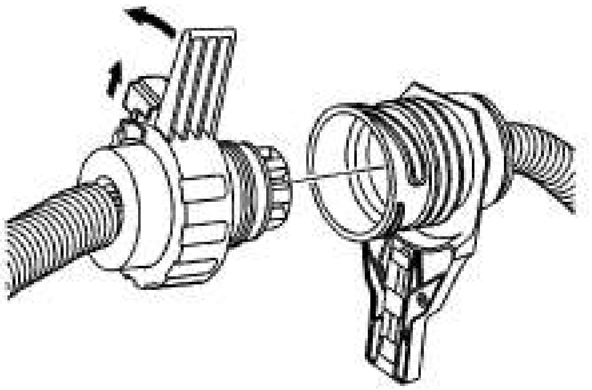
5	Fluid Filter Seal Assembly **Notice:** Refer to General Repair Instructions in the Preface section. **Tip** Use a screwdriver or snap ring pliers.
6	Electrical Connector Slide Lock **Notice:** Refer to General Repair Instructions in the Preface section.
7	Electrical Connector Passage Sleeve **Special Tools** • DT 47715 • J 42183

Transmission Fluid Pump Cleaning and Inspection



Callout	Component Name
Caution: Valve springs can be tightly compressed. Use care when removing retainers and plugs. Personal injury could result. **Important:** Clean and inspect all components and machined surfaces.	
1	Pressure Regulator Valve Train
2	Converter Feed Limit Valve Train
3	Pressure Relief Ball Valve and Spring
4	TCC Control Valve and Spring
5	1-2-3-4 and 3-5 Reverse Clutch Fluid Seal Rings (Quantity: 3) **Important:** Discard the seal rings and replace with NEW rings.
6	A/Trans Fluid Pump Locator Pin

Automatic Transmission Inline 16-Way Connector Description



The transmission electrical connector is an important part of the transmission operating system. Any interference with the electrical connection can cause the transmission to set diagnostic trouble codes or affect proper operation. The following items can affect the electrical connection:

- Bent pins in the connector from rough handling during connection and disconnection
- Wires backing away from the pins or coming uncrimped, in the external wiring harness
- Dirt contamination entering the connector when disconnected
- Transmission fluid leaking into the connector, wicking up into the external wiring harness and degrading the wire insulation
- Moisture intrusion in the connector
- Low pin retention in the external connector from excessive connection and disconnection of the wiring connector assembly
- Pin corrosion from contamination
- Damaged connector assembly

Remember the following points:

- Limit twisting or wiggling the connector during removal. Bent pins can occur.
- Do not pry the connector off with a screwdriver or other tool.
- Whenever the transmission external wiring connector is disconnected from the internal harness and the engine is operating, DTCs will set. Clear these DTCs after reconnecting the

external connector.

Use the following procedure to disconnect the engine side of the 16-way connector from the transmission side:

1. Unlock the slide lock on the engine wiring harness connector.
2. Rotate the connector lever counterclockwise and remove the connector from the electrical connector passage sleeve.

Use the following procedure to reconnect the engine side of the 16-way connector to the transmission side:

1. Orient the alignment slot on the engine side of the connector with the alignment tab on the electrical connector passage sleeve.
2. Slide the engine side connector through the electrical connector passage sleeve and into the transmission side connector.
3. Rotate the connector lever clockwise until the connector is fully seated.
4. Lock the slide lock on the connector.

Definitions and Abbreviations

Throttle Positions

Engine Braking: A condition where the engine is used to slow the vehicle by manually downshifting during a zero throttle coastdown.

Full Throttle Detent Downshift: A quick apply of the accelerator pedal to its full travel, forcing a downshift.

Heavy Throttle: Approximately 3/4 of accelerator pedal travel, 75 percent throttle position.

Light Throttle: Approximately 1/4 of accelerator pedal travel, 25 percent throttle position.

Medium Throttle: Approximately 1/2 of accelerator pedal travel, 50 percent throttle position.

Minimum Throttle: The least amount of throttle opening required for an upshift.

Wide Open Throttle (WOT): Full travel of the accelerator pedal, 100 percent throttle position.

Zero Throttle Coastdown: A full release of the accelerator pedal while the vehicle is in motion and in drive range.

Shift Condition Definitions

Bump: A sudden and forceful apply of a clutch or a band.

Chuggle: A bucking or jerking. This condition may be most noticeable when the converter clutch is engaged. It is similar to the feel of towing a trailer.

Delayed: A condition where a shift is expected but does not occur for a period of time. This may be described as a clutch or band engagement that does not occur as quickly as expected during a part throttle or wide open throttle apply of the accelerator, or during manual downshifting to a lower range. This term is also defined as LATE or EXTENDED.

Double Bump - Double Feel: Two sudden and forceful applies of a clutch or a band.

Early: A condition where the shift occurs before the car has reached proper speed. This condition tends to labour the engine after the upshift.

End Bump: A firmer feel at the end of a shift than at the start of the shift. This is also defined as END FEEL or SLIP BUMP.

Firm: A noticeably quick apply of a clutch or band that is considered normal with a medium to heavy throttle. This apply should not be confused with HARSH or ROUGH.

Flare: A quick increase in engine RPM along with a momentary loss of torque. This most generally occurs during a shift. This condition is also defined as SLIPPING.

Harsh - Rough: A more noticeable apply of a clutch or band than FIRM. This condition is considered undesirable at any throttle position.

Hunting: A repeating quick series of upshifts and downshifts that causes a noticeable change in engine RPM, such as a 4-3-4 shift pattern. This condition is also defined as BUSYNESS.

Initial Feel: A distinctly firmer feel at the start of a shift than at the finish of the shift.

Late: A shift that occurs when the engine RPM is higher than normal for a given amount of throttle.

Shudder: A repeating jerking condition similar to CHUGGLE but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Slipping: A noticeable increase in engine RPM without a vehicle speed increase. A slip usually occurs during or after initial clutch or band apply.

Soft: A slow, almost unnoticeable clutch or band apply with very little shift feel.

Surge: A repeating engine related condition of acceleration and deceleration that is less intense than CHUGGLE.

Tie-Up: A condition where two opposing clutch and/or bands are attempting to apply at the same time causing the engine to labour with a noticeable loss of engine RPM.

Noise Conditions

Drive Link Noise: A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light throttle acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise: A hum related to vehicle speed which is most noticeable under a light throttle acceleration.

Planetary Gear Noise: A whine related to vehicle speed, which is most noticeable in FIRST gear, SECOND gear, FOURTH gear or REVERSE. The condition may become less noticeable, or go away, after an upshift.

Pump Noise: A high pitched whine that increases in intensity with engine RPM. This condition may also be noticeable in all operating ranges with the vehicle stationary or moving.

Torque Converter Noise: A whine usually noticed when a vehicle is stopped, and the transmission is in DRIVE or REVERSE. The noise will increase with engine RPM.

Driver Shift Control

Driver Shift Control (DSC) allows the driver to change gears similar to a manual transmission. Refer to the vehicle owner's manual for specific DSC operating instructions.

WOT: Wide Open Throttle

Drive Range - Fourth Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command OFF the normally-high C35R pressure control solenoid 2. At the same time the normally-low CBR1/C456 pressure control solenoid 3 is commanded ON to regulate 4-5-6 clutch apply.

4-5-6 CLUTCH APPLIES

CBR1/C456 Pressure Control Solenoid 3

The CBR1/C456 pressure control solenoid 3 is commanded ON allowing actuator feed fluid to enter the PCS CBR1/456 clutch fluid circuit. PCS CBR1/456 clutch fluid is routed through orifice #39 to the CBR1/C456 clutch regulator valve and, through orifice #31 to the CBR1/C456 clutch boost valve.

CBR1/C456 Clutch Regulator Valve

PCS CBR1/456 clutch fluid moves the CBR1/C456 clutch regulator valve against CBR1/C456 clutch regulator valve spring force to allow line fluid to pass through the valve an enter the CBR1/456 clutch feed circuit. CBR1/456 clutch feed is then routed to the 4-5- 6 clutch boost valve and clutch select valve 2.

4-5-6 Clutch Boost Valve

PCS CBR1/456 clutch fluid pressure acts on a differential area moving the CBR1/456 clutch boost valve against the CBR1/456 clutch boost valve spring. CBR1/456 clutch fluid passes through the valve and enters the CBR1/456 clutch feedback circuit. As PCS CBR1/456 clutch fluid pressure is increased to a given value, the CBR1/456 clutch boost valve opens the CBR1/456 clutch feedback circuit to exhaust. This results in the CBR1/456 clutch regulator valve moving to the full feed position, sending full line pressure to the clutch.

Clutch Select Valve 2

CBR1/456 clutch feed fluid passes through the clutch select valve 2 and enters the 456 clutch feed circuit. 456 clutch feed fluid is routed to the clutch select valve 3 where it passes through the valve and enters the 456 clutch fluid circuit. 456 clutch fluid is routed to the 4-5-6 clutch, the 2-6 clutch regulator gain valve and to the #3 ball check valve. 456 clutch fluid seats the #3 ball check valve against solenoid 2 fluid passage and directed into the CSV3 enable fluid circuit where it is routed through orifice #20 and to clutch select valve 3.

4-5-6 Clutch

456 clutch fluid enters the 4-5-6 clutch housing to move the piston against spring force, combined with force from the compensator to apply the 4-5-6 clutch plates.

3-5 REVERSE CLUTCH RELEASES

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 is commanded OFF, allowing PCS 35 reverse clutch fluid from the 3-5 reverse clutch boost valve and the 3-5 reverse clutch regulator valve to exhaust through the solenoid.

3-5 Reverse Clutch Boost Valve

3-5 reverse boost valve spring force moves the valve to allow 35 reverse clutch feedback fluid from the 3-5 reverse clutch regulator valve to enter the 35 reverse clutch fluid circuit and exhaust.

3-5 Reverse Clutch Regulator Valve

3-5 reverse clutch regulator valve spring force moves the valve to allow 35 reverse clutch fluid from the 3-5 reverse clutch to pass through the valve and enter the exhaust backfill fluid circuit. 35 reverse clutch fluid then enters the exhaust backfill fluid circuit and is routed through orifice #30 to the exhaust backfill pressure relief valve where excess pressure is exhausted.

3-5 Reverse Clutch

3-5 reverse clutch spring force combined with force from the compensator move the 3-5 reverse clutch piston to release the 3-5 clutch plates and forces 35 reverse clutch fluid to exhaust from 1-2-3-4 and 3-5 reverse clutch housing. 35 reverse clutch fluid is then routed to the 3-5 reverse clutch regulator valve and exhausted.

ACTUATOR

Drive Range, Fifth Gear Default

If the transmission is in 4th, 5th or 6th gear during a transmission electrical component failure, the transmission will default to 5th gear. All solenoids will default to their normal state. If the torque converter clutch was applied, it will release. The transmission will stay in 5th gear default range until the ignition has been turned off or transmission shifted to reverse. When the vehicle is restarted, and shifted back into drive, the transmission will then operate in the 3rd gear default range. This default action will enable the vehicle to be safely driven to a service centre.

3-5 REVERSE CLUTCH APPLIES

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 defaults to ON, allowing actuator feed fluid to enter the PCS 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #48 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #40 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the PCS 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3- 5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS1 fluid from the pressure switch 1 exhausts through the valve, allowing the switch to close.

3-5 Reverse Clutch

3-5 reverse clutch fluid enters the 1-2-3-4 & 3-5 reverse clutch housing to move the piston against spring force combined with force from the compensator to apply the 3-5 reverse clutch plates.

Clutch Select Valve 3

Once the clutch select valve 3 is moved to the ON position in 4th gear, it will remain in this position throughout the 5th gear default range, until the ignition has been turned OFF. When the ignition is OFF, fluid will exhaust from the valve, thus when the vehicle is restarted, the transmission will then be in the 3rd gear default range.

1-2-3-4 CLUTCH RELEASES or 2-6 CLUTCH RELEASES

C1234 Pressure Control Solenoid 5

If the transmission was in 4th gear when an electrical condition commands a protection mode, the C1234 pressure control solenoid 5 defaults to the OFF position, allowing PCS 1234 clutch fluid from the 1-2-3-4 clutch, the 1-2-3-4 clutch regulator valve and 1- 2-3-4 clutch boost valve to exhaust.

2-6 CB26 Pressure Control Solenoid 4

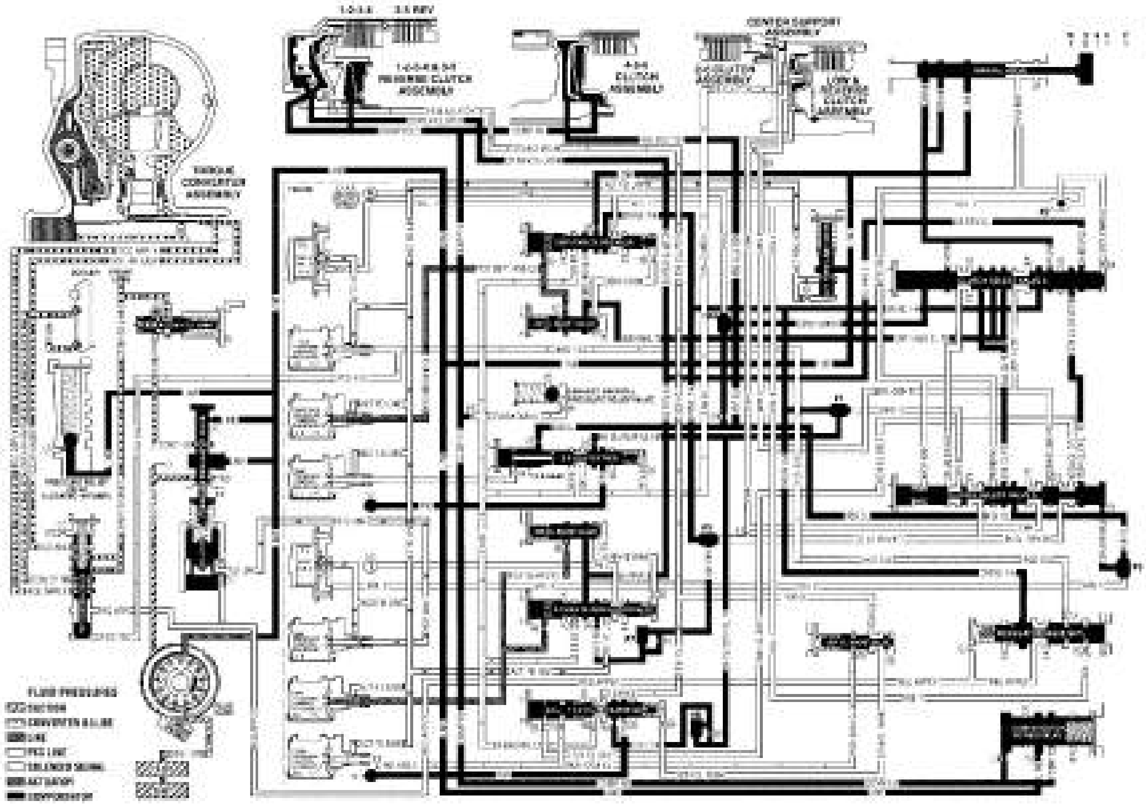
If the transmission was in 6th gear when an electrical condition commands a protection mode, the CB26 pressure control solenoid 4 defaults to the OFF position, allowing PCS 26 clutch fluid from the 2-6 clutch regulator valve, and the 2-6 clutch to exhaust.

TORQUE CONVERTER CLUTCH RELEASES

TCC Pressure Control Solenoid

The TCC pressure control solenoid will default to it's normal state, OFF. PCS TCC fluid will exhaust from the TCC control valve, and spring force will shuttle the valve to the off position. TCC apply fluid will then be routed to the cooler, and TCC release fluid will be routed to the torque converter for complete TCC release.

Drive Range, Fifth Gear Default



1-2-3-4
3-5 REV
1-2-3-4 & 3-5 REVERSE CLUTCH ASSEMBLY
4-5-6 CLUTCH ASSEMBLY
CENTER SUPPORT ASSEMBLY
LOW & REVERSE CLUTCH ASSEMBLY
TORQUE CONVERTER ASSEMBLY
FLUID PRESSURES

Drive Range, Fifth Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command ON the normally-high C35R pressure control solenoid 2. At the same time the normally-low C1234 pressure control solenoid 5 is commanded OFF.

3-5 REVERSE CLUTCH APPLIES

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 is commanded ON, allowing actuator feed fluid to enter the PCS 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #48 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #40 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 35 reverse clutch fluid pressure acts on a differential area moving the PCS 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. 35 reverse clutch fluid passes through the valve and enters the 35 reverse clutch feedback circuit. As PCS 35 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 35 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 35 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 35 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 35 reverse clutch feedback fluid. This allows 35 reverse feed to pass through the valve and enter the 35 reverse clutch circuit. 35 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS1 fluid from the pressure switch 1 exhausts through the valve allowing the switch to close.

Clutch Select Valve 2

35 reverse clutch fluid passes through the clutch select valve 2 and enters the 1234 clutch default feed fluid circuit. 1234 clutch default feed fluid is then routed to the clutch select valve 3.

3-5 Reverse Clutch

35 reverse clutch fluid enters the 1-2-3-4 & 3-5 reverse clutch housing to move the piston against spring force combined with force from the compensator to apply the 3-5 reverse clutch plates.

1-2-3-4 CLUTCH RELEASES

C1234 Pressure Control Solenoid 5

The C1234 pressure control solenoid 5 is commanded OFF, allowing PCS 1234 clutch fluid from the 1-2-3-4 clutch regulator valve and 1-2-3-4 clutch boost valve to exhaust.

1-2-3-4 Clutch Regulator Valve

1-2-3-4 clutch regulator valve spring force moves the valve to allow 1234 clutch feed fluid from the 1-2-3-4 clutch to pass through the valve and enter the exhaust backfill fluid circuit. 1234 clutch fluid the enters the exhaust backfill fluid circuit and is routed through orifice # 30 to the exhaust backfill pressure relief valve where excess pressure is exhausted. Also, 1234 clutch regulator valve spring force moves the valve to allow 1234 clutch feed fluid to pass through the valve and enter the PS4 fluid circuit. PS4 fluid is then routed to pressure switch 4 and opens the normally-closed switch.

1-2-3-4 Clutch Boost Valve

1-2-3-4 clutch boost valve spring force moves the valve to allow 1234 clutch feedback fluid from the 1-2-3-4 clutch regulator valve to enter the 1234 clutch circuit and exhaust.

1-2-3-4 Clutch

1-2-3-4 clutch spring force combined with force from the compensator moves the 1-2-3-4 clutch piston to release the clutch plates and force 1234 clutch fluid from the 1-2-3-4 and 3-5 reverse clutch housing. 1234 clutch fluid is routed through the 1-2-3-4 clutch regulator valve where it enters the exhaust backfill fluid circuit.

Drive Range, First Gear Engine Braking

When the gear selector lever is moved to the Drive (D) range from the Neutral (N) position, the transmission will provide engine braking. In this operating range, the normally-low C1234 pressure control solenoid 5 is commanded ON and in the engine braking mode the following changes occur within the hydraulic circuits:

FLUID PRESSURE IS DIRECTED TO THE 1-2-3-4 CLUTCH AND THE LOW & REVERSE CLUTCH TO PROVIDE ENGINE BRAKING

Manual Valve

The manual valve is moved to the Drive (D) position and allows line fluid pressure to enter the drive fluid circuit. Drive fluid is then routed to the clutch select valve 2.

Clutch Select Valve 2

Drive fluid at the clutch select valve 2 passes through the valve and enters the drive brake circuit. Drive brake fluid is then routed to the clutch select valve 3.

Clutch Select Valve 3

Drive brake fluid at the clutch select valve 3 passes through the valve and enters the Drive B fluid circuit. Drive B fluid is then routed to #1 ball check valve.

#1 Ball Check Valve

Drive B fluid seats the #1 ball check valve against drive 1-6 fluid to force drive B fluid into the CB26/C1234 feed passage. CB26/ C1234 feed fluid is routed to the #6 ball check valve, through orifice #43 and, to the 2-6 clutch regulator valve. CB26/C1234 feed fluid passes through the 2-6 clutch regulator valve and enters the PS3 fluid circuit. PS3 fluid is then routed to the normally closed pressure switch 3 and opens the switch.

#6 Ball Check Valve

CB26/C1234 feed fluid seats the #6 ball check valve against the 1234 clutch feed passage forcing CB26/C1234 feed fluid through orifice #32 before entering the 1234 clutch feed circuit. 1234 clutch feed fluid is routed through orifice #33 and then to the 1- 2-3-4 clutch regulator valve.

1-2-3-4 CLUTCH APPLIES

C1234 Pressure Control Solenoid 5

The C1234 Pressure Control Solenoid 5 is commanded ON allowing actuator feed limit fluid to enter the PCS1234 clutch fluid circuit. PCS1234 clutch fluid is then routed through orifice #35 to the 1-2-3-4 clutch regulator valve. PCS1234 clutch fluid is also routed through orifice #29 and then to the 1-2- 3-4 clutch boost valve.

1-2-3-4 Clutch Regulator Valve

PCS1234 clutch fluid moves the 1-2-3-4 clutch regulator valve against 1-2-3-4 clutch regulator valve spring force to allow 1234 clutch feed fluid to pass through the valve and enter the 1234 clutch fluid circuit. 1234 clutch fluid is then routed to the 1234 clutch boost valve and the 1-2-3-4 clutch.

1-2-3-4 Clutch Boost Valve

PCS1234 clutch fluid pressure acts on a differential area moving the 1234 clutch boost valve against the 1234 clutch boost valve spring. 1234 clutch fluid passes through the valve and enters the 1234 clutch feedback circuit. As PCS 1234 clutch fluid pressure is increased to a given value, the 1234 clutch boost valve opens the 1234 clutch feedback circuit to exhaust. This results in the 1234 clutch regulator valve moving to the full feed position sending full 26 CL/1234 CL feed pressure (full line pressure) to the clutch.

1-2-3-4 Clutch

1234 clutch fluid enters the 1234 clutch housing to move the piston against spring force and compensator feed fluid to apply the 1-2-3-4 clutch plates.

Drive Range, First Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, throttle position sensor and other vehicle sensors to determine the precise moment to de-energise or "turn off" shift solenoid 1 and command OFF the normally-high CBR1/C456 pressure control solenoid 3.

LOW & REVERSE CLUTCH RELEASES

Shift Solenoid 1

When shift solenoid 1 is "turned OFF", CSV2 enable fluid from the clutch select valve 2 passes by the #2 ball check valve and enters the solenoid 1 fluid circuit. Solenoid 1 fluid from the #2 ball check valve and TCC regulator valve is then routed to the solenoid where it exhausts.

Clutch Select Valve 2

CSV2 enable fluid is exhausted from the clutch select valve 2 and clutch select valve 2 spring force moves the valve to the released position. With clutch select valve 2 in the released position, drive fluid from the manual valve passes through the valve and enters the drive 1-6 fluid circuit. Drive 1-6 fluid then feeds all clutch regulator valves and the TCC regulator valve.

CBR1/C456 Pressure Control Solenoid 3

The CBR1/C456 pressure control solenoid 3 is commanded OFF allowing PCS CBR1/C456 fluid from the CBR1/C456 clutch regulator valve and 456 clutch boost valve to exhaust.

CBR1/C456 Clutch Regulator Valve

CBR1/C456 clutch regulator valve spring force moves the valve to exhaust the CBR1/456 clutch feed circuit and allow drive 1-6 fluid to enter the PS5 fluid circuit. PS5 fluid is then routed to the normally-closed pressure switch 5 and opens the switch. PS5 fluid is also routed to the #4 ball check valve and flows into the CSV2 latch fluid circuit.

#4 Ball Check Valve

PS5 fluid pressure seats the #4 ball check valve against the 456 clutch fluid circuit. PS5 fluid is then directed into the CSV2 latch fluid circuit and routed to the clutch select valve 2. CSV2 latch fluid combines with clutch select valve 2 spring force and holds the valve in this position during all six forward gear ranges.

#5 Ball Check Valve

Drive 1-6 fluid pressure seats the #5 ball check valve against the 35 clutch reverse feed fluid passage. Drive 1-6 fluid is then directed into the 35R supply fluid circuit which is routed to the #7 ball check valve and orifice #25.

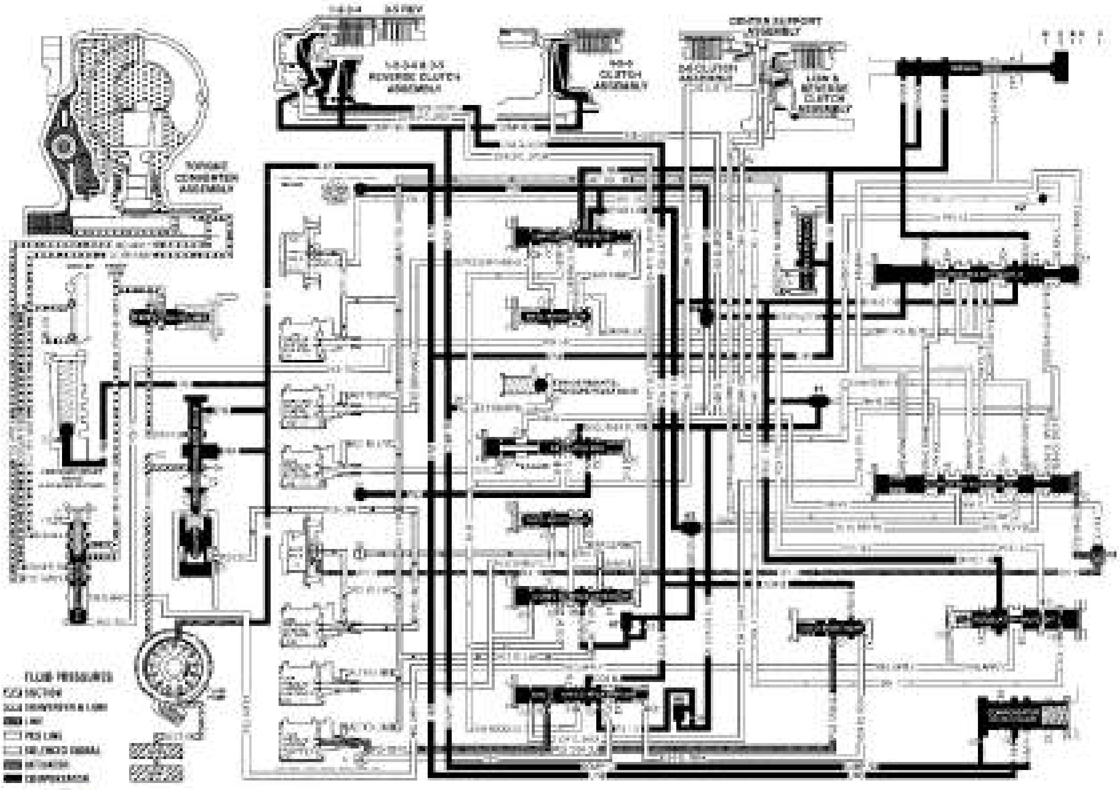
#7 Ball Check Valve

35R supply fluid seats the #7 ball check valve against the 35R feed fluid passage to force 35R supply fluid through orifice #25 before entering the 35R feed circuit. 35R feed fluid is then routed to the 3-5 reverse clutch regulator valve.

Low and Reverse Clutch

Low and reverse clutch spring force moves the low and reverse clutch piston which forces CBR and CBR1 fluid out of the centre support. CBR fluid is routed to the clutch select valve 3 where it exhausts. CBR1 fluid is routed to the clutch select valve 2 where it exhausts. The low and reverse clutch is in the released position.

Drive Range, First Gear



Drive Range, Second Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command ON the normally-low pressure control solenoid 4.

SECOND CLUTCH APPLIES

CB26 Pressure Control Solenoid 4

The CB26 pressure control solenoid 4 is commanded ON, allowing actuator feed limit fluid to enter the PCS 26 clutch fluid circuit. PCS 26 clutch fluid is then routed through orifice #44 to the 2-6 clutch regulator gain valve.

2-6 Clutch Regulator Gain Valve

The 2-6 clutch regulator gain valve allows the gain (valve input to output pressure magnification factor) of the 2-6 clutch regulator valve to be different for a 1-2 shift verses a 5-6 shift. For a 1-2 shift, PCS 26 clutch fluid pressure acts on a differential area resulting in the "high gain" pressure output.

2-6 Clutch Regulator Valve

PCS 26 clutch fluid moves the 2-6 clutch regulator gain valve assembly against the 2--6 clutch regulator valve spring force to allow 26 clutch/1234 clutch feed fluid to pass through the valve. 26 clutch/1234 clutch feed fluid is routed into the 26 clutch fluid circuit where it passes through orifice #41 and then to the spring end of the 2-6 clutch regulator valve, and to the 2-6 clutch within the centre support.

2-6 Clutch

26 clutch fluid from the 2-6 clutch regulator valve is routed through the centre support and to the 2-6 clutch piston assembly. 26 clutch fluid pressure moves the piston against 2-6 clutch spring force to apply the 2-6 clutch plates.

Drive Range, Sixth Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command ON the normally-low CB26 pressure control solenoid 4. At the same time the normally-high C35R pressure control solenoid 2 is commanded OFF.

2-6 CLUTCH APPLIES

CB26 Pressure Control Solenoid 4

The CB26 pressure control solenoid 4 is commanded ON, allowing actuator feed fluid to enter the PCS 26 clutch fluid circuit. PCS 26 fluid is routed through orifice #44 and then to the 2-6 clutch regulator gain valve.

2-6 Clutch Regulator Gain Valve

The 2-6 clutch regulator gain valve allows the gain (valve input to output pressure magnification factor) of the 2-6 clutch regulator valve to be different for a 1-2 shift verses a 5-6 shift. For a 5-6 shift PCS 26 clutch fluid pressure passes through the hollow valve and only acts on the 26 regulator valve area, resulting in the "low gain" pressure output.

2-6 Clutch Regulator Valve

PCS 26 clutch fluid moves the 2-6 clutch regulator/gain valve assembly against the 2-6 clutch regulator valve spring force to allow 26 clutch/1234 clutch feed fluid to pass through the valve. 26 clutch/1234 clutch feed fluid is routed into the 26 clutch fluid circuit where it passes through orifice #41 and then to the spring end of the 2-6 clutch regulator valve, and to the 2-6 clutch within the centre support.

2-6 Clutch

26 clutch fluid from the 2-6 clutch regulator valve is routed through the centre support and to the 2-6 clutch piston assembly. 26 clutch fluid pressure moves the piston against 2-6 clutch spring force to apply the 2-6 clutch plates.

3-5 CLUTCH RELEASES

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 is commanded OFF, allowing PCS 35 reverse clutch fluid from the 3-5 reverse clutch boost valve and the 3-5 reverse clutch regulator valve to exhaust through the solenoid.

3-5 Reverse Clutch Boost Valve

3-5 reverse boost valve spring force moves the valve to allow 35 reverse clutch feedback fluid from the 3-5 reverse clutch regulator valve to enter the 35 reverse clutch circuit and exhaust.

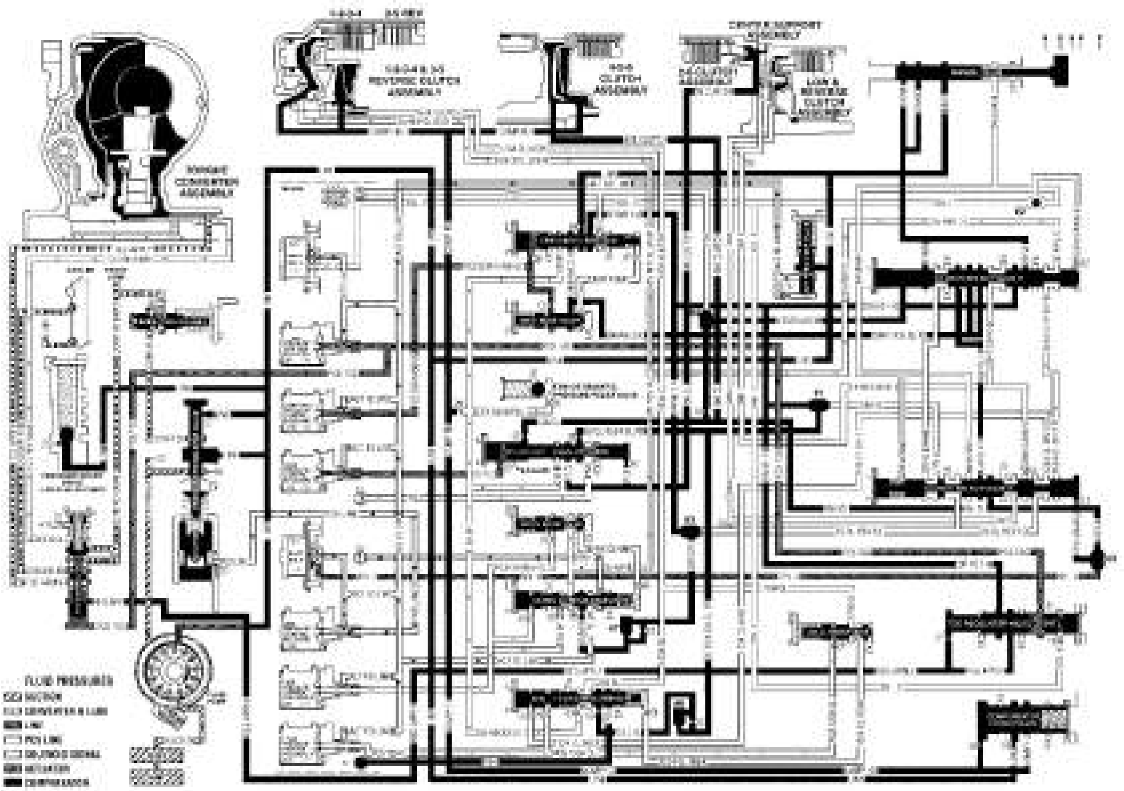
3-5 Reverse Clutch Regulator Valve

3-5 reverse clutch regulator valve spring force moves the valve to allow 35 reverse clutch fluid from the 3-5 reverse clutch to pass through the valve and enter the exhaust backfill fluid circuit. 35 reverse clutch fluid then enters the exhaust backfill fluid circuit and is routed through orifice #30 to the exhaust backfill pressure relief valve where excess pressure is exhausted.

3-5 Reverse Clutch

3-5 reverse clutch spring force combined with force from the compensator move the 3-5 reverse clutch piston to release the 3-5 clutch plates and forces 35 reverse clutch fluid to exhaust from 1-2-3-4 and 3-5 reverse clutch housing. 35 reverse clutch fluid is then routed to the 3-5 reverse clutch regulator valve where it enters the exhaust backfill circuit.

Drive Range, Sixth Gear



Drive Range, Third Gear Default

If the transmission is in 1st, 2nd or 3rd gear during a transmission electrical component failure, the transmission will default to 3rd gear. All solenoids will default to their normal state. If the torque converter clutch was applied, it will release. This default action will enable the vehicle to be safely driven to a service centre.

1-2-3-4 CLUTCH STAYS APPLIED

Shift Solenoid 2

Shift solenoid 2 defaults to it's normally-closed state (OFF), and SOL 2 fluid exhausts through the solenoid.

Clutch Select Valve 3

Sol 2 fluid pressure no longer holds the clutch select valve 3 open. When the valve moves back to the closed position, it opens the 1234 clutch default fluid circuit, and 1234 default fluid is routed to the 1-2-3-4 clutch regulator valve.

1-2-3-4 Clutch Regulator Valve

With the absence of PCS 1234 clutch fluid, due to the default state of the C1234 pressure control solenoid 5, the 1-2-3-4 regulator valve closes from spring force. However, the 1234 clutch default fluid enters behind the 1-2-3-4 regulator shuttle valve and keeps the valve in the open position.

1-2-3-4 Clutch

With the 1-2-3-4 clutch regulator valve still held in the open position, the 1-2-3-4 clutch will stay applied.

3-5 REVERSE CLUTCH APPLIED or APPLIES

C35R Pressure Control Solenoid 2

The normal state for the C35R pressure control solenoid 2 is ON, therefore PSC 35 reverse clutch fluid will still be routed to the 3-5 reverse clutch regulator valve and the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3-5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS1 fluid from the pressure switch 1 exhausts through the valve, allowing the switch to close.

3-5 Reverse Clutch Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch

3-5 reverse clutch fluid enters the 1-2-3-4 & 3-5 reverse clutch housing to move the piston against spring force combined with force from the compensator to apply the 3-5 reverse clutch plates.

Drive Range, Third Gear Default

LOW & REVERSE CLUTCH ASSEMBLY
TORQUE CONVERTER ASSEMBLY
FLUID PRESSURES

Drive Range, Third Gear

As the vehicle speed increases, the transmission control module (TCM) receives input signals from the automatic transmission input and output speed sensors, the throttle position sensor and other vehicle sensors to determine the precise moment to command OFF the normally-low CB26 pressure control solenoid 4. At the same time the C35R pressure control solenoid 2 is also commanded ON to regulate 3-5 clutch apply.

3-5 REVERSE CLUTCH APPLIES

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 is commanded ON allowing actuator feed fluid to enter the PCS 35 reverse clutch fluid circuit. PCS 35 reverse clutch fluid is routed through orifice #48 and then to the 3-5 reverse clutch regulator valve. PCS 35 reverse clutch fluid is also routed through orifice #40 and then to the 3-5 reverse clutch boost valve.

3-5 Reverse Clutch Boost Valve

PCS 35 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. 35 reverse clutch fluid passes through the valve and enters the 35 reverse clutch feedback circuit. As PCS 35 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 35 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 35 reverse clutch feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch Regulator Valve

PCS 35 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 35 reverse clutch feedback fluid. This allows 35 reverse feed to pass through the valve and enter the 35 reverse clutch circuit. 35 reverse clutch fluid is then routed to the 3-5 reverse clutch, the 3-5 reverse boost valve and the clutch select valve 2. When the 3-5 reverse clutch regulator valve is in this position, PS1 fluid from the pressure switch 1 exhausts through the valve allowing the switch to close.

3-5 Reverse Clutch

35 reverse clutch fluid enters the 1-2-3-4 & 3-5 reverse clutch housing to move the piston against spring force combined with force from the compensator to apply the 3-5 reverse clutch plates.

2-6 CLUTCH RELEASES

CB26 Pressure Control Solenoid 4

The CB26 pressure control solenoid 4 is commanded OFF allowing PCS 26 clutch fluid from the 2-6 clutch regulator valve to exhaust. 26 clutch/1234 clutch feed fluid at the 2-6 clutch regulator valve passes through the valve and enters the PS3 fluid circuit. PS3 fluid is then routed to pressure switch 3 and opens the normally-closed switch.

2-6 Clutch Regulator Valve

2-6 clutch regulator valve spring force moves the valve to allow 26 clutch fluid from the 2-6 clutch to pass through the valve and enter the exhaust backfill fluid circuit.

2-6 Clutch

2-6 clutch spring force moves the 2-6 clutch piston to release the 2-6 clutch plates and forces 26 clutch fluid to exhaust from the centre support. 26 clutch fluid is routed through the 2-6 clutch regulator valve where it enters the exhaust backfill fluid circuit and is routed through orifice #30 to the exhaust backfill pressure relief valve where excess pressure is exhausted.

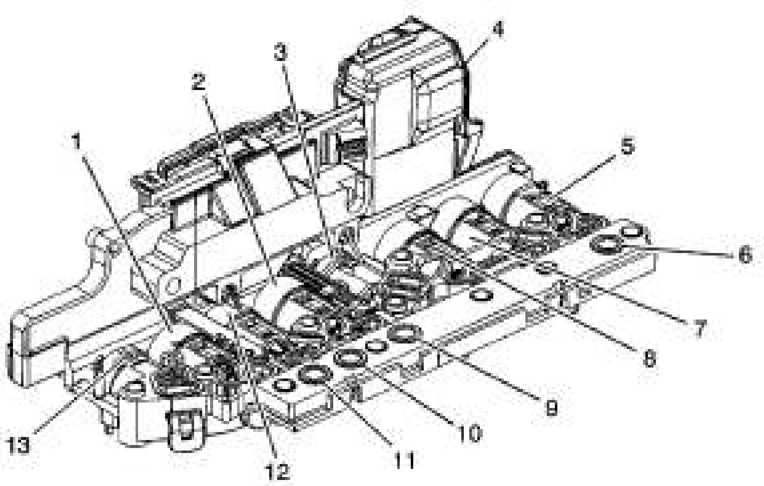
Electronic Component Description

Control Solenoid (W/Body and TCM) Valve Assembly



(1) Line Pressure Control (PC) Solenoid
(2) Torque Converter Clutch (TCC) Pressure Control (PC) Solenoid
(3) Shift Solenoid (SS) 2
(4) 16 Pin Connector
(5) Pressure Control (PC) Solenoid 3
(6) Transmission Fluid Pressure (TFP) Switch 5
(7) Pressure Control (PC) Solenoid 4
(8) Pressure Control (PC) Solenoid 2
(9) Transmission Fluid Pressure (TFP) Switch 3
(10) Transmission Fluid Pressure (TFP) Switch 1
(11) Transmission Fluid Pressure (TFP) Switch 4
(12) Pressure Control (PC) Solenoid 5
(13) Shift Solenoid (SS) 1

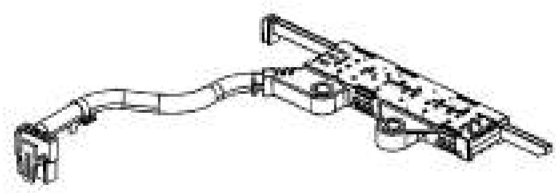
The control solenoid (w/body and TCM) valve assembly contains the following components:

- Transmission control module (TCM)
- Clutch pressure control solenoids (Clutch PC Sol)
- Shift solenoids (SS)
- Line pressure control solenoid (Line PC Sol)
- Torque converter clutch pressure control solenoid (TCC PC Sol)
- Transmission fluid temperature sensor (TFT Sensor)
- TCM temperature sensor

- Power-up temperature sensor
- Transmission fluid pressure switches (TFP Sw)

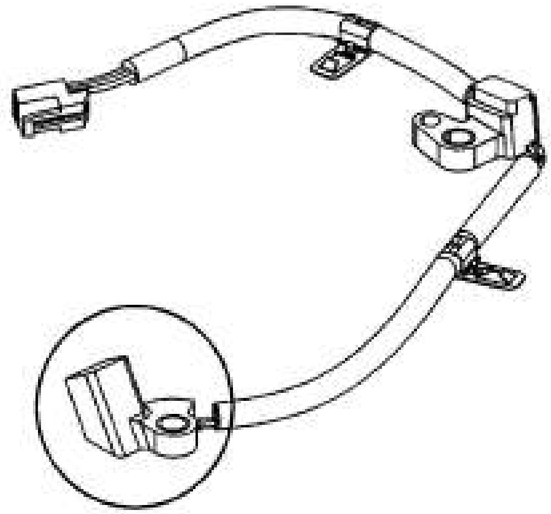
These components are not serviced separately. The control solenoid (w/body and TCM) valve assembly utilizes a lead-frame system to connect these components electrically to the TCM. No wires are used for these components. The control solenoid (w/body and TCM) valve assembly bolts directly to the lower and upper valve body assemblies inside the transmission. The control solenoid (w/body and TCM) valve assembly connects to the engine harness 16-way connector via a pass-thru sleeve.

Internal Mode Switch (IMS)



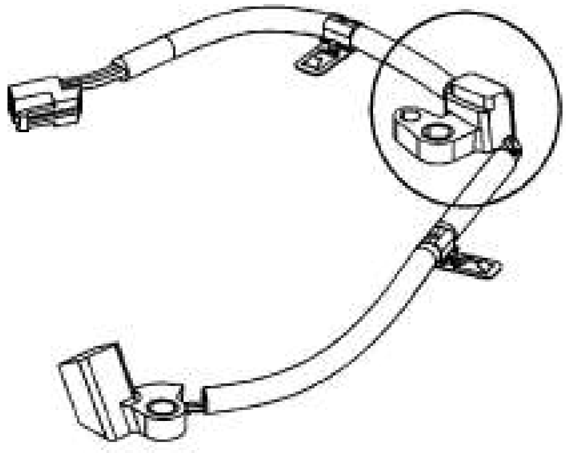
The transmission manual shift shaft switch assembly is a sliding contact switch attached to the manual shift shaft inside the transmission case. The five inputs to the TCM from the transmission manual shift shaft switch assembly indicate the transmission gear selector lever position. This information is used for engine controls as well as determining the transmission shift patterns. The state of each input is available for display on the scan tool. The five input parameters represented are Signal A, Signal B, Signal C, Signal P (Parity) and Signal N (P/N Start).

Input Speed Sensor (ISS)



The input speed sensor (ISS) is a hall-effect type sensor. The ISS mounts to the control valve upper body assembly and connects to the control solenoid (w/body and TCM) valve assembly through a wire harness and connector. The sensor faces the 1-2-3-4 and 3-5-R clutch housing machined teeth surface. The sensor receives 8.3-9.3 volts on the ISS/OSS Supply Voltage circuit from the TCM. As the 1-2-3-4 and 3-5-R clutch housing rotates, the sensor produces a signal frequency based on the machined surface of the 1-2-3-4 and 3-5-R clutch housing. This signal is transmitted through the ISS signal circuit to the control solenoid (w/body and TCM) valve assembly. The control solenoid (w/body and TCM) valve assembly uses the ISS signal to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

Output Speed Sensor (OSS)



The output speed sensor (OSS) is a hall-effect type sensor. The OSS mounts to the control valve upper body assembly and connects to the control solenoid (w/body and TCM) valve assembly through a wire harness and connector. The sensor faces the output shaft machined teeth surface. The sensor receives 8.3-9.3 volts on the ISS/OSS supply voltage circuit from the TCM. As the output shaft rotates, the sensor produces a signal frequency based on the machined surface of the output shaft. This signal is transmitted through the OSS signal circuit to the TCM. The TCM uses the OSS signal to determine line pressure, transmission shift patterns, torque converter clutch (TCC) slip speed and gear ratio.

Neutral - Engine Running

When the gear selector is moved to the Neutral (N) position, the hydraulic and electrical system operation is identical to Park (P) range. However, if Neutral is selected after the vehicle was operating in Reverse (R), the normally high C35R pressure control solenoid 2 is commanded OFF and the following changes occur in the hydraulic system:

3-5 REVERSE CLUTCH RELEASES

Manual Valve

The manual valve is moved to the Neutral position and blocks line pressure from entering the reverse and drive fluid circuits. The reverse fluid from the #2 ball check valve and clutch select valve 3 is opened to an exhaust passage at the manual valve.

C35R Pressure Control Solenoid 2

The C35R pressure control solenoid 2 is commanded OFF allowing PCS 3-5 reverse clutch fluid from the 3-5 reverse clutch boost valve and 3-5 reverse clutch regulator valve to exhaust.

3-5 Reverse Clutch Boost Valve

3-5 reverse boost valve spring force moves the valve to allow 3-5 reverse clutch feedback fluid from the 3-5 reverse clutch regulator valve to enter the 3-5 reverse clutch circuit and exhaust.

3-5 Reverse Clutch Regulator Valve

3-5 reverse clutch regulator valve spring force moves the valve to allow 3-5 reverse clutch fluid from the 3-5 reverse clutch and clutch select valve 2 to pass through the valve and enter the exhaust backfill fluid circuit. 3-5 reverse clutch fluid then enters the exhaust backfill fluid circuit and is routed through orifice #30 to the exhaust backfill pressure relief valve where excess pressure is exhausted.

3-5 Reverse Clutch

3-5 reverse clutch spring force combined with a force from the compensator moves the 3-5 reverse clutch piston to release the 3-5 reverse clutch plates and force 3-5 reverse clutch fluid to exhaust from the 1-2-3-4 and 3-5 reverse clutch housing. 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch regulator valve allowing the 3-5 reverse clutch to release.

Clutch Select Valve 3

When reverse fluid exhausts through the manual valve, CSV3 enable fluid moves the valve against clutch select valve 3 spring force. 3-5 reverse feed fluid is routed around #7 ball check valve and into the 3-5 reverse supply circuit. 3-5 reverse supply fluid is routed around #5 ball check valve and into the 3-5 clutch reverse feed circuit and exhausts at the clutch select valve 3.

Park - Engine Running

When the gear selector lever is in the Park (P) position, fluid is drawn into the pump through the transmission fluid filter assembly, from the transmission fluid pan assembly. Line pressure is then directed to the following valves:

FLUID PRESSURE DIRECTED IN PREPARATION FOR A SHIFT

Manual Valve

Mechanically controlled by the gear selector lever, the manual valve is in the Park (P) position and prevents line pressure from the pressure regulator valve from entering the reverse and drive circuits.

CBR1/C456 Pressure Control (PC) Solenoid 3

The CBR1/C456 PCS is energized (HIGH) allowing actuator feed limit fluid to enter the PCS CBR1/C456 CL fluid circuit. PCS CBR1/C456 CL fluid is then routed through orifice #31 to the 4-5-6 clutch boost valve and through orifice #39 to the CBR1/ C456 clutch regulator valve.

CBR1/C456 Clutch Regulator Valve

PCS CBR1/C456 CL fluid at the CBR1/C4-5-6 clutch regulator valve moves the valve against CBR1/C4-5-6 clutch regulator spring force and CBR1/FDBK fluid. This allows line pressure to pass through the valve and enter the CBR1/456CL FD circuit. CBR1/456CL FD is then routed to Clutch Select Valve 2.

Shift Solenoid 1

Shift solenoid 1 is energized (ON) allowing actuator feed limit fluid to enter the solenoid 1 circuit. Solenoid 1 fluid is routed to the #2 ball check valve and through orifice #10 to the TCC regulator valve and shuttle valve (SHTL).

TCC Regulator Valve and Shuttle Valve

Solenoid 1 fluid is routed to the TCC regulator valve and shuttle valve and moves the valve against TCC regulator valve spring force.

#2 Ball Check Valve

Solenoid 1 fluid seats the #2 ball check valve against the reverse fluid passage and fluid is forced through orifice #22 into the CSV2 enable fluid circuit.

Clutch Select Valve 2

CSV2 enable fluid is routed to the clutch select valve 2 and moves the valve against clutch select valve 2 spring force. This allows CBR1/456 CL FD fluid to pass through the valve and enter the CBR1/CBR FD circuit. CBR1/CBR FD fluid is then routed: to clutch select valve 3, into the CBR1 fluid circuit and, through orifice #49 where it enters the CBR fluid circuit and an exhaust passage at the clutch select valve 3 (this fluid is intended to keep the low and reverse clutch full of fluid but not pressurized). CBR1 fluid is then routed to the low & reverse clutch assembly in preparation for a shift into low or reverse gear.

Shift Solenoid 2

Shift solenoid 2 is energized (ON) allowing actuator feed limit fluid to enter the solenoid 2 fluid circuit and is then routed to the #3 ball check valve.

3-5 Reverse Clutch Regulator Valve

Actuator feed limit fluid is routed through the valve and into the PS1 fluid passage. PS1 fluid is then sent to the normally closed #1 pressure switch and opens the switch.

#3 Ball Check Valve

Solenoid 2 fluid seats the #3 ball check valve against 456 CL fluid passage and fluid is forced through orifice #20 into the CSV3 enable fluid circuit. CSV3 enable fluid is then routed to the clutch select valve 3.

Clutch Select Valve #3

CSV3 enable fluid moves the clutch select valve 3 against clutch select valve 3 spring force. CBR fluid at the clutch select valve 3 passes through the valve and exhausts.

Reverse

When the gear selector lever is moved to the Reverse (R) position (from the Park position) the normally high C35R pressure control solenoid 2 is commanded ON and the following changes occur in the transmission's hydraulic and electrical systems:

FLUID PRESSURE DIRECTED IN PREPARATION FOR A SHIFT

Manual Valve

With the manual valve in the reverse position, line pressure is directed into the reverse fluid circuit to the #2 ball check valve and clutch select valve 3.

#2 Ball Check Valve

Reverse fluid seats the #2 ball check valve against the solenoid 1 fluid passage and fluid is forced through orifice #22 into the CSV2 enable circuit.

Clutch Select Valve 2

CSV2 enable fluid, present at the valve from Park position, continues to hold the clutch select valve 2 against clutch select valve 2 spring force.

LOW & REVERSE CLUTCH APPLIES

Clutch Select Valve 3

Reverse fluid from the manual valve is routed to clutch select valve 3 to combine with clutch select valve 3 spring force to keep the valve in the off position. This allows reverse fluid to pass through the valve and enter the 3-5 clutch reverse feed circuit. 3-5 clutch reverse feed fluid from the clutch select valve 3 is also routed to #5 ball check valve. CBR1/CBR FD fluid is also directed through the clutch select valve 3 to the low and reverse clutch assembly.

Low & Reverse Clutch

CBR & CBR1 fluid pressures are routed to both the inner and outer areas of the low and reverse clutch piston to hold the piston against spring force and hold the low and reverse clutch plates. The clutch was already applied in Park, but is applied with more holding capacity in Reverse (both piston areas are pressurized).

#5 Ball Check Valve

3-5 clutch reverse feed fluid seats #5 ball check valve against the drive 1-6 circuit allowing 3-5 clutch reverse feed fluid to enter the 3-5 reverse supply circuit. 3-5 reverse supply fluid is then routed to #7 ball check valve and through orifice #25 where is enters the 3-5 reverse feed circuit. 3-5 reverse feed passes through orifice #46 and then is routed to the 3-5 reverse clutch regulator valve.

3-5 REVERSE CLUTCH APPLIES

C35R Pressure Control Solenoid 2

The C35R Pressure Control Solenoid 2 is energized (HIGH) allowing actuator feed limit fluid to enter the PCS 3-5 reverse clutch circuit. PCS 3-5 reverse clutch fluid is then routed through orifice #48 to the 3-5 reverse clutch regulator valve and through orifice #40 to the 3-5 reverse boost valve.

3-5 Reverse Clutch Regulator Valve

PCS 3-5 reverse clutch fluid moves the 3-5 reverse clutch regulator valve against 3-5 reverse clutch regulator valve spring force and 3-5 reverse clutch feedback fluid. This allows 3-5 reverse feed to pass through the valve and enter the 3-5 reverse clutch circuit. 3-5 reverse clutch fluid is then routed to the 3-5 reverse clutch and the 3-5 reverse boost valve. PS1 fluid from pressure switch 1 exhausts through the valve allowing the switch to close.

3-5 Reverse Boost Valve

PCS 3-5 reverse clutch fluid pressure acts on a differential area moving the 3-5 reverse clutch boost valve against the 3-5 reverse clutch boost valve spring. 3-5 reverse clutch fluid passes through the valve and enters the 3-5 reverse clutch feedback circuit. As PCS 3-5 reverse clutch fluid pressure is increased to a given value, the 3-5 reverse clutch boost valve opens the 3-5 reverse clutch feedback circuit to exhaust. This results in the 3-5 reverse clutch regulator valve moving to the full feed position sending full 3-5 clutch reverse feed pressure (full line pressure) to the clutch.

3-5 Reverse Clutch

3-5 reverse clutch fluid enters the 1-2-3-4 & reverse clutch housing to move the piston against spring force and compensator feed fluid to apply the 3-5 reverse clutch plates.

Transmission Adaptive Functions

The 6L80 transmission utilizes a line pressure control system during upshifts to compensate for the normal wear of transmission components. As the apply components within the transmission wear or change over time, shift time (the time required to apply a clutch) increase or decreases. In order to compensate for these changes, the transmission control module (TCM) adjusts the pressure commands to the various PC solenoids, to maintain the originally calibrated shift timing. The automatic adjusting process is referred to as "adaptive learning" and it is used to ensure consistent shift feel plus increase transmission durability. The TCM monitors the A/T input speed sensor (ISS) and the A/T output speed sensor (OSS) during commanded shifts to determine if a shift is occurring too fast (harsh) or too slow (soft) and adjusts the corresponding pressure control (PC) solenoid signal to maintain the set shift feel.

The purpose of the adapt function is to automatically compensate the shift quality for the various vehicle shift control systems. The adapt function is a continuous process that will help to maintain optimal shift quality throughout the life of the vehicle.

Transmission Component and System Description

The mechanical components of the 6-Speed RWD are as follows:

- A torque converter with an electronically controlled capacity clutch (ECCC)
- Vane-type fluid pump assembly
- 1-2-3-4 and 3-5 Reverse clutch assembly
- Input sun gear and carrier assembly
- 4-5-6 clutch assembly with turbine shaft
- 4-5-6 clutch hub assembly
- 1-2-3-4 clutch hub assembly
- 2-6 and 3-5 reverse clutch hub assembly
- Centre support assembly, with 2-6 clutch assembly, and low and Reverse clutch assembly
- Low clutch sprag assembly
- A double planetary output carrier assembly
- Output shaft assembly
- Control valve body assembly

The electrical components of the 6-Speed RWD are as follows:

- Input and output speed sensor assembly
- Manual shift shaft position switch
- Control solenoid valve assembly, which contains the following components:
  - Transmission control module (TCM)
  - 5 variable bleed line pressure control (PC) solenoids
  - Transmission fluid pressure (TFP) switch assembly
  - Torque converter clutch (TCC) pressure control solenoid
  - 2 shift solenoids

For more information, refer to Electronic Component Description .

Transmission General Description

The Hydra-matic 6-Speed RWD is a fully automatic, 6-speed, rear-wheel drive, electronic-controlled transmission. It consists primarily of a 4-element torque converter, an integral fluid pump and converter housing, a single and double planetary gear set, friction and mechanical clutch assemblies, and a hydraulic pressurization and control system. There are four variants of the transmission, all based on torque capacity. Architecture is common between the variants, and component differences are primarily related to size.

The 4-element torque converter contains a pump, a turbine, a pressure plate splined to the turbine, and a stator assembly. The torque converter acts as a fluid coupling to smoothly transmit power from the engine to the transmission. It also hydraulically provides additional torque multiplication when required. The pressure plate, when applied, provides a mechanical direct drive coupling of the engine to the transmission.

The planetary gear sets provide the 6 forward gear ratios and reverse. Changing gear ratios is fully automatic and is accomplished through the use of a transmission control module (TCM) located inside the transmission. The TCM receives and monitors various electronic sensor inputs and uses this information to shift the transmission at the optimum time.

The TCM commands shift solenoids and variable bleed pressure control solenoids to control shift timing and feel. The TCM also controls the apply and release of the torque converter clutch which allows the engine to deliver the maximum fuel efficiency without sacrificing vehicle performance. All the solenoids, including the TCM, are packaged into a self-contained control solenoid valve assembly.

The hydraulic system primarily consists of a vane-type pump, 2 control valve body assemblies, converter housing and case. The pump maintains the working pressures needed to stroke the clutch pistons that apply or release the friction components. These friction components, when applied or released, support the automatic shifting qualities of the transmission.

The friction components used in this transmission consist of 5 multiple disc clutches. The multiple disc clutches combine with one mechanical sprag clutch to deliver 7 different gear ratios, 6 forward and one reverse, through the gear sets. The gear sets then transfer torque through the output shaft.

The transmission may be operated in any of the following gear ranges:

PARK (P): This position locks the rear wheels and prevents the vehicle from rolling either forward or backward. PARK is the best position to use when starting the vehicle. Because the transmission utilizes a shift lock control system, it is necessary to fully depress the brake pedal before shifting out of PARK. For safety reasons, use the parking brake in addition to the PARK position.

REVERSE (R): This position allows the vehicle to be operated in a rearward direction.

NEUTRAL (N): This position allows the engine to be started and operated while driving the vehicle. If necessary, you may select this position in order to restart the engine with the vehicle moving. This position should also be used when towing the vehicle.

DRIVE (D): Drive range should be used for all normal driving conditions for maximum efficiency and fuel economy. Drive range allows the transmission to operate in each of the 6 forward gear ratios. Downshifts to a lower gear, or higher gear ratio, are available for safe passing by depressing the accelerator or by manually selecting a lower gear in the manual mode range.

MANUAL MODE (M): This position allows the driver to select a range of gears appropriate for current driving conditions. Refer to the vehicle owner's manual for specific manual mode information.

Transmission Indicators and Messages

The following transmission-related indicators and messages may be displayed on the Instrument Panel Cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to Indicator/Warning Message Description and Operation.

"High Trans Temp": This message is displayed when the TCM detects a transmission fluid temperature (TFT) equal to or greater than 130°C (266°F) for 5 seconds.

Diagnostic Starting Point - Clutch

Reviewing the Clutch System Description and Operation will help determine the correct symptom diagnostic procedure when a malfunction exists. Reviewing clutch system description and operation information will also help determine if the condition described by the customer is normal operation. Refer to Symptoms - Clutch in order to identify the correct procedure for diagnosing the system and where the procedure is located.

Symptoms - Clutch

Strategy Based Diagnostics

Review the system operations in order to familiarise yourself with the system functions. Refer to Clutch System Description and Operation.

Visual/Physical Inspection

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the clutch fluid reservoir for the correct fluid level.
- Inspect the hydraulic clutch lines for dents, kinks or other obvious damage that may affect the clutch system operations.
- Inspect the clutch system for contamination of dirt, oil, or other substances that may affect the clutch system operations.
- Inspect for aftermarket parts.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating correctly.

Symptom List

Important: Due to the variety of clutch options, there may be components in the mechanical diagnostic tables that are not on a particular vehicle.

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Clutch Drag Hard Shifting.
- Clutch Slipping.
- Clutch Grabbing.
- Clutch Noisy.
- Clutch Pedal Spongy Low Pedal Effort.
- Clutch Pedal Hard to Push.
- Clutch Vibration.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Diagnostic Information and Procedures | **Document ID: 1992603**

Clutch Pedal Hard to Push (RHD)

Cause	Action
DEFINITION: The clutch pedal requires high effort to operate. Review the Symptoms - Clutch .	
Incorrect hydraulic fluid	1. Inspect for the correct fluid in the master cylinder. Refer to General Specifications . 2. Flush the hydraulic system and fill with the correct fluid. Refer to Clutch Master Cylinder Fluid Replacement 3. Replace the clutch hydraulic system if the incorrect fluid used was mineral based.
Contaminated hydraulic fluid	1. Inspect the hydraulic fluid for water. 2. Inspect the hydraulic fluid for dirt or debris. 3. Flush the hydraulic system and fill with the correct fluid. Refer to Clutch Master Cylinder Fluid Replacement
Clutch pedal binding	1. Inspect the pedal for binding. 2. Replace the pedal. Refer to Clutch Pedal Replacement .
Clutch pedal spring worn	Replace the clutch pedal spring. Refer to Clutch Pedal Replacement
Kinked or damaged clutch hydraulic pipe	1. Inspect for a kinked or damaged hydraulic hose. 2. Repair or replace the clutch hydraulic hose. Refer to Hydraulic Clutch Hose/Pipe Replacement .
clutch driven plate excessively worn	Replace the clutch assembly. Refer to Clutch Assembly Replacement (3.6L Engine) or Clutch Assembly Replacement (6.0L Engine) in Clutch.

Clutch Rattle (RHD)

Cause	Action
DEFINITION: A rattle noise coming from the clutch components with the clutch disengaged or engaged. Review the Symptoms - Clutch .	
Idle rattle clutch engaged	Replace the engine flywheel, due to faulty damper springs. Refer to the following procedures: • Engine Flywheel Replacement . • Clutch Assembly Replacement .
Clutch is incorrectly installed	Replace the clutch assembly. Refer to Clutch Assembly Replacement .
Clutch disc splines and transmission input shaft splines worn	1. Inspect the clutch disc hub to transmission input shaft splines for excessive clearance. 2. Replace the clutch assembly if the clutch splines are worn. Refer to Clutch Assembly Replacement . 3. Replace the transmission input shaft. Refer to Transmission Disassemble for 3.6L Engines or Transmission Disassemble for 6.0L Engines.

Clutch Vibration (RHD)

Clutch Vibration

Cause	Action
DEFINITION: Vibration from the clutch components during disengagement or engagement. Review the Symptoms - Clutch .	
Excessive driveline torsional activity	Review the Clutch Vibration
Clutch incorrectly installed	Remove the clutch and install it correctly. Refer to Clutch Assembly Replacement .
Clutch pilot bearing worn or damaged - 6.0L	1. Replace the clutch pilot bearing. Refer to Clutch Pilot Bearing Replacement for 6.0L engine. 2. Inspect the transmission input shaft pilot bearing journal for wear or damage. 3. Replace the transmission input shaft if the splines are excessively worn. Refer to Transmission Disassemble for Aisin AY6 or Transmission Disassemble for Tremec 6 speed.
Transmission input splines worn or damaged	1. Inspect the clutch driven plate to input splines for wear or damage. 2. Replace the transmission input shaft if the splines are excessively worn. Refer to Transmission Disassemble for Aisin AY6 or Transmission Disassemble for Tremec 6 speed.
Clutch driven plate facings damaged	Replace the clutch assembly. Refer to Clutch Assembly Replacement .
Flywheel housing to clutch housing excessively misaligned	Replace the faulty clutch housing or transmission front case. Refer to Transmission Disassemble for Aisin AY6 or Transmission Disassemble for Tremec 6 speed .
Clutch out of balance	Replace the clutch assembly. Clutch Assembly Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | Document ID: 1992630

Clutch Assembly Replacement (3.6L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling.

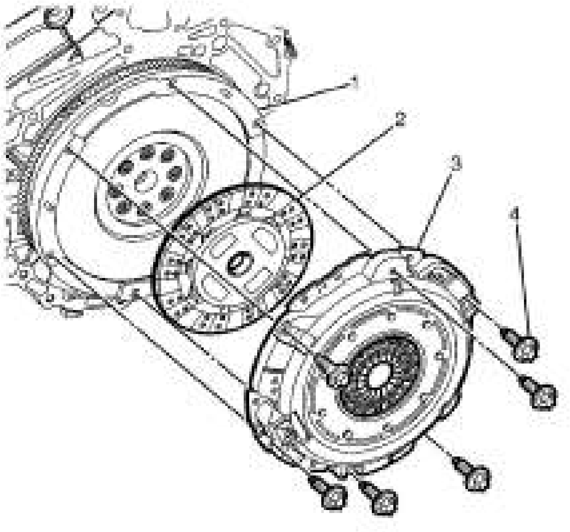
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

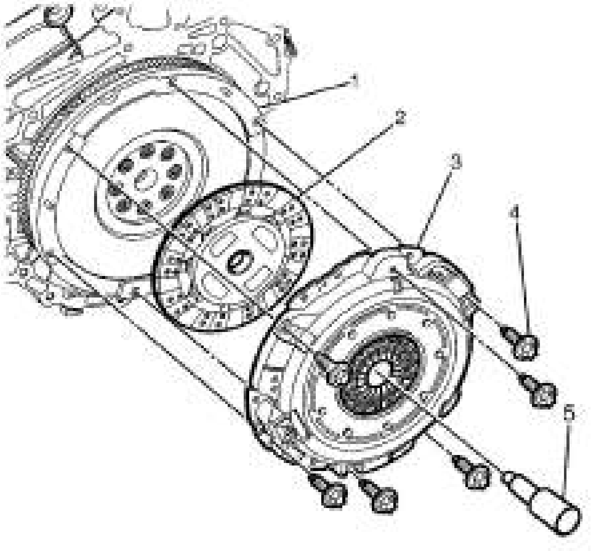
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove the transmission assembly. Refer to Transmission Replacement.



5. Mark the relationship of the pressure plate (3) to the flywheel (1) to maintain the correct balance condition on reassembly.
6. Loosen all pressure plate to flywheel retaining bolts (4) working from opposite sides to avoid distortion.
7. Continue loosening pressure plate to flywheel retaining bolts (4) from opposite sides until all are removed.
8. Remove the pressure plate (3) and clutch driven plate (2) from the flywheel (1).

Installation Procedure



Important: Do Not apply any lubricant to clutch driven plate splines if lubricant is applied premature failure could result.

Important: Install the clutch driven plate (2) with the short boss facing the flywheel (1). Flywheel side is stamped on the clutch driven plate hub (FW Side).

1. While holding the pressure plate (3), and clutch driven plate (2), together, align them to the flywheel (1).

   Important: The pressure plate to flywheel retaining bolts (4) must not to be fully tightened at this stage.

2. Install the pressure plate to flywheel retaining bolts (4).

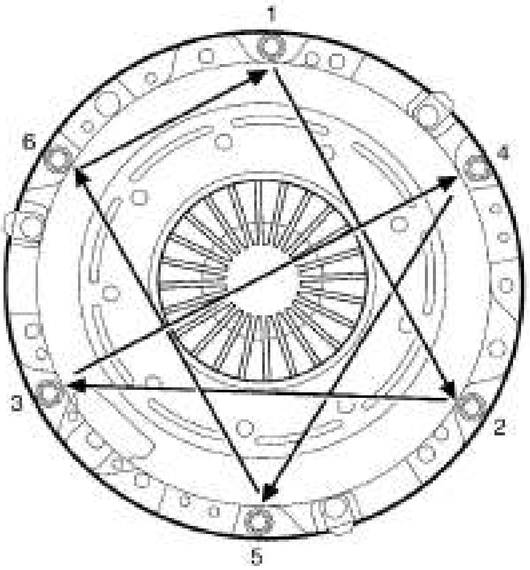
   Do Not tighten at this stage.

3. Using a universal clutch driven plate centering tool (5) align the clutch driven plate (2) to the flywheel (1).

   Notice: Refer to General Repair Instructions in the Preface section.

   Notice: Refer to General Repair Instructions in the Preface section.

   Notice: Refer to Fastener Notice in the Preface section.



4. Tighten the pressure plate to flywheel retaining bolts, using the sequence shown.
5. Tighten the flywheel.

   Tighten
   Tighten the bolts a first pass to 15 N·m (11 lb ft).

   Tighten
   Tighten the bolts a second pass to 30 N·m (22 lb ft).

6. Remove the clutch driven plate centering tool.

   Notice: Refer to General Repair Instructions in the Preface section.

7. Install the transmission assembly. Refer to Transmission Replacement.
8. Inspect lubricant level in transmission, adjust as necessary. Refer to General Specifications.
9. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
10. Connect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
11. Enable the SIR. Refer to SIR Disabling and Enabling.
12. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1992647**

Clutch Assembly Replacement (6.0L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.

   Caution: Refer to Battery Disconnect Caution in the Preface section.

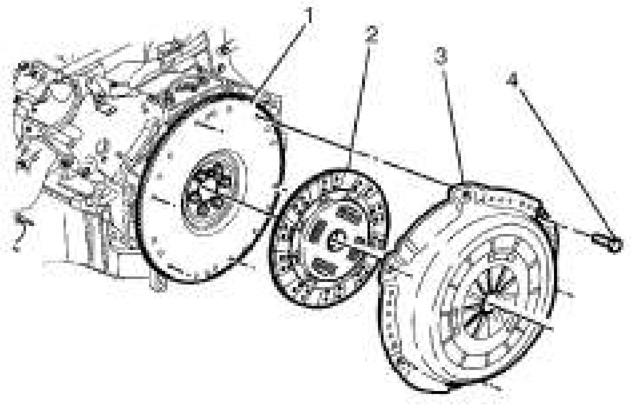
2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove transmission. Refer to Transmission Replacement.

   Notice: Refer to General Repair Instructions in the Preface section.

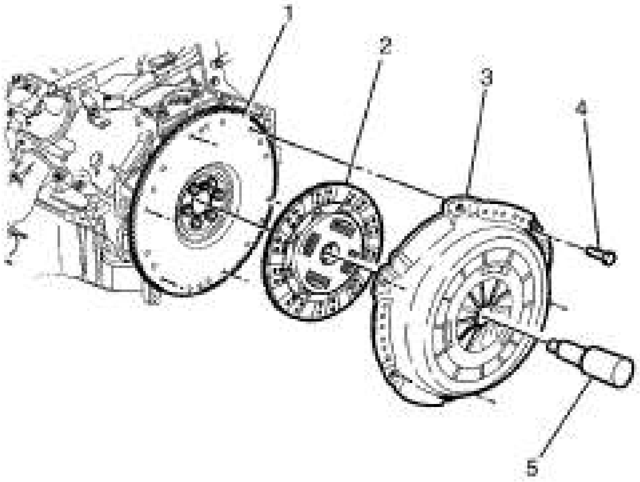


5. Loosen all of the pressure plate to flywheel retaining bolts (4) working from opposite sides to avoid distortion.
6. Continue loosening pressure plate to flywheel retaining bolts (4) from opposite sides until all are removed.
7. Remove the pressure plate (3) and clutch driven plate (2) from the flywheel (1).

Installation Procedure

Notice: Refer to General Repair Instructions in the Preface section.

Notice: Refer to Clutch Pressure Plate Adjustment in the Preface section.



Important: Apply any a small amount of grease to clutch driven plate splines or transmission input shaft splines.

Important: Install the clutch driven plate (2) with the short boss facing the flywheel (1). Flywheel side is stamped on the clutch driven plate hub (FW Side).

1. While holding the pressure plate (3), and clutch driven plate (2), together, align them to the flywheel (1).

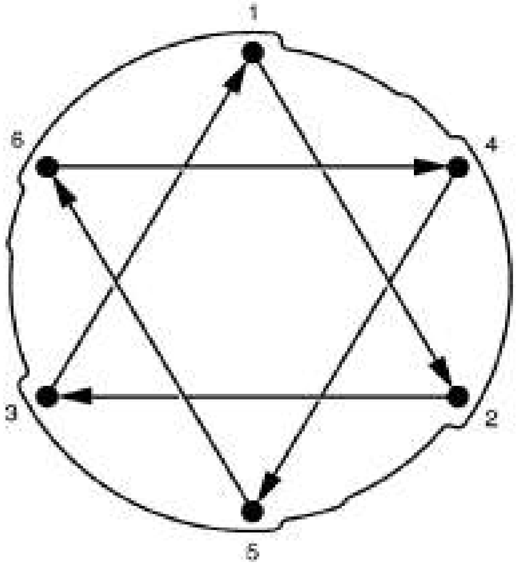
   Important: The pressure plate to flywheel retaining bolts (4) must not to be tightened at this stage.

2. Install the pressure plate to flywheel retaining bolts (4).

   Do not tighten at this stage.

3. Using a clutch driven plate centering tool (5) align the clutch driven plate (2) to the flywheel (1).
4. Install the pressure plate bolts (4), and insert the clutch centering tool (5).

   Notice: Refer to Fastener Notice in the Preface section.



5. Tighten the pressure plate to flywheel retaining bolts, using the sequence shown.
6. Tighten the flywheel.

   Tighten
   Tighten the bolts a first pass to 15 N·m (11 lb ft).

   Tighten
   Tighten the bolts a second pass to 35 N·m (26 lb ft).

   Tighten
   Tighten the bolts a third pass to 55 N·m (41 lb ft).

   Tighten
   Tighten the bolts a fourth pass to 70 N·m (52 lb ft).

   Notice: Refer to General Repair Instructions in the Preface section.

7. Install transmission. Refer to Transmission Replacement.
8. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
9. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
10. Enable the SIR. Refer to SIR Disabling and Enabling in SIR.
11. Press the clutch pedal several times to allow the self-adjusting pressure plate function to take affect.
12. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | Document ID: 1992714

Clutch Concentric Actuator Cylinder Replacement (3.6L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.

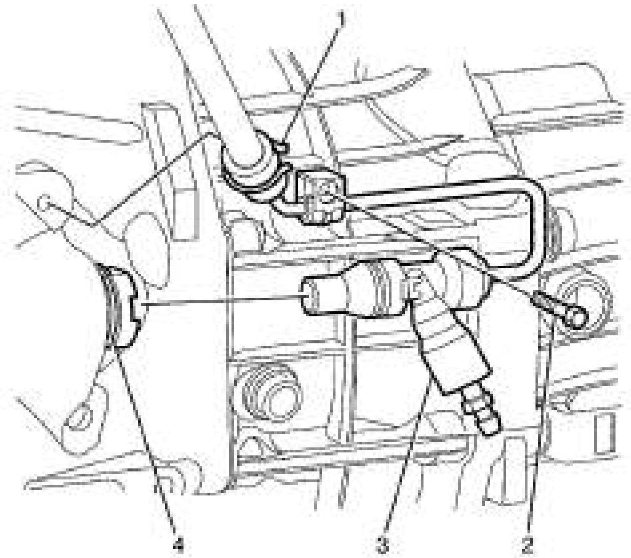
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

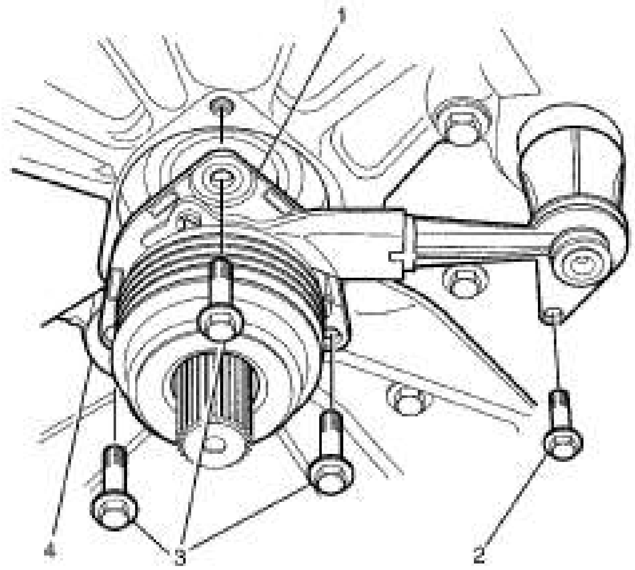
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove the transmission assembly. Refer to Transmission Replacement.



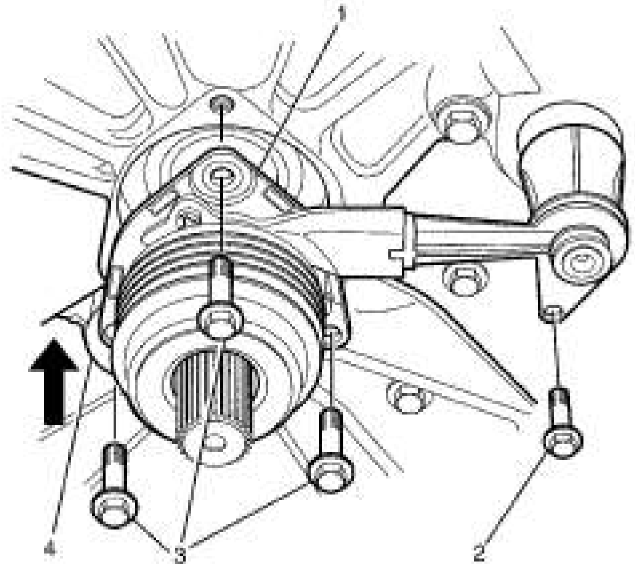
Important: If carrying out transmission removal procedure remove flexible clip (1) and leave assembly attach to transmission.

5. Detach the flexible hose securing clip (1).
6. Remove the concentric actuator cylinder feed pipe bracket to transmission retaining bolt (2).
7. Release the bleeder assembly securing clip (4), by using a suitable screwdriver and releasing it from the bleeder adapter.
8. Remove the bleeder assembly (3).



9. Remove the concentric actuator cylinder to transmission retaining bolts (3).
10. Remove the concentric actuator cylinder feed pipe to transmission retaining bolt (2).
11. Remove the concentric actuator cylinder (1) from the front of the transmission (4).

Installation Procedure



1. Install the concentric actuator cylinder (1) to the front of the transmission (4).

   Important: The concentric actuator cylinder feed pipe to transmission retaining bolt (2) must not to be fully tightened at this stage.

2. Install the concentric actuator cylinder feed pipe to transmission retaining bolt (2).

Do not fully tighten at this stage.

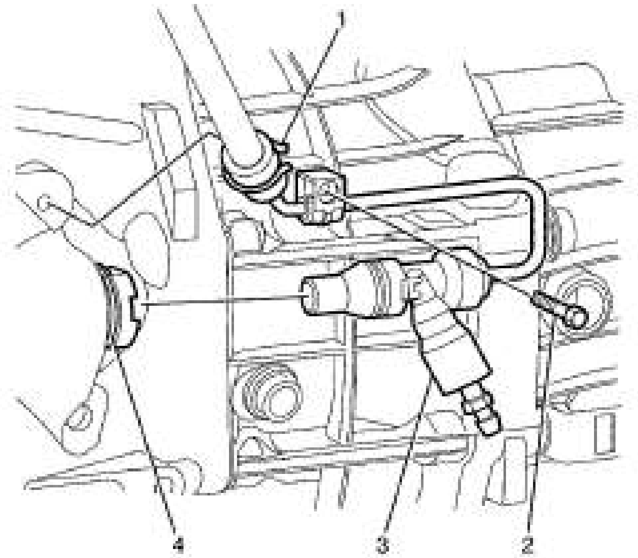
Notice: Refer to Fastener Notice in the Preface section.

3. Install the concentric actuator cylinder to transmission retaining bolts (3).

   Tighten
   Tighten the bolts 16 N·m (12 lb ft).

4. Tighten the concentric actuator cylinder feed pipe to transmission retaining bolt (2).

   Tighten
   Tighten the bolt to 8 N·m (71 lb in).



5. Install the bleeder assembly (3).
6. Install the bleeder assembly securing clip (4).
7. Install the concentric actuator cylinder feed pipe bracket to transmission retaining bolt (2).

   Tighten
   Tighten the bolt to 8 N·m (71 lb in).

8. Install the flexible hose securing clip, listen for an audible click to confirm fitting.
9. Install the transmission assembly. Refer to Transmission Replacement.
10. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
11. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
12. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
13. Road test vehicle for correct clutch and transmission operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | Document ID: 1992719

Clutch Concentric Actuator Cylinder Replacement (6.0L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling .

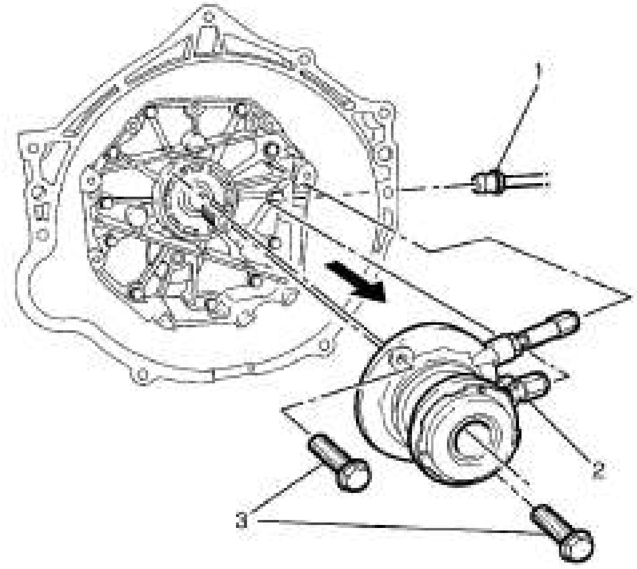
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to Safety Glasses Caution in the Preface section.

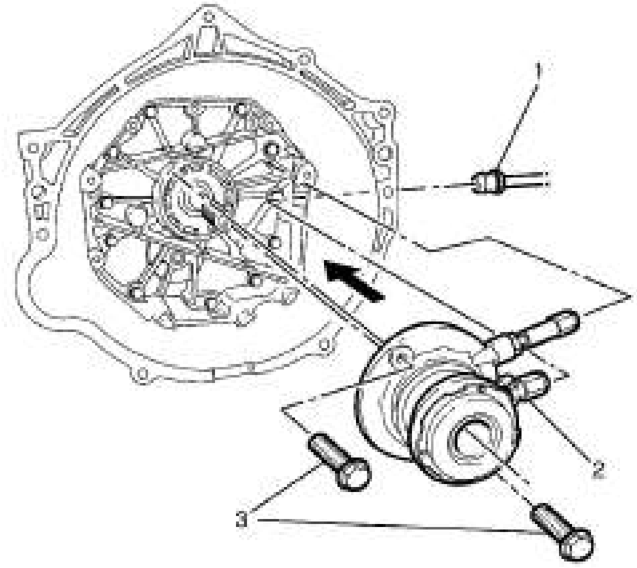
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove transmission. Refer to Transmission Replacement .



5. Disconnect the concentric actuator cylinder feed pipe (1) from the concentric actuator cylinder (2) by using a suitable screwdriver to remove the wire clip, take care not to loose clip when removed.
6. Remove the concentric actuator cylinder to transmission retaining bolts (3).
7. Remove the concentric actuator cylinder (2) from the front of the transmission.

Installation Procedure



1. Install the concentric actuator cylinder (2) to the front of the transmission.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the concentric actuator cylinder to transmission retaining bolts (3).

   Tighten
   Tighten the bolts to 10 N·m (89 lb in).

   Notice: Refer to General Repair Instructions in the Preface section.

3. Install the concentric actuator cylinder feed pipe (1) to the concentric actuator cylinder (2).
4. Install transmission. Refer to Transmission Replacement .
5. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding .
6. Enable the SIR system. Refer to SIR Disabling and Enabling .
7. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
8. Road test vehicle for correct clutch and transmission operation.

Clutch Master Cylinder Fluid Replacement (3.6L Engine)

Tools Required

Customer Concern Verification Sheets AU529 Hydraulic Pressure Bleeder.

Caution: Refer to Safety Glasses Caution in the Preface section.

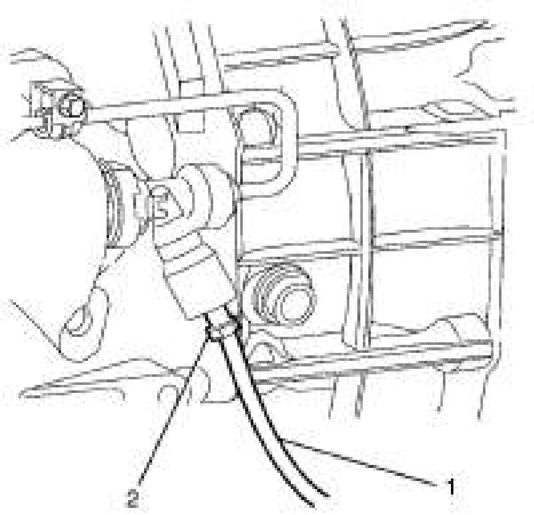
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle.

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Notice: DO NOT use fluid which has been bled from a hydraulic clutch system, in order to fill the clutch master cylinder reservoir, due to the possibility that the fluid may be aerated, have too much moisture content, or be contaminated and may cause system or vehicle damage.



2. Install the hydraulic pressure bleeder to the bleed nipple (2).

Loosen the bleeder assembly bleed nipple (2).

Use the hydraulic pressure bleeder (1) to force air from the hydraulic system.

Allow fluid flow through the system until fluid runs clearly, immersed into a clean container.

Make sure the correct fluid level is maintained.

Notice: Refer to Fastener Notice in the Preface section.

3. Tighten the bleeder assembly bleed nipple (2).

   Tighten
   Tighten the bleed nipple to 18 N·m 13 lb ft).

4. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1997014**

Clutch Master Cylinder Fluid Replacement (6.0L Engine)

Tools Required

Customer Concern Verification Sheets AU529

Caution: Refer to Safety Glasses Caution in the Preface section.

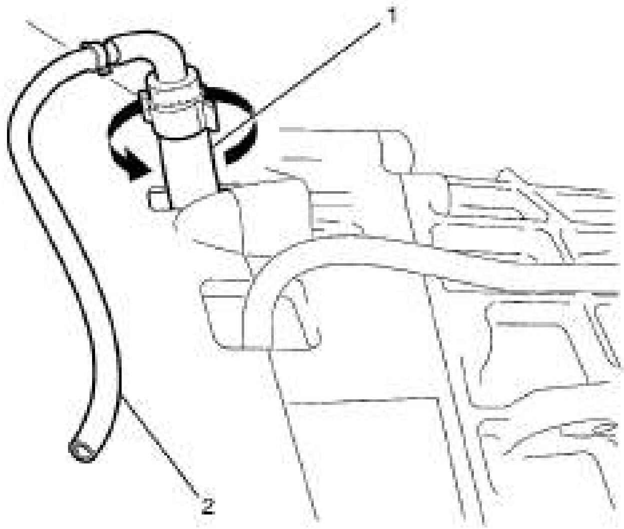
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle .

Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

Notice: DO NOT use fluid which has been bled from a hydraulic clutch system, in order to fill the clutch master cylinder reservoir, due to the possibility that the fluid may be aerated, have too much moisture content, or be contaminated and may cause system or vehicle damage.



2. Install the bleeder to the concentric actuator cylinder bleeder screw (1).
   2.1. Loosen the concentric actuator cylinder bleeder screw (1).
   2.2. Use the bleeder (2) to force air from the hydraulic system.
   2.3. Allow fluid flow through the system until fluid runs clearly, immersed into a clean container.
   2.4. Make sure the correct fluid level is maintained.

Notice: Refer to Fastener Notice in the Preface section.

2.5. Tighten the concentric actuator cylinder bleed screw (1).

Tighten
Tighten the bleed screw to 18 N·m 13 lb ft).

3. Lower the vehicle.
4. Make sure fluid level is correct.
5. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | Document ID: 1974899

Clutch Master Cylinder Replacement (RHD)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling.

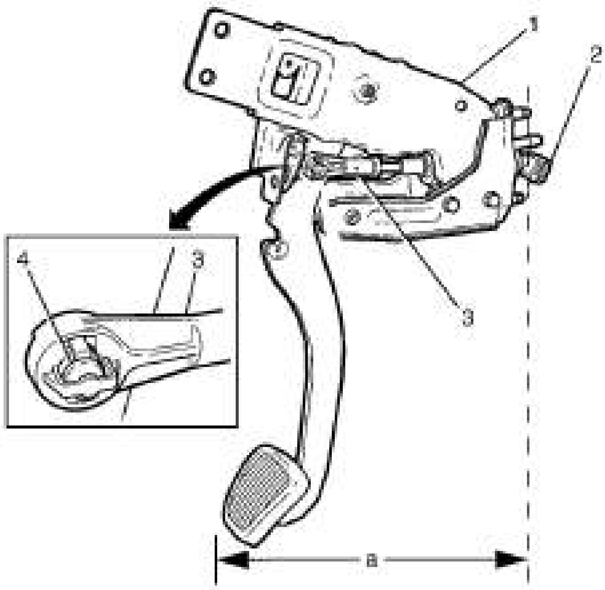
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.
3. Remove the clutch pedal assembly. Refer to Clutch Pedal Replacement.
4. Place the clutch pedal on a suitable work surface.

   Important: Note the position of the clutch over centre spring (4).

5. Remove the clutch over centre spring (4).
6. Use a suitable screwdriver to pry off the push rod connector (1).
7. Disconnect the push rod connector (1) from the clutch pedal.
8. Remove the clutch master cylinder to clutch pedal retaining bolts (3).
9. Remove the clutch master cylinder (2).

Installation Procedure



1. Install the clutch master cylinder (2) to the pedal assembly (1).

   Important: The clutch master cylinder to clutch pedal retaining bolts (1) must not to be fully tightened at this stage.

2. Install the clutch master cylinder to clutch pedal retaining bolts (1).

   Do not fully tighten at this stage.

3. Connect the push rod connector (3) to the clutch pedal pin (4).
4. Remove the clutch position switch. Refer to Clutch Pedal Position Switch Replacement.

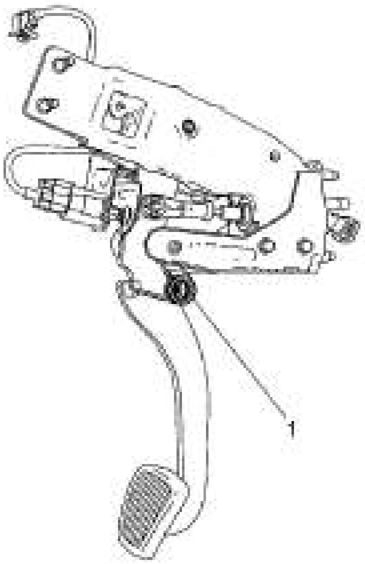
   Important: Measure from pedal pad bottom edge when at the top of travel to mod plate surface plane.

5. With an assistant raise clutch pedal to a height of 224 mm (a) to achieve the correct pedal height.

   Notice: Refer to Fastener Notice in the Preface section.

6. Tighten the clutch master cylinder to clutch pedal retaining bolts (1).

   Tighten
   Tighten the bolts to 12 N·m (106 lb in).



Important: Pushing the pedal to the bottom of travel will assist with the clutch over centre spring (1) installation.

Important: Make sure that the clutch over centre spring (1) is installed in its original position.

7. Install the clutch over centre spring (1).
8. Install the clutch position switch. Refer to Clutch Pedal Position Switch Replacement.
9. Install the clutch pedal assembly. Refer to Clutch Pedal Replacement.
10. Reconnect the clutch patch harness to the cockpit harness.
11. Enable the SIR system. Refer to SIR Disabling and Enabling.
12. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
13. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1974799**

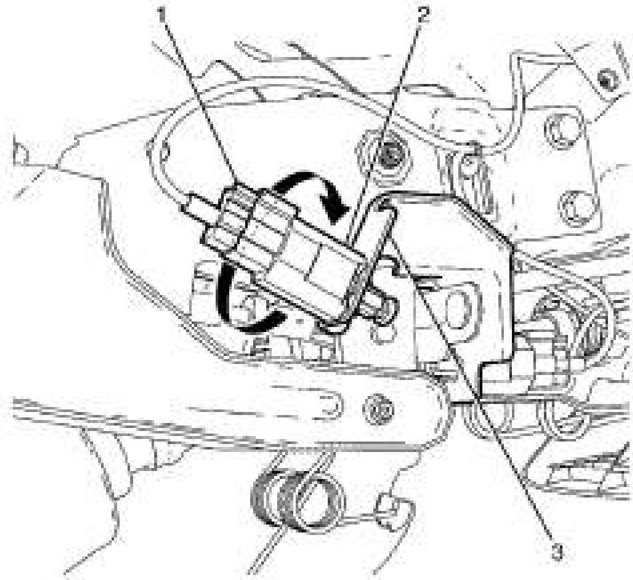
Clutch Pedal Engine Start Switch Replacement

Removal Procedure - Up to 17 Sept 2007

1. Disable the SIR system. Refer to SIR Disabling and Enabling .

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
4. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .

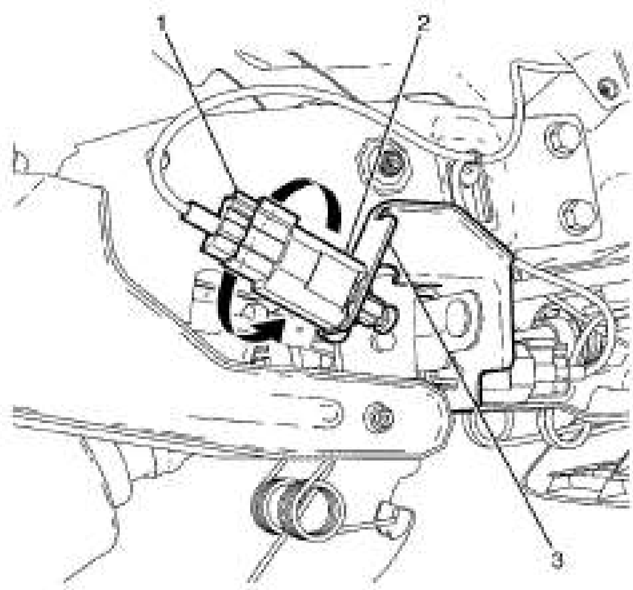


5. Disconnect the clutch pedal engine start switch electrical connector (1).

   Important: Rotate the clutch pedal engine start switch (2) clockwise a 1/4 turn, then pull to release from the clutch bracket (3).

6. Remove the clutch pedal engine start switch (2).

Installation Procedure - Up to 17 Sept 2007



Important: Rotate the clutch pedal engine start switch (2) a 1/4 of a turn anti-clockwise to lock it into the clutch bracket (3).

1. Install the clutch pedal engine start switch (2).
2. Connect the clutch pedal engine start switch electrical connector (1).
3. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
4. Install the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
5. Enable the SIR. Refer to SIR Disabling and Enabling .
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. Road test vehicle for correct clutch operation.

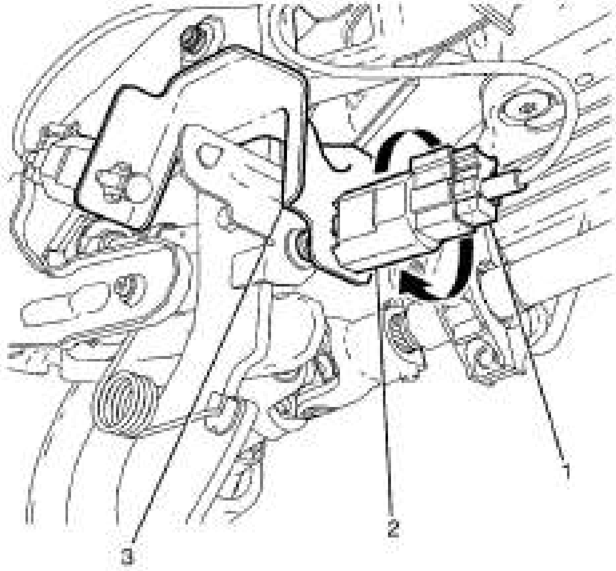
Clutch Pedal Position Switch Replacement

Removal Procedure - Up to 17 Sept 2007

1. Disable the SIR system. Refer to SIR Disabling and Enabling .

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
3. Remove the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
4. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .

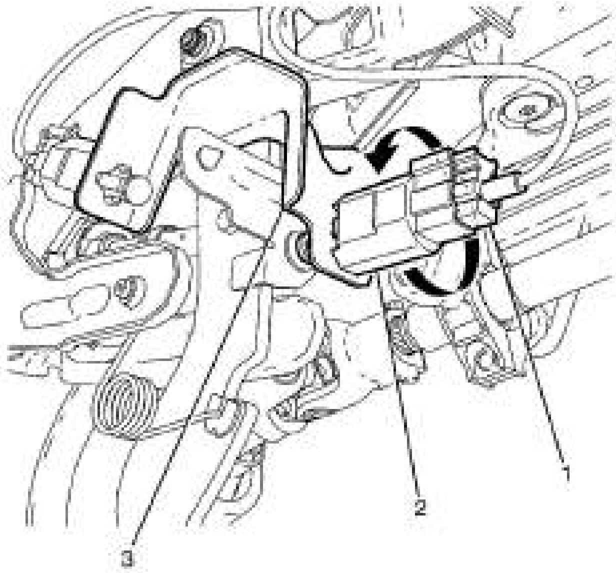


5. Disconnect the clutch position switch electrical connector (1).

   Important: Rotate the clutch position switch (2) clockwise a 1/4 turn, then pull to release from the clutch bracket (3).

6. Remove the clutch position switch (2).

Installation Procedure - Up to 17 Sept 2007



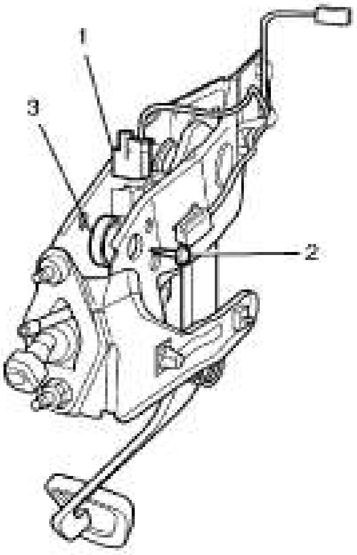
Important: Rotate the clutch position switch (2) a 1/4 of a turn anti-clockwise to lock it into the clutch bracket (3).

1. Install the clutch position switch (2).
2. Connect the clutch position switch electrical connector (1).
3. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
4. Install the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
5. Enable the SIR. Refer to SIR Disabling and Enabling .
6. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
7. Road test vehicle for correct clutch operation.

Removal Procedure - From 17 Sept 2007

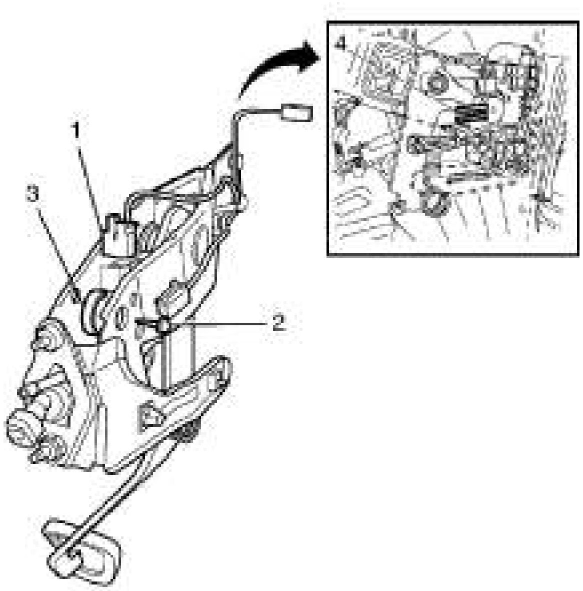
Caution: Refer to Battery Disconnect Caution in the Preface section.

1. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .
2. Disable the SIR system. Refer to SIR Disabling and Enabling .
3. Remove the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
4. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
5. Remove the clutch pedal assembly. Refer to Clutch Pedal Replacement .



6. Disconnect the clutch pedal position sensor electrical connector (1).
7. Remove the clutch pedal assembly to clutch pedal position sensor retaining bolt (2).
8. Remove the clutch pedal position sensor (3).

Installation Procedure - From 17 Sept 2007



Important: Clutch pedal pin is located between the clutch pedal position sensor (3).

1. Install the clutch pedal position sensor (3).
2. Install the clutch pedal assembly to clutch pedal position sensor retaining bolt (2).

Tighten

Tighten the bolt to 13 N·m (115 lb in).

3. Connect the clutch pedal position sensor electrical connector (1).
4. Install the clutch pedal assembly. Refer to Clutch Pedal Replacement .
5. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
6. Install the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
7. Enable the SIR. Refer to SIR Disabling and Enabling .
8. Connect the negative battery cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
9. Road test vehicle for correct operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1974771**

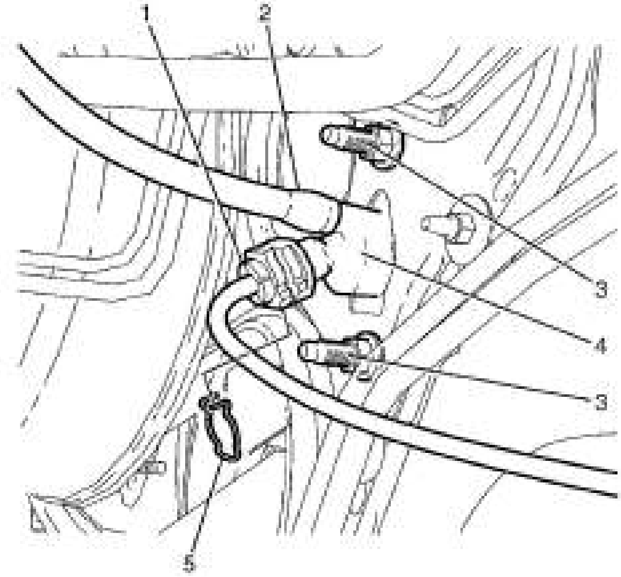
Clutch Pedal Replacement (RHD)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling .

   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

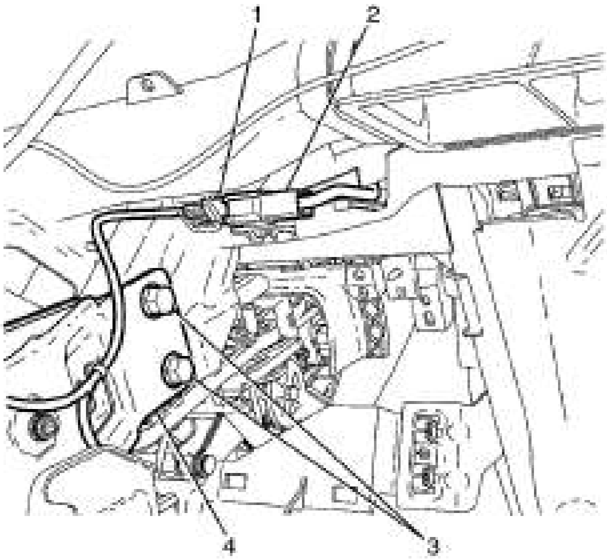


Important: Do not fully remove the hydraulic clutch hose/pipe retaining clip (5) from the clutch master cylinder (4).

3. Release the hydraulic clutch hose/pipe retaining clip (5) from the clutch master cylinder (4).
4. Disconnect the hydraulic clutch hose/pipe (1) from the clutch master cylinder (4).

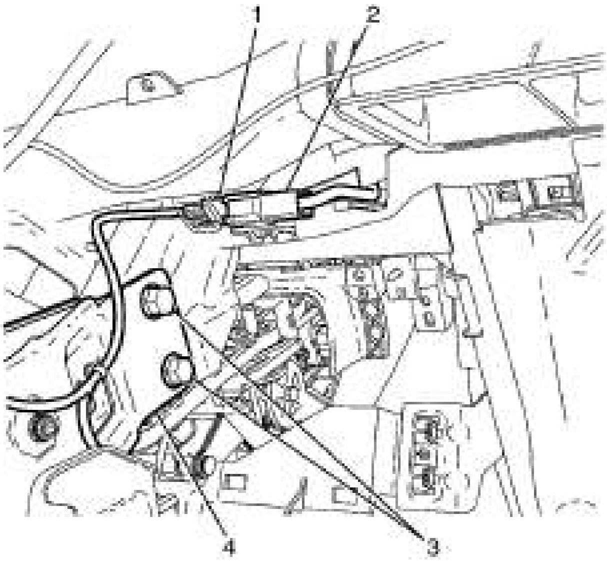
   Important: Ensure the rubber seal is attached to the reservoir (not on the master cylinder).

5. Pull the clutch master cylinder reservoir hose (2) from the clutch master cylinder (4).
6. Remove the clutch pedal to mod plate retaining nuts (3).
7. Remove the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .
8. Remove the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .



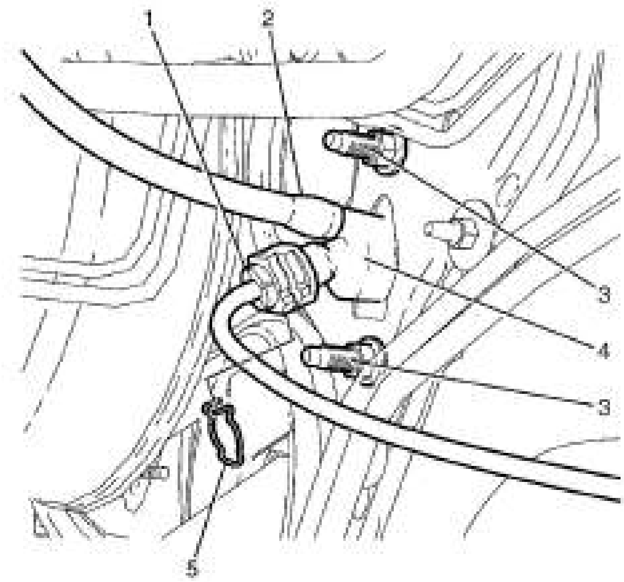
9. Disconnect the clutch pedal wiring harness (1) from the cockpit wiring harness (2).
10. Remove the clutch pedal to instrument panel crossmember retaining bolts (3).
11. Lower and remove the clutch pedal assembly (4).

Installation Procedure



1. Install the clutch pedal assembly (4) to the vehicle.

   Notice: Refer to Fastener Notice in the Preface section.



2. Install the clutch pedal to mod plate retaining nuts (3).

   Tighten
   Tighten the nut to 22 N·m (16 lb ft).

   Important: Listen for an audible click to confirm fitting.

3. Push fit the hydraulic clutch hose/pipe (1) to the clutch master cylinder (4).
4. Connect the clutch pedal wiring harness (1) to the cockpit wiring harness (2).
5. Install the instrument panel lower trim panel retainer. Refer to Instrument Panel Retainer Replacement .
6. Install the instrument panel lower trim panel assembly. Refer to Instrument Panel Insulator Panel Replacement - Right Side .

   Notice: Refer to Fastener Notice in the Preface section.

7. Install the clutch pedal to instrument panel crossmember upper retaining bolts (3).

   Tighten
   Tighten the nut to 22 N·m (16 lb ft).

8. Connect the clutch master cylinder reservoir hose (2), by firmly pushing it on to the clutch master cylinder (4).
9. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding .
10. Enable the SIR system. Refer to SIR Disabling and Enabling .
11. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
12. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | Document ID: 1992741

Clutch Pilot Bearing Replacement

Tools Required

- J 23907 Clutch Pilot Bearing Remover
- J 38836 Pilot Bushing Installer/Clutch

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling .

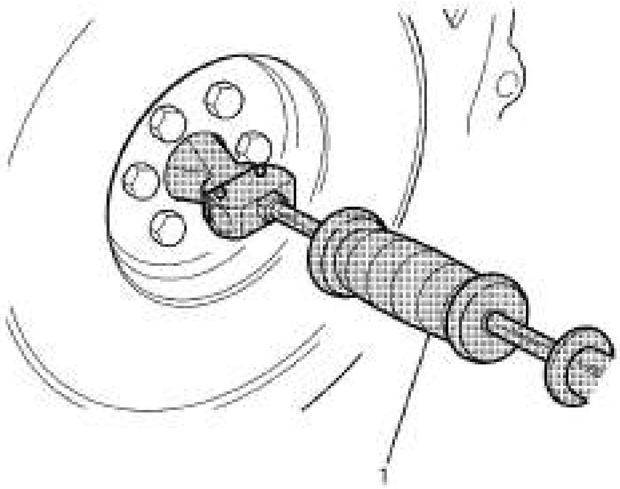
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection .

   Caution: Refer to Safety Glasses Caution in the Preface section.

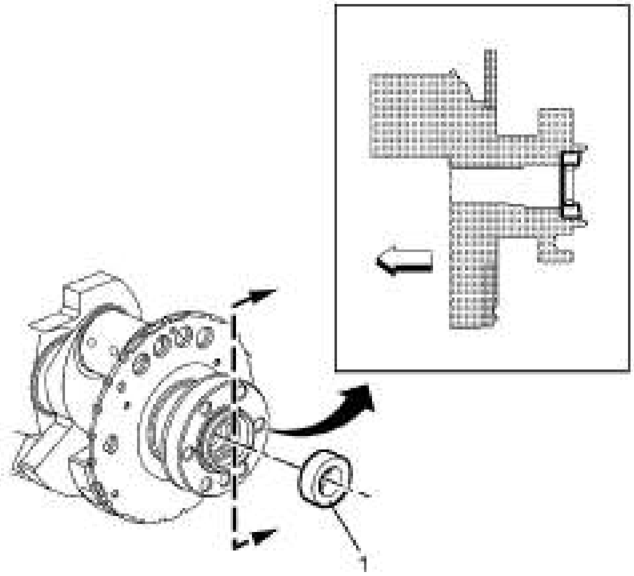
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Remove the transmission assembly. Refer to Transmission Replacement .
5. Remove the clutch assembly. Refer to Clutch Assembly Replacement .



6. Remove the clutch pilot bearing, using the clutch pilot bearing remover (1).

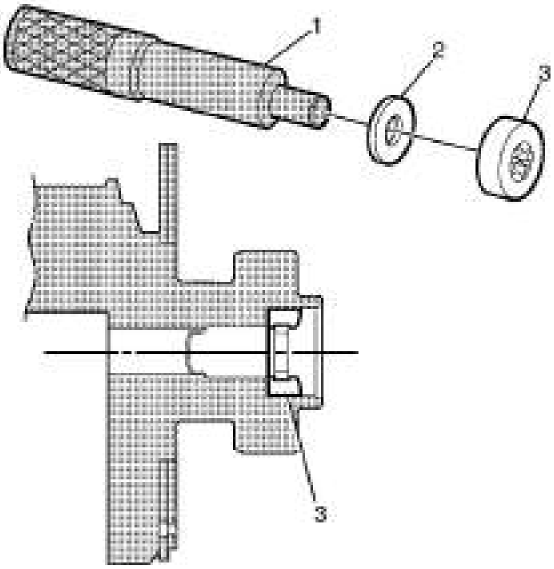
Installation Procedure



Important: Make sure that the crankshaft rear oil gallery plug (1) is not a loose fit, damaged or leaking.

Important: The correct depth (a) for the oil gallery plug is 31.2 to 31.6 mm.

1. Apply sealant LOCTITE R 242 and install it to the correct depth, If replacing the oil gallery plug (1).



Important: Use a 5/8 inch flat washer (2) against the tool to support the bearing races.

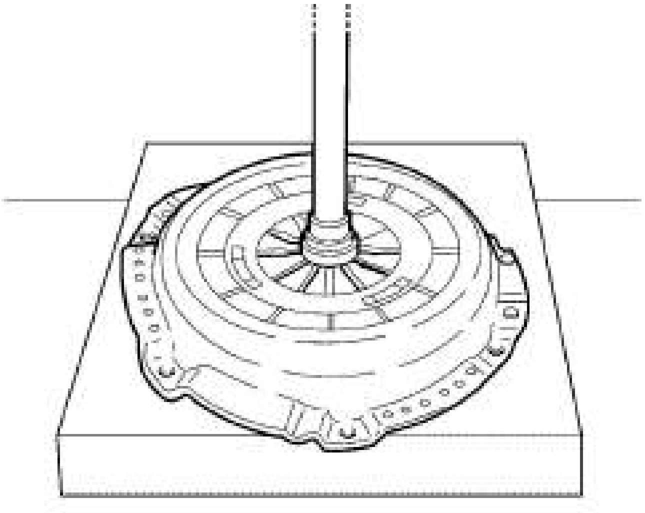
Important: When installed correctly the bearing should be flush with the crankshaft counter-bore.

2. Install the clutch pilot bearing (3) to the rear of the crankshaft, using pilot bushing installer (1).
3. Install the clutch assembly. Refer to Clutch Assembly Replacement .
4. Install the transmission assembly. Refer to Transmission Replacement .
5. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding .
6. Enable the SIR. Refer to SIR Disabling and Enabling in SIR.
7. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection .
8. Road test vehicle for correct operation.

Clutch Pressure Plate Adjustment (6.0L Engine)

Adjustment Procedure

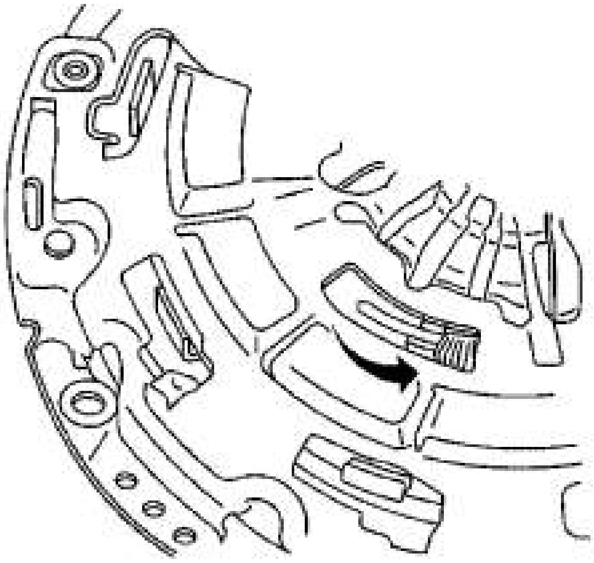
Important: Before installing the pressure plate, the self adjusting feature must be pre-set.



1. Place the flat side of the clutch driven plate downwards on the flat press plates, then place the pressure plate assembly over it.

   Notice: Refer to General Repair Instructions in the Preface section.

2. Using a hydraulic press, compress the pressure plate diaphragm spring until tension is release from the clutch driven plate.
3. Hold using a suitable tool against the step adjusting ring tension spring stop in front of the adjusting ring tension spring.



Important: Do not force the adjustment ring as damage to the pressure plate may occur.

Important: Minimal effort is required to rotate the adjustment ring.

4. Using a suitable tool, rotate the stepped adjusting ring counterclockwise, compressing the tension springs, until the adjusting ring steps are fully adjusted out, then continue to hold in position.
5. Release the press pressure from the pressure plate diaphragm spring fingers.
6. Release the adjusting ring tension spring stops.
7. Remove the pressure plate from the press.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1990916**

Clutch Release Bearing Replacement (3.6L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.

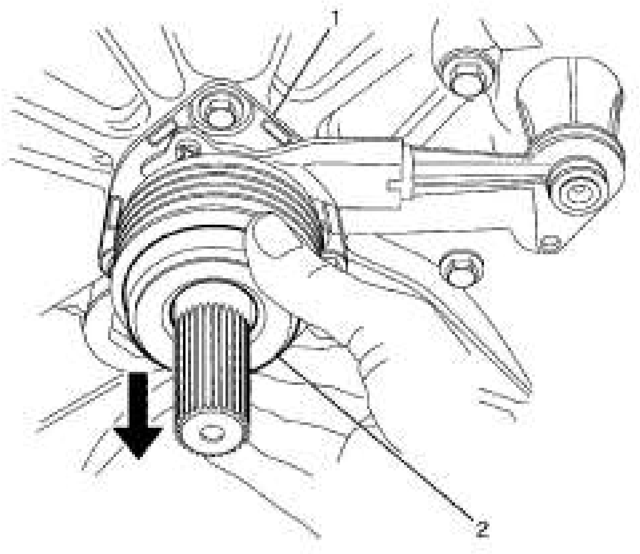
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

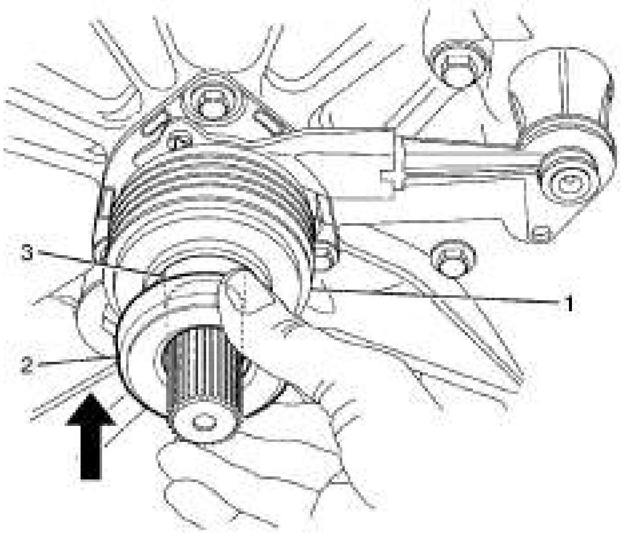
   Caution: Refer to Vehicle Lifting Caution in the Preface section.

3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove the transmission assembly. Refer to Transmission Replacement.



5. Pull on the release bearing (2), to release it from the concentric actuator cylinder (1).
6. Remove the release bearing (2) from the concentric actuator cylinder (1).

Installation Procedure



1. Clean the exposed section of the concentric actuator cylinder guide sleeve (3).
2. Lubricate the concentric actuator cylinder guide sleeve (3).

   Important: Push the release bearing (2), over the concentric actuator cylinder guide sleeve (3) until it is fully installed.

3. Install the release bearing (2) to the concentric actuator cylinder (1).
4. Install the transmission assembly. Refer to Transmission Replacement.
5. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
6. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
7. Connect the battery ground cable to the battery. Refer to Battery Negative Cable Disconnection and Connection.
8. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1990918**

Clutch Release Bearing Replacement (6.0L Engine)

Removal Procedure

1. Disable the SIR system. Refer to SIR Disabling and Enabling in SIR.

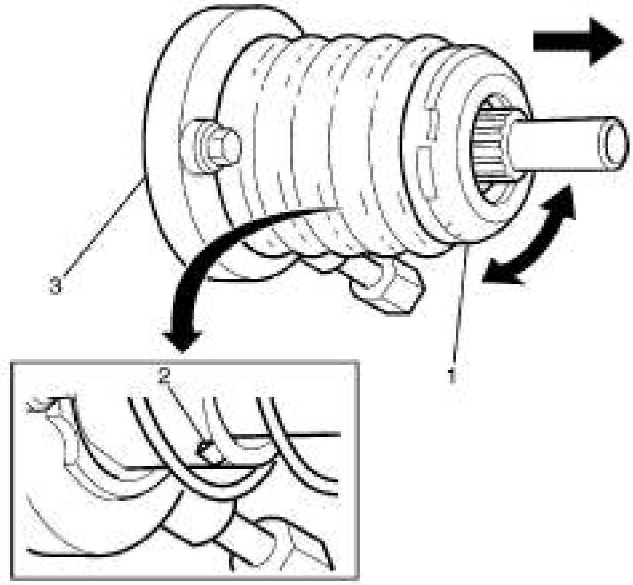
   Caution: Refer to Battery Disconnect Caution in the Preface section.

2. Disconnect the battery ground cable from the battery. Refer to Battery Negative Cable Disconnection and Connection.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

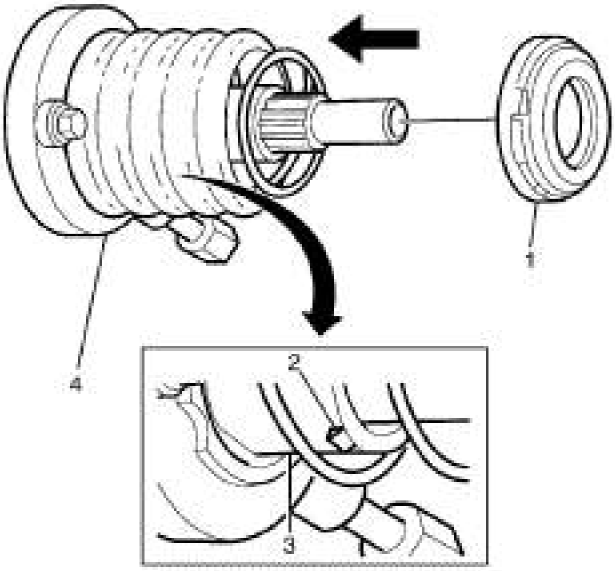
3. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
4. Remove transmission. Refer to Transmission Replacement.



Important: Twist and pull the release bearing (1) to release it from the concentric actuator cylinder (3) to throw-out bearing locking tab (2).

5. Remove the release bearing (1) from the concentric actuator cylinder (3).

Installation Procedure

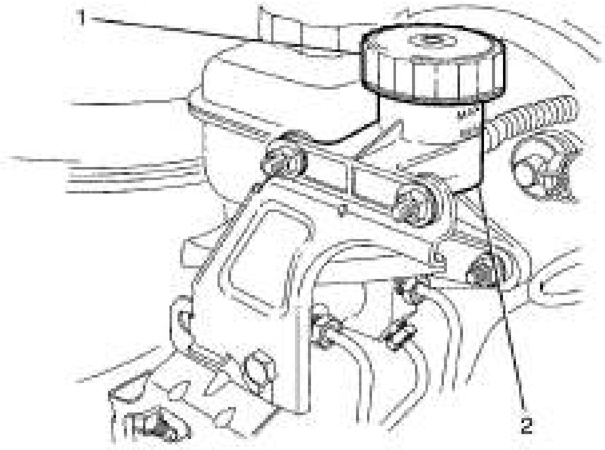


1. Clean the exposed section of the concentric actuator cylinder (4) guide sleeve (3).
2. Lubricate the concentric actuator cylinder guide sleeve (3).

   Important: The release bearing (2) must lock into the concentric actuator cylinder to throw-out bearing locking tab (2).

3. Install the release bearing (1) to the concentric actuator cylinder guide sleeve (3).
4. Install transmission. Refer to Transmission Replacement.
5. Bleed the clutch hydraulic system. Refer to Hydraulic Clutch Bleeding.
6. Enable the SIR system. Refer to SIR Disabling and Enabling in SIR.
7. Road test vehicle for correct clutch operation.

Hydraulic Clutch Bleeding (3.6L Engine)



1. Clean any dirt from around the clutch fluid reservoir cap (1).

   Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

   Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

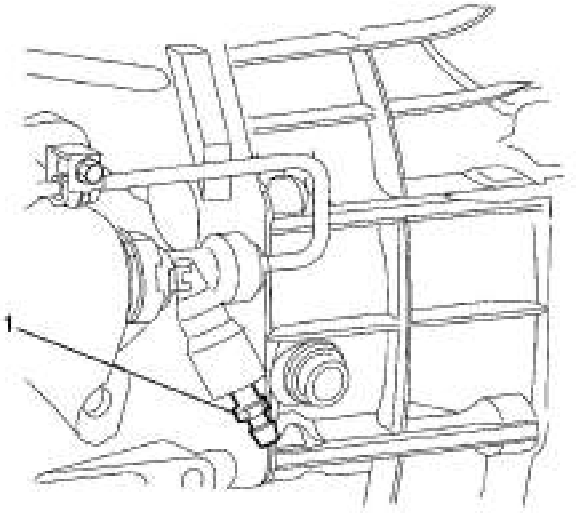
   Notice: DO NOT use fluid which has been bled from a hydraulic clutch system, in order to fill the clutch master cylinder reservoir, due to the possibility that the fluid may be aerated, have too much moisture content, or be contaminated and may cause system or vehicle damage.

2. Remove the clutch fluid reservoir cap (1) and ensure the clutch fluid reservoir (2) is filled to the fill line with new hydraulic fluid. Add fluid if required from a clean sealed container. For clutch fluid specifications, refer to General Specifications.
3. Stroke the clutch pedal from the up stop to the down stop position at least 15 times slowly to avoid aeration of fluid.

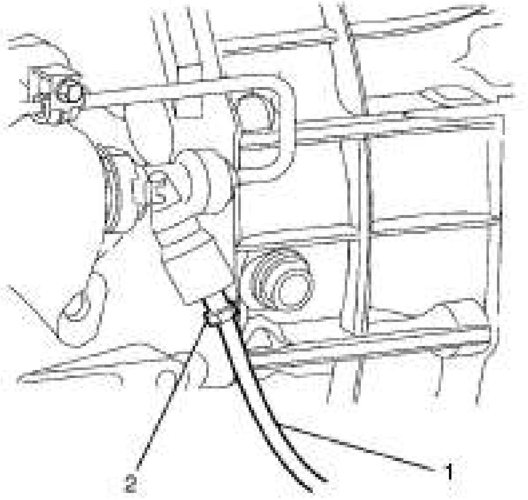
   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support vehicle. Refer to Lifting and Jacking the Vehicle.



5. Loosen the bleeder assembly bleed nipple (1).
6. Tighten the bleeder assembly bleed nipple (1), using only light finger force.



7. Connect one end of a rubber tube (1) to the bleeder assembly bleed nipple (2).

   Important: Make sure that the end of the rubber tube (1) always stays submerged in a suitable container.

8. Insert the other end of the rubber tube (1) into a clean container filled with clean brake fluid.

   Important: Do not pump the clutch pedal repeatedly as entrapped air will cause fluid to foam.

9. Using an assistant, slowly depress the clutch pedal to the down stop position.

10. Open the bleeder assembly bleed nipple (2) 1/4 turn to release trapped air.
11. Close the bleeder assembly bleed nipple (2) and slowly return the clutch pedal to the up stop position.
12. Open the bleeder assembly bleed nipple (2) and slowly depress the clutch pedal from the up stop to the down stop position until fluid escapes through the bleeder assembly.
13. Close the bleeder assembly bleed nipple (2).
14. Return the clutch pedal to the up stop position.
15. Depress the clutch pedal from the up stop to the down stop position.
16. Open the bleeder assembly bleed nipple (2) and allow fluid with air bubbles to escape through the bleeder assembly.
17. Close the bleeder assembly bleed nipple (2).

    Important: Always make sure that the clutch fluid reservoir remains filled with new clean hydraulic fluid.

18. Repeat steps 14-17 until fluid without air bubbles escapes through the bleeder assembly (1).

    Notice: Refer to Fastener Notice in the Preface section.

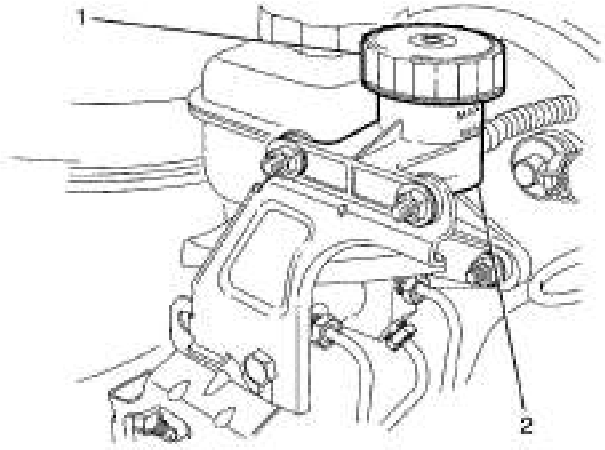
19. Tighten the bleeder assembly bleed nipple (3), with the clutch pedal still depressed.

    Tighten
    Tighten the bleed nipple to 18 N·m (13 lb ft).

20. Lower the vehicle.
21. Make sure fluid level is correct.
22. Road test vehicle for correct clutch operation.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Clutch | Repair Instructions | **Document ID: 1974795**

Hydraulic Clutch Bleeding (6.0L Engine)



1. Clean any dirt from around the clutch fluid reservoir cap (1).

   Caution: Refer to Brake Fluid Irritant Caution in the Preface section.

   Notice: Refer to Brake Fluid Effects on Paint and Electrical Components Notice in the Preface section.

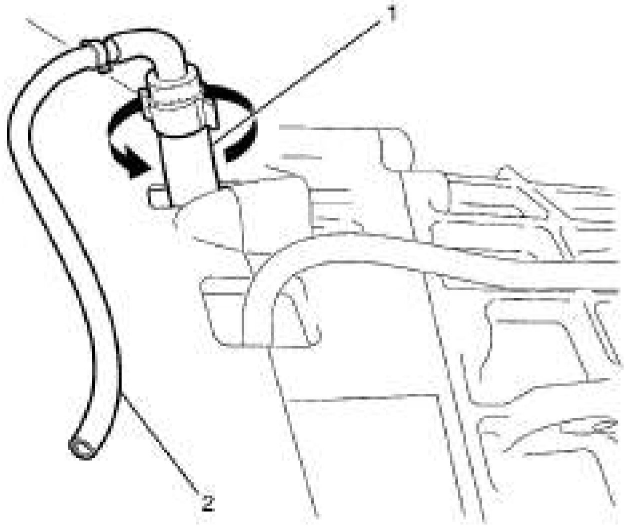
   Notice: DO NOT use fluid which has been bled from a hydraulic clutch system, in order to fill the clutch master cylinder reservoir, due to the possibility that the fluid may be aerated, have too much moisture content, or be contaminated and may cause system or vehicle damage.

2. Remove the clutch fluid reservoir cap (1) and ensure the clutch fluid reservoir (2) is filled to the fill line with new hydraulic fluid. Add fluid if required from a clean sealed container. For clutch fluid specifications, refer to General Specifications.
3. Stroke the clutch pedal from the up stop to the down stop position at least 15 times slowly to avoid aeration of fluid.

   Caution: Refer to Safety Glasses Caution in the Preface section.

   Caution: Refer to Vehicle Lifting Caution in the Preface section.

4. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



5. Loosen the concentric actuator cylinder bleeder screw (1).
6. Connect one end of a rubber tube (2) to the concentric actuator cylinder bleed screw (1).

    Important: Make sure that the end of the rubber tube (2) always stays submerged in a suitable container.

7. Insert the other end of the rubber tube (2) into a clean container filled with clean brake fluid.

    Important: Do not pump the clutch pedal repeatedly as entrapped air will cause fluid to foam.

8. Using an assistant, slowly depress the clutch pedal to the down stop position.
9. Open the concentric actuator cylinder bleed screw (1) 1/4 turn to release trapped air.
10. Close the concentric actuator cylinder bleed screw (1) and slowly return the clutch pedal to the up stop position.
11. Open the concentric actuator cylinder bleed screw (1) and slowly depress the clutch pedal from the up stop to the down stop position until fluid escapes through the bleeder assembly (1).
12. Close the concentric actuator cylinder bleed screw (1).
13. Return the clutch pedal to the up stop position.
14. Depress the clutch pedal from the up stop to the down stop position.
15. Open the concentric actuator cylinder bleed screw (1) and allow fluid with air bubbles to escape.
16. Close the concentric actuator cylinder bleed screw (1).

    Important: Always make sure that the clutch fluid reservoir remains filled with new clean hydraulic fluid.

17. Repeat steps 14-17 until fluid without air bubbles escapes into the container.

    Notice: Refer to Fastener Notice in the Preface section.

18. Tighten the concentric actuator cylinder bleed screw (1), with the clutch pedal still depressed.

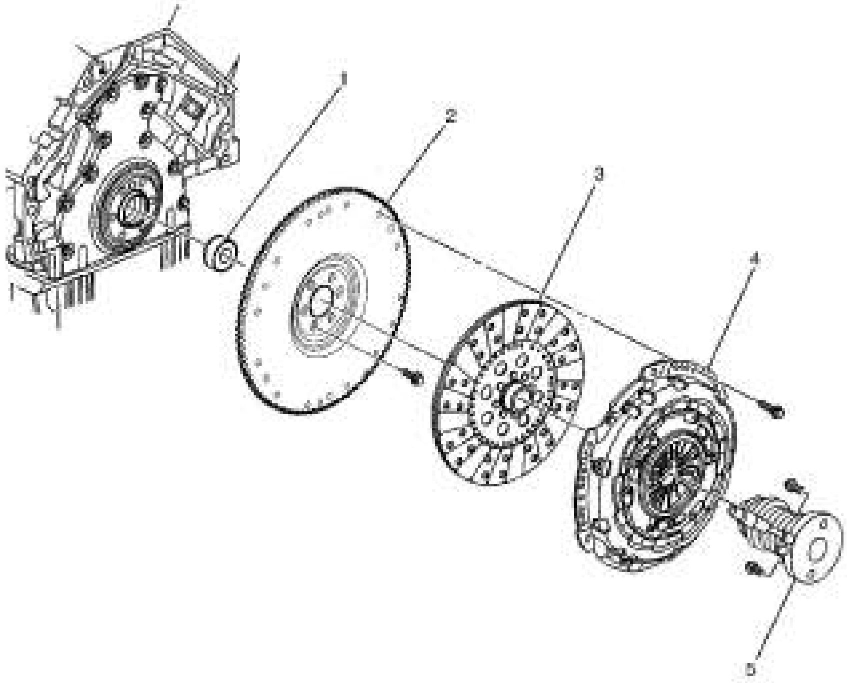
Tighten
Tighten the bleeder screw to 18 N·m (13 lb ft).

19. Lower the vehicle to the ground.
20. Make sure fluid level is correct.
21. Road test vehicle for correct clutch operation.

Clutch System Description and Operation (SWBRHD)

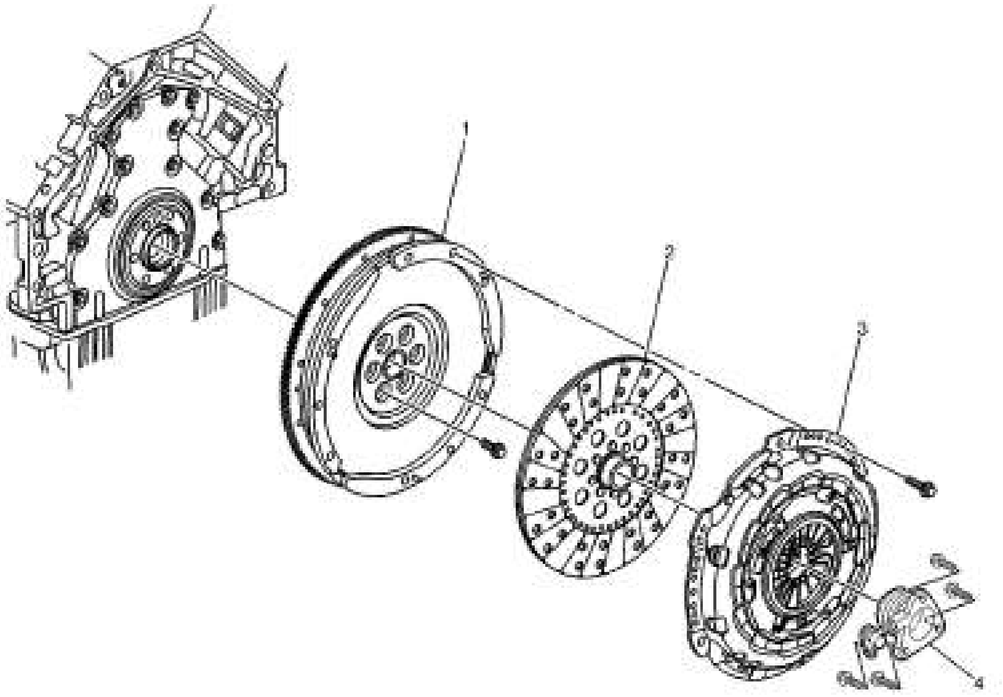
Description and Operation - Up to 17 Sep 2007

Tremec 6-Speed



(1) Clutch Pilot Bearing
(2) Engine Flywheel
(3) Clutch Driven Plate
(4) Clutch Pressure Plate
(5) Clutch Concentric Actuator Cylinder

Aisin AY6



(1) Engine Flywheel
(2) Clutch Driven Plate
(3) Clutch Pressure Plate
(4) Clutch Concentric Actuator Cylinder

The following are the principal components of the clutch system:

- The driving members; attached to the engine and turning with the engine
- The driven member; attached to the driveline and transmission and turning with the driveline and transmission
- The operating members; including the spring, the clutch hydraulic system, and the clutch pedal linkages, required to apply and release the pressure, which holds the driving and driven members in contact with each other

Clutch Driving Members

The clutch driving members consist of two, flat surface, iron plates. One of these surfaces is a heavy flat ring, with one side machined, known as the clutch driven plate and the other is the rear face of the engine flywheel. This is a dual mass flywheel that is designed to absorb engine vibrations before they are transmitted to the driveline, where they can create gear rattle. This is achieved by splitting the conventional flywheel into two sections: a primary section, which bolts to the crankshaft, and a secondary section, onto which the clutch is bolted. The primary section of the flywheel contains springs to isolate the engine vibrations. A small amount of fore aft looseness between the primary and secondary sections is normal. It is also normal for the secondary section to have a rotating travel of 25-50 mm (1-2 in) measured near the flywheel ring gear, while the primary section stays stationary.

Clutch Driven Members (V6)

The driven member, clutch driven plate, has a splined hub that freely slides lengthwise along the splines of the transmission input shaft, which also drives the shaft through these same splines. Suitable friction facings are attached to each side of the plate by rivets.

In order to make the clutch engagement as smooth as possible and eliminate chatter; the steel segments driving the splined hub are slightly waved, which causes the contact pressure on the facings to rise gradually as the waved springs flatten out.

Clutch Operating Members

The driving member and the driven member are held in contact by spring pressure. This pressure is exerted by a one-piece conical or diaphragm spring.

A diaphragm spring is a conical piece of spring steel that has been specially stamped to give it greater flexibility. The diaphragm is positioned between the cover and the pressure plate so that the diaphragm spring is nearly flat when the clutch is in the engaged position.

The pressure of the inner rim of the spring on the pressure plate decreases as the flat position is passed. The inner rim of the diaphragm bears on the pressure plate and is pivoted on a ring on the outer edge of the pressure plate. The application of a pulling load on the inner section of the pressure plate will cause the inner rim to move away from the flywheel and allow the pressure plate to move away from the clutch disc, thereby releasing or disengaging the clutch.

The clutch release bearing is moved by the actuator assembly to move the release levers which move the pressure plate to the rear, thus separating the clutch disc from the flywheel when the clutch pedal is depressed by the driver. A piston return spring in the actuator cylinder preloads the clutch linkage and assures a small load on the release bearing with the actuator assembly at all times. As the clutch disc wears, the diaphragm spring fingers move forward forcing the release bearing, actuator assembly, and pushrod to move. This movement forces the actuator cylinder piston to move forward in its bore, consuming hydraulic fluid from the master cylinder reservoir, thereby providing the SELF-ADJUSTING feature of the hydraulic clutch linkage system.

Hydraulic Clutch Description

The clutch hydraulic system consists of a master cylinder and an actuator cylinder. When pressure is applied to the clutch pedal, pedal depressed, the pushrod contacts the plunger and pushes it down the bore of the master cylinder. In the first 0.8 mm (0.031 in) of movement, the recuperation seal closes the port to the fluid reservoir tank, and as the plunger continues to move down the bore of the cylinder, the fluid is forced through the outlet line to the actuator cylinder mounted to the driveline support assembly. As fluid is pushed down the pipe from the master cylinder, this in turn forces the piston in the actuator cylinder outward. As the actuator cylinder piston moves forward, it forces the release bearing to disengage the clutch pressure plate from the clutch disc. On the return stroke, pedal released, the plunger moves back as a result of the return pressure of the clutch. Fluid returns to the master cylinder and the final movement of the plunger opens the port to the fluid reservoir, allowing an unrestricted flow of fluid between system and reservoir. This systems has a clutch pedal hold down assist spring. Its purpose is to keep the clutch pedal depressed. This reduces driver fatigue during stop and go traffic.

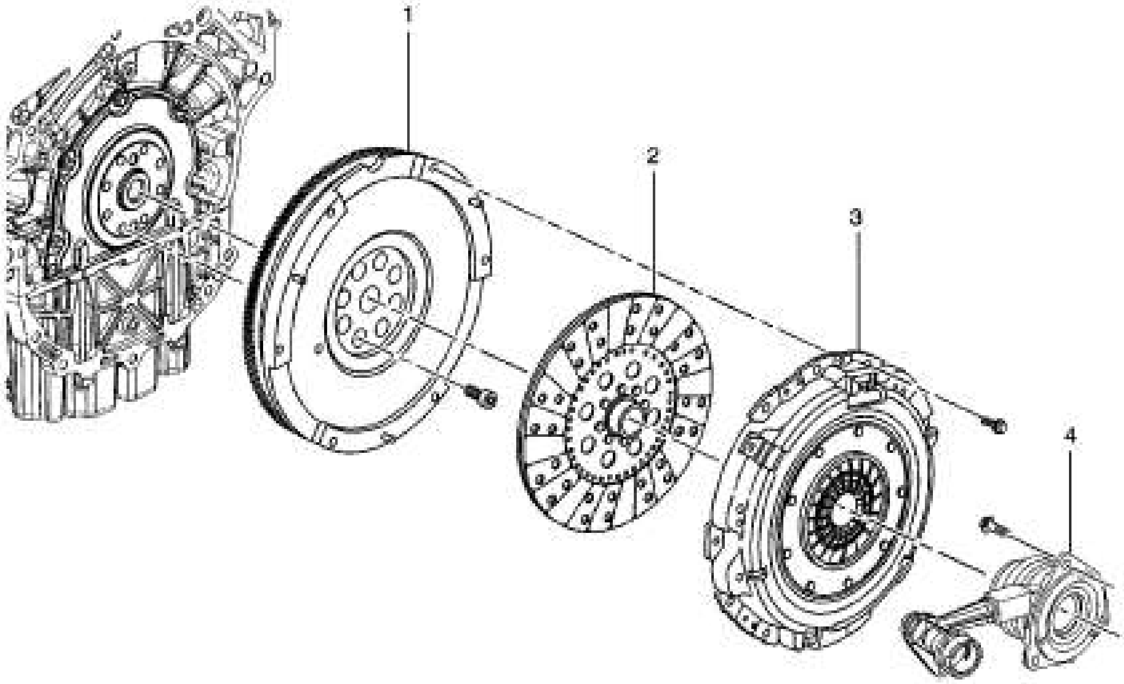
Aisin AY6



(1) Engine Flywheel
(2) Clutch Driven Plate
(3) Clutch Pressure Plate
(4) Clutch Actuator Cylinder

The following are the principal components of the clutch system:

- The driving members; attached to the engine and turning with the engine.
- The driven member; attached to the driveline and transmission and turning with the driveline and transmission.
- The operating members; including the spring, the clutch hydraulic system, and the clutch pedal linkages, required to apply and release the pressure, which holds the driving and driven members in contact with each other.

Clutch Driving Members

The clutch driving members consist of two, flat surface, iron plates. One of these surfaces is a heavy flat ring, with one side machined, known as the clutch driven plate and the other is the rear face of the engine flywheel. This is a dual mass flywheel that is designed to absorb engine vibrations before they are transmitted to the driveline, where they can create gear rattle. This is achieved by splitting the conventional flywheel into two sections: a primary section, which bolts to the crankshaft; and a secondary section, onto which the clutch is bolted. The primary section of the flywheel contains springs to isolate the engine vibrations. A small amount of fore aft looseness between the primary and secondary sections is normal. It is also normal for the secondary section to have a rotating travel of 25-50 mm (1-2 in) measured near the flywheel ring gear, while the primary section stays stationary.

Clutch Driven Members (V6)

The driven member, clutch driven plate, has a splined hub that freely slides lengthwise along the splines of the transmission input shaft, which also drives the shaft through these same splines. Suitable friction facings are attached to each side of the plate by rivets.

In order to make the clutch engagement as smooth as possible and eliminate chatter; the steel segments driving the splined hub are slightly waved, which cause the contact pressure on the facings to rise gradually as the waved springs flatten out.

Clutch Operating Members

The driving member and the driven member are held in contact by spring pressure. This pressure is exerted by a one-piece conical or diaphragm spring.

A diaphragm spring is a conical piece of spring steel that has been specially stamped to give it greater flexibility. The diaphragm is positioned between the cover and the pressure plate so that the diaphragm spring is nearly flat when the clutch is in the engaged position.

The pressure of the inner rim of the spring on the pressure plate decreases as the flat position is passed. The inner rim of the diaphragm bears on the pressure plate and is pivoted on a ring on the outer edge of the pressure plate. The application of a pulling load on the inner section of the pressure plate will cause the inner rim to move away from the flywheel and allow the pressure plate to move away from the clutch disc, thereby releasing or disengaging the clutch.

The clutch release bearing is moved by the actuator assembly to move the release levers which move the pressure plate to the rear, thus separating the clutch disc from the flywheel when the clutch pedal is depressed by the driver. A piston return spring in the actuator cylinder preloads the clutch linkage and assures a small load on the release bearing with the actuator assembly at all times. As the clutch disc wears, the diaphragm spring fingers move forward forcing the release bearing, actuator assembly, and pushrod to move. This movement forces the actuator cylinder piston to move forward in its bore, consuming hydraulic fluid from the master cylinder reservoir, thereby providing the SELF-ADJUSTING feature of the hydraulic clutch linkage system.

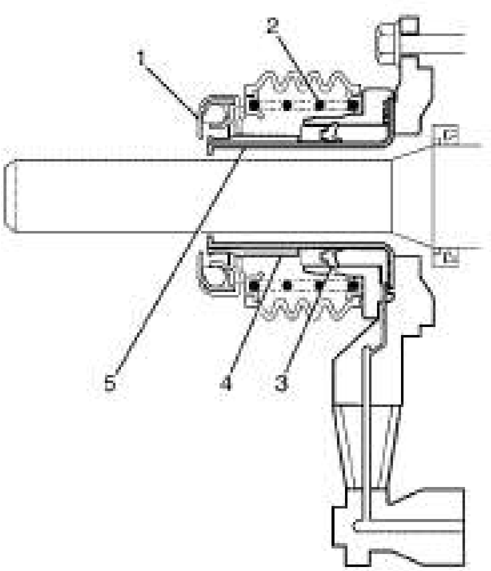
The electrical switch on the clutch pedal/bracket assembly has 3 functions. One function is a clutch interlock, ensuring the engine does not start unless the pedal is positioned on the floor. The second function is to cancel the cruise control system, if equipped, when the clutch pedal is depressed and the third function is to use the pedal position data to improve driveability.

Hydraulic Clutch Description

The clutch hydraulic system consists of a master cylinder and an actuator cylinder. When pressure is applied to the clutch pedal, pedal depressed, the pushrod contacts the plunger and pushes it down the bore of the master cylinder. In the first 0.8 mm (0.031 in) of movement, the recuperation seal closes the port to the fluid reservoir tank, and as the plunger continues to move down the bore of the cylinder, the fluid is forced through the outlet line to the actuator cylinder mounted to the driveline support assembly. As fluid is pushed down the pipe from the master cylinder, this in turn forces the piston in the actuator cylinder outward. As the actuator cylinder piston moves forward, it forces the release bearing to disengage the clutch pressure plate from the clutch disc. On the return stroke, pedal released, the plunger moves back as a result of the return pressure of the clutch. Fluid returns to the master cylinder and the final movement of the plunger opens the port to the fluid reservoir, allowing an unrestricted flow of fluid between system and reservoir. This systems has a clutch pedal hold down assist spring. Its purpose is to keep the clutch pedal depressed. This reduces driver fatigue during stop and go traffic.

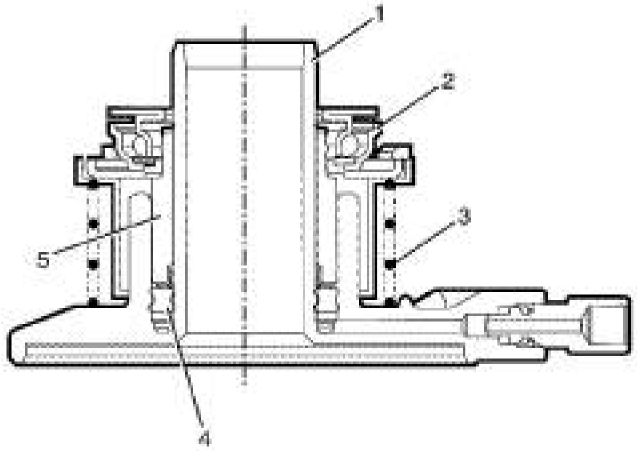
Hydraulic Clutch System Description and Operation (SWBRHD)

Concentric Actuator Cylinder Operation (3.6L) Engine



The pressurised fluid acts upon the seal (3) which then moves stroking the sleeve (4) in front of it. The release bearing (1) is also attached to the sleeve which means it also moves with the seal, in turn forcing the fingers of the pressure plate to move against the spring force. The concentric actuator cylinder sleeves continues to move the cylinder body, the pressure plate diaphragm spring guide (2) starts to pivot due to the force being applied. When this happens the clutch driven plate is allowed to spin. As this action takes place the flywheel and transmission input shaft friction link is broken which then allows smooth gear changing. The release bearing and actuating sleeve are moved back along the actuating body cylinder guide (5) by releasing the clutch pedal which in turn operates the pressure plate diaphragm spring force. As the clutch pressure plate is self-adjusting, the "at rest position of the release bearing and concentric slave cylinder sleeve remains relatively the same throughout the life of the assembly.

Concentric Actuator Cylinder Operation (6.0L Engine)



The pressurised fluid acts upon the seal upon the seal (4) which then moves stroking the sleeve in front of it. The release bearing (2)) is also attached to the sleeve (5) which means it also moves with the seal (4), in turn forcing the fingers of the pressure plate to move against the spring force. As the concentric actuator cylinder continues to move on the cylinder body, (1) the pressure plate diaphragm spring starts to pivot due to the force being applied. When this happens the clutch driven plate is allowed to spin. As this action takes place the flywheel and transmission input shaft friction link is broken which then allows smooth gear changing. The release bearing and actuating sleeve are moved back along the actuating body cylinder guide by releasing the clutch pedal which in turn operates the pressure plate diaphragm spring (3) force. As the clutch pressure plate is self-adjusting, the "at rest position of the release bearing and concentric slave cylinder sleeve remains relatively the same throughout the life of the assembly.

Master Cylinder Operation

As the clutch pedal is depressed, force is transmitted via the clutch pedal push rod to the clutch master cylinder piston moving it down the cylinder bore. When the piston stars to move, the primary seal covers the compensation port and the resultant build up in pressure, seats the relief valve in the end of the piston. As hydraulic pressure develops, the fluid is displaced and moves the piston in the concentric actuator cylinder against the return spring and clutch pressure plate diaphragm spring forces, to stroke the concentric actuator cylinder push rod. In turn, this action moves the clutch release lever and bearing, releasing the clutch pressure plate.

Diagnostic Starting Point - Manual Transmission

Begin the system diagnosis with Diagnostic System Check - Vehicle in Vehicle DTC Information. The Diagnostic System Check - Vehicle in Vehicle DTC Information, will provide the following information:

- The identification of the control module or modules which command the system.
- The ability of the control module or modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the status of the codes.

Use the Diagnostic System Check - Vehicle in Vehicle DTC Information, in order to identify the correct procedure for diagnosing the system and where the procedure is located.

Diagnostic Trouble Code (DTC) Type Definitions

Diagnostic trouble codes (DTCs) are categorized into emissions and non-emissions related types. If a DTC is set, the malfunction indicator lamp (MIL) and failure data are utilized by the control module diagnostic executive according to the DTC type. Each DTC is set based upon the individual DTCs running and setting criteria. Read the Action Taken When the DTC Sets and Conditions for Clearing the MIL/DTC in the supporting text for taking appropriate action to each DTC.

Emissions Related DTCs

Type A

The following actions occur at the time of the first failure:

- The MIL is turned ON.
- A DTC is stored in memory.
- The Freeze Frame/Failure Records are stored.
- The Failure Records are updated after the first failure of each ignition cycle.

Some Type A DTCs will not perform the above actions when the DTC first detects a failure. Two consecutive failures are required. This allows systems, such as evaporative emission (EVAP), to accurately identify what failure exists before setting a DTC and requesting MIL illumination.

Type B

The following actions occur at one of the following times:

- First failure:
  - The MIL is not turned ON.
  - A DTC is stored in memory as a Failed Last Test.
  - The Failure Records are stored.
- Second consecutive drive cycle with a failure:
  - The MIL is turned ON.
  - A DTC is stored in memory as a history DTC.
  - The Freeze Frame data is stored.
  - The Failure Records are stored.
- Second non-consecutive drive cycle with a failure:
  - The MIL is not turned ON.
  - A DTC is stored in memory as a Failed Last Test.
  - The Failure Records are stored.

Non-Emissions Related DTCs

Type C

The following actions occur at the time of a failure:

- The MIL does not turn ON.
- A DTC is stored in memory as a history DTC.
- The Failure Records are stored.
- The Failure Records are updated after the first failure of each ignition cycle.
- Some Type C DTCs may also cause an auxiliary service lamp to be illuminated, and/or display a message to the vehicle operator.

Type X

Actions did not occur. These DTCs are coded into the control module software, but will not run for one of the following reasons:

- The associated hardware is not installed with the vehicle emission package.
- The diagnostic is not required for the vehicle emission package.

DTC P0501 or P0502

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0501: Vehicle Speed Sensor (VSS) Performance

DTC P0502: Vehicle Speed Sensor (VSS) Circuit Low Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition Voltage	P0502	P0502	--	P0501
Signal	P0502	P0502	P0502	P0501
Ground	--	P0502	--	P0501

Typical Scan Tool Information

Vehicle Speed Sensor Parameter

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running, in gear, drive wheels rotating. *Parameter Normal Range:* Displays km/h (mph)			
Ignition Voltage	0 km/h (mph)	0 km/h (mph)	--
Signal	0 km/h (mph)	0 km/h (mph)	0 km/h (mph)
Ground	0 km/h (mph)	0 km/h (mph)	--

Circuit/System Description

Vehicle speed information is provided to the engine control module (ECM) by the vehicle speed sensor (VSS). The VSS consists of a hall-effect sensor mounted to the transmission case which interfaces with a rotor pressed onto the transmission output shaft. The hall-effect sensor contains a permanent magnet and a semiconductor plate to which ignition voltage is applied. As the output shaft spins, the rotor directs the field of the permanent magnet either toward or away from the plate. The VSS produces a frequency signal that is proportional to vehicle speed. The ECM converts the VSS signal to vehicle speed, displayed on the scan tool in kilometers per hour or miles per hour. The ECM also uses the VSS signal to generate the 4,000 pulses per mile vehicle speed signal used by the instrument cluster.

Conditions for Running the DTC

- The engine speed is greater than 1800 RPM for 3 seconds.
- The engine coolant temperature (ECT) is greater than 40°C (104°F).

Conditions for Setting the DTC

The VSS indicates a speed of less than 0 km/h (0 mph) for 4 seconds.

Action Taken When the DTC Sets

- P0501 and P0502 are Type B DTCs.
- The ECM disables cruise control.

Conditions for Clearing the MIL/DTC

P0501 and P0502 are Type B DTCs.

Diagnostic Aids

The battery must be fully charged and pass a battery test. Refer to Battery Inspection/Test.

Scan Tool Reference

Control Module References for scan tool information.

Circuit / System Verification

1. Operate the vehicle on the road at 64 km/h (40 mph). Observe the transmission vehicle speed sensor parameter with a scan tool. The VSS signal should match the instrument panel speedometer indicator.
2. Operate the vehicle within the Conditions for Running the DTC, to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records.

Circuit / System Testing

1. Ignition OFF, disconnect the X2 harness connector at the ECM.
2. Disconnect the VSS harness connector.
3. Ignition OFF, test for less than 5 ohms of resistance between the ground circuit at the VSS harness connector terminal 3 and ground.

   If greater than the specified value, repair the open/high resistance condition.
4. Ignition ON, test for less than 1 V between the signal circuit terminal 1 and ground at the VSS harness connector.

   If greater than the specified value, test the signal circuit for a short to voltage.
5. Ignition ON, test for greater than 11 V between the ignition voltage circuit, at the VSS harness connector terminal 3, and ground.

   If less than the specified value, test the ignition voltage circuit for a short to ground or an open/high resistance.
6. Ignition ON, install a 3 A fused jumper wire between the ignition voltage circuit terminal 3 and the signal circuit terminal 1 at the VSS harness connector. Test for greater than 11 V at X2, terminal 43 of the ECM harness connector.

   If less than the specified value, test the VSS signal circuit for a short to ground, or an open/high resistance.
7. Remove the 3 A fused jumper wire.
8. Ignition ON, engine OFF, transmission in NEUTRAL.
9. Install a 3 A fused jumper wire between the ignition voltage circuit terminal 1 on the VSS harness connector and terminal 1 on the VSS. Connect a second jumper wire between the ground circuit terminal 2 on the VSS harness connector and terminal 2 on the VSS.
10. Test for greater than 0.15 V AC, at terminal 1 on the VSS sensor, while rotating the rear wheels by hand.

    If less than the specified value, replace the VSS.
11. If all circuits test normal, replace the ECM.

Component Testing

1. Remove the VSS sensor. Refer to Vehicle Speed Sensor Replacement.
2. Inspect and repair the VSS or the transmission for the following conditions:
   - Loose or damaged VSS
   - Excessive VSS to rotor gap

- Incorrect VSS rotor alignment
- Loose or damaged VSS rotor

Repair Instructions

- Vehicle Speed Sensor Replacement
- Engine Control Module Programming and Setup
- Engine Control Module Replacement

Repair Verifications

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

DTC P0806

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0806: Clutch Pedal Position (CPP) Sensor Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
CPP Sensor Signal	P0807	P0807	P0808	P0806
CPP Sensor 5 V Reference	P0651, P0807	P0807	P0651, P0808	--
CPP Sensor Low Reference	--	P0808	P0808	--

Typical Scan Tool Information

CPP Sensor Voltage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Voltage Parameter Normal Range:* 0-volts with clutch pedal applied to 5 V when clutch pedal is released.			
CPP Sensor 5 V Reference	0 V	0 V	5 V
CPP Sensor Signal	0 V	0 V	5 V
CPP Sensor Low Reference	--	5 V	--

CPP Sensor Percentage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Percent Parameter Normal Range:* 0% with clutch pedal released to 100% when clutch pedal is applied.			
CPP Sensor 5 V Reference	100%	100%	0-100%
CPP Sensor Signal	100%	100%	100%

CPP Sensor Low Reference	--	0%	--

Circuit/System Description

The clutch pedal position (CPP) sensor is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released, to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

DTCs P0335, P0336, P0502, P0503, P0607, P0808, or P080A are not set.

Conditions for Setting the DTC

The CPP sensor is stuck in range.

Action Taken When the DTC Sets

P0806 is a Type A DTC.

Conditions for Clearing the MIL/DTC

P0806 is a Type A DTC.

DTC Type Reference

Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON, observe the scan tool CPP sensor percent parameter. The percentage should vary from 0% when the clutch pedal is released, to 100% when the clutch pedal is in the apply position.
2. Perform the CPP learn procedure. Refer to Clutch Pedal Position Sensor Learn.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Ignition ON, observe the scan tool CPP sensor voltage parameter for 0.1-volt.

   If less than the specified value, replace the CPP sensor.

   If greater than the specified value, replace the ECM.

Component Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Measure the resistance between the signal terminal B and the low reference terminal A of the CPP sensor. Sweep the CPP sensor through the entire range. The resistance should vary low to high and high to low without any spikes or dropouts.

   If the resistance is erratic with spikes or dropouts, replace the CPP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Clutch Pedal Replacement
- Engine Control Module Replacement
- Engine Control Module Programming and Setup

DTC P0807 or P0808

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

CPP Sensor Low Reference	--	P0808	P0808	--

Typical Scan Tool Information

CPP Sensor Voltage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Voltage Parameter Normal Range:* 0 V with clutch pedal applied to 5 V when clutch pedal is released.			
CPP Sensor 5 V Reference	0 V	0 V	5 V
CPP Sensor Signal	0 V	0 V	5 V
CPP Sensor Low Reference	--	5 V	--

CPP Sensor Percentage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Percentage Parameter Normal Range:* 0% with clutch pedal released to 100% when clutch pedal is applied.			
CPP Sensor 5 V Reference	100%	100%	0-100%

CPP Sensor Signal	100%	100%	100%
CPP Sensor Low Reference	--	0%	--

Circuit/System Description

The clutch pedal position (CPP) is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

- DTCs P0641 or P0651 are not set.
- The system voltage is more than 9 volts.
- The ignition is in the RUN position.

Conditions for Setting the DTC

P0807

The CPP sensor voltage is less than 0.1 V for more than 1 second.

P0808

The CPP sensor voltage is more than 5.2 V for more than 1 second.

Action Taken When the DTC Sets

P0807 and P0808 are Type A DTCs.

Conditions for Clearing the MIL/DTC

P0807 and P0808 are Type A DTCs.

Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. If DTC P0641 or P0651 is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition ON, observe the scan tool CPP sensor percent parameter. The percentage should vary from 0 percent when the clutch pedal is released, to 100 percent when the clutch pedal is in the apply position.
3. Perform the CPP learn procedure. Refer to Clutch Pedal Position Sensor Learn.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Ignition OFF, test for less than 1 ohms between the low reference circuit terminal A and the negative post of the battery.

   If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal C and ground.

   If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify that the scan tool CPP sensor parameter is less than 0.1 V.

   If greater than the specified value, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Install a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal C. Verify that the scan tool CPP sensor parameter is between 4.8-5.2 V.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.
6. If all circuits test normal, test or replace the CPP sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Measure the resistance between the signal terminal B and the low reference terminal A of the CPP sensor. Sweep the CPP sensor through the entire range. The resistance should vary low to high and high to low without any spikes or dropouts.

   If the resistance is erratic with spikes or dropouts, replace the CPP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Engine Control Module Replacement
- Engine Control Module Programming and Setup

DTC P080A

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P080A: Clutch Pedal Position (CPP) Not Learned

Circuit/System Description

The clutch pedal position (CPP) is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

Clutch pedal fully applied.

Conditions for Setting the DTC

Clutch pedal position not learned.

Action Taken When the DTC Sets

P080A is a Type B DTC.

Conditions for Clearing the MIL/DTC

P080A is a Type B DTC.

Circuit/System Verification

Perform the clutch pedal position sensor learn procedure Refer to Clutch Pedal Position Sensor Learn.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Clutch Pedal Position Sensor Learn
- Engine Control Module Replacement
- Engine Control Module Programming and Setup

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Diagnostic Information and Procedures | **Document ID: 1992425**

Clutch Pedal Position Sensor Learn

Important: The clutch pedal position (CPP) sensor learn procedure is required when the following service procedures have been performed regardless of whether DTC P080A is set:

- An engine control module (ECM) replacement
- A CPP sensor replacement
- Any repairs which affect the CPP sensor relationship

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, except DTC P080A, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC that set.
3. With a scan tool, select Clutch Pedal Position Learn under Module Setup in Manual Transmission, and perform the following instructions displayed on the scan tool screen.

   Important: The CPP sensor learn procedure cannot be performed more than once per ignition cycle. The clutch pedal needs to be fully depressed and held steady throughout this procedure in order to perform a correct learning.

4. The scan tool will display under CPP Learn Status: Not Learned, In Process, Complete, Fail - Low Volt, Fail - High Volt, or Fail Moving. The scan tool will display under CPP Learn Status Complete if the process was successful.
5. If the scan tool indicates that DTC P080A ran and passed this ignition the CPP sensor learn procedure is complete. If the scan tool indicates DTC P080A failed or did not run this ignition, refer to DTC P080A. If any other DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC.
6. Turn OFF the ignition for 30 seconds after the learn procedure has successfully completed in order to store the CPP sensor variation values in ECM history.

Symptoms - Manual Transmission

Strategy Based Diagnostics

Review the system operations in order to familiarize yourself with the system functions. Refer to Transmission System Description and Operation .

Visual/Physical Inspection

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the manual transmission for the correct fluid level.
- Inspect the manual transmission for fluid leaks.
- Inspect the manual transmission for broken or loose transmission mounts.
- Inspect the shifter for damage or excessive freeplay.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating properly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Transmission Shifts Hard .
- Transmission Gear Clash When Shifting Gears .
- Transmission Noisy .
- Transmission Does Not Shift into One Gear .
- Transmission Locked in One Gear .
- Transmission Jumps Out of Gear .
- Transmission Clunk on Acceleration or Deceleration .
- Transmission Fluid Leak Diagnosis .

Transmission Clunk on Acceleration or Deceleration

Diagnostic Aids

All manual transmissions and axles have gear play that might cause a clunk. If the transmission is suspected of causing the clunk, compare it with a similar vehicle. An internal clunk in the transmission is the natural response of the driveline to an impact, but may also be caused by improper assembly, which would also cause other symptoms.

Step	Action	Yes	No
DEFINITION: A clunk is heard and/or felt on acceleration or deceleration.			
1	Did you review the Symptoms - Manual Transmission, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission .
2	Inspect the engine mounts for being loose or damaged. Refer to Engine Mount Inspection in Engine Mechanical - 3.6L (LY7). Did you find and repair the condition?	Go to Step 7	Go to Step 3
3	Inspect the transmission mounts for being loose or damaged. Refer to Transmission Mount Replacement . Did you find and repair the condition?	Go to Step 7	Go to Step 4
4	Inspect the transmission to engine fasteners for being loose or missing. Refer to Fastener Tightening Specifications . Did you find and repair the condition?	Go to Step 7	Go to Step 5
5	Inspect the driveline for causing the clunk. Refer to Diagnostic Starting Point - Propeller Shaft . Did you find and repair the condition?	Go to Step 7	Go to Step 6
6	Replace the transmission. Refer to Transmission Replacement . Is the replacement complete?	Go to Step 7	--
7	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Does Not Shift into One Gear

Diagnostic Aids

If the transmission shifts into gear and then jumps out of gear, refer to Transmission Jumps Out of Gear . If it is an intermittent condition, other driveline components may be faulty.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step is to confirm that the clutch is not slipping. During certain conditions, the clutch may slip, and feel as though the transmission is not in gear.

3. A static shift test is performed by shifting into all gears with the engine not operating. While performing the test, you should note how the shift lever movement feels. Also, feel for the shift rails moving freely, the detent plungers operating when coming out of a gear and going in the next gear, and the synchronizer sleeve movement.

5. A dynamic shift test is performed by shifting into all gears with the engine operating. Test for the correct mesh of the synchronizers sleeve and the speed gear selector teeth. Move the shift lever and feel for the synchronizer sleeve to just release from the gear, then let up on the clutch pedal. Depress the clutch pedal and move the shift lever to re-engage that gear, to ensure full travel of the shift components.

Step	Action	Yes	No
DEFINITION: The shift lever will not move into a particular gear position, or when it is in a gear position, power is not delivered through the transmission.			
1	Did you review the Symptoms - Manual Transmission . Did you perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission
2	Inspect the clutch system for slipping. Refer to Clutch Slipping in Clutch. Is the clutch working properly?	Go to Step 3	Go to Clutch Assembly Replacement .
3	1. Perform a static shift test on the transmission. 2. Test for the following: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. • Synchronizer sleeve movement. Were you able to shift into the gear position that has the concern?	Go to Step 5	Go to Step 4

4	Remove the shifter and inspect for worn or faulty components Refer to Shift Control Assembly Replacement . Did you find and repair the condition?	Go to Step 7	Go to Step 5
5	1. Perform a dynamic shift test on the transmission. 2. Test for the following: • Detent plungers or shift rails binding. • Synchronizer sleeve binding. • Synchronizer sleeve engaging on the speed gear selector teeth. Were you able to shift into the gear position that has the concern?	Go to Step 7	Go to Step 6
6	Replace the transmission. Refer to Transmission Replacement . Is the replacement complete?	Go to Step 7	--
7	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Diagnostic Information and Procedures | **Document ID: 1992818**

Transmission Fluid Leak Diagnosis

Diagnostic Aids

Using the incorrect type of transmission fluid may affect the sealing ability of the seals. Ensure the use of the correct type of transmission fluid. The incorrect type of sealer may not be compatible with the transmission fluid or may not have the correct characteristics for sealing the affected components. Ensure the use of the correct type of sealers. Refer to Adhesives, Fluids, Lubricants, and Sealers in Manual Transmission - Aisin AY6.

Test Description

The number below refers to the step number on the diagnostic table.

5. Use an approved method to clean the transmission to ensure the leak location is correctly identified. If using a powder method or dye method ensure the products are compatible with the transmission fluid.

Step	Action	Yes	No
DEFINITION: Visible sign of the transmission fluid leaking from the transmission.			
1	Did you review the manual transmission symptoms and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission.
2	1. Inspect for the transmission fluid level higher than the recommended level. Refer to Transmission Fluid Level Inspection. 2. Adjust the transmission level if incorrect. Was the transmission fluid level too high?	Go to Step 25	Go to Step 3
3	Inspect the transmission vent for a blockage. Is the transmission vent blocked?	Go to Step 4	Go to Step 5
4	Repair or replace the transmission vent. Did you find and repair the condition?	Go to Step 25	Go to Step 5
5	Verify the location of the leak. 1. Clean the transmission assembly. 2. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached. 3. Visual inspect or use the powder method or dye and black light method to locate the leak. Is the leak occurring at the drain or fill plug?	Go to Step 6	Go to Step 7
6	Replace the drain or fill plug. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 25	Go to Diagnostic Aids

7	Is the leak at the transmission output shaft seal?	Go to Step 8	Go to Step 9
8	Remove the mainshaft rear oil seal and inspect for the following. Refer to Mainshaft Rear Oil Seal Replacement. • Damaged or worn seal • Damaged seal bore • Improper installation • Cracks in the component • Output flange sealing surface is scratched, nicked, damaged, or worn • Loose or worn bearing causing excessive seal wear • Output flange nut loose Did you find and repair the condition?	Go to Step 25	Go to Diagnostic Aids
9	Is the leak at the shift rail area?	Go to Step 10	Go to Step 11
10	Inspect the shift rail seal for damage. Did you find and repair the condition?	Go to Step 25	Go to Diagnostic Aids
11	Is the leak at the front of the transmission?	Go to Step 12	Go to Step 15
12	1. Remove the transmission. Refer to Transmission Replacement. 2. Inspect the input shaft for leaking. 3. Remove the CSC assembly. Refer to Clutch Concentric Actuator Cylinder Replacement in Clutch. Did you find and repair the condition?	Go to Step 25	Go to Step 13
13	1. Inspect for the leak at the input shaft seal. 2. Inspect for the following if the input shaft seal is leaking: • Damaged or worn seal • Damaged seal bore • Improper installation • Cracks in the component • Input shaft sealing surface is scratched, nicked, damaged, or worn • Loose or worn bearing causing excessive seal wear 3. Replace the CSC assembly. Refer to Clutch Concentric Actuator Cylinder Replacement in Clutch.	Go to	

	Did you find and repair the condition?	Step 25	Go to Step 14
14	1. Inspect the case for cracks or porosity. 2. If cracks and or porosity are found replace the transmission. Refer to Transmission Replacement. Did you find and repair the condition?	Go to Step 25	Go to Diagnostic Aids
15	Is the leak at the vehicle speed sensor (VSS)?	Go to Step 16	Go to Step 17
16	1. Remove the VSS. Refer to Vehicle Speed Sensor Replacement. 2. Inspect for the following: • Cut or damaged O-ring seal • VSS over tightened causing deformation in the VSS • VSS bore scratched or damaged Did you find and repair the condition?	Go to Step 25	Go to Step 1
17	Is the leak at the backup light switch?	Go to Step 18	Go to Step 19
18	1. Remove the backup light switch. Refer to Backup Lamp Switch Replacement. 2. Inspect for the following: • Cross threaded or damaged threads • Insufficient sealant • Leaking switch • Improper installation Did you find and repair the condition?	Go to Step 25	Go to Step 1
19	Is the leak at the shift shaft plunger plug?	Go to Step 20	Go to Step 21
20	1. Remove the shift shaft detent plug. Refer to Transmission Disassemble and Transmission Assemble. 2. Inspect for the following: • Loose, not installed properly • Insufficient sealant • Cracked case • Improper installation Did you find and repair the condition?	Go to Step 25	Go to Step 1
21	Is the leak at the sealing flanges of the transmission cases?	Go to Step 22	Go to Step 23
	1. Remove the transmission. Refer to Transmission Replacement. 2. Disassemble the transmission. Refer to Transmission Disassemble.		

22	3. Inspect the sealing surfaces. Refer to Transmission Case Cleaning and Inspection. Did you find and repair the condition?	Go to Step 25	Go to Step 23
23	Is the leak coming from a crack or porosity in the transmission case?	Go to Step 24	Go to Diagnostic Aids
24	1. Remove the transmission. Refer to Transmission Replacement. 2. Disassemble the transmission. Refer to Transmission Disassemble. 3. Replace the faulty case. Refer to Transmission Assemble. Did you find and repair the condition?	Go to Step 25	Go to Diagnostic Aids
25	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Diagnostic Information and Procedures | Document ID: 1992244

Transmission Gear Clash When Shifting Gears

Diagnostic Aids

Gear clashing may be caused by shifting at too high of an engine RPM or by rushing the shift. If gear clashing is occurring in more than one gear, the clutch may not be releasing properly for proper synchronizer operation.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step tests for the proper releasing of the clutch. If the clutch reserve is not proper, the mainshaft gears may still be turning causing the gear clashing.

5. This step inspects for the proper transmission fluid. A special fluid is required for the correct lubrication of the synchronizers.

7. A static shift test is performed by shifting into all of the gear positions with the engine not operating. While performing the test, you should note how the shift lever movement is felt. Also, while shifting from one gear to another, feel for binding in the shift rails. You should be able to feel the detent plungers operating when coming out of a gear and going into a gear. Excessive play in the gear shift lever may prevent the shift forks from fully engaging the synchronizer.

9. A dynamic shift test is performed by shifting into all of the gear positions with the engine operating. Test for the correct mesh of the synchronizers, and for the clutch releasing correctly. Move the shift lever and feel for the synchronizer sleeve to just release from the gear, then let up on the clutch pedal. Depress the clutch pedal and move the shift lever to re-engage that gear. If it shifts back into the gear without clashing, the clutch is releasing correctly and the synchronizer is working. If clashing occurs, test on another gear. If all gears clash, the clutch is not releasing correctly.

Step	Action	Yes	No
DEFINITION: Noise from the transmission when shifting gears. A grinding or grating sound, when the synchronizer sleeve is engaging with the selector teeth on the speed gear. A suspected internal transmission condition, if the noise only occurs in one gear.			
1	Did you review the Symptoms - Manual Transmission, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission
2	With the engine operating, does the transmission shift from neutral to any gear, without the vehicle lurching or gear clashing?	Go to Step 5	Go to Step 3
3	Inspect for proper clutch operation. Refer to Clutch System Description and Operation in Clutch. Does the clutch operate properly?	Go to Step 5	Go to Step 4

4	Repair the clutch system. Refer to Symptoms - Clutch in Clutch. Did you find and repair the condition?	Go to Step 11	Go to Step 5
5	Inspect for the correct transmission fluid level and the proper fluid. Refer to Transmission Fluid Replacement. Is the transmission fluid level correct and at the proper level?	Go to Step 7	Go to Step 6
6	Fill the transmission to the correct level, or change the transmission fluid if it is not the correct type. Does the transmission still have gear clash?	Go to Step 7	Go to Step 11
7	1. Perform a static shift test on the transmission. 2. Test for the following: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. Did the transmission shift smoothly into the gear that is clashing?	Go to Step 9	Go to Step 8
8	Remove the shift lever and inspect for damage or worn components. Refer to Shift Control Assembly Replacement. Did you find and repair the condition?	Go to Step 11	Go to Step 9
9	1. Perform a dynamic shift test on the transmission. 2. Test for the following: • Detent plungers or shift rails binding. • Synchronizer sleeve binding. • Gear clashing in more than the suspected gear. Is the transmission hard to shift into all gears?	Go to Transmission Shifts Hard	Go to Step 10
10	Replace the transmission. Refer to Transmission Replacement. Is the replacement complete?	Go to Step 11	--
11	Operate the system and verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Diagnostic Information and Procedures | **Document ID: 1992814**

Transmission Jumps Out of Gear

Diagnostic Aids

If the transmission jumps out of gear during deceleration, inspect the components that may allow for the gears or shafts to tip. If the gears or shafts tip, the synchronizer sleeve can disengage from the selector teeth on the speed gear. If the transmission jumps out of gear during acceleration, inspect the components that may not allow full engagement of the synchronizer sleeve to the selector teeth on the speed gear. Insufficient engagement of the selector teeth under torque may cause the transmission to jump out of gear.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. A static shift test is performed by shifting into all gear positions with the engine not operating. While performing the test, slowly move the shift lever. Feel for proper movement of the shift lever and transmission internal shift components.

4. A dynamic shift test is performed by shifting into all gear positions with the engine operating. Test for the correct mesh of the synchronizers sleeve and the speed gear selector teeth. Move the shift lever to NEUTRAL and then let up on the clutch pedal. Depress the clutch pedal and move the shift lever to re-engage the gear, to ensure full travel of the shift components.

5. This step inspects for worn or damaged transmission or engine mounts. Loose mounts may cause a shock on the transmission allowing for gear disengagement.

Step	Action	Yes	No
DEFINITION: Gear disengagement occurs during acceleration or deceleration.			
1	Did you review the Symptoms - Manual Transmission, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission.
2	1. Perform a static shift test. 2. Test for the following: • Blockage preventing full shift lever movement • Excessive movement in the shift lever • Detent plungers engaging in the shift rails • Synchronizer sleeve movement Did the transmission shift completely into all gears?	Go to Step 4	Go to Step 3
3	Remove the shifter and inspect for worn or faulty components. Refer to Shift Control Assembly Replacement. Did you find and repair the condition?	Go to Step 8	Go to Step 4

4	1. Perform a dynamic shift test on the transmission. 2. Test for the following: • Synchronizer sleeve engagement to the speed gear selector teeth • Detent plungers engaging in the shift rails Did the transmission shift completely into all gears?	Go to Step 5	Go to Step 7
5	Inspect the engine and/or transmission mounts. Refer to Transmission Mount Replacement. Did you find and repair the condition?	Go to Step 8	Go to Step 6
6	1. Align the housing, if required. 2. Tighten any loose housing bolts. Refer to Transmission Replacement. Did you find and repair the condition?	Go to Step 8	Go to Step 7
7	Replace the transmission. Refer to Transmission Replacement. Is the replacement complete?	Go to Step 8	--
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Diagnostic Information and Procedures | Document ID: 1992815

Transmission Locked in One Gear

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step is to ensure the use of the proper transmission fluid. A special fluid is used to ensure proper synchronizer operation, and for sufficient lubrication. Improper fluid may cause the synchronizers to stick or the transmission components to overheat.

4. A static shift test is performed by shifting into all gears with the engine not operating. By confirming that the transmission can be shifted into all positions, ensures that the shift lever is not excessively worn or damaged.

6. A dynamic shift test is performed by shifting into all of the gear positions with the engine operating. Test to ensure that the internal shift components are functioning properly.

Step	Action	Yes	No
DEFINITION: The transmission cannot be shifted out of a gear, or the vehicle will not move because the transmission is locked.			
1	Did you review the Symptoms - Manual Transmission, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission.
2	Inspect for the correct type of transmission fluid. Is the correct type transmission fluid being used?	Go to Step 4	Go to Step 3
3	Drain the transmission, and refill with the correct type of fluid. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 8	Go to Step 4
4	1. Perform a static shift test on the transmission. 2. Test for the shift lever moving to all positions. Were you able to shift into all positions?	Go to Step 6	Go to Step 5
5	1. Remove the shifter. 2. Inspect for worn or faulty components. Refer to Shift Control Assembly Replacement. Did you find and repair the conditions?	Go to Step 8	Go to Step 6
6	1. Perform a dynamic shift test on the transmission. 2. Test for being able to shift in and out of the gear with the concern. Were you able to shift the transmission correctly?	Go to Step 8	Go to Step 7

7	Replace the transmission. Refer to Transmission Replacement. Is the replacement complete?	Go to Step 8	--
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Noisy

Diagnostic Aids

If the vehicle is equipped with the 3.6L engine, the transmission is in neutral with the engine operating, and a whirling kind of a noise, neutral gear rattle, is heard outside the vehicle, this is a normal condition.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. This step inspects for vibration causing a noise.
5. This step inspects for the correct transmission fluid level. If the transmission fluid level is excessively low, damage may have occurred to the transmission components.
7. This step inspects for the correct type of transmission fluid. The transmission uses a special fluid. If the incorrect fluid was used, there may have been an overheating problem. Overheating may cause damage to the transmission components.
11. This step tests to determine if clutch components are making the noise. Depress the clutch pedal slowly and listen for the change in noise. If the noise changes while pressing the pedal, it may be a faulty clutch component. If the noise does not change until the clutch is completely disengaged, the transmission component is faulty. Improper sealing of the shifter may be allowing normal transmission noise to be heard by the driver.

Step	Action	Yes	No
DEFINITION: The transmission is making a noise. The different noises may be a whine or a growl from faulty bearings or gears. The noise may also be caused from a faulty component causing a vibration noise or rattle.			
1	Did you review the Symptoms - Manual Transmission. Did you perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission
2	Is the noise present at a certain road speed, or with a certain load?	Go to Step 3	Go to Step 4
3	Is the noise present in all gears?	Go to Step 5	Go to Step 4
4	Is the noise present in just one gear?	Go to Step 13	Go to Step 5
5	Inspect the transmission fluid level. Is the fluid level correct?	Go to Step 7	Go to Step 6
6	Add transmission fluid. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 14	Go to Step 7

7	Inspect the transmission for the correct fluid type. Refer to Lubrication Specifications. Is the transmission fluid the correct type?	Go to Step 9	Go to Step 8
8	Drain and refill the transmission with the correct type fluid. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 14	Go to Step 9
9	1. Inspect for engine to transmission alignment. 2. Inspect for loose transmission mounting bolts. Are there any loose transmission mounting bolts?	Go to Step 10	Go to Step 11
10	Replace and tighten the transmission mounting bolts. Refer to Transmission Mount Replacement. Is the noise still present?	Go to Step 11	Go to Step 14
11	With the engine operating, depress the clutch pedal. Is the noise still present?	Go to Step 12	Go to Step 13
12	1. Remove the clutch. Refer to Clutch Assembly Replacement in Clutch. 2. Inspect the following components for being the cause of the noise. • The release bearing. • The dual mass flywheel. • The pressure plate. • The clutch disc. • The engine crankshaft end play. Did you find and repair the condition?	Go to Step 14	Go to Step 13
13	Replace the transmission. Refer to Transmission Replacement. Is the replacement complete?	Go to Step 14	--
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Shifts Hard

Diagnostic Aids

An intermittent hard shift may be caused by an intermittent clutch condition. With a self adjusting clutch, the clutch may be between adjustments and not give full clutch release. This might be felt by a low clutch pedal. After several applications, the clutch may adjust properly, to give the proper pedal feel.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. A static shift test is performed by shifting into all of the gear positions with the engine not operating. While performing the test one should note how the shift lever movement is felt. Also while shifting from one gear to the other feel for binding in the shift rails. You should be able to feel the detent plungers operating when coming out of a gear and going into a gear.

5. A dynamic shift test is performed by shifting into the gear positions with the engine operating. Test for the correct mesh of the synchronizers and for the clutch releasing correctly. When shifting into and out of a gear, feel for the shift detent plungers and for the synchronizers sleeve for moving freely.

7. The transmission uses a synthetic transmission fluid that allows proper synchronizer operation. The incorrect fluid may cause hard shifting by varnish build up, or not enough lubrication for proper synchronizer operation.

Step	Action	Yes	No
DEFINITION: The transmission does not shift smoothly, or without difficulty, from one gear to the other.			
1	Did you review the Symptoms - Manual Transmission, and perform the necessary inspections?	Go to Step 2	Go to Symptoms - Manual Transmission
2	Inspect the clutch system for proper operation. Refer to Clutch System Description and Operation in Clutch. Did you find or repair the condition?	Go to Step 11	Go to Step 3
3	1. Perform a static shift test on the transmission. 2. Test for the following: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. Are you able to shift into all gears?	Go to Step 5	Go to Step 4
	Remove the shifter and inspect for worn or faulty		

4	components. Refer to Shift Control Assembly Replacement. Did you find and repair the condition?	Go to Step 11	Go to Step 5
5	1. Perform a dynamic shift test on the transmission. 2. Test for the following: • Detent plungers or shift rails binding. • Synchronizer sleeve binding. • Gear clash into only one gear. • Gear clash into all gears. Did the transmission shift hard into all gears?	Go to Step 6	Go to Step 10
6	Inspect the transmission for the correct fluid level and type of the transmission fluid. Refer to Transmission Fluid Replacement. Is the transmission at the correct level and proper fluid being used?	Go to Step 8	Go to Step 7
7	Drain and refill the transmission with the correct type fluid. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 11	Go to Step 8
8	1. Remove the transmission. Refer to Transmission Replacement. 2. Inspect the clutch pressure plate and/or clutch driven plate. Is the clutch pressure plate and/or clutch driven plate worn or faulty?	Go to Step 9	Go to Step 10
9	Replace the clutch assembly. Refer to Clutch Assembly Replacement in Clutch. Did you find and repair the condition?	Go to Step 11	Go to Step 10
10	Replace the transmission. Refer to Transmission Replacement. Is the replacement complete?	Go to Step 11	--
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

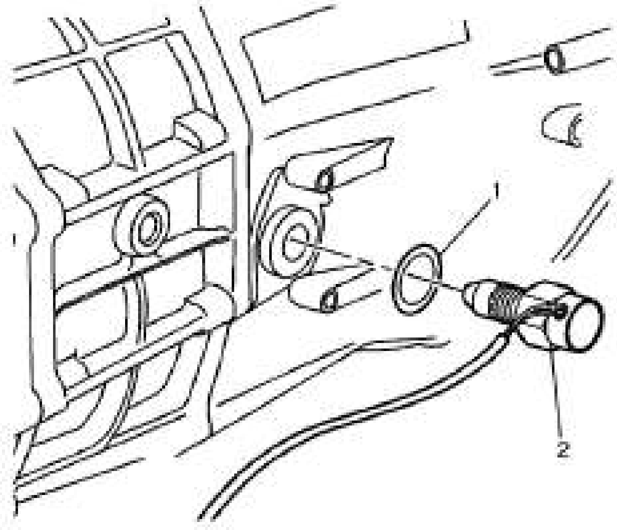
Backup Lamp Switch Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

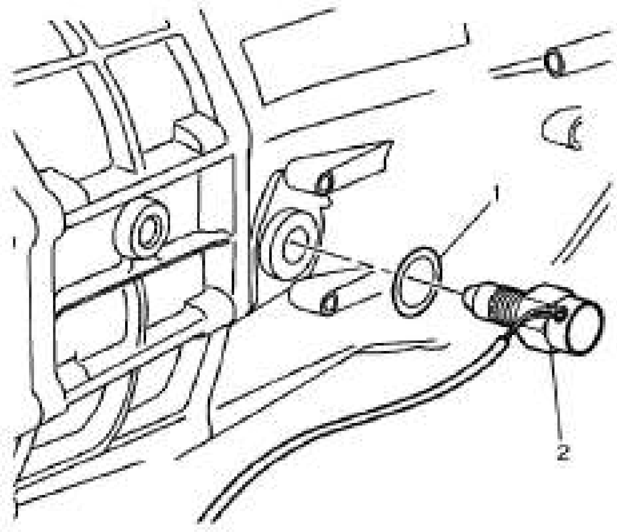
1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Disconnect the backup lamp switch electrical connector.
3. Using a suitable tool, remove the backup lamp switch (2) and washer (1) from the case. Discard the washer.

   Discard the washer.

Installation Procedure



1. Install a NEW washer (1) to the backup lamp switch.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the backup lamp switch (2) to the transmission.

   Tighten
   Tighten the switch to 44 N·m (32 lb ft).

3. Connect the backup lamp switch electrical connector.
4. Lower the vehicle.

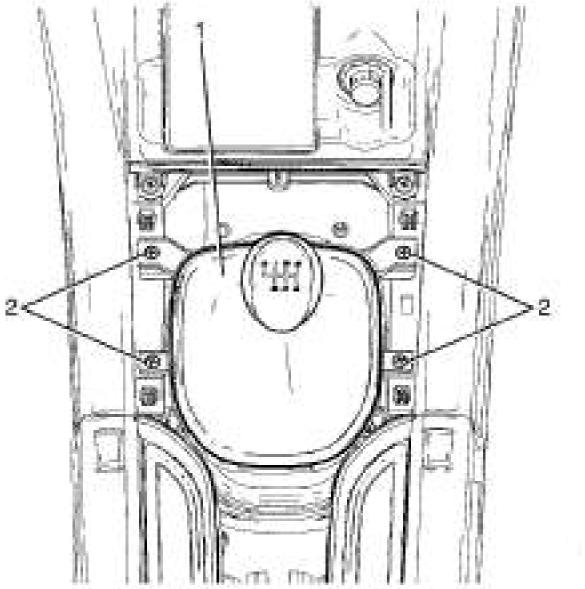
Control Lever and/or Boot Replacement

Removal Procedure

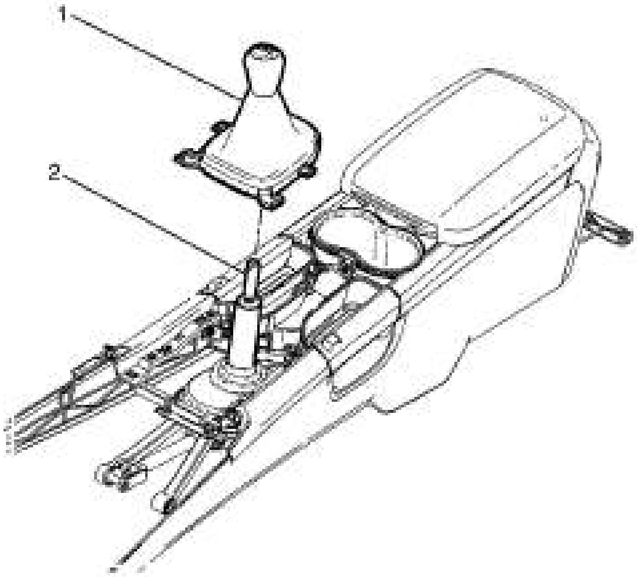
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the trim plate. Refer to Console Trim Plate Replacement.

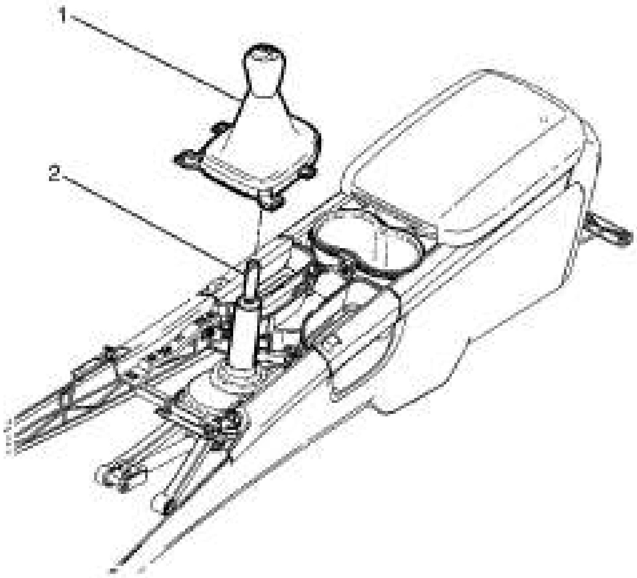


2. Remove the gearshift lever boot to front console retaining screws (2).

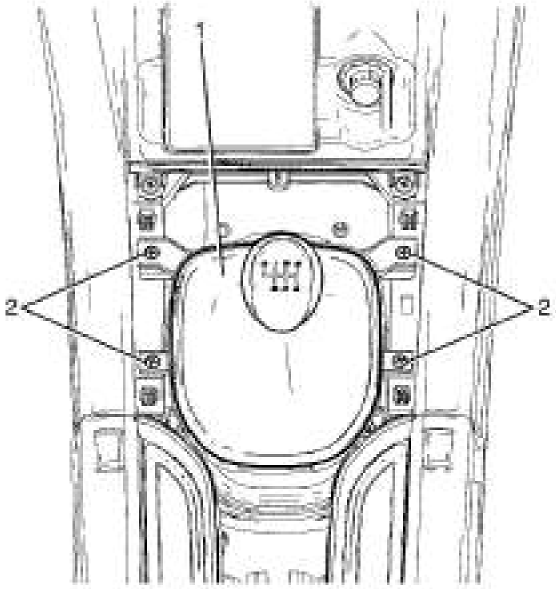


3. Lift the gearshift lever boot (1) enough to enable a firm grasp to be made on the gearshift lever (2) with the left hand, then grasp the gearshift knob with the right.
4. While rocking the knob sideways, and with an upward force applied, dislodge the knob retaining claws from the lever.
5. Remove the gearshift lever knob and boot assembly (1) from the gearshift lever.

Installation Procedure



1. Install the gearshift lever knob and boot assembly (1) to the gearshift lever.
2. Align the gearshift lever knob to the gearshift lever (2).
3. Apply pressure to the top of the gearshift knob to engage into the gearshift lever.



4. Install the gearshift lever boot to front console retaining screws (2).

Tighten
Tighten the bolts to 2 N·m (18 lb. in).

5. Install the trim plate. Refer to Console Trim Plate Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - On Vehicle | **Document ID: 1996690**

Mainshaft Rear Oil Seal Replacement

Tools Required

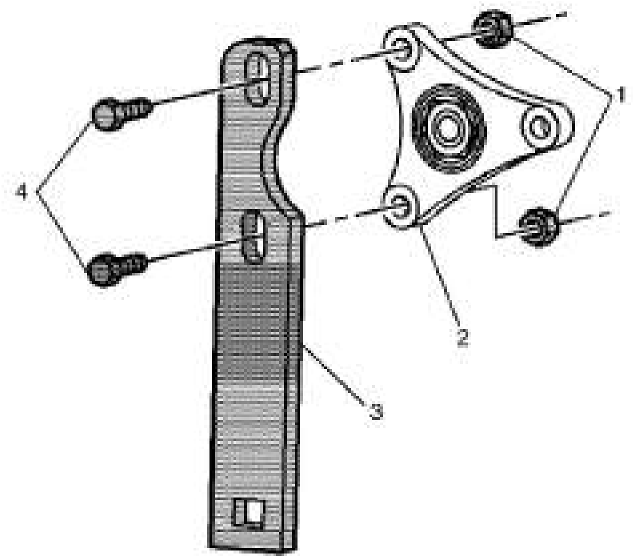
- J 6125-1B Slide Hammer
- J 23129 Universal Seal Remover
- J 29873 Injector Nozzle Socket 30 mm
- J 44765 Seal Installer
- J 45012 Holding Fixture
- J 45019 Flange and Pinion Gage Remover

Removal Procedure

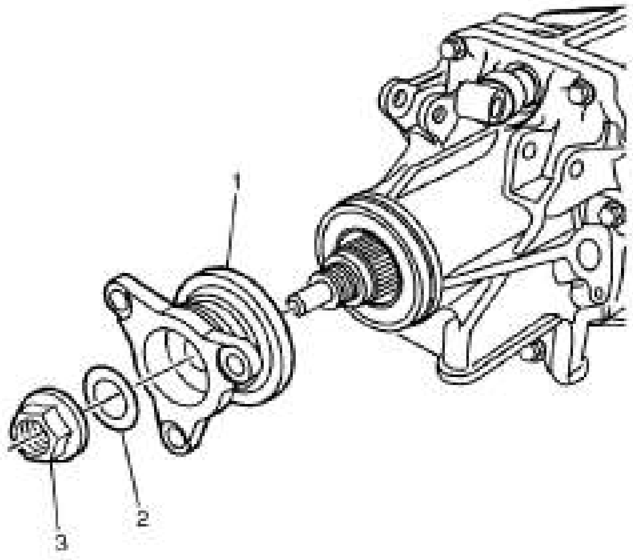
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the exhaust system. Refer to Exhaust System Replacement.
3. Remove the propeller shaft. Refer to Propeller Shaft Replacement.



4. Install the J 45012 to the drive flange (2).
5. While holding the J 45012 , remove the flange retaining nut using the J 29873 .
6. Remove the J 45012 .



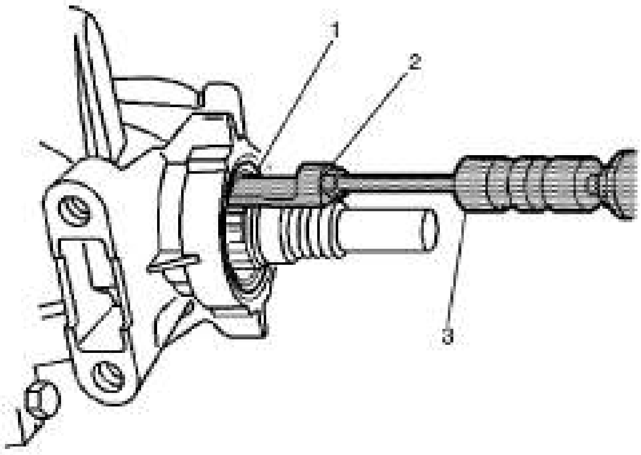
7. Remove the drive flange to output shaft retaining nut (1). The retaining nut must be discarded after removal.

   Discard the retaining nut.

8. Remove the drive flange thrust washer (2). The thrust washer must be discarded after removal

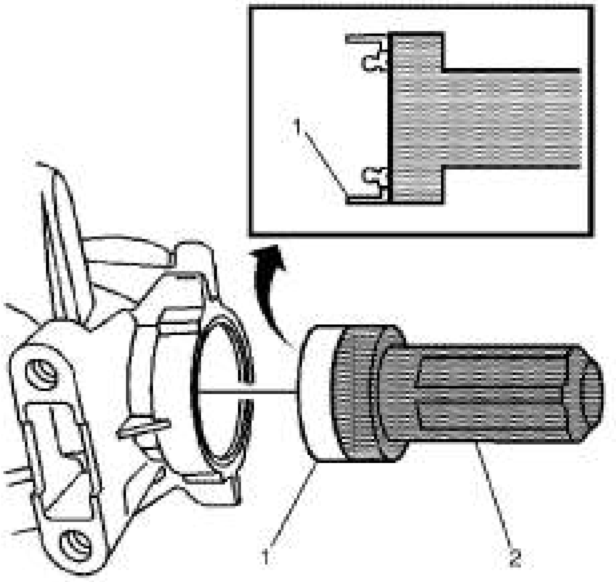
   Discard the thrust washer.

9. Remove the drive flange using the J 45019 .



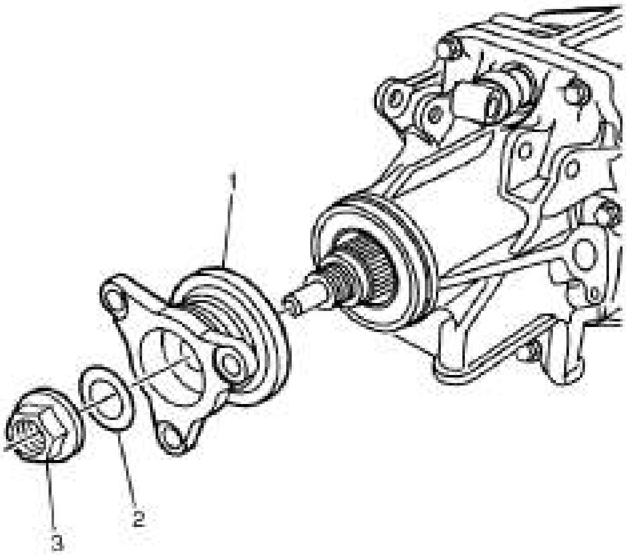
10. Use the J 6125-1B and J 23129 to remove the transmission case extension seal (1) from the transmission case extension.

Installation Procedure

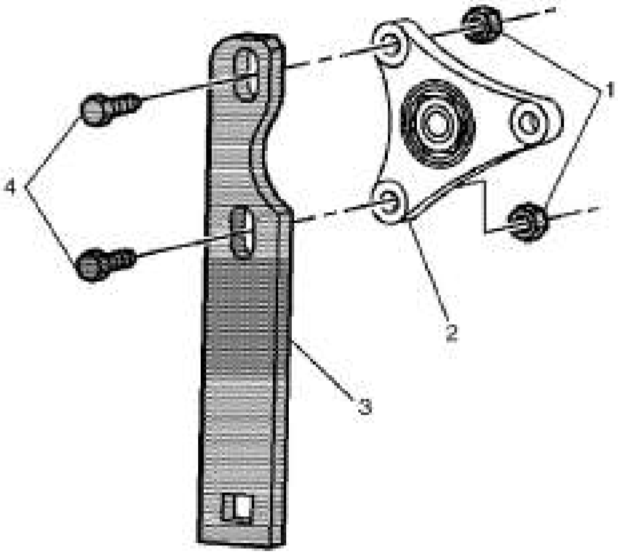


Important: Install the seal onto the tool before installing into the case to prevent damage to the seal.

1. Using J 44765 install the new transmission case extension seal (1).



2. Install the drive flange (1) to the transmission output shaft.
3. Install the thrust washer (2) to the transmission output shaft.
4. Install the NEW transmission output shaft to drive flange retaining nut (3).



5. Install the J 45012 to the drive flange.

   Notice: Refer to Fastener Notice in the Preface section.

6. While holding J 45012 , install a NEW drive flange retaining nut using J 29873 .

   Tighten
   Tighten the drive flange retaining nut to 57 N·m (42 lb ft).

7. Remove the J 45012 from the drive flange.
8. Install the propeller shaft. Refer to Propeller Shaft Replacement.
9. Install the exhaust system. Refer to Exhaust System Replacement.
10. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - On Vehicle | **Document ID: 1996695**

Shift Control Assembly Replacement

Tools Required

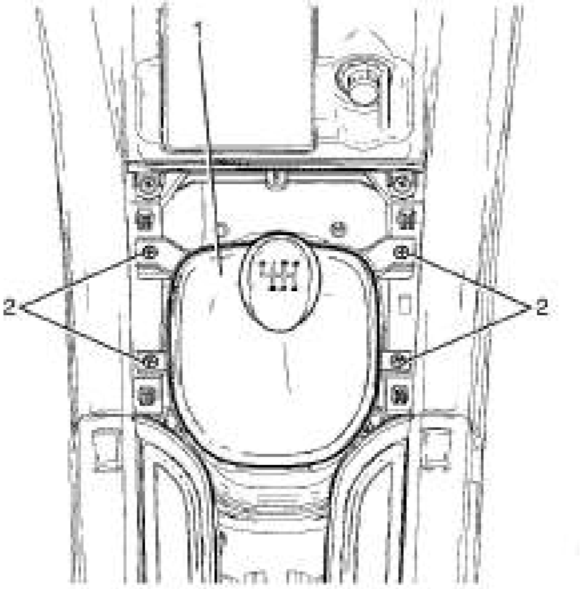
EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

Removal Procedure

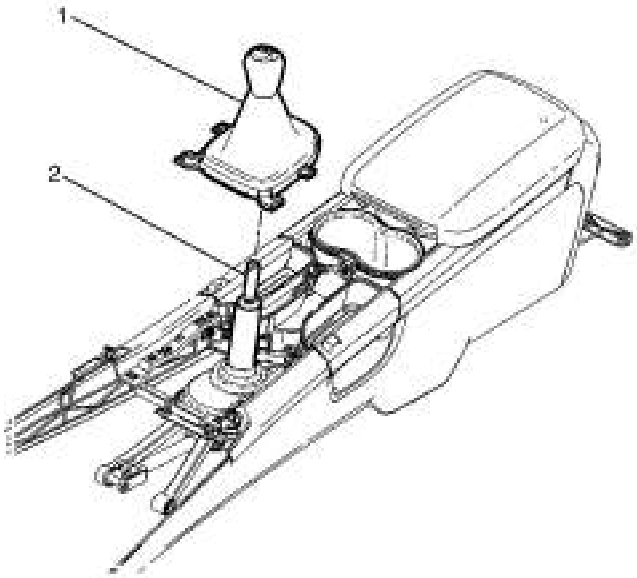
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

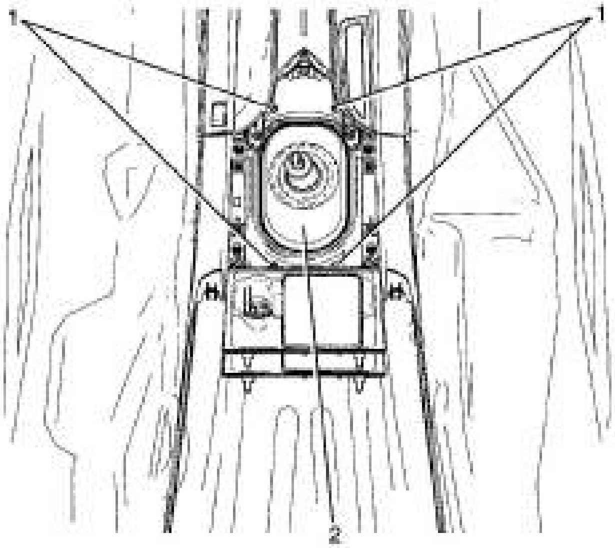
1. Remove the trim plate. Refer to Console Trim Plate Replacement .



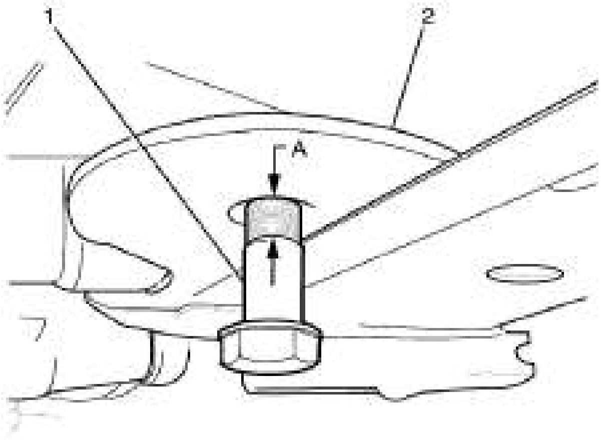
2. Remove the gearshift lever boot to front console retaining screws (2).



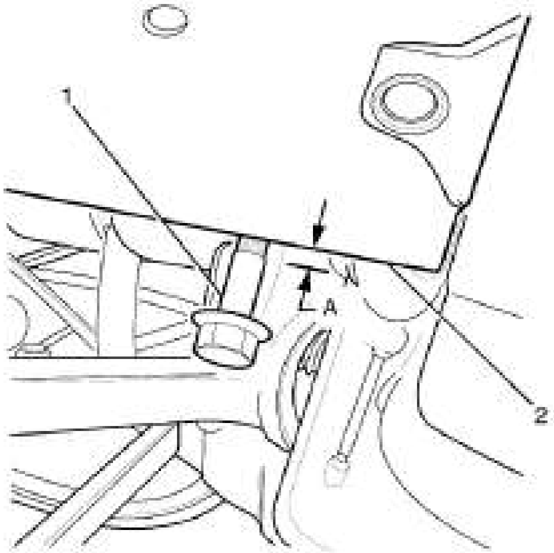
3. Lift the gearshift lever boot (1) enough to enable a firm grasp to be made on the gearshift lever (2) with the left hand, then grasp the gearshift knob with the right.
4. While rocking the knob sideways, and with an upward force applied, dislodge the knob retaining claws from the lever.
5. Remove the gearshift lever knob and boot assembly, from the gearshift lever (2).



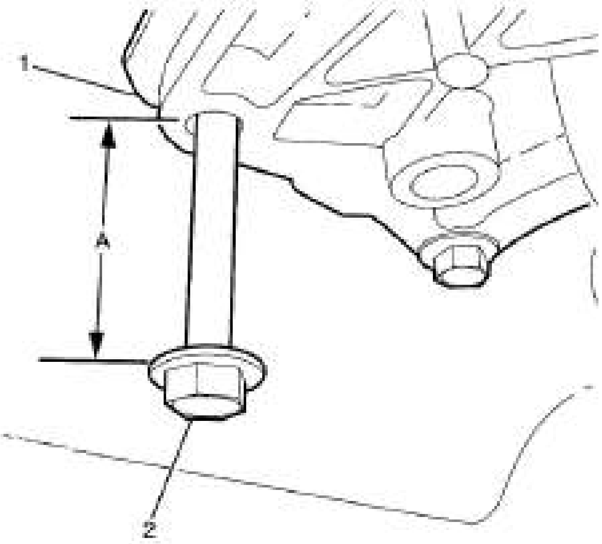
6. Remove the shift control assembly to shift control adapter plate retaining bolts (1).
7. Raise the vehicle. Refer to Lifting and Jacking the Vehicle .
8. Remove the exhaust system. Refer to Exhaust System Replacement .
9. Remove the propeller shaft. Refer to Propeller Shaft Replacement .
10. Support the power train with a suitable jack or table.
11. Using special tool EN-48536 lower engine and transmission assembly 65 millimetres.
12. Support the transmission with a suitable jack.



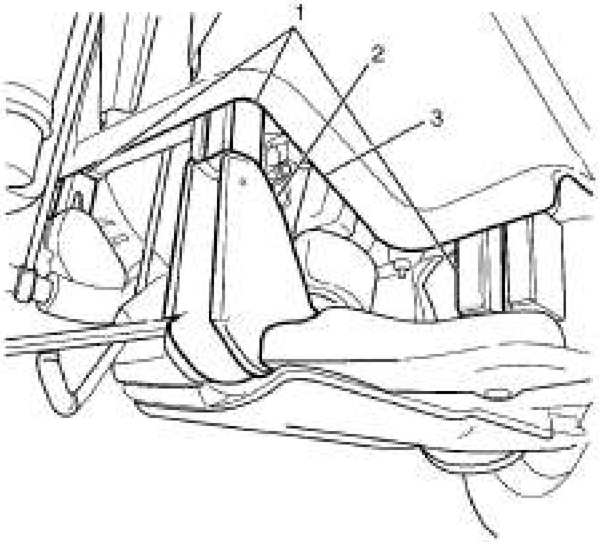
13. Replace the front sub frame rear bolts and fit bolts from special tool kit EN-48536 .
14. Install the retaining bolt (1) until the stepped shank (A) is two millimetres below sub frame (2).



15. Replace the front sub frame front bolts and fit bolts from special tool kit EN-48536 .
16. Install the retaining bolt (1) until the stepped shank (A) is two millimetres below chassis rail flange (2).



17. Remove the left front and right rear retaining bolts from the transmission mount and install two retaining bolts from special tool kit in diagonal holes e.g Left hand front and Right hand rear.
18. Install the retaining bolt (2) in until a 65 millimetre gap is achieved (A).
19. Remove front sub frame middle retaining bolts.
20. Lower power train slowly until the subframe and transmission mount are resting on the retaining bolts.



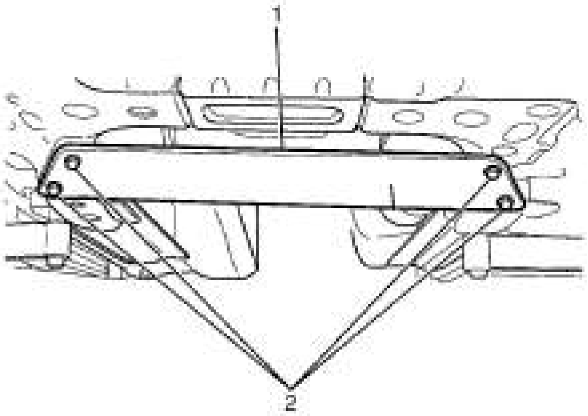
21. Insert 65 millimetre spacer blocks (1) between the subframe (2) and the chassis rails (3).
22. Tension front sub frame front and rear retaining bolts.

Tighten
Tighten the bolts to 95 N·m (70 lb. ft).

23. Install and tension middle sub frame retaining bolts.

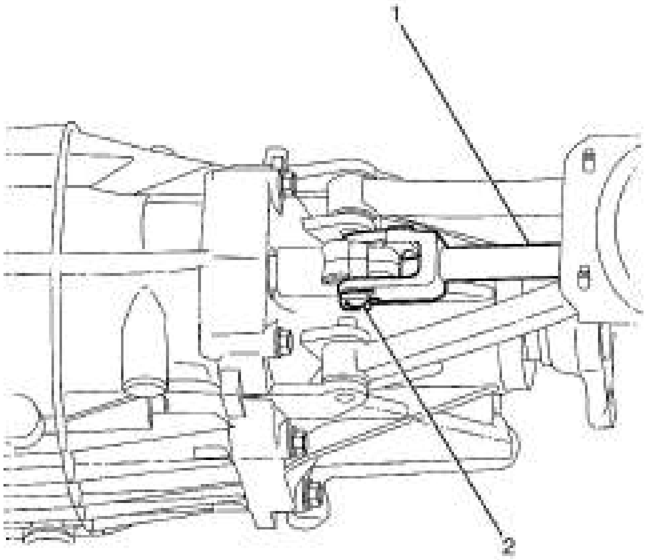
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

24. Remove suitable supporting jack.

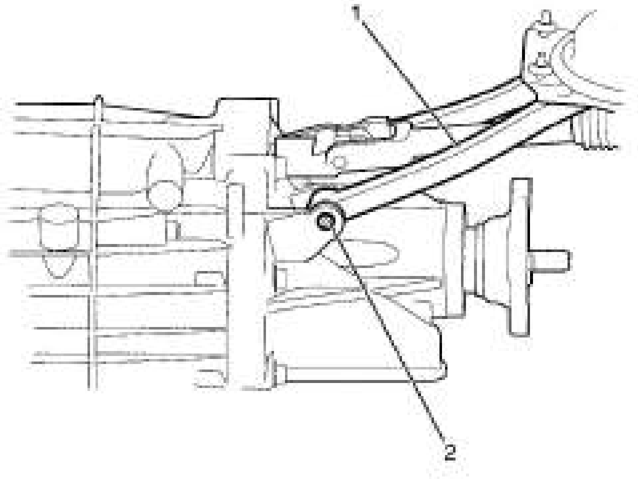


25. Install the engine support plate (1) to the front sub frame (2).
26. Install the engine support plate to front subframe retaining bolts (3).

    Tighten
    Tighten the bolts to 10 N·m (89 lb. in).

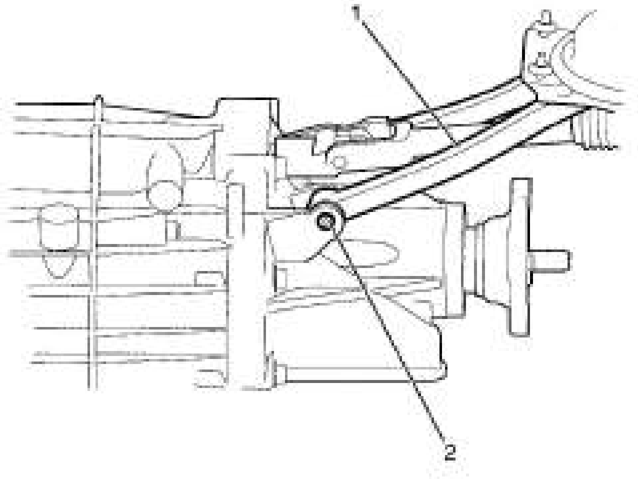


27. Use a suitable tool to remove the selector shaft rod retaining clip (2) from the shift control assembly (1).

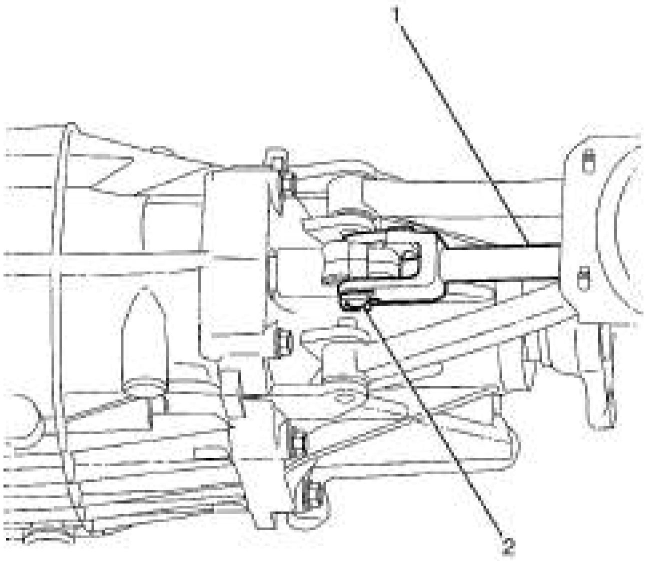


28. Remove the retaining pin (2) from the shift control assembly (1). Repeat for opposite side.
29. Remove the shift control assembly from the transmission.
30. Remove the shift control assembly from the vehicle.

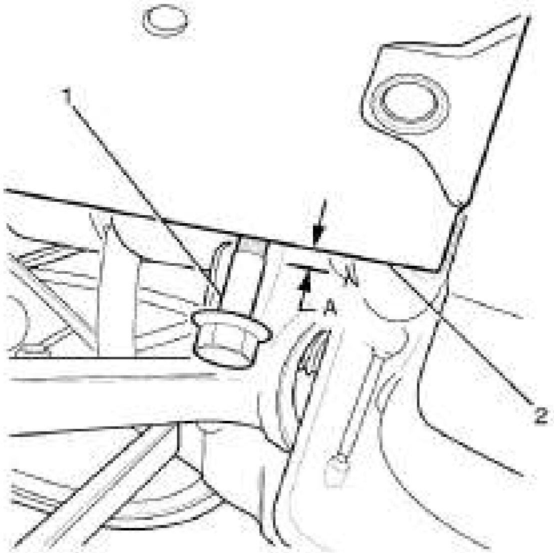
Installation Procedure



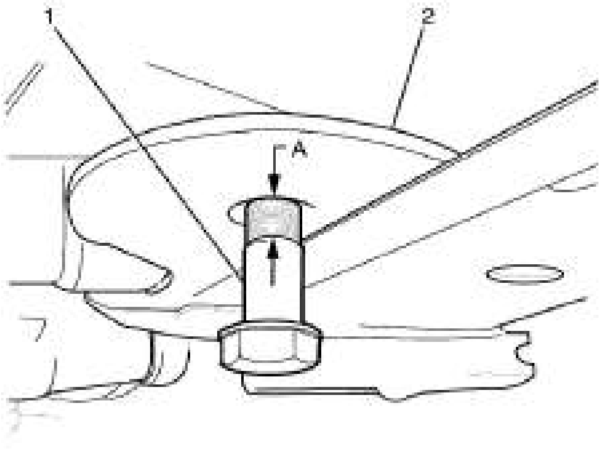
1. Install the shift control assembly (1) to the vehicle.
2. Install the retaining pin (2) to the shift control assembly. Repeat for opposite side.



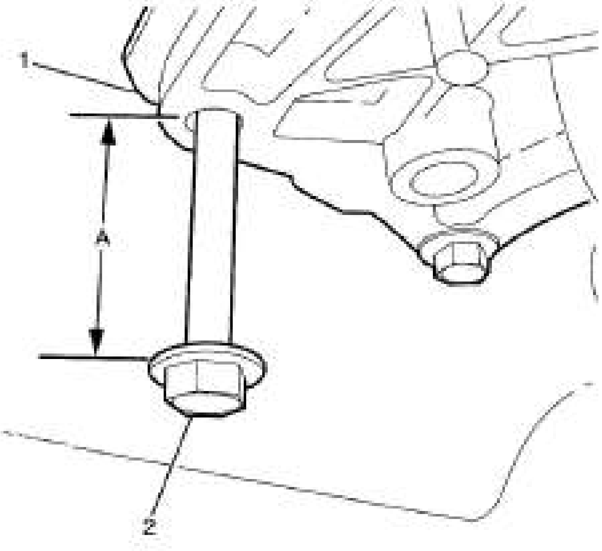
3. Install the selector shaft to shift control assembly rod.
4. Install the selector shaft rod retaining clip (2) from the shift control assembly (1).
5. Support the power train with a suitable jack or table.
6. Support the transmission with a suitable jack.



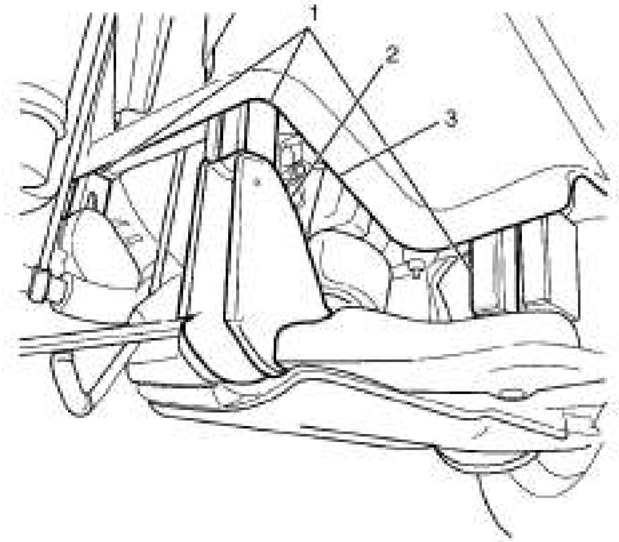
7. Loosen the retaining bolt (1) until the stepped shank (A) is two millimetres below sub frame (2).



8. Loosen the retaining bolt (1) until the stepped shank (A) is two millimetres below the sub frame (2).



9. Loosen the transmission mount to body retaining bolts (2) in the diagonal holes. (I.E. Left hand front and Right hand rear.)
10. Remove front sub frame middle retaining bolts.
11. Remove the spacer blocks from the front sub frame.
12. Raise the power train slowly until the front subframe and transmission mount are located on the vehicle.



13. Remove the six 65 millimetre spacer blocks (1) between subframe (2) and chassis rails (3).
14. Install the front sub frame to chassis rail retaining bolts.

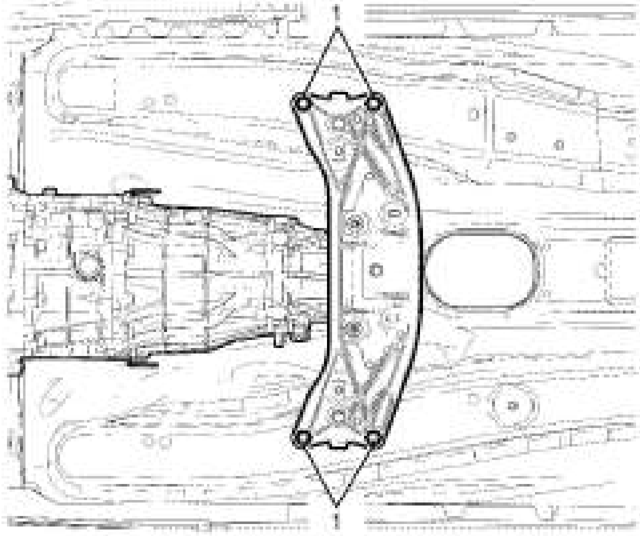
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

15. Install the rear sub frame to chassis rail retaining bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

16. Install the centre sub frame to chassis rail retaining bolts.

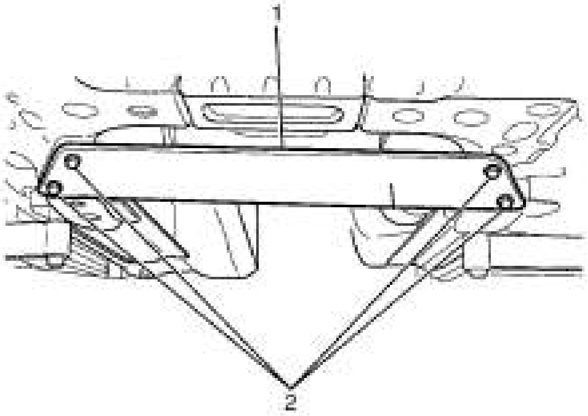
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).



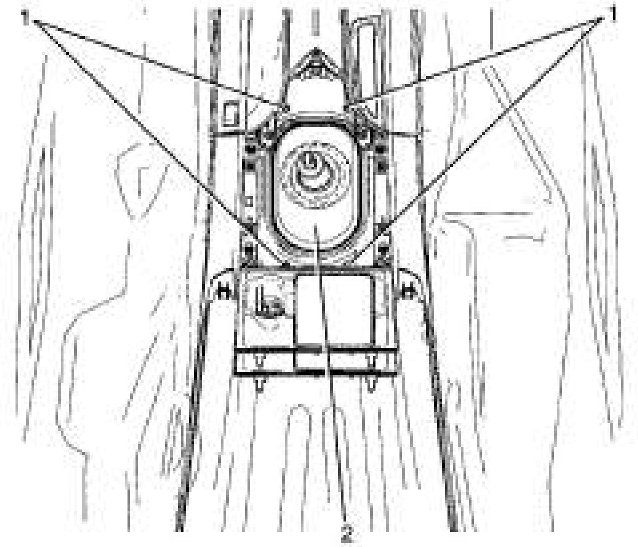
17. Install the transmission mount to body retaining bolts (1).

Tighten
Tighten the bolts to 58 N·m (43 lb. ft).

18. Raise the vehicle.
19. Remove supporting jack or table.

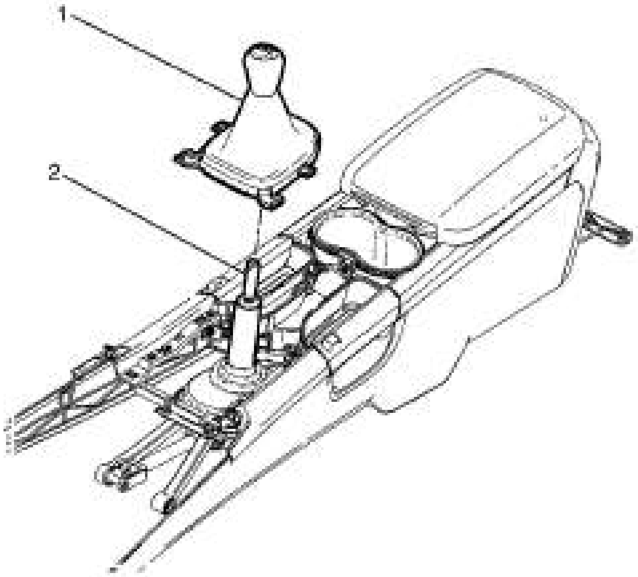


20. Remove the engine support plate (1) to front sub frame retaining bolts (2).
21. Remove the engine support plate from the vehicle.
22. Install the propeller shaft. Refer to Propeller Shaft Replacement .
23. Install the exhaust system. Refer to Exhaust System Replacement .
24. Lower the vehicle.

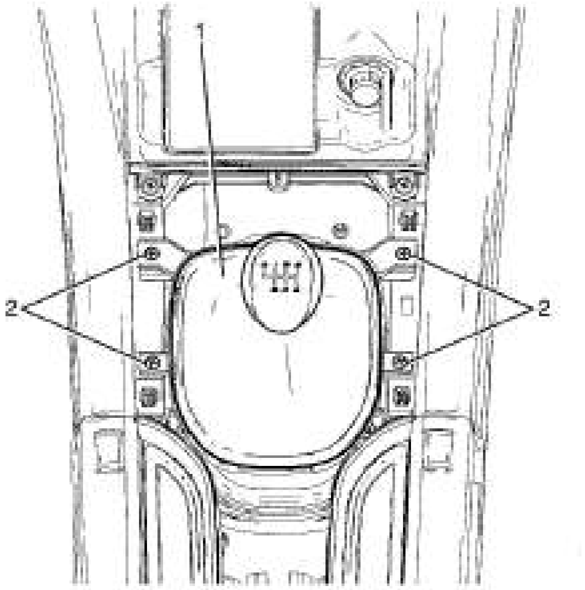


25. Install the shift control assembly to shift control adapter plate retaining nuts (1).

    Tighten
    Tighten the bolts to 12 N·m (106 lb. in).



26. Install the gearshift lever knob and boot assembly (1) to the gearshift lever.
27. Align the gearshift lever knob to the gearshift lever (2).
28. Apply pressure to the top of the gearshift knob to engage into the gearshift lever.



29. Install the gearshift lever boot to front console retaining screws (2).

    Tighten
    Tighten the bolts to 2 N·m (18 lb. in).

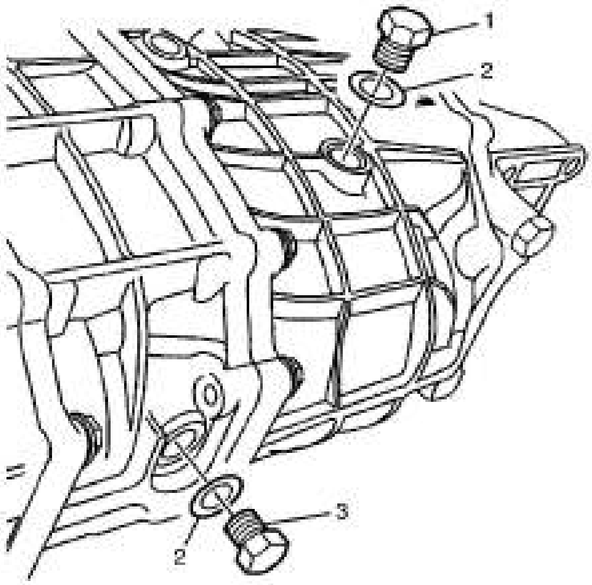
30. Install the trim plate. Refer to Console Trim Plate Replacement .

Transmission Fluid Level Inspection

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

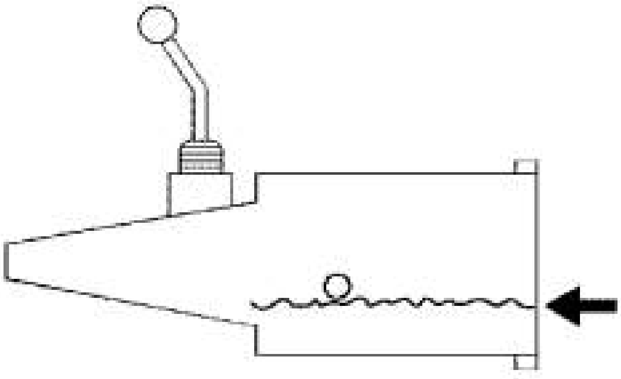
Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.

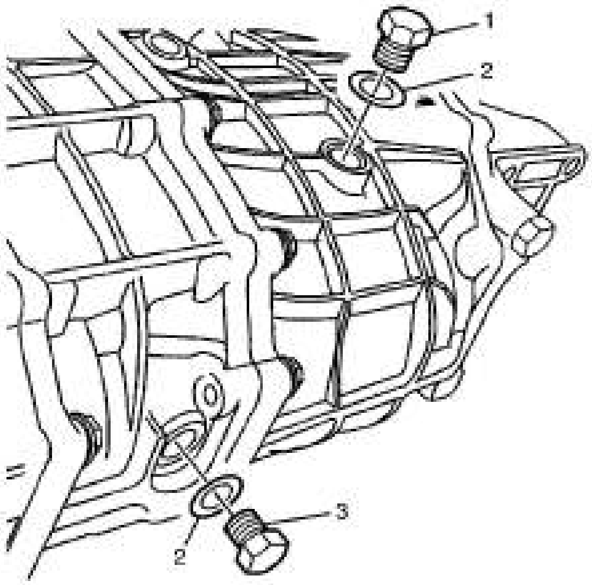


2. Clean any dirt from around the fill plug (1).
3. Remove the transmission fill plug (1) from the transmission.
4. Remove the transmission fill plug washer (2) and discard.

   Discard the washer.



5. Check that the transmission fluid level is even with the bottom of the fill plug hole.
6. Add transmission fluid, if necessary.



7. Install a NEW sealing washer (2) to the transmission fill plug.

   Notice: Refer to Fastener Notice in the Preface section.

8. Install the transmission fill plug (1) to the transmission.

   Tighten
   Tighten the transmission fill plug to 37 N·m (27 lb ft).

9. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - On Vehicle | **Document ID: 1985104**

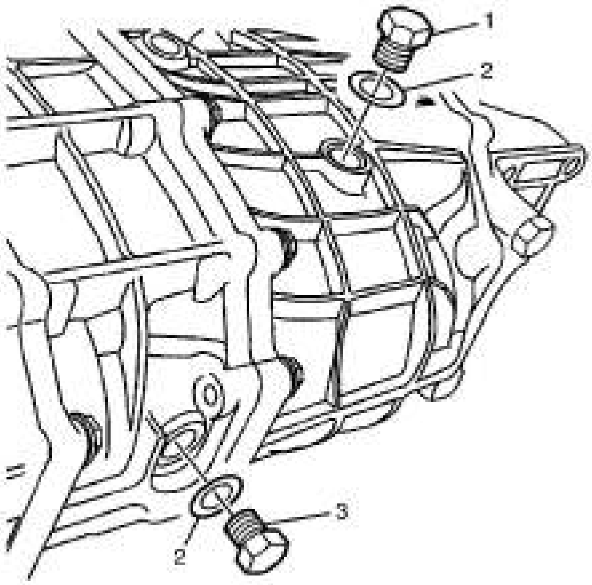
Transmission Fluid Replacement

Draining Procedure

Caution: Refer to Protective Goggles and Glove Caution in the Preface section.

Caution: Refer to Vehicle Lifting Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Clean away any dirt and debris from around the transmission fluid drain plug (3) area.
3. Position an appropriate container below the transmission drain plug.
4. Remove the transmission fluid drain plug (3) and washer (2) and discard.

   Discard the washer.

5. Allow the transmission fluid to drain into the container.
6. Install a NEW sealing washer (2) to the transmission drain plug.

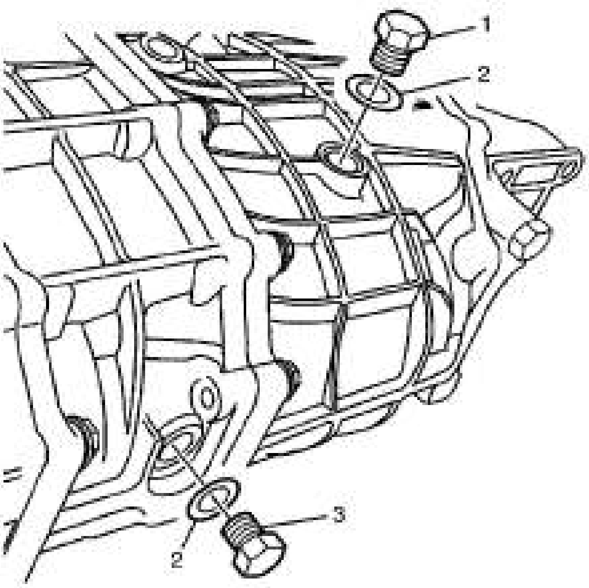
   Notice: Refer to Fastener Notice in the Preface section.

7. Install the transmission drain plug (1) to the transmission.

   Tighten
   Tighten the drain plug to 37 N·m (27 lb ft).

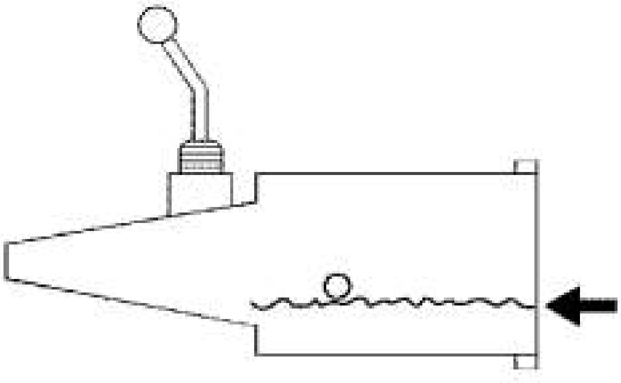
8. Remove the container used to catch the used transmission fluid from under the vehicle.

Filling Procedure

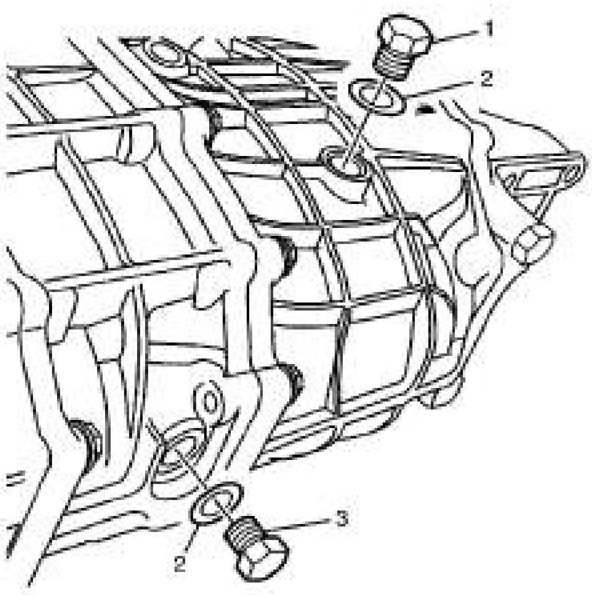


1. Clean away any dirt and debris from the transmission fluid fill plug (1) area.
2. Remove the transmission fluid fill plug (1) and washer (2) and discard.

   Discard the washer.



3. Fill the transmission to just below the bottom of the fill plug hole with the recommended fluid. Refer to Lubrication Specifications.



4. Install a NEW sealing washer (2) to the transmission fill plug.

   Notice: Refer to Fastener Notice in the Preface section.

5. Install the transmission fill plug (1) to the transmission.

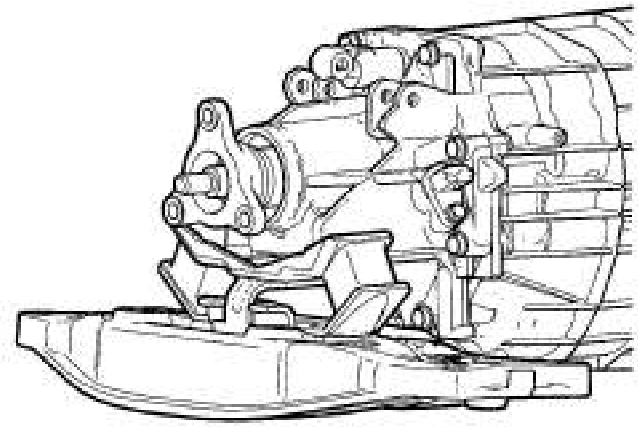
   Tighten
   Tighten the fill plug to 37 N·m (27 lb ft).

Transmission Mount Inspection

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .



Important: Before replacing any transmission mount due to suspected fluid loss, verify that the source of the fluid is the transmission mount, not the engine, transmission or accessories.

2. Raise the transmission in order to remove the weight from the transmission mount and create slight tension in the rubber.
3. Observe the transmission mount while raising the transmission. Replace the transmission mount if the transmission mount exhibits any of the following conditions:
   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the transmission mount.
   - The rubber is split through the centre of the transmission mount.
4. If there is movement between the metal plate of the transmission mount and its attaching points, lower the transmission on the transmission mount. Tighten the bolts or nuts attaching the transmission mount to the frame or transmission mount bracket. Refer to Transmission Mount Replacement .
5. Lower the vehicle.

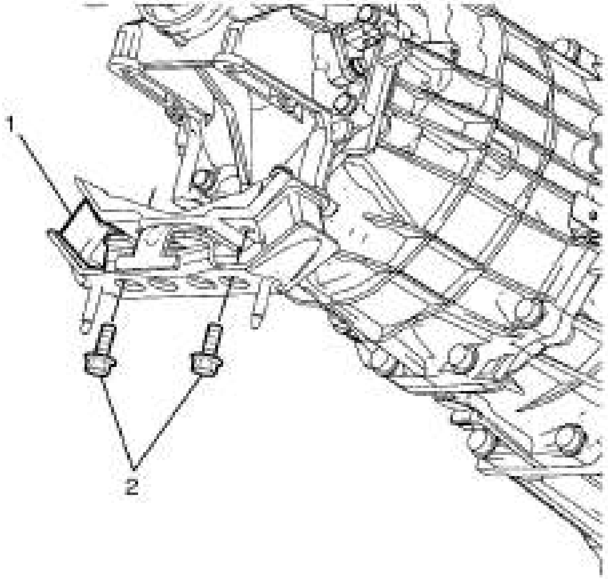
Transmission Mount Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

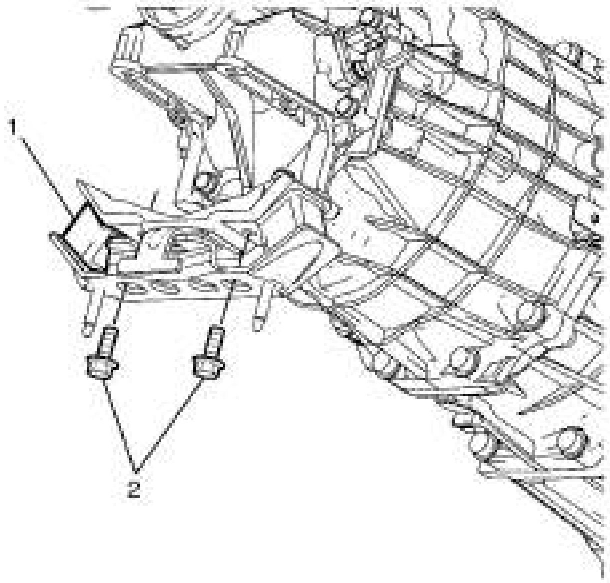
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the transmission support. Refer to Transmission Support Replacement.



3. Remove the transmission mount to transmission upper retaining bolts (2).
4. Remove the transmission mount (1).

Installation Procedure



1. Install the transmission mount to the transmission.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the transmission mount (1) to transmission upper retaining bolts(2).

   Tighten
   Tighten the bolts to 60 N·m (44 lb ft).

3. Install the transmission support. Refer to Transmission Support Replacement.
4. Lower the vehicle.

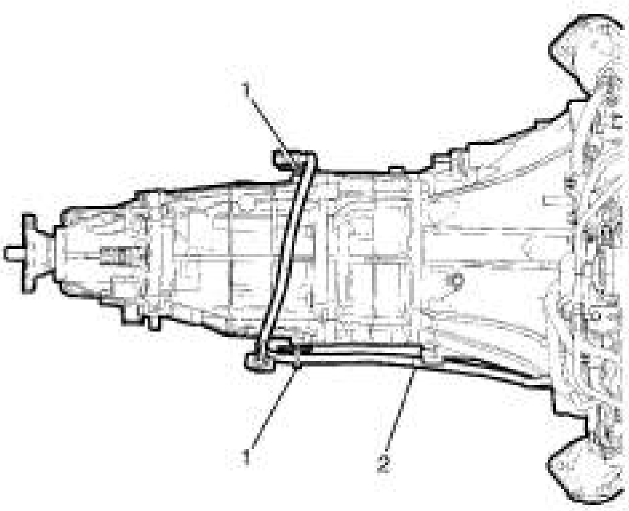
Transmission Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

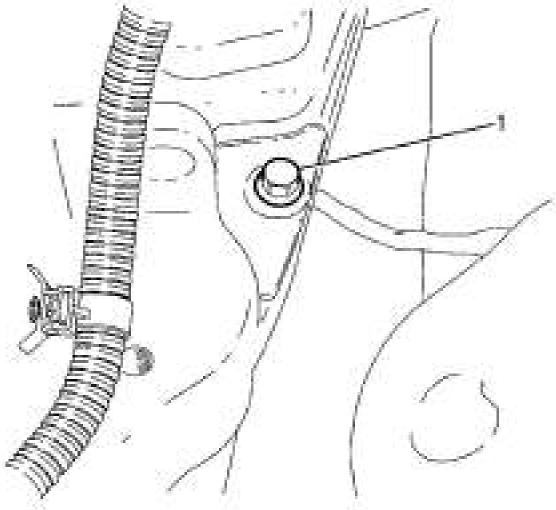
1. Remove the shift control assembly. Refer to Shift Control Assembly Replacement .
2. Remove the propeller shaft. Refer to Propeller Shaft Replacement .



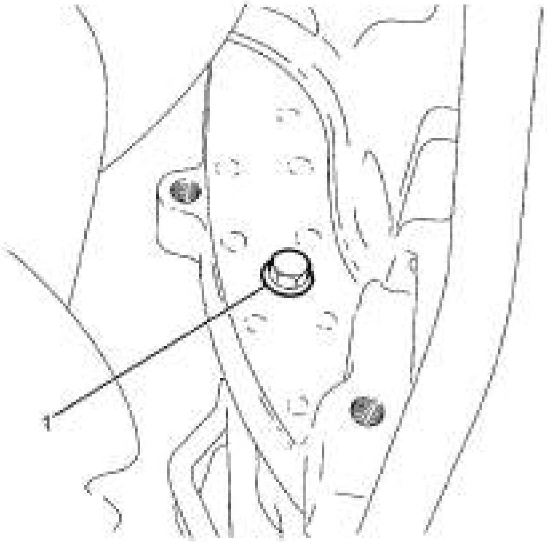
3. Disconnect the following electrical connector:

   Backup lamp switch (2).

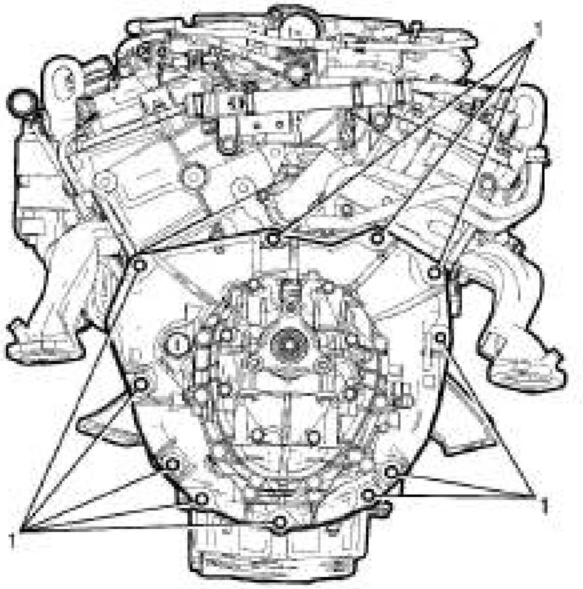
4. Disconnect the oxygen sensor connectors (1) from the transmission.
5. Disconnect the clutch slave cylinder. Refer to Clutch Concentric Actuator Cylinder Replacement .
6. Remove the starter motor. Refer to Starter Motor Replacement .



7. Remove the transmission close out panel to transmission retaining bolt (1).



8. Remove the transmission close out panel to transmission retaining bolt (1).

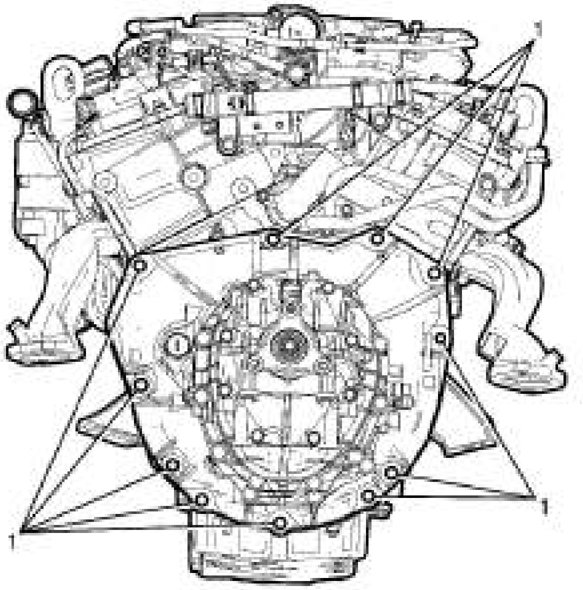


9. Remove the transmission to engine block retaining bolts (1)
10. Remove the transmission from the vehicle.

Installation Procedure

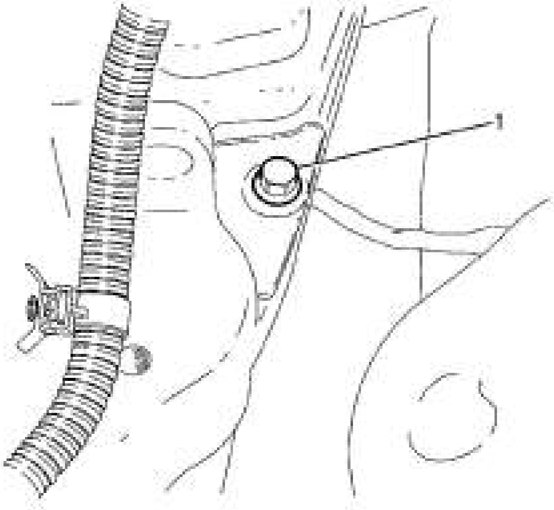
Important: Engage third gear on the transmission to allow for alignment of the input spline of the transmission to the clutch assembly.

1. Install the transmission to the vehicle.



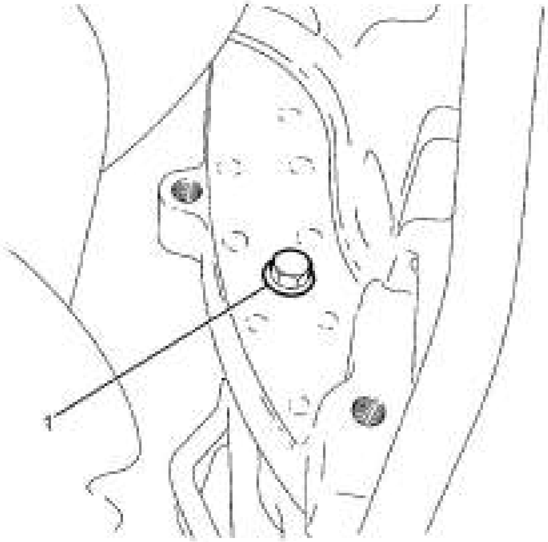
2. Install the transmission to engine block retaining bolts (1)

Tighten
Tighten the bolts to 48 N·m (35 lb ft).



3. Install the transmission close out panel to transmission retaining bolt (1).

   Tighten
   Tighten the bolt to 20 N·m (15 lb ft).

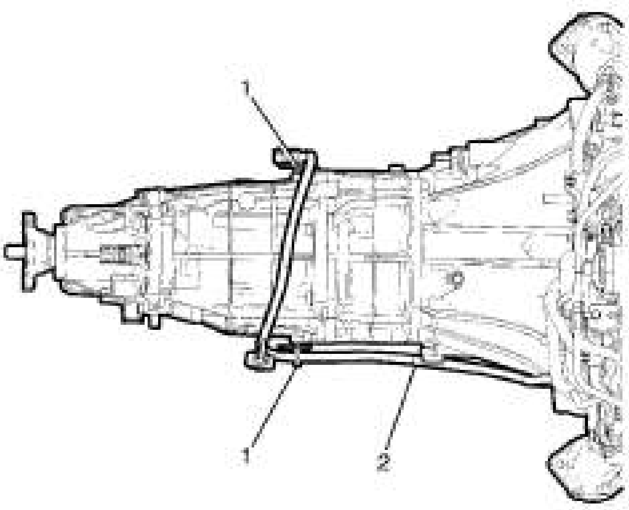


4. Install the transmission close out panel to transmission retaining bolt (1).

   Tighten
   Tighten the bolt to 20 N·m (15 lb ft).

5. Connect the clutch slave cylinder. Refer to Clutch Concentric Actuator Cylinder Replacement .

6. Install the starter motor. Refer to Starter Motor Replacement .



7. Connect the following electrical connector:

   Backup lamp switch (1).

8. Connect the oxygen sensor connectors (1) from the transmission.
9. Install the shift control assembly to the transmission. Refer to Shift Control Assembly Replacement .
10. Install the propeller shaft. Refer to Propeller Shaft Replacement .
11. Check the transmission fluid and fill as necessary. Refer to Transmission Fluid Level Inspection and Transmission Fluid Replacement .
12. Install the exhaust system. Refer to Exhaust System Replacement .
13. Lower the vehicle.

Transmission Final Test and Inspection

Complete the following procedure after the transmission is installed in the vehicle:

1. With the ignition OFF or disconnected and clutch pedal depressed, crank the engine several times. Listen for any unusual noises or evidence that any parts are binding.
2. Place transmission in neutral, start the engine and listen for any unusual noises or evidence that any parts are binding.
3. While the engine continues to idle raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
4. Perform a final inspection for the proper fluid level. Refer to Transmission Fluid Level Inspection .
5. Lower the vehicle.
6. Road test the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - On Vehicle | **Document ID: 1977480**

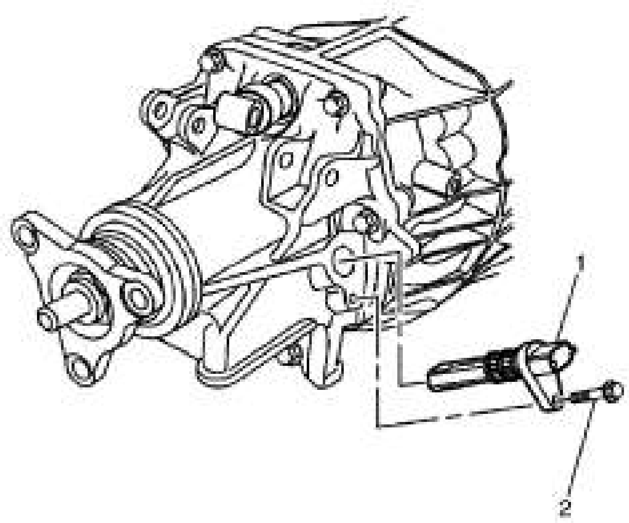
Vehicle Speed Sensor Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

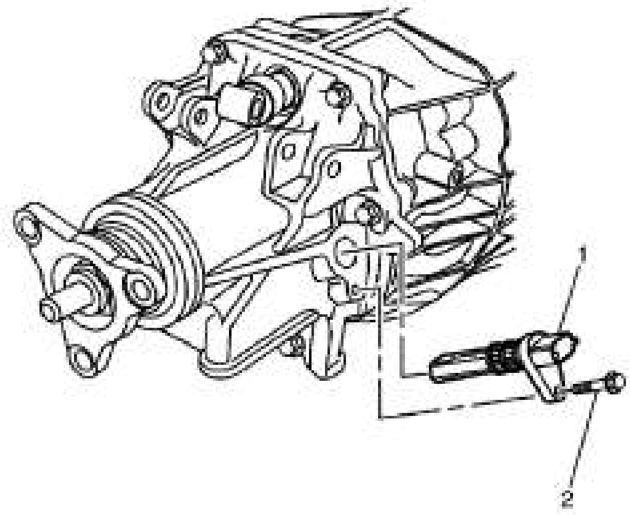
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Remove the VSS bolt (2).
3. Remove the VSS (1) from the rear extension housing.

Installation Procedure



1. Install the VSS (1) to the rear extension housing.

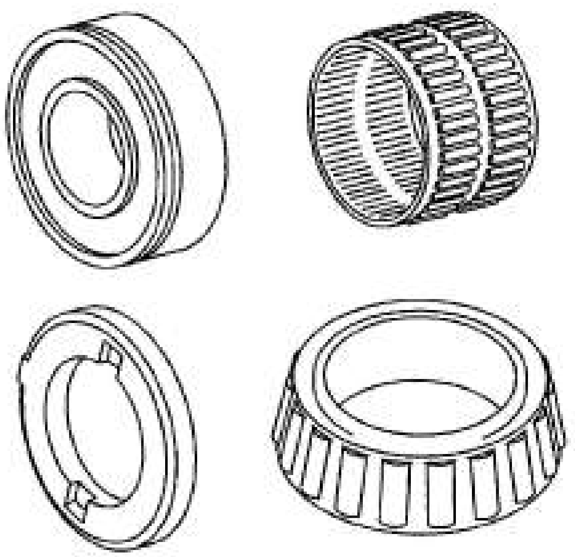
   Notice: Refer to Fastener Notice in the Preface section.

2. Install the VSS bolt (2).

   Tighten
   Tighten the bolt to 8 N·m (71 lb in).

3. Lower the vehicle.

Bearings and Spacers Cleaning and Inspection



Notice: Do not allow the bearings to spin. Turn them slowly by hand. Spinning the bearings may damage the race and the rollers.

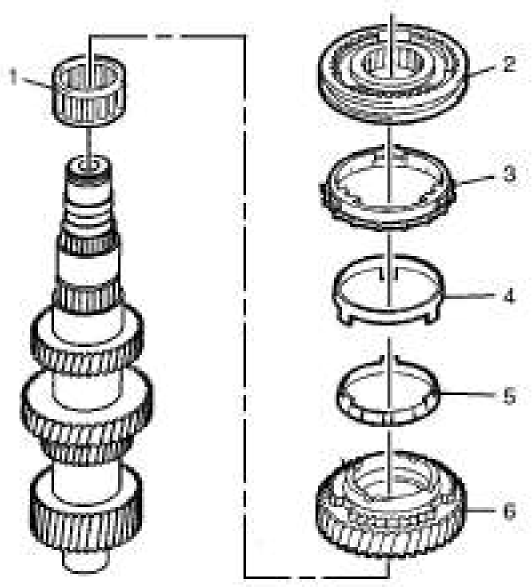
1. Mark or tag the bearings in order to ensure they are properly installed in the correct location.
2. Clean all of the roller bearings, needle bearings, and ball bearings in a suitable solvent and air dry all the parts.
3. Inspect the bearings and races for the following conditions:
   - Roughness
   - Brinelling
   - Pitting
4. Inspect the cage bearings for being bent or for having damaged cages.
5. Replace the bearings with any of the above conditions.
6. Replace mated bearing parts when only one part is damaged.
7. Inspect the thrust washers for scoring or wear.
8. Replace any faulty thrust washers.
9. Do not file surfaces which have been hardened and precision ground.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1996523**

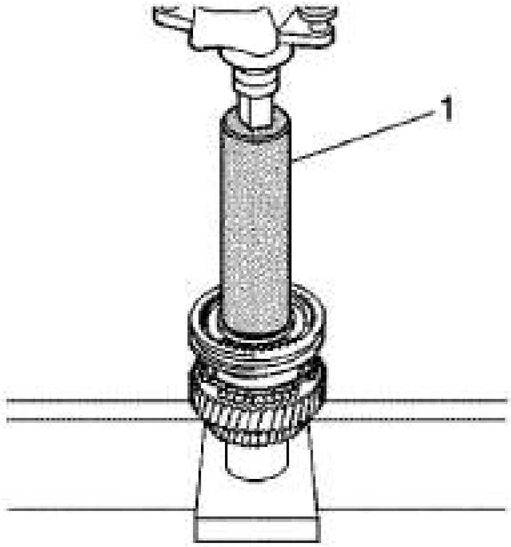
Counter Gear Shaft Assemble

Tools Required

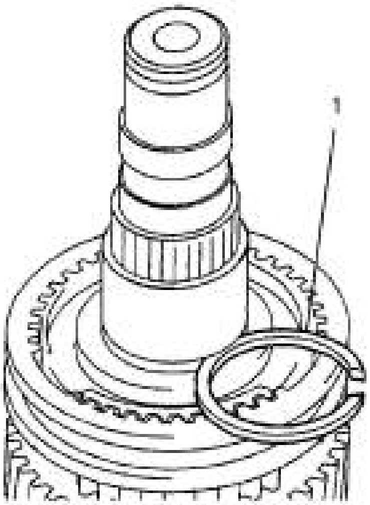
- DT-47722 Shift Rail Bushing Remover and Installer
- DT-47723 Output Shaft Bearing Installer
- J-22912-01 Split Plate Bearing Puller
- J 45869 Gear Protection Plates



1. Apply an approved lubricant to the counter gear shaft and install the following components:
   - the 2nd gear bearing (1)
   - the 2nd gear (6)
   - the 2nd gear synchronizer inner cone (5)
   - the 2nd gear synchronizer outer cone (4)
   - the 2nd gear outer blocker ring (3)
   - the 1st/2nd gear synchronizer sleeve (2)

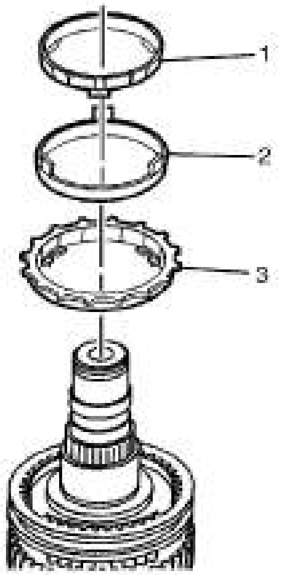


2. Using a hydraulic press and DT-47722 (1), install the 1st/2nd gear synchronizer sleeve with the boss side facing 2nd gear. The synchronizer ring set and transmission clutch hub are to be aligned when installing the transmission clutch hub assembly.

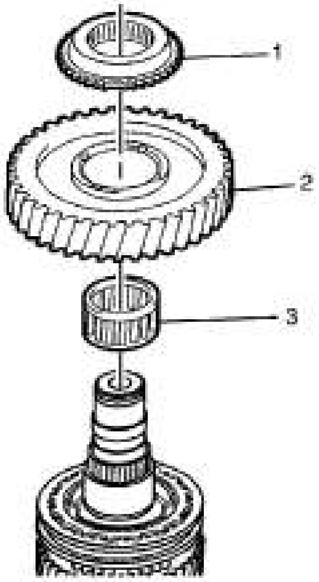


Important: The retaining ring is a selected fit. Always install a NEW retaining ring.

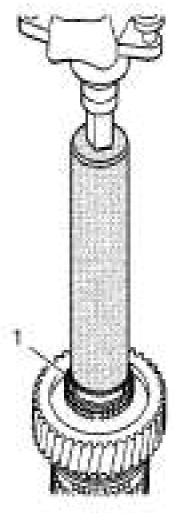
3. Select the maximum thickness snap ring (1) that will fit in the groove. Refer to Countershaft Front and Rear Bearing Retaining Ring Specifications .
4. Install a NEW snap ring to the counter gear shaft.



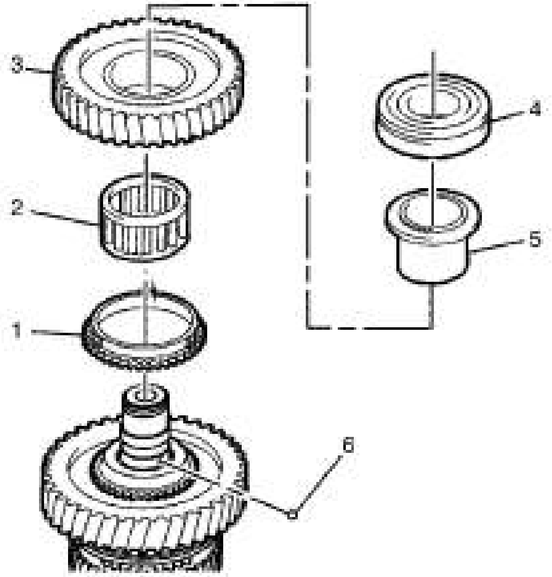
5. Apply an approved lubricant and install the following components:
   - the 1st gear outer blocking ring (3)
   - the 1st gear synchronizer outer cone (2)
   - the 1st gear synchronizer inner cone (1)



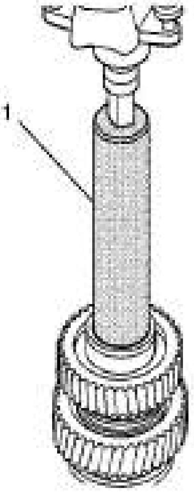
6. Apply an approved lubricant and install and align the 1st gear bearing (3), 1st gear (2) and the reverse gear spline (1).



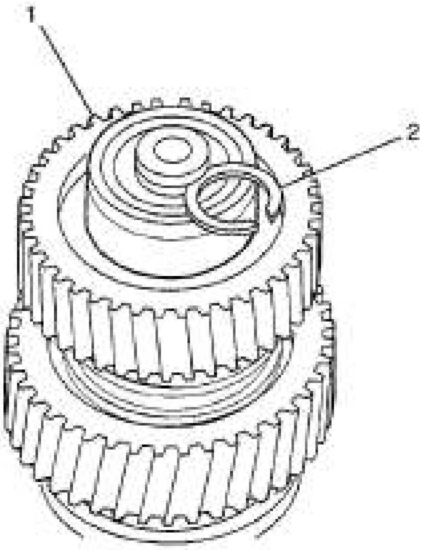
7. Using a hydraulic press and DT-47723 , install the reverse gear spline (1).



8. Apply an approved lubricant and install the reverse gear blocking ring (1).
9. Install the ball (6) to the countershaft.
10. Apply an approved lubricant and install the reverse gear bushing bearing (2).
11. Apply an approved lubricant to the synchronizer sleeve and reverse gear (3).
12. Align and install the synchronizer sleeve and reverse gear (3) together.
13. Apply an approved lubricant and install the reverse gear bushing (5) with ball.
14. Install the counter gear front bearing (4) with groove facing forward.



15. Using a hydraulic press and DT-47723 (1), install the counter gear front bearing.



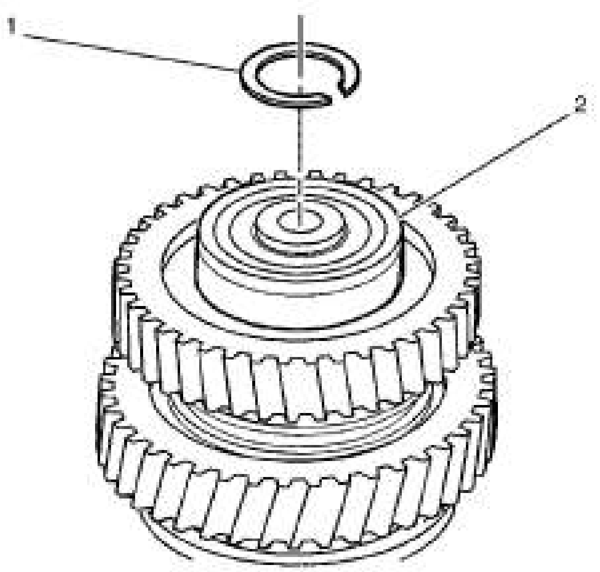
Important: The retaining ring is a selected fit. Always install a NEW retaining ring.

16. Select the maximum thickness snap ring (2) that will fit in the groove. Refer to 1st and 2nd Gear Synchronizer Retaining Ring Specifications .
17. Install a NEW snap ring (2) to the counter gear shaft (1).

Counter Gear Shaft Disassemble

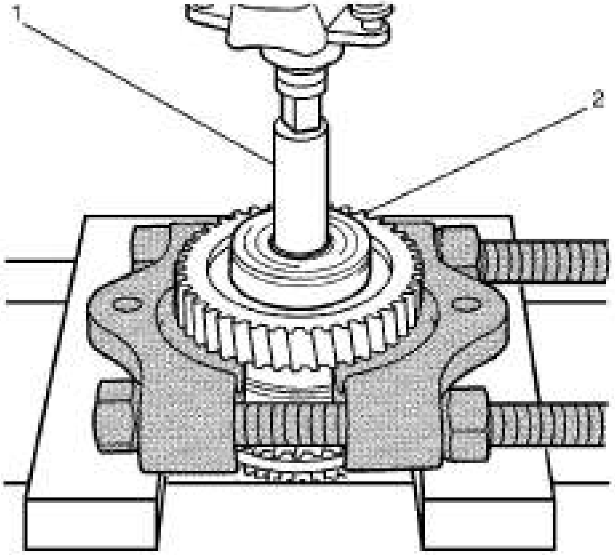
Tools Required

J-22912-01 Split Plate Bearing Puller



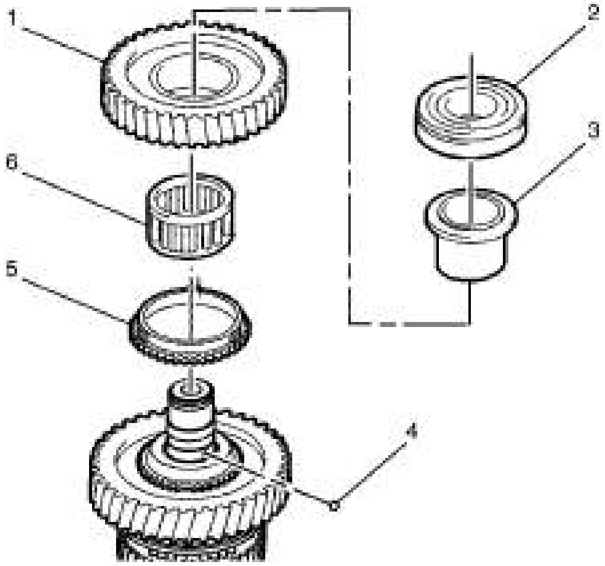
1. Remove the snap ring (1) from the countershaft above the counter gear front bearing (2). Discard the snap ring (1).

   Discard the snap ring.



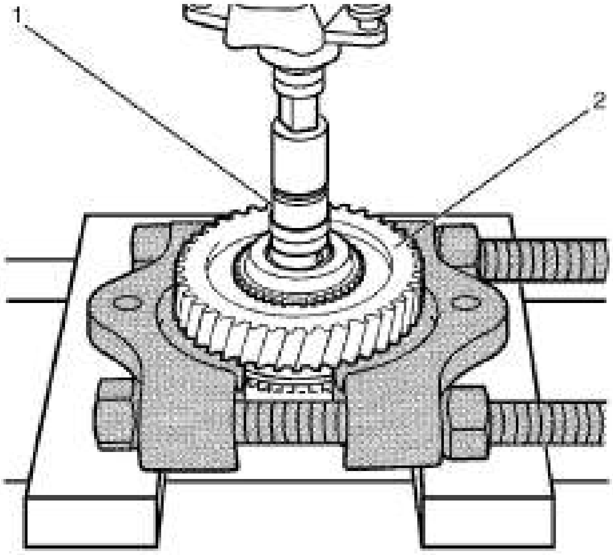
Important: Place the edge of gear on press plate.

2. Using a hydraulic press and J-22912-01 , remove the counter gear front bearing and reverse synchronizer assembly as a unit (2).

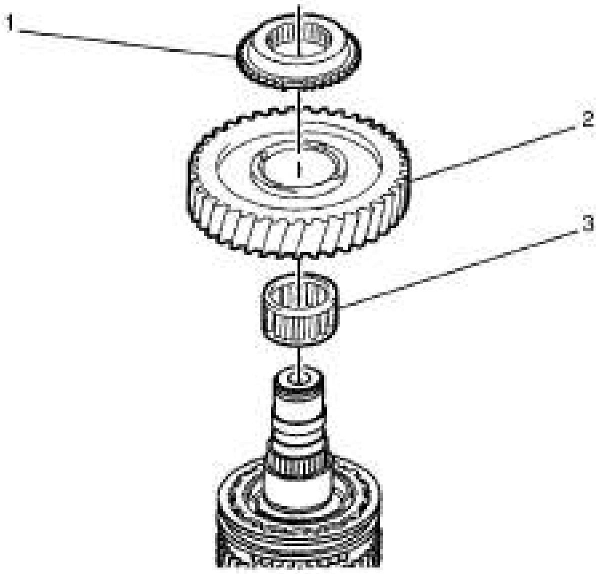


3. Remove the following components from the counter shaft as an assembly:
   - the counter gear front bearing (2)
   - the reverse gear bushing (3)
   - the reverse gear (1)
   - the reverse gear bearing (6)
   - the reverse gear blocking ring (5)

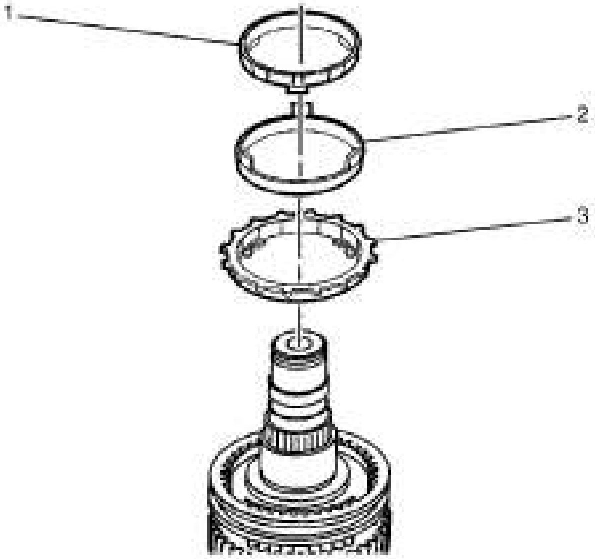
4. Using a suitable tool, remove the locking ball (4) from the counter shaft.



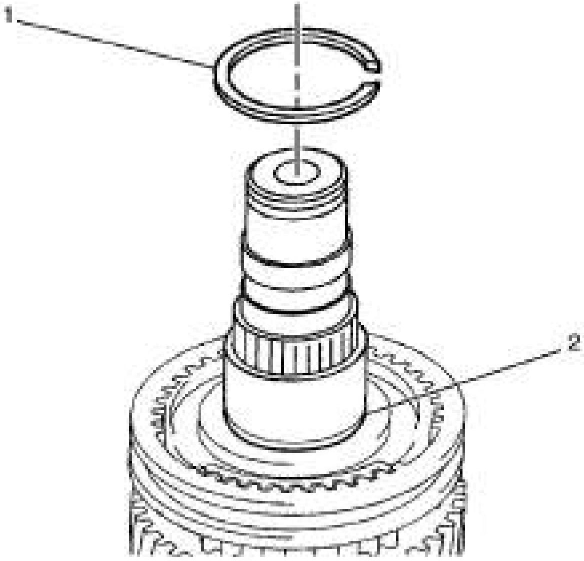
5. Using a hydraulic press and J-22912-01 , remove the reverse gear spline and 1st gear as a unit (2).



6. Remove the reverse gear spline (1) from the counter shaft.
7. Remove the 1st gear (2) from the counter shaft.
8. Remove the 1st gear bearing (3) from the counter shaft.

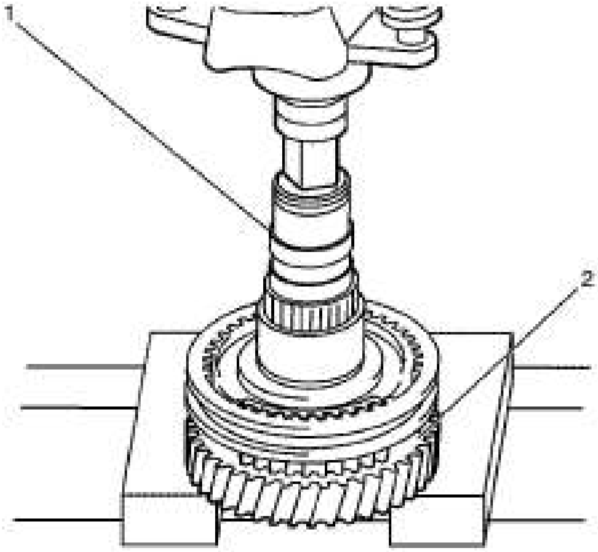


9. Remove the 1st gear synchronizer inner cone (1) from the counter shaft.
10. Remove the 1st gear synchronizer outer cone (2) from the counter shaft.
11. Remove the 1st gear outer blocking ring (3) from the counter shaft.



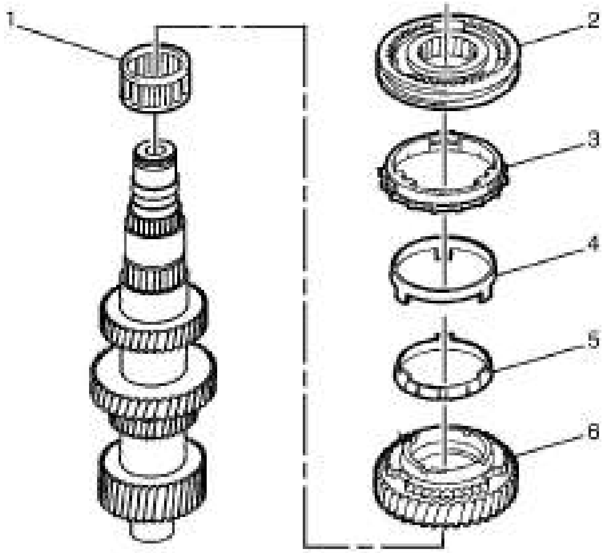
12. Remove the 2nd gear assembly to counter shaft snap ring (1) and discard.

    Discard the snap ring.



Important: Place the edge of gear on press plate.

13. Using a hydraulic press, remove the 2nd gear and the 1-2 synchronizer assembly (2) as a unit.



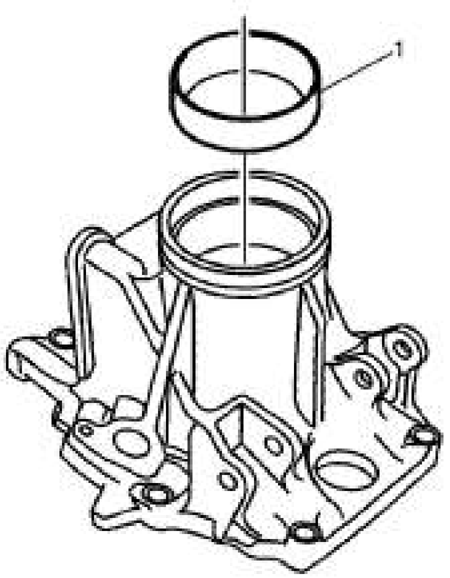
14. Remove the following components from the counter shaft as an assembly:
    - The 1st/2nd gear synchronizer sleeve (2)
    - The 2nd gear outer blocking ring (3)
    - The 2nd gear synchronizer outer cone (4)
    - The 2nd gear synchronizer inner cone (5)
    - The 2nd gear (6)

- The 2nd gear bearing (1)

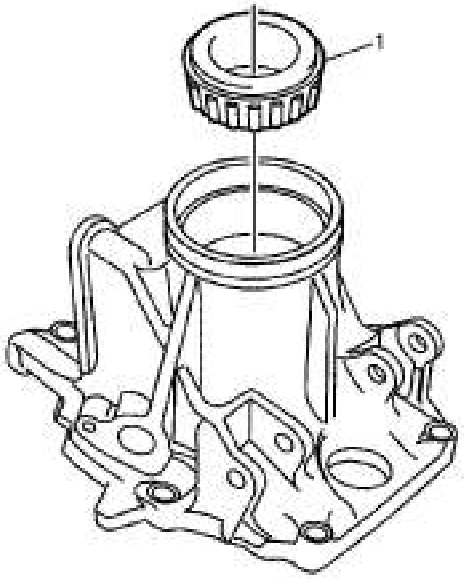
Extension Assemble

Tools Required

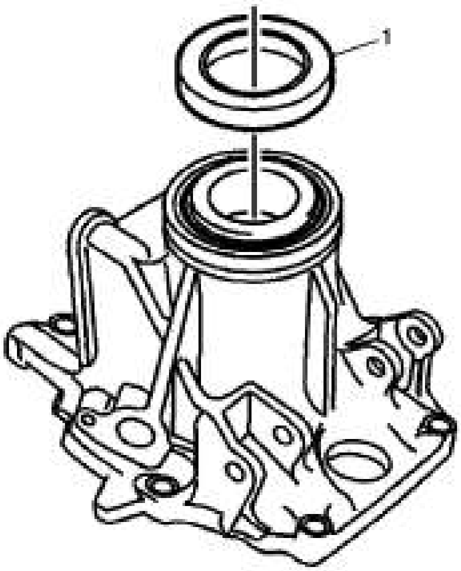
- DT-47721 Shift Shaft Seal Installer
- DT-47725 Extension Housing Bearing Cup Installer
- J 21128 Axle Pinion Oil Seal Installer
- J 36614 Inner Pinion Bearing Installer



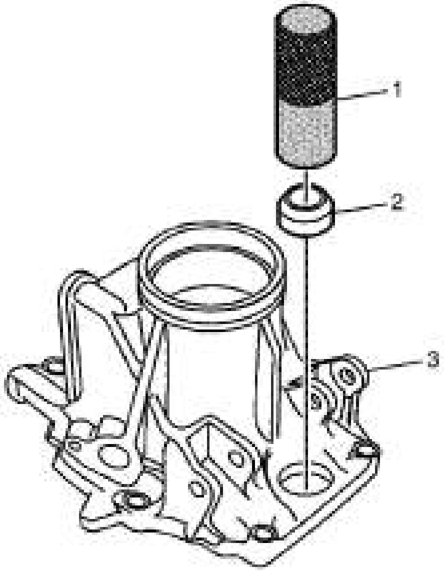
1. Using DT-47725 and J 36614 , install the tapered bearing race (1).



2. Apply an approved gear oil and install the tapered roller bearing (1).



3. Using J 21128 , install a NEW rear output seal (1).



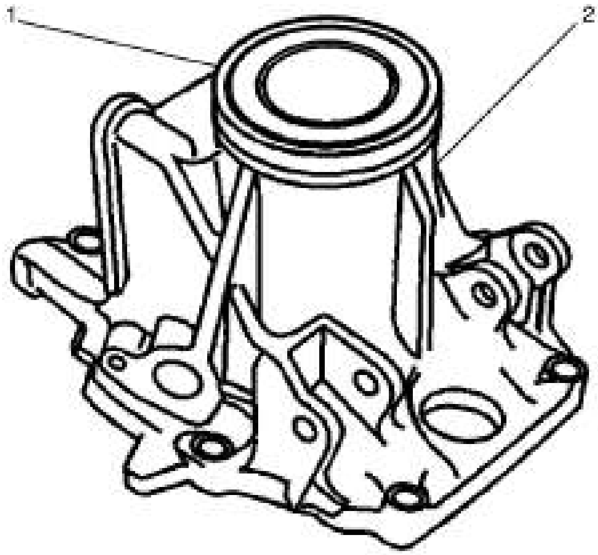
4. Using DT-47721 , install a NEW shift shaft seal (1).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1997916**

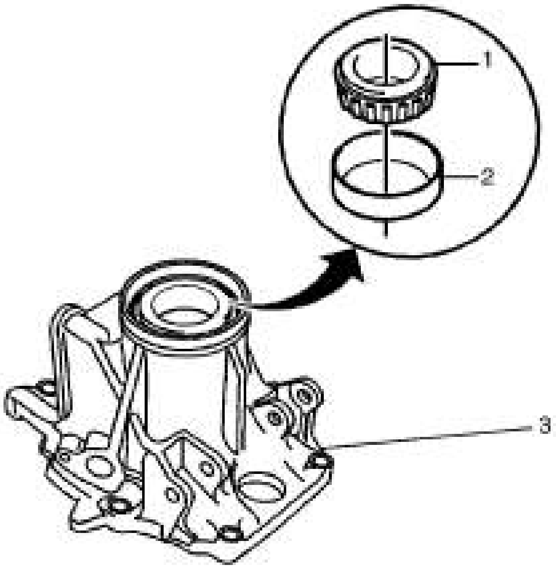
Extension Disassemble

Tools Required

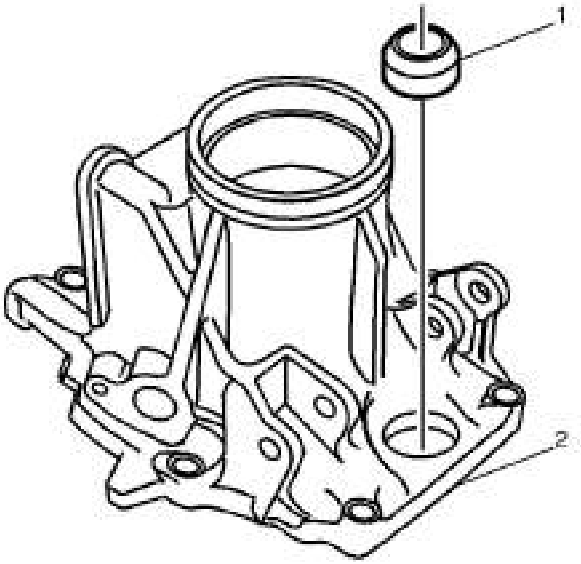
- DT-47721 Shift Shaft Seal Installer
- J 2619-01 Slide Hammer
- J 26941 Bushing and Bearing Remover 3 - 4 in



1. Using J 2619-01 and J 26941 , remove the rear output shaft seal (1) from the extension housing.



2. Using J 2619-01 and J 26941 , remove the rear output shaft bearing assembly (1 and 2) from the extension housing.



3. Using tool DT-47721 , remove the shift shaft seal (1) from the extension housing.

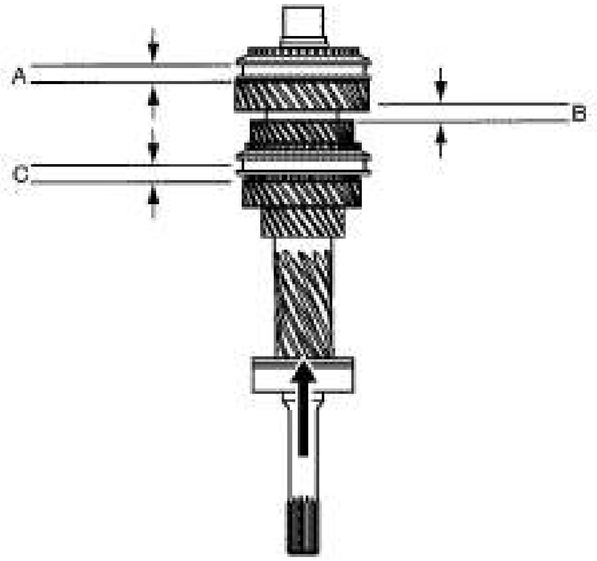
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1996539**

Gears and Shafts Cleaning and Inspection

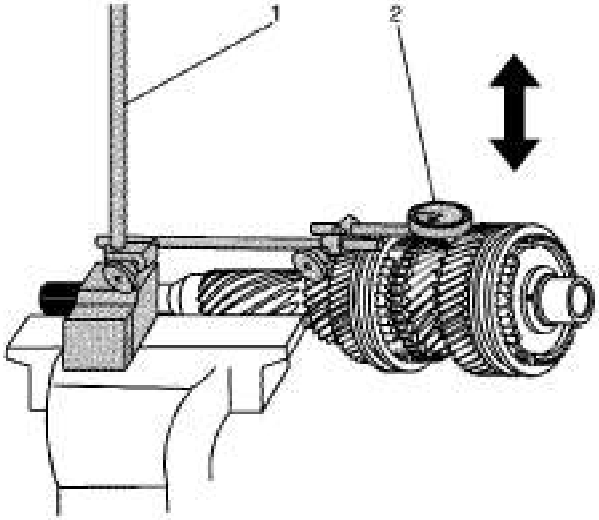
Tools Required

- J 8001-3 Dial Indicator
- J 26900-12 Dial Indicator - 1-10 mm
- J 26900-13 Magnetic Indicator Base

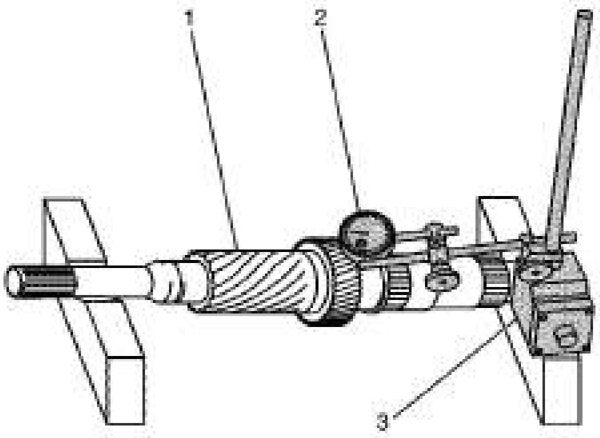
Input Shaft



1. Inspect 3rd (B), 4th (C), and 6th gear (A) for axial clearance. Lift up on the gear from the settled position and measure travel. Refer to Transmission Clearance Specifications.



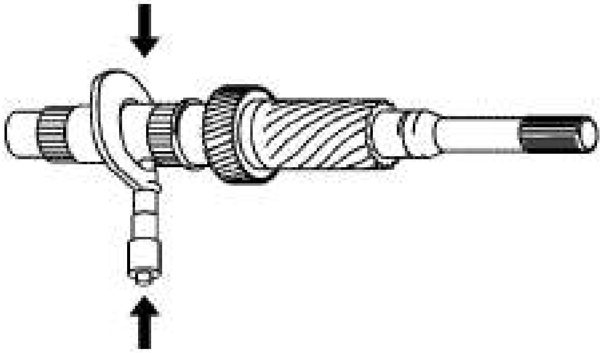
2. Measure the radial clearance for each of the speed gears.
    2.1. Place the speed gear, with the needle roller bearing, on the input shaft at the correct journal.
    2.2. Use J 8001-3 or J 26900-12 (1) and J 26900-13 (2).
    2.3. Position J 8001-3 or J 26900-12 on the gear.
    2.4. Move the gear up and down and measure travel. Refer to Transmission Clearance Specifications.
3. If the clearance exceeds the maximum, replace either the gear, the needle roller bearing, or the input shaft.
4. Retest for radial clearance for each of the speed gears and measure travel. Refer to Transmission Clearance Specifications.
5. Clean the input shaft in a suitable solvent.
6. Clean and air dry the oil gallery.
7. Inspect the input shaft bearing surfaces for the following conditions:
    - Wear
    - Lack of lubricant
    - Debris embedded in the oil grooves
    - Brinelling
8. Inspect the input shaft splines for wear or damage.
9. Replace the input shaft if any of the above conditions are found.



10. Using J 8001-3 or J 26900-12 (1), J 26900-13 (2) and V-blocks, inspect the input shaft for runout.

    Specification
    Maximum runout: 0.06 mm (0.0024 in)

11. If the runout exceeds the maximum, replace the input shaft.



Important: To calculate the radial clearance, measure shaft diameter, needle roller bearing diameter and gear inner diameter.

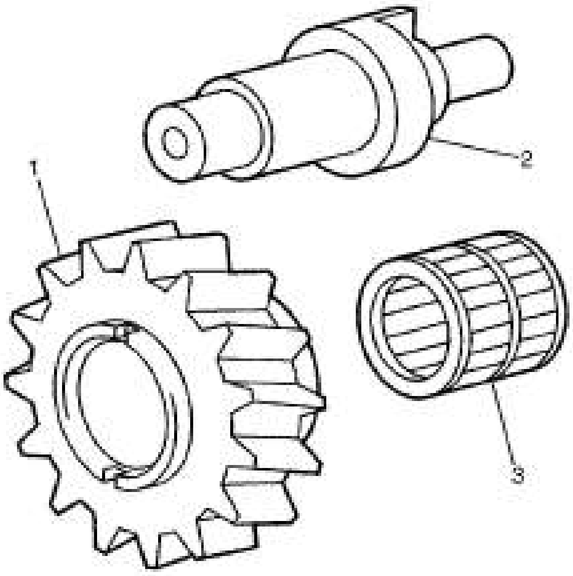
12. Using a micrometer, measure the diameter of the input shaft journals.

Specification

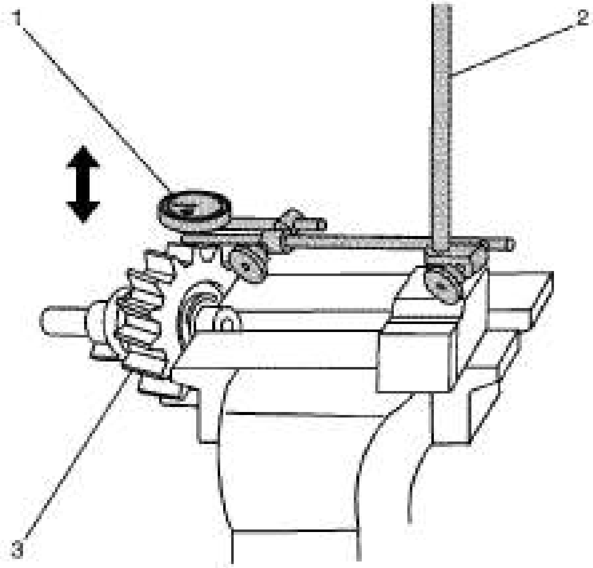
- Minimum diameter 1st gear (a): 38.860 mm (1.5299 in)
- Minimum diameter 2nd gear (b): 46.860 mm (1.8449 in)
- Minimum diameter 3rd gear (c): 37.869 mm (1.4905 in)

13. If the journal diameter is less than the minimum, replace the input shaft.

Reverse Idler Gear and Shaft



1. Clean the reverse idler gear and shaft in a suitable solvent and air dry all the parts.
2. Inspect the bushing in the reverse idler gear for the following conditions:
   - Excessive wear
   - Scoring
   - Pitting
3. Replace the reverse idler gear if the bushing is faulty.
4. Inspect the reverse idler gear shaft for the following conditions:
   - Excessive wear
   - Scoring
   - Pitting
5. Replace the reverse idler gear shaft if it is faulty.



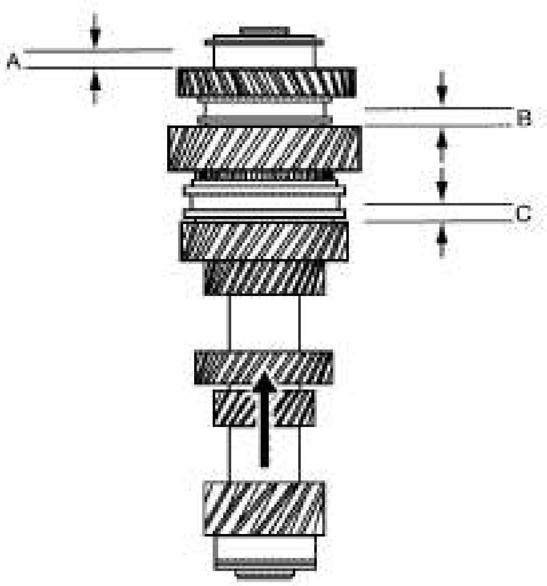
6. Using J 8001-3 or J 26900-12 (1) and J 26900-13 (2), measure the reverse idler gear (3) radial clearance.

   Specification

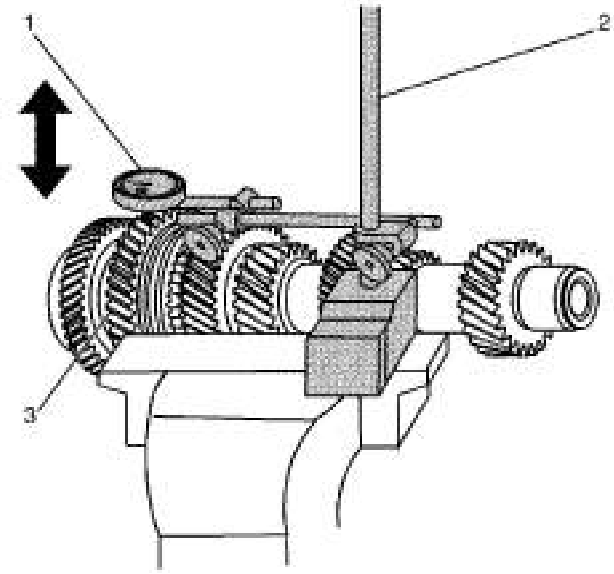
   - Standard Clearance: 0.040-0.082 mm (0.0016-0.0032 in)
   - Maximum Clearance: 0.130 mm (0.0051 in)

7. If the clearance exceeds the maximum, replace the reverse idler gear or the reverse idler gear shaft.

Countershaft



1. Inspect 1st (B), 2nd (A), and reverse gear (C) for axial clearance. Lift up on the gear from the settled position and measure travel. Refer to Transmission Clearance Specifications.

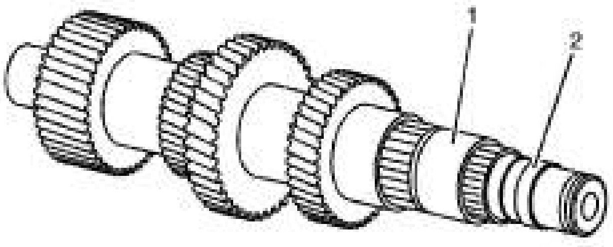


2. Measure the radial clearance for 5th countershaft gear (3).
    1. 2.1. Place the 5th countershaft gear, with the needle roller bearing, on the countershaft journal.
    2. 2.2. Use J 8001-3 or J 26900-12 (1) and J 26900-13 (2).
    3. 2.3. Position J 8001-3 or J 26900-12 on the gear.
    4. 2.4. Move the gear up and down.

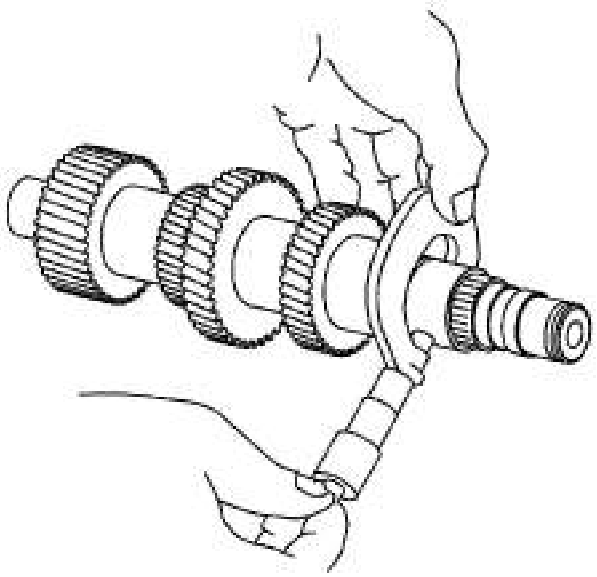
Specification

- Standard Clearance: 0.015-0.068 mm (0.0006-0.0027 in)
- Maximum Clearance: 0.160 mm (0.0063 in)

3. If the clearance exceeds the maximum, replace the gear, the roller bearing, or the countershaft.



4. Clean the countershaft in a suitable solvent and air dry all the parts.
5. Inspect the rear bearing race (1) on the countershaft for the following conditions:
   - Brinelling
   - Wear
   - Scoring
6. Inspect the 5th countershaft gear bearing race (2) for the following conditions:
   - Brinelling
   - Wear
   - Scoring

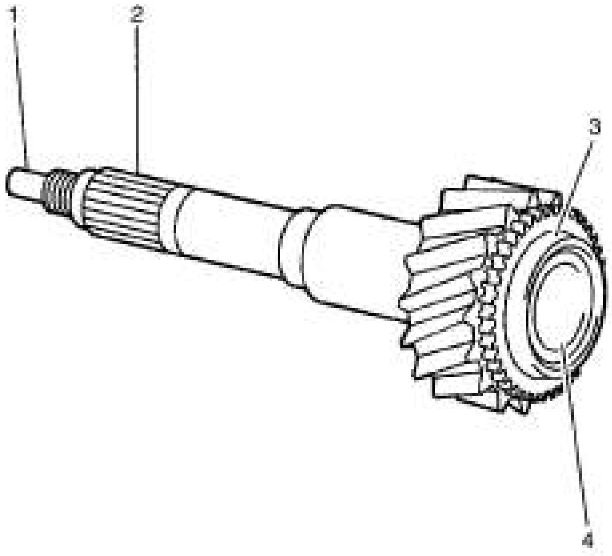


7. Using a micrometer, measure the outer diameter of the countershaft journal.

   Specification
   Minimum diameter: 29.860 mm (1.1756 in)

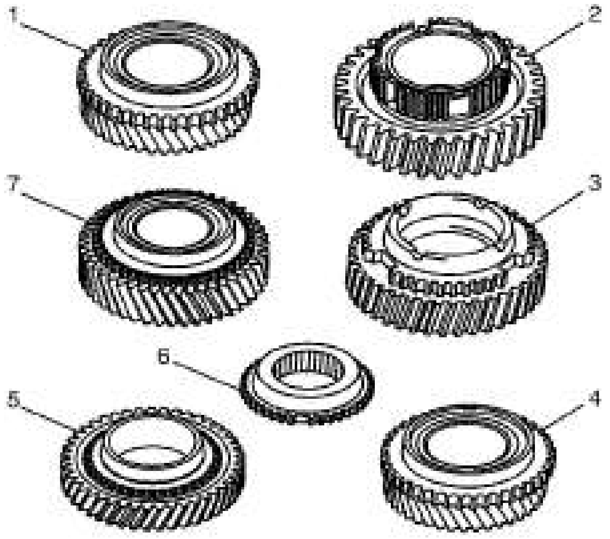
8. Inspect all of the countershaft gears for being faulty following the gear inspection steps.
9. Replace the countershaft if it is faulty.

Output Shaft

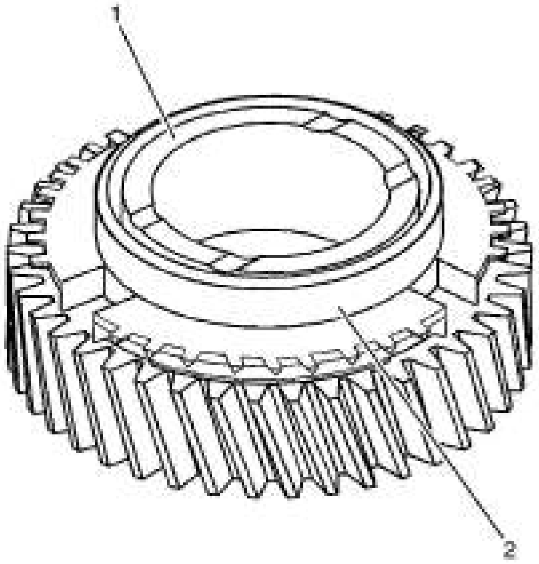


1. Clean the output shaft in a suitable solvent and air dry all the parts.
2. Inspect the pilot bearing journal (1) for wear or scoring.
3. Inspect the clutch disc splines (2) for wear. Steps in the splines may cause concerns with clutch operation.
4. Inspect the synchronizer blocking ring surface (3) for the following conditions:
   - Grooves
   - Excessive wear
   - Heat marks
   - Scoring
5. Inspect the input shaft front support bearing journal (4) for the following conditions:
   - Brinelling
   - Pitting
   - Excessive wear
6. Inspect the gear teeth and selector teeth for being faulty following the gear inspections steps.
7. Replace the output shaft if any of the above conditions are found.

Gears



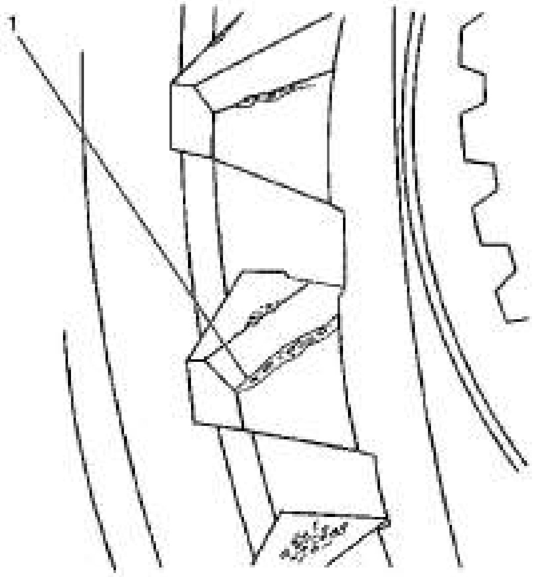
1. Clean the 1st gear (7), the 2nd gear (3), the 3rd gear (1), the 4th gear (4), reverse drive gear (6), the 6th gear (5), the reverse gear (2), and the countershaft gear in a suitable solvent and air dry all the parts.



2. Inspect the thrust surfaces (1) on both sides of the gears for the following conditions:
   - Wear
   - Galling
   - Scoring
3. Replace any gears that have faulty thrust surfaces. Worn thrust surfaces may cause gear clashing or hard shifting, by not allowing full engagement of the synchronizer blocking rings. Worn thrust surfaces may also cause gear noise or may cause clunking during acceleration or deceleration.
4. Inspect the synchronizer blocking ring surface (2) for the following conditions:

- Grooves
- Excessive wear
- Heat marks
- Scoring

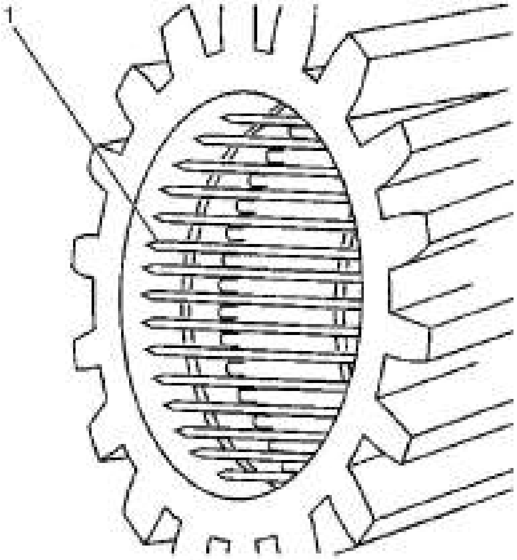
5. Replace any gear that has a faulty blocking ring surface.



6. Inspect the selector teeth of the gears for gear change damage.

   If there is gear change damage, the tooth edges (1) are worn and chipped and, in some cases, affected by plastic deformation because of high shift loads that resemble ragged edges. Such severe deformation of the selector teeth edges causes hard gearshift changes. The spline flanks may also show signs of wear resembling fretting corrosion.

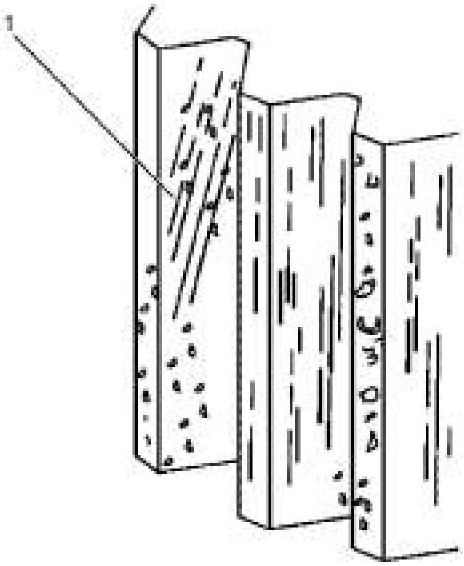
7. If gear change damage is present, replace or repair the affected parts. Gear change damage is caused by any of the following conditions:
   - Corresponding speeds of gears not adequately matched
   - Operating the transmission incorrectly
   - Incorrect clutch operation



8. Inspect the gears for brinelling (1).

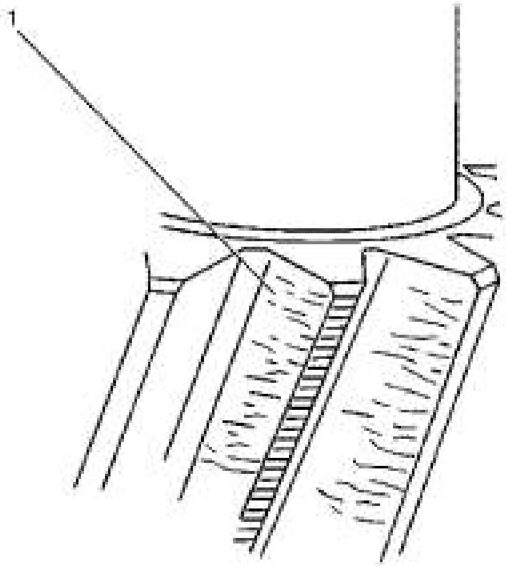
   Brinelling occurs on the roller races of the gears and is characterized by what appears to be the impression of the bearing rollers.

9. Replace any gears showing brinelling.



10. Inspect the gears for break-in-wear or running-in-wear (1).

    Break-in-wear is not considered damage because it usually ceases after the running-in-period has expired, without damaging the components. Rough peaks produced during manufacture are worn away or, to some extent, are rolled into the surface. The grinding and shaving marks (1) on the surface are still visible.



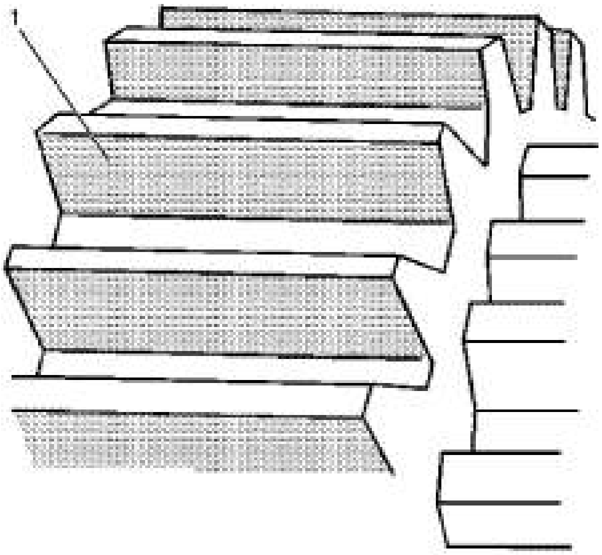
11. Inspect the gear teeth for scratches (1).

    Scratches are linear indentations on the flank, running in the direction of sliding.

12. If scratches are present, replace the affected parts.

    Scratches can be caused by the following conditions:

    - Dust and abrasive particles, including those caused by flank contact, in the lubricating oil.
    - The sliding action of the flanks.



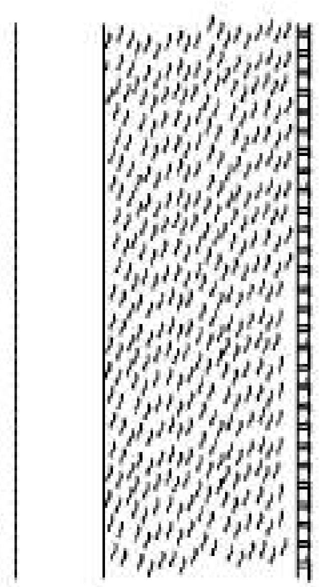
13. Inspect the gear teeth for abrasive wear.

    The marks left by the machining process are erased from the active flank. Instead, the entire flank takes on a matte gray appearance (1). Substantial changes take place in the tooth profile and clearance once abrasive wear has reached an advanced stage. This not only increases the noise level, but can also cause secondary damage.

14. If abrasive wear is present, replace the affected parts.

    Abrasive wear is caused by the following conditions:

    - Oil contamination resulting from wear or surface fatigue in other areas of the transmission.
    - Sand, sludge, etc. penetrating into the transmission from the outside.



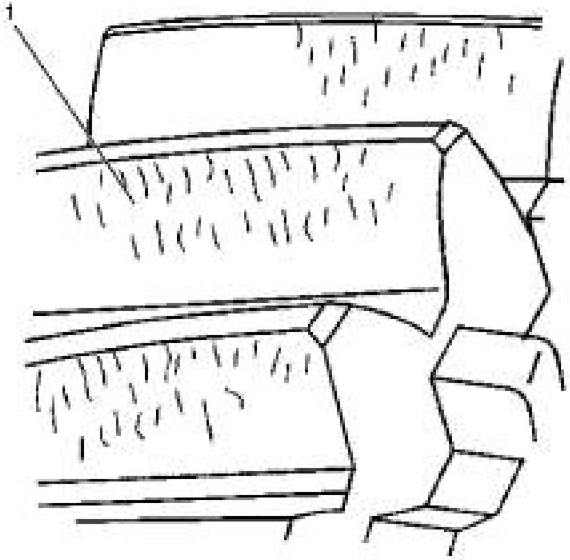
15. Inspect the gear teeth for rippling or brinelling.

    The polished tooth flanks show signs of ripple-like alterations in the surface structure, which run perpendicular to the direction of sliding, and may resemble a washboard.

16. If rippling or brinelling is present, replace the affected parts.

    Rippling or brinelling is caused by the following conditions:

    - A combination of inadequate lubrication, high flank loads and low peripheral speeds
    - Friction-induced vibration



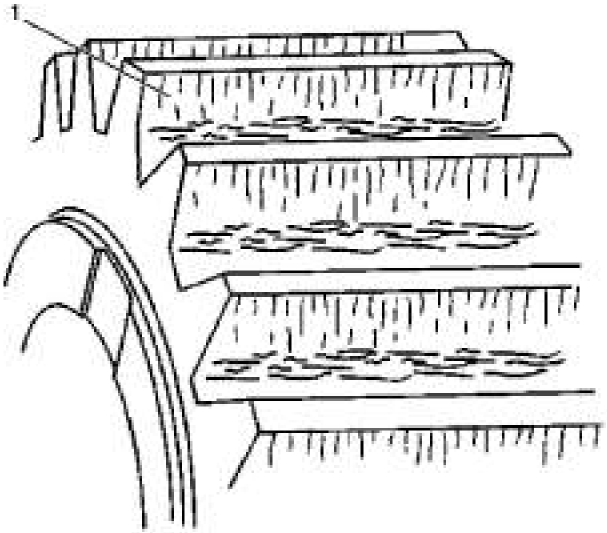
17. Inspect the gear teeth for light scoring (1).

    Light scoring is identified as rough, partially porous lines or areas aligned in the direction of sliding. When the film of lubricant is torn away between the flanks, this permits direct metal-to-metal contact causing seizure or welding. These welded zones are immediately torn apart again, producing the damage associated with scoring. Scoring initially occurs in areas subjected to high hertz frequency stresses and high sliding speeds, usually along the tooth root and tooth tip. Light scoring only covers a part of the entire surface of the flank, or is not strongly developed and has caused only insignificant wear after smoothing.

18. If light scoring is present, replace the affected parts.

    Light scoring is caused by the following conditions:

    - Inadequate oil viscosity.
    - Unfavorable gear geometry.
    - Temporary lack of lubricant.
    - Surface roughness.
    - Faulty heat treatment of the gears.



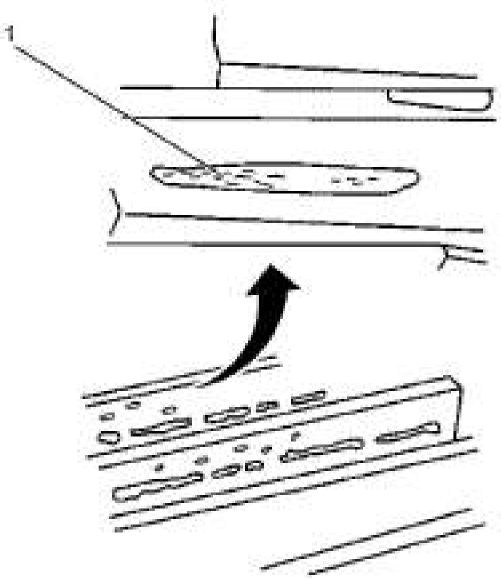
19. Inspect the gear teeth for severe scoring (1).

    Severe scoring is the same as light scoring, except large areas of the tooth flank are affected. At an advanced stage, the flank may heat up to such an extent that localized discoloring occurs.

20. If severe scoring is present, replace the affected parts.

    Severe scoring is caused by the following conditions:

    - Inadequate oil viscosity.
    - Unfavorable gear geometry.
    - Temporary lack of lubricant.
    - Surface roughness.
    - Faulty heat treatment of the gears.



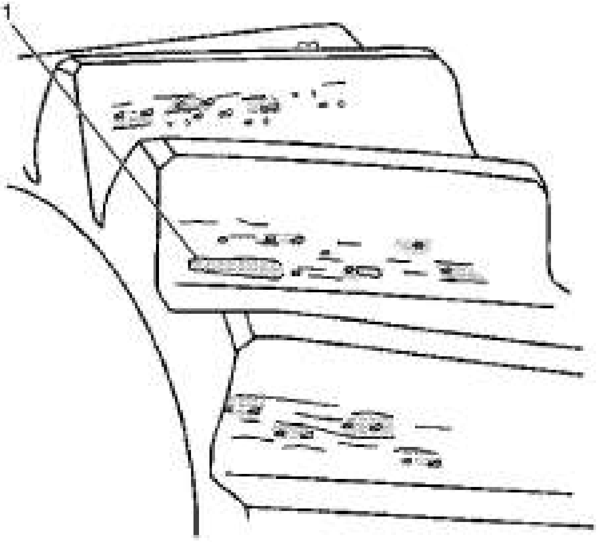
21. Inspect the gears for flank fatigue (1), causing gray spots.

    Gray spots are localized pittings on the flank caused by material fatigue and extremely fine pittings formed on the load-bearing flanks. If they are in cluster, they appear to the naked eye as matte gray staining. Under high magnification, a large number of microscopic cracks become visible on the flank. Pittings originating from these cracks may create the appearance of local flank wear. Most of the gray spots are located in the root zone of the gear teeth.

22. If gray spots are present, replace the affected parts.

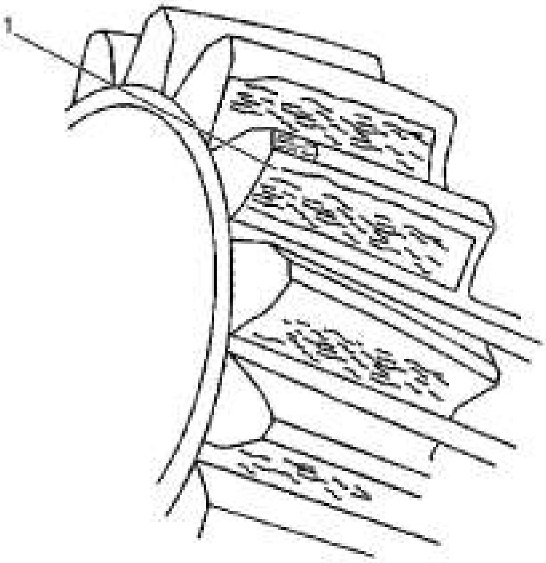
    Gray spots are caused by the following conditions:

    - Material fatigue.
    - Contact pressure.
    - Sliding movement.
    - Composite friction.



23. Inspect the gear teeth for slight pittings (1).

    Slight pittings are identified as pore-like areas of individual pittings on the flank caused by material fatigue. Usually, slight pittings are only present in the root zone of the flank. Slight pittings may cease after run-in. A change in operating conditions may also stop continued development of slight pitting.



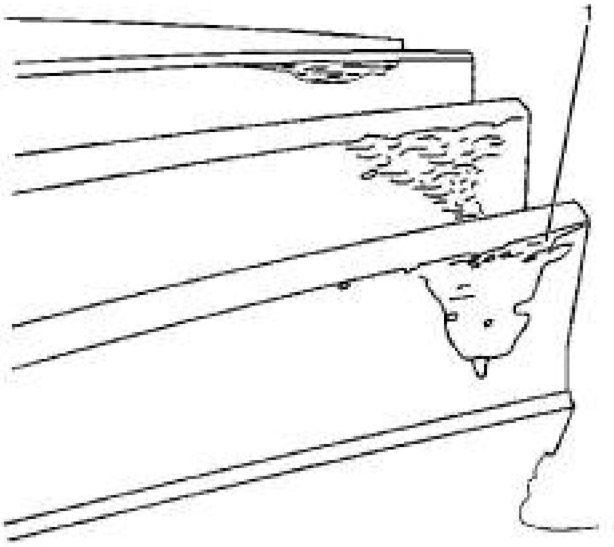
24. Inspect the gear teeth for pittings (1).

    Pittings are material fatigue on the flank (1). The total pitting surface may become so large that smooth running is considerably impaired, or the remaining flank face still bearing the load will soon be destroyed by wear.

25. If pittings are present, replace the affected parts.

    Pitting is caused by the following conditions:

    - Exceeding the sliding and rolling stresses for the material.
    - Incorrect oil viscosity.
    - Excessive operating temperature.



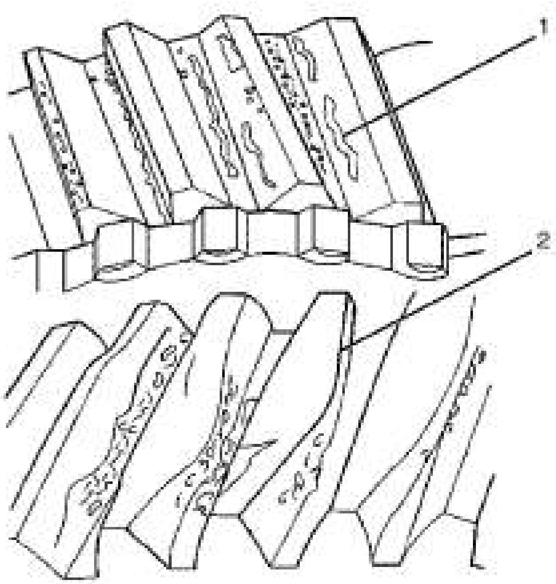
26. Inspect the gears for spalling (1).

    Spalling is extensive triangular pits on the flank, spreading from a zone of gray spots or a fine line of pits at the root. The depth of the exposed surface is relatively constant throughout. Further cracks may extend from the pits at an angle. In some cases, the damage may even progress into the tip zone, causing tip damage.

27. If spalling is present, replace the affected parts.

    Spalling is caused by the following conditions:

    - Exceeding the sliding and rolling stresses for the material.
    - Incorrect oil viscosity.
    - Excessive operating temperature.



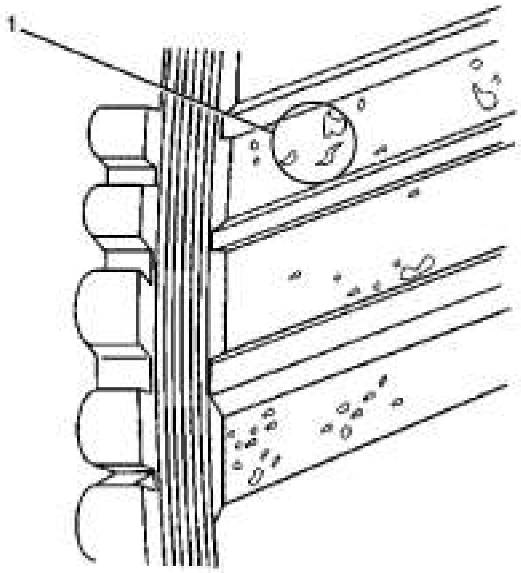
28. Inspect the gears for damage from overheating.

    Overheating damage is identified by grayish to bluish black discoloration of the gear, burnt oil, and reduced hardness. Due to the reduction in hardness, there is scored or grooved flank wear in the direction of sliding (1), particularly in the tip and root zones. If there is extreme overheating, the material softens, causing distortion of the gear teeth (2), bending the teeth from thermal distortion.

29. If damage from overheating is present, replace or repair the affected parts.

    Overheating is caused by the following conditions:

    - Temporary or complete lack of lubrication - low oil level.
    - Very high peripheral speeds.
    - Insufficient tooth clearance.



30. Inspect the gears for corrosion (1).

    Corrosion is brownish red to black spots (1), sometimes with local material loss on the flank. If corrosion has not caused material loss to the flank, the sliding and rolling action of the flank can help to remove some of the corrosion.

31. If corrosion is severe, replace the affected parts.

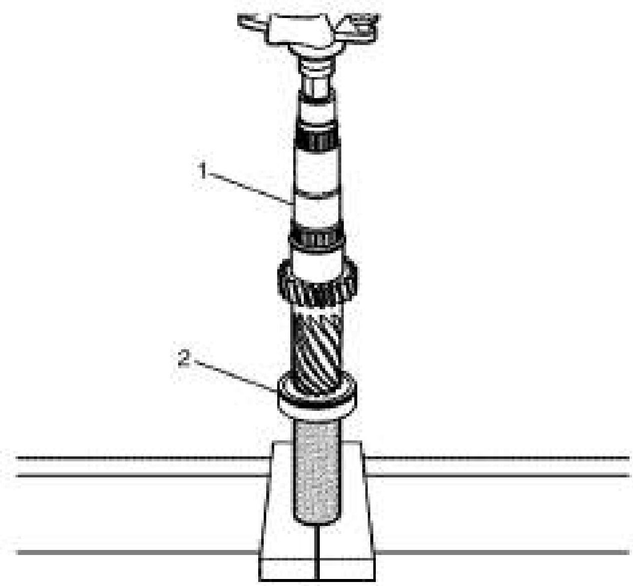
    Corrosion is caused by the following conditions:

    - Water or salt water entering the transmission.
    - Condensation forming under unfavorable operating conditions.
    - Oil aging and the decomposition of corrosion inhibitors.

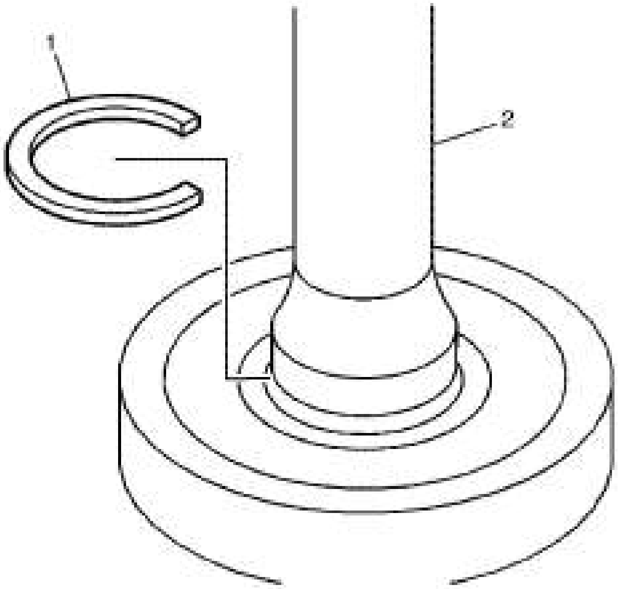
Input Shaft Assemble

Tools Required

DT-47723 Output Shaft Bearing Installer

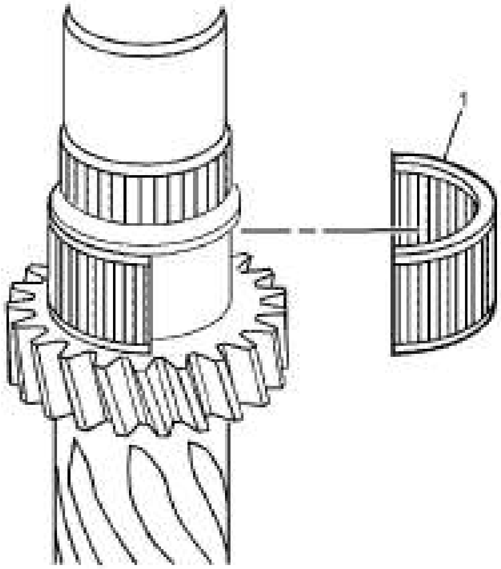


1. Using a hydraulic press and a suitable tool, install the counter gear front bearing (2) on the input shaft (1).

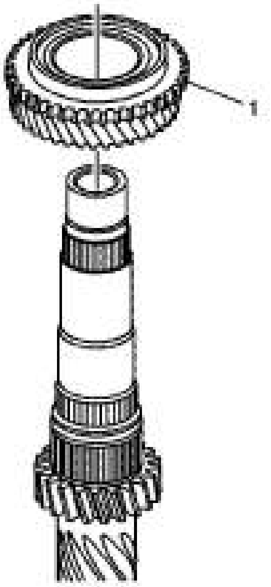


Important: The retaining ring is a selected fit. Always install a NEW snap ring.

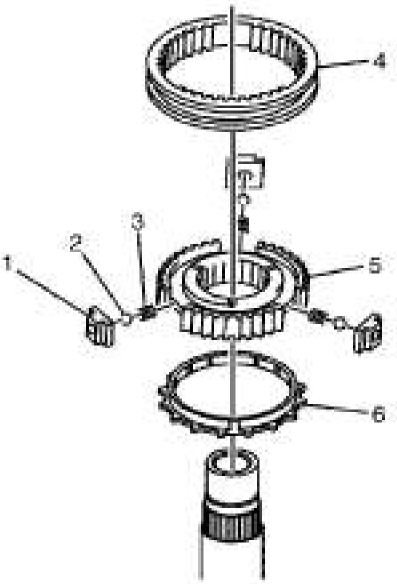
2. Select the maximum thickness snap ring (1) that will fit in the groove. Refer to Input Shaft Bearing Retaining Ring Specifications.
3. Install a NEW snap ring (1) and ensure that the radial bearing rotates smoothly.



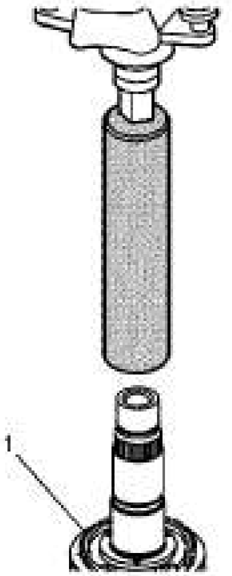
4. Apply an approved lubricant and install the 4th gear bearing (1) to the input shaft.



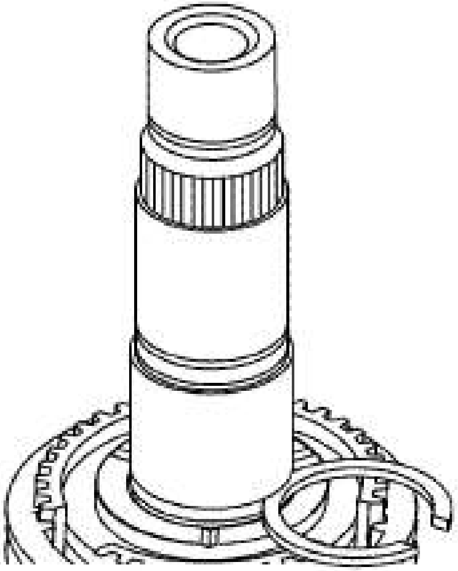
5. Apply an approved lubricant and install the 4th gear (1) input shaft.



6. Apply an approved lubricant and install the following components:
   - the blocking ring (6)
   - the 3rd/4th gear synchronizer hub (5) including the spring (3), detent ball (2) and insert (1)
   - the 3rd/4th gear synchronizer sleeve (4) with the higher boss facing the front

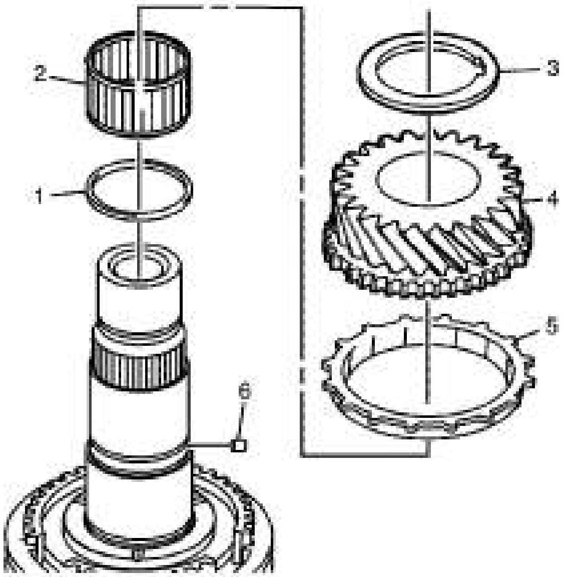


7. Using a hydraulic press and DT-47723 , install the 3rd/4th synchronizer hub assembly (1).



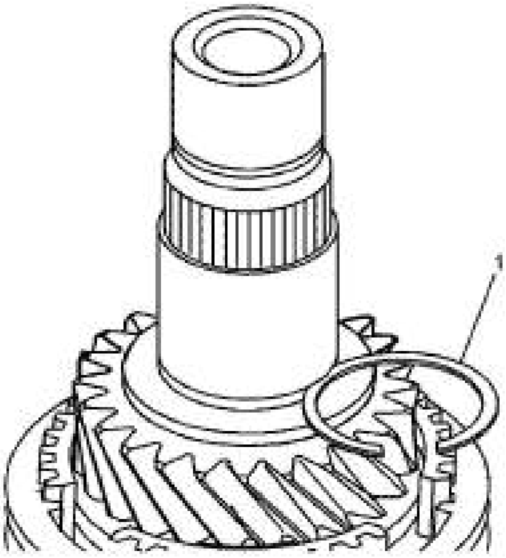
Important: The retaining ring is a selected fit. Always install a NEW snap ring.

8. Select the maximum thickness snap ring (1) that will fit in the groove. Refer to 3rd and 4th Gear Synchronizer Retaining Ring Specifications.
9. Install a NEW snap ring (1) to the input shaft.



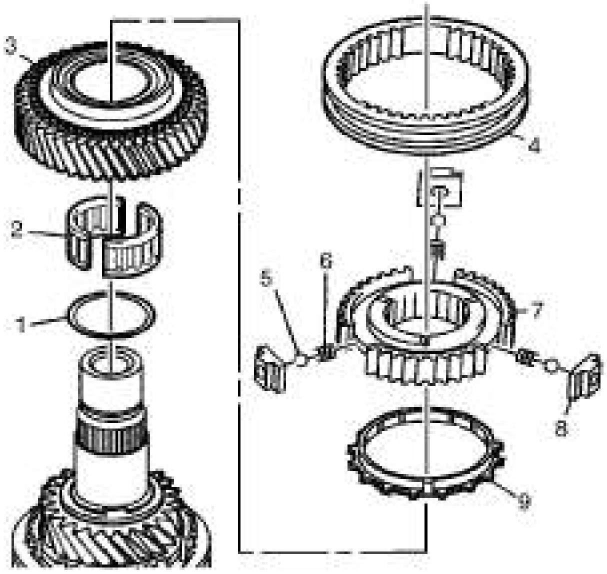
10. Apply an approved lubricant to the components and install the following components:
    - 3rd/4th gear spacer (1)
    - 3rd gear bearing (2)
    - 3rd gear blocking ring (5)
    - Install and align the 3rd gear (4)

- Locating pin (6)
- Install and align the 3rd gear thrust washer (3)



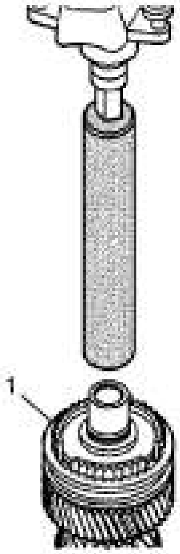
Important: The retaining ring is a selected fit. Always install a NEW retaining ring.

11. Select the maximum thickness snap ring (1) that will fit in the groove. Refer to 3rd and 4th Gear Synchronizer Retaining Ring Specifications.
12. Install a NEW snap ring (1) to the input shaft.

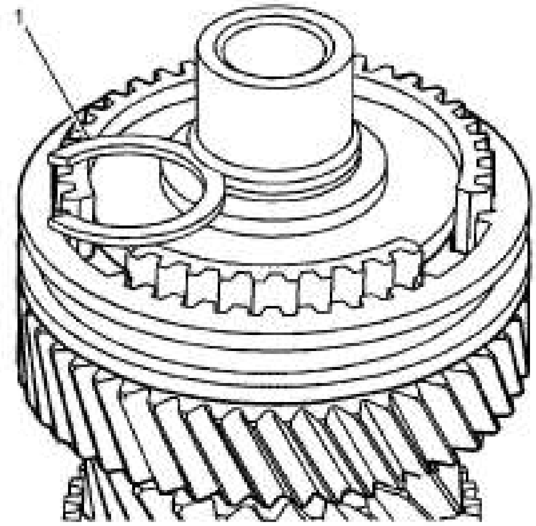


13. Install the 6th gear bearing spacer (1).
14. Apply an approved lubricant and install the 6th gear bearing (2).
15. Apply an approved lubricant and install the 6th gear (3).
16. Apply an approved lubricant and install the 6th gear blocking ring (9).

17. Apply an approved lubricant and install the 5th/6th gear synchronizer hub (7) including the spring (6), detent ball (5) and insert (8).
18. Apply an approved lubricant and install the 5th/6th synchronizer sleeve (4) with higher boss of sleeve facing the rear.



19. Use a hydraulic press and DT-47723 to install the 5th/6th synchronizer hub assembly (1).



Important: The retaining ring is a selected fit. Always install a NEW snap ring.

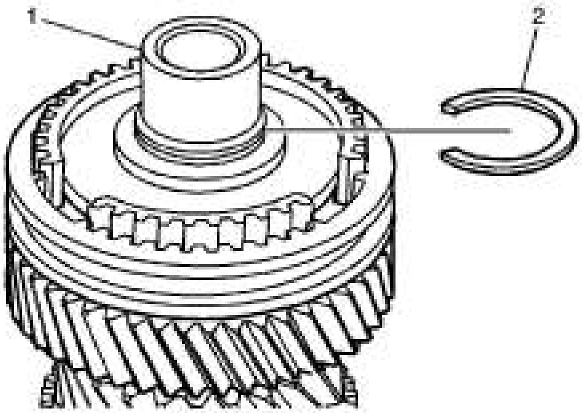
20. Select the maximum thickness snap ring (1) that will fit in the groove. Refer to 6th Gear Retaining Ring Specifications.
21. Install a NEW snap ring (1) to the input shaft.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1996666**

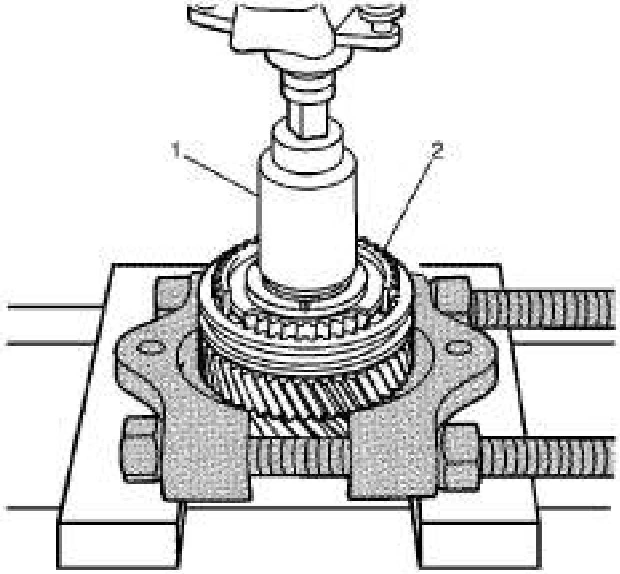
Input Shaft Disassemble

Tool Required

J-22912-01 Split Plate Bearing Puller

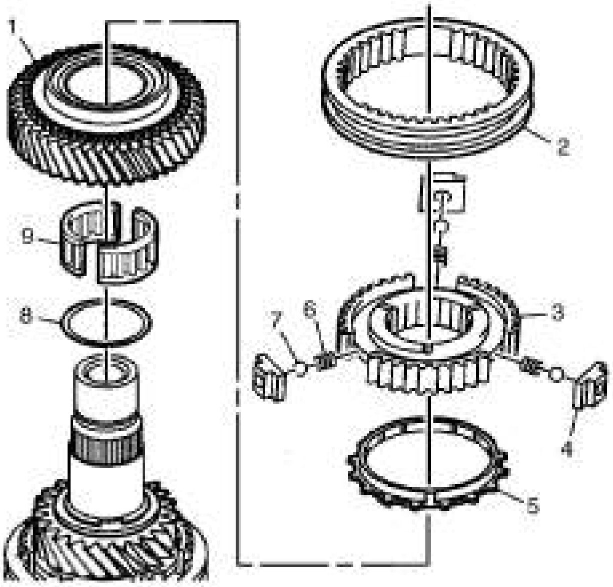


1. Remove the 5th/6th gear synchronizer hub to input shaft (1) snap ring (1).



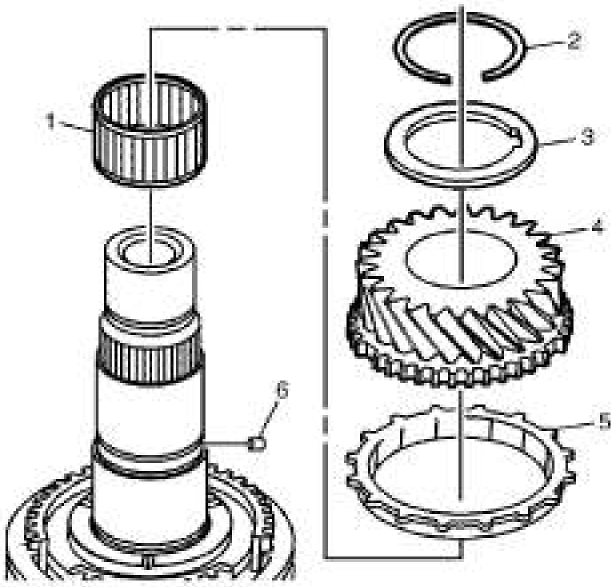
Important: Place the edge of gear on press plate.

2. Using a hydraulic press and J-22912-01 , remove the 6th gear and the synchronizer (2) as a unit.

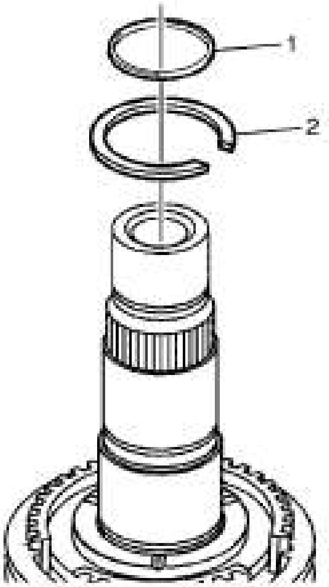


Important: Before removing sleeve (2), cover components in order to keep the ball and spring from ejecting loose.

3. Remove the following components from the input shaft as an assembly:
    - the 5th/6th gear synchronizer sleeve (2)
    - the 5th/6th gear synchronizer hub (3) including insert (4), detent ball (7) and spring (6)
    - the 5th gear synchronizer blocking ring (5)
    - the 6th gear (1)
    - the 6th gear bearing (9)
    - the 6th gear bearing spacer (8)

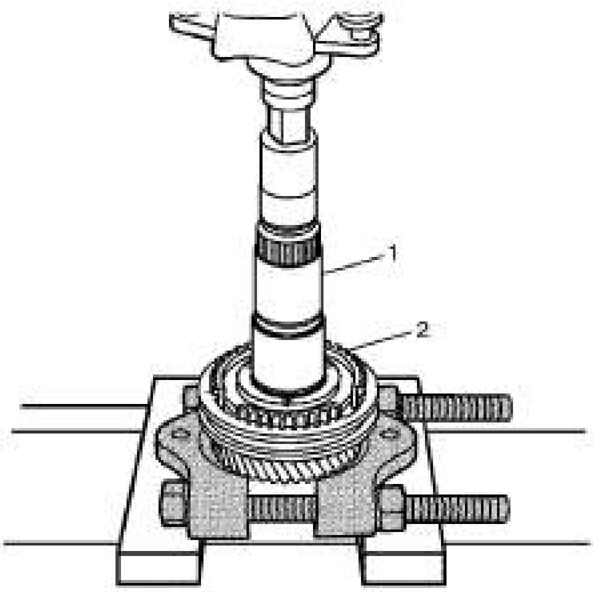


4. Remove the 6th gear to input shaft snap ring (2).
5. Remove the 3rd gear to input shaft thrust washer (3).
6. Remove the input shaft thrust washer locating pin (6).
7. Remove the 3rd gear assembly which includes:
   - the 3rd gear (4)
   - the 3rd gear blocking ring (5)
8. Remove the 3rd gear bearing (1).



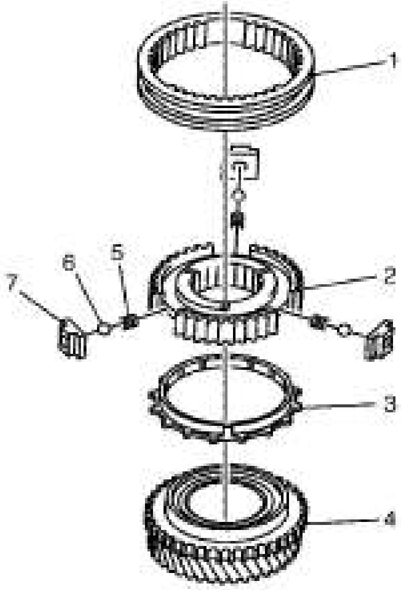
9. Remove the 3rd/4th gear spacer (1) from the input shaft.
10. Remove the 4th gear to input shaft snap ring (2) and discard.

    Discard the snap ring.



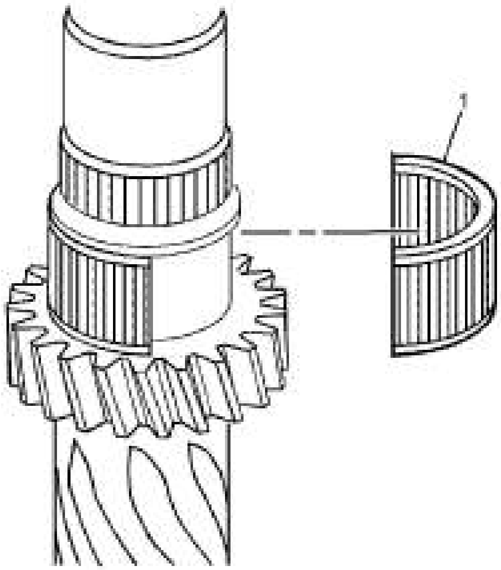
Important: Place the edge of gear on press plate.

11. Using a hydraulic press and J-22912-01 , remove the 4th gear and the synchronizer as a unit from the input shaft (1).

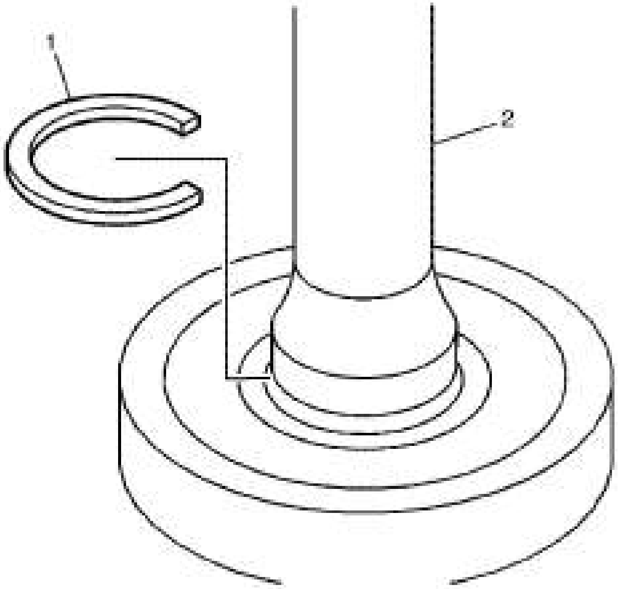


Important: Before removing sleeve (1), cover components in order to keep the ball and spring from ejecting loose.

12. Remove the following components as an assembly:
    - the 3rd/4th gear synchronizer sleeve (1)
    - the 3rd/4th gear synchronizer hub (2) including insert (7), detent ball (6) and spring (5)
    - the 4th gear blocking ring (3)
    - the 4th gear (4)

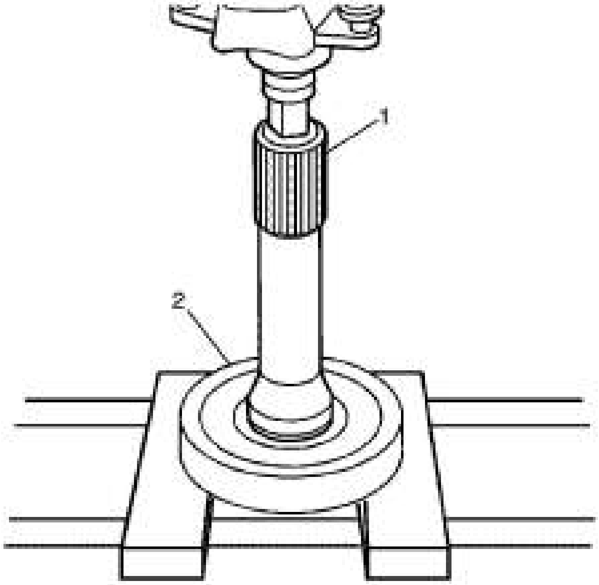


13. Remove the 4th gear bearing (1) from the input shaft.



14. Remove the input shaft snap ring (1) and discard.

    Discard the snap ring.

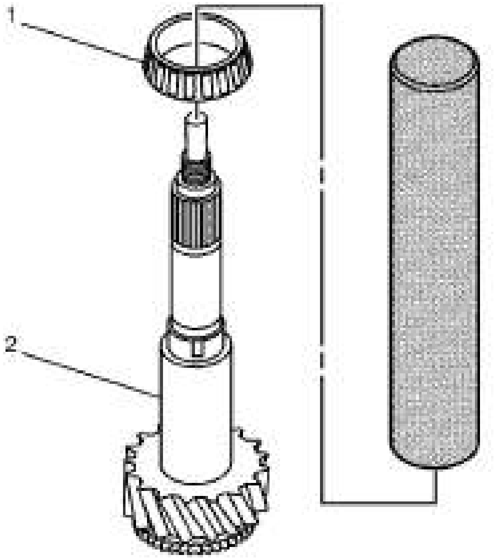


15. Using a hydraulic press, remove the counter gear front bearing (2) from the input shaft (1).

Output Shaft Assemble

Tools Required

DT-47723 Output Shaft Bearing Installer

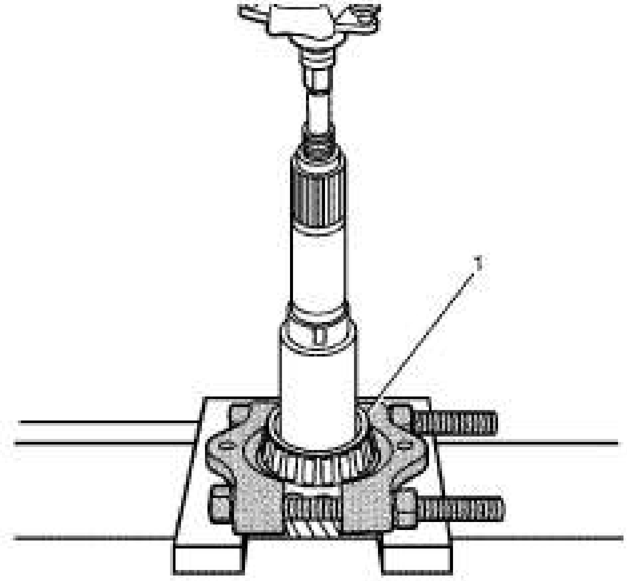


Using DT-47723 , install the output shaft bearing (1) to the output shaft (2).

Output Shaft Disassemble

Tools Required

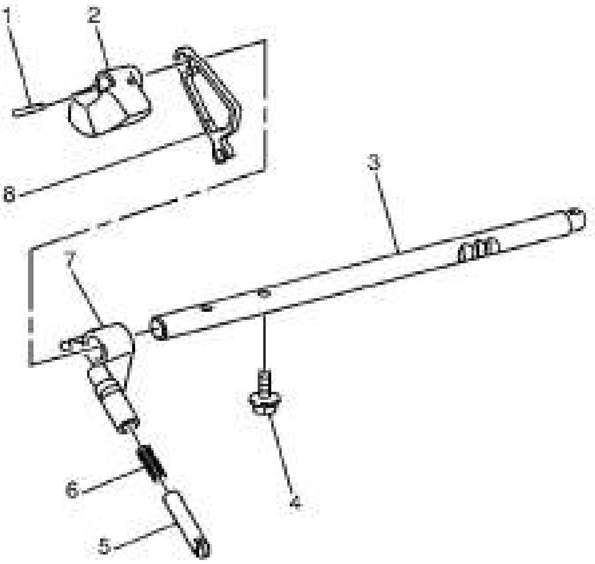
1. J-22912-01 Split Plate Bearing Puller



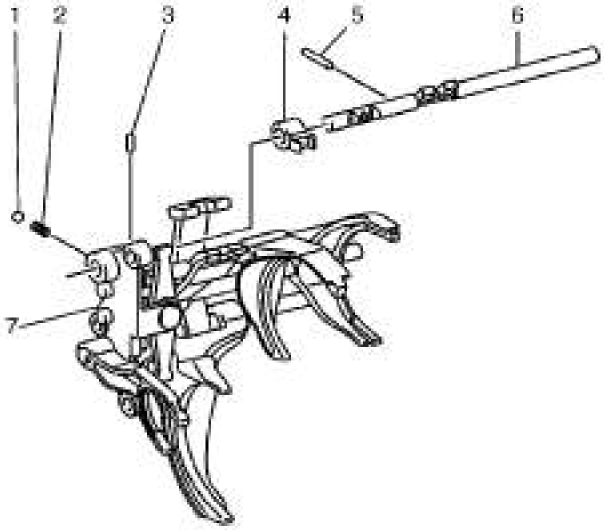
2. Using a hydraulic press and J-22912-01 , remove the tapered roller bearing (1) from the output shaft.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1985107**

Shift Shaft and Shift Fork Cleaning and Inspection

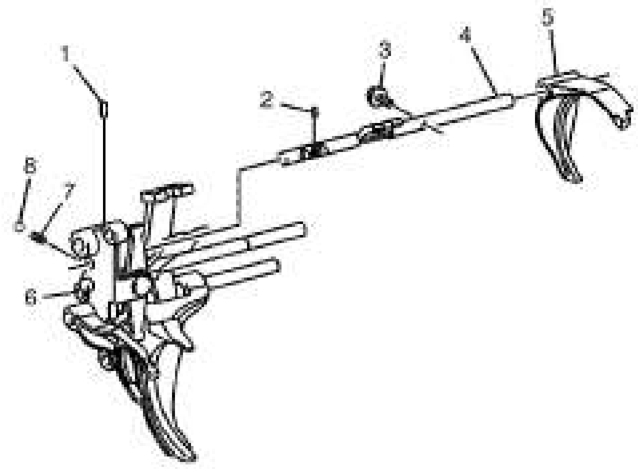


1. Using a suitable tool, remove the pin (1) from the dynamic damper weight (2).
2. Remove the shift shaft detent cam (8) and the weight (2) from the shift control shaft (3).
3. Remove the shift shaft detent (5) and the shift shaft detent spring (6).
4. Remove the bolt (4) from the shift shaft detent lever (7).
5. Remove the shift shaft detent lever (62) from the shift control shaft (66).



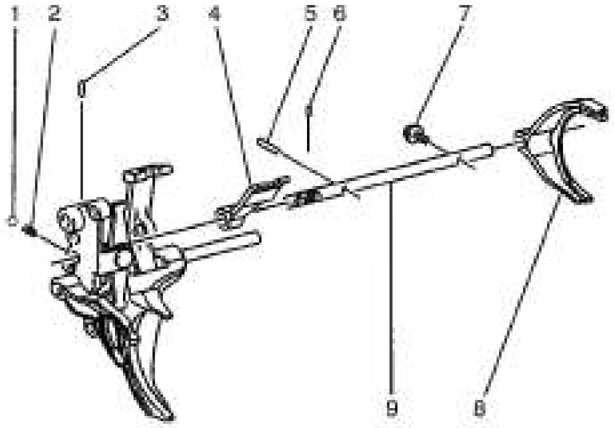
Important: The shift detent ball (1) and spring (2) will come out of the shift control lever when the 1st/2nd shift shaft (6) is removed.

6. Remove the 1st/2nd shift fork pin (5).
7. Remove the 1st/2nd shift shaft (6).
8. Remove the slotted pin (5) from the select control lever assembly (4). Slide the select control lever assembly (4) from the 1st/2nd shift shaft (6).
9. Using a suitable tool, remove the pin (3) from the shift control lever bracket (7).



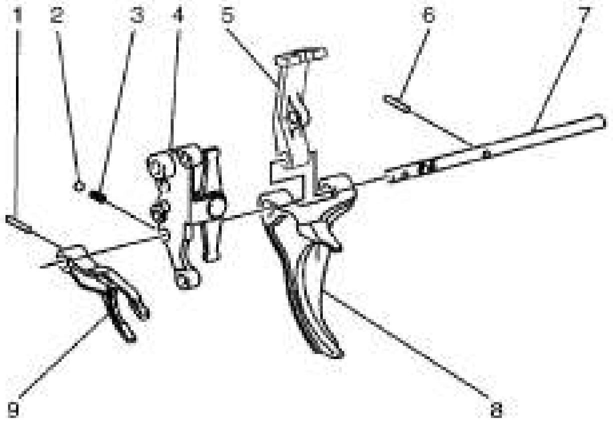
Important: The shift detent ball (8) and spring (7) will come out of the shift control lever bracket (6) when the 3rd/4th shift shaft (4) is removed.

10. Remove the bolt (3) from the 3rd/4th shift fork (5).
11. Remove the 3rd/4th shift shaft (4).
12. Remove the shift fork (5).
13. Using a suitable tool, remove pins (2 and 1).



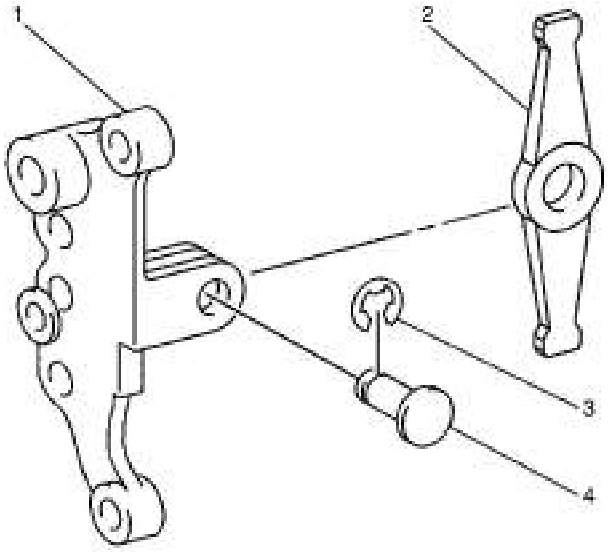
Important: The shift detent ball (1) and spring (2) will come out of the shift control lever bracket when the 5th/6th shift shaft (9) is removed.

14. Remove the bolt (7) from the 5th/6th shift fork (8). Slide the 5th/6th shift fork (8) from the 5th/6th shift shaft (9).
15. Remove the 5th/6th shift shaft (9).
16. Using a suitable tool, remove the pin (5) from the shift lever assembly (4). Slide the shift lever assembly (4) from the 5th/6th shift shaft (9).
17. Using a suitable tool, remove pins (6 and 3).

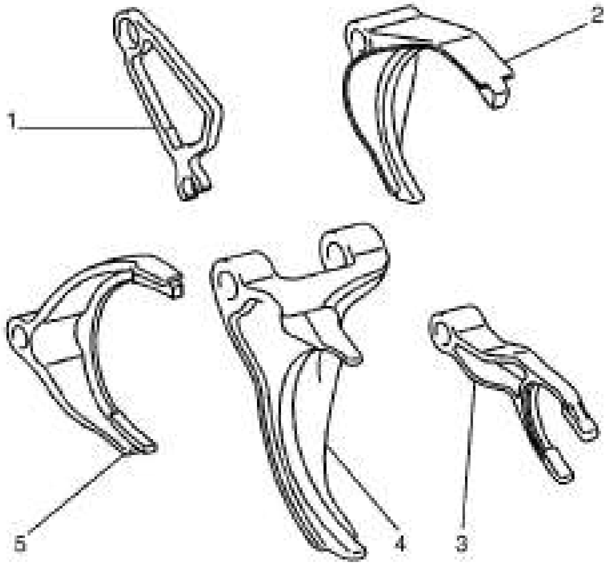


Important: The shift detent ball (2) and spring (3) will come out of the shift control lever bracket (4) when the reverse shift shaft (7) is removed.

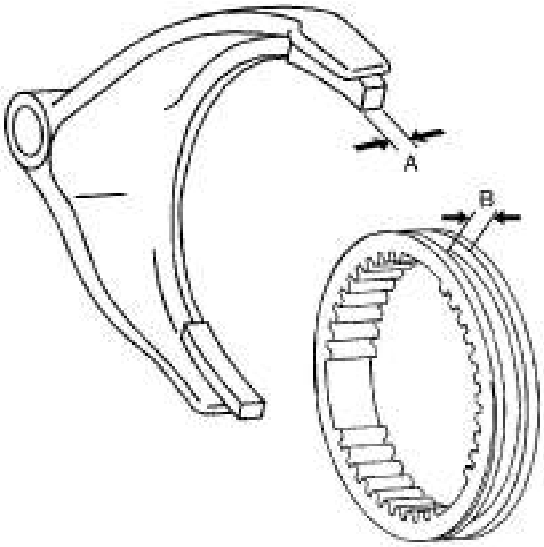
18. Using a suitable tool, remove the slotted pin (1) from the reverse shift fork (9). Slide the reverse shift fork (9) off the reverse shift shaft (7).
19. Remove the reverse shift shaft assembly.
20. Using a suitable tool, remove the slotted pin (6) from the intl shift control lever (5). Slide the intl shift control lever (5) and 1st/2nd shift fork assembly (8) from the reverse shift shaft (7).



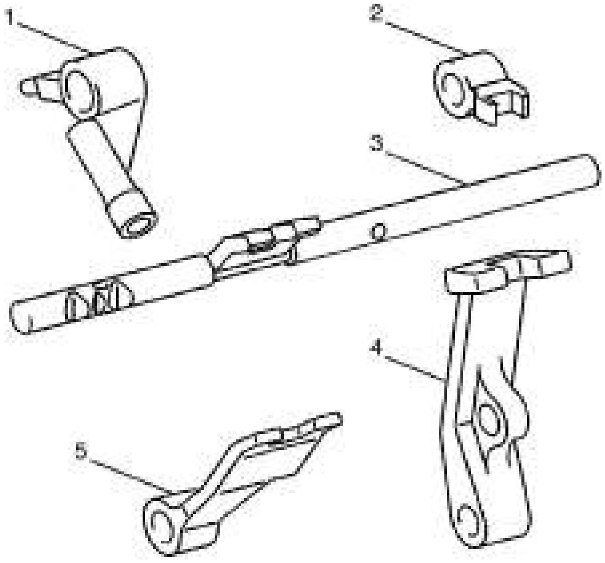
21. Remove the E-clip (3) and pull the control select arm pin (4) from the shift control lever bracket (1).
22. Remove the control select arm (2) from the shift control lever bracket (1).



23. Inspect the shift shaft detent cam (1), shift forks (2), (5), (3) and assembly (4) for:
    - A bent fork
    - For wear
    - Cracks

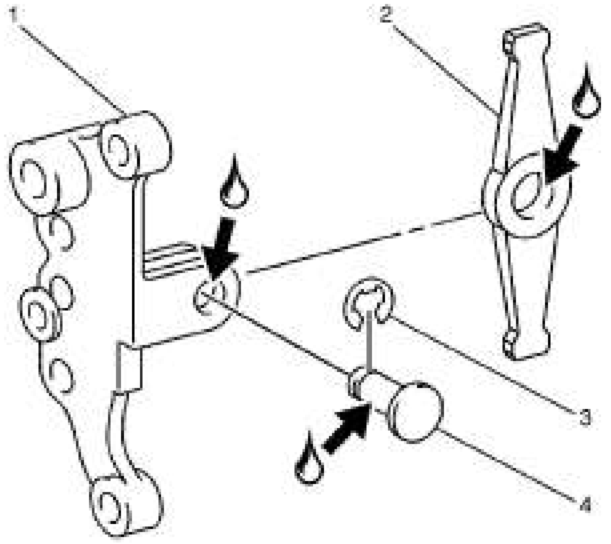


24. Measure the fork width (A) and sleeve groove width (B) for wear. If synchronizer sleeve to shift fork width clearance exceeds the maximum, replace the synchronizer sleeve and/or shift fork. Refer to Transmission Clearance Specifications.

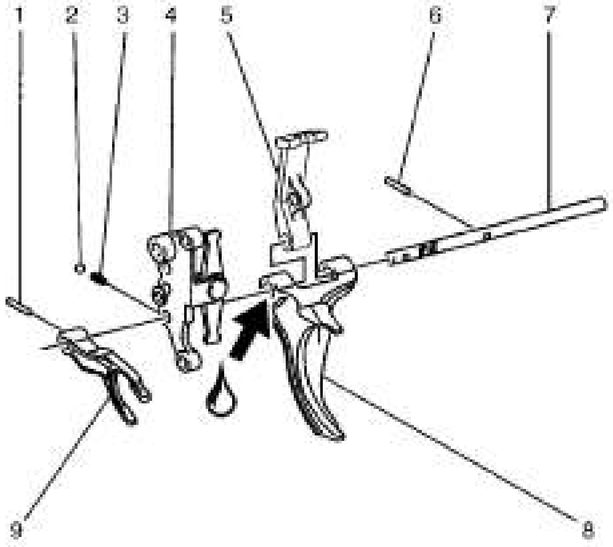


25. Inspect the shift shaft detent lever (1), assembly (4 and 2), shift shaft (3) and control lever (4) for:
    - A bent fork
    - For wear
    - Cracks

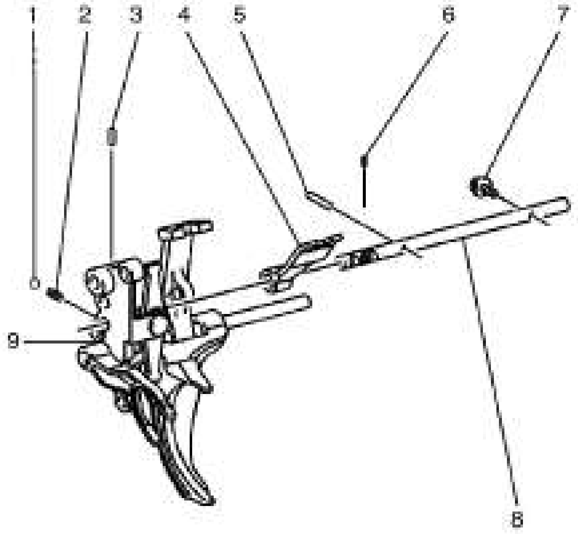
Shift Shaft and Shift Forks Assemble



1. Apply an approved lubricant and install the control select arm (2) into the shift control lever bracket (1).
2. Apply an approved lubricant and install the control select arm pin (4).
3. Install the E-clip (3) to the control select arm pin.



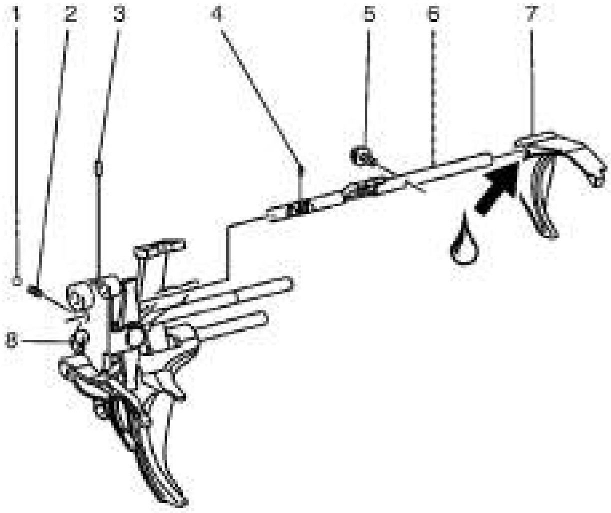
4. Apply an approved lubricant and slide the internal shift control lever (5) and 1st/2nd shift fork assembly (8) onto the reverse shift shaft (7). Install the slotted pin (6) into the lever (5).
5. Install the slotted pin (6) into the internal shift control lever (5).
6. Install the shift control lever bracket (4) onto the reverse shift shaft (7).
7. Slide the reverse shift fork (9) onto the reverse shift shaft (7). Install the slotted pin (1) into the reverse shift fork (9).
8. Install the spring (3) and shift detent ball (2) into the bracket (4).



9. Install the pin (3) into the shift control lever bracket (9).
10. Install the pin (6) into the 5th/6th shift shaft (8).
11. Install the 5th/6th shaft (8) into the hole in the shift lever assembly (4).
12. Install a NEW bolt (7) into the shift lever assembly (4).

    Tighten
    Tighten the bolt to 19 N·m (14 lb ft).

13. Install the 5th/6th shift shaft (8) into the shift control lever bracket (9).

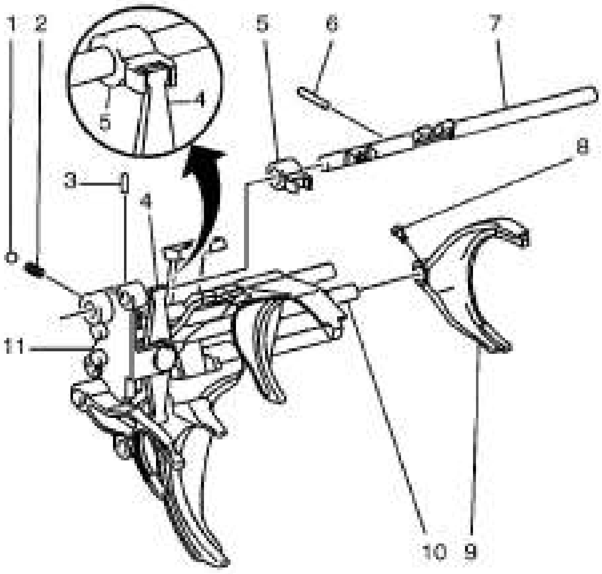


14. Apply an approved lubricant and slide the 3rd/4th shift fork (7) onto the 3rd/4th shift shaft (6). Install a NEW bolt (5) into the 3rd/4th shift fork (7).

    Tighten

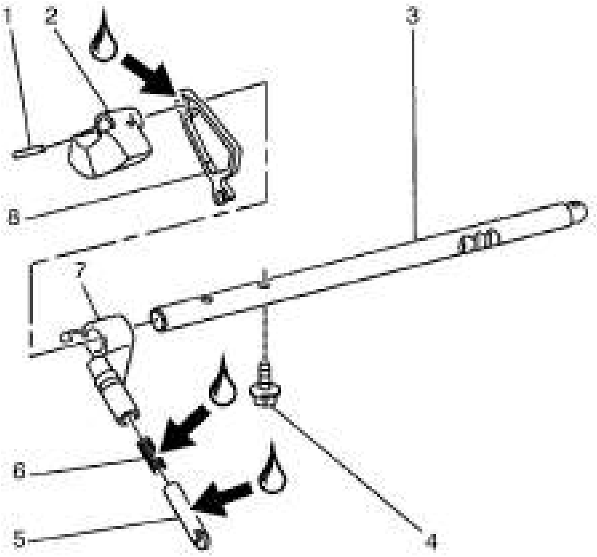
Tighten the bolt to 19 N·m (14 lb ft).

15. Insert the spring (2) and the shift detent ball (1) into the shift control lever bracket (8).
16. Install the pin (4) into the 3rd/4th shift shaft (6).
17. Install pin (3) into the shift control lever bracket (8).
18. Install the 3rd/4th shift shaft (6) into the shift control lever (8).



19. Install the spring (2) and detent ball (1) into the shift control lever bracket (11).
20. Install the pin (3) into the shift control lever bracket (11).
21. Install the groove of select control lever assembly (5) into the projection of the control select arm (4).
22. Slide the 1st/2nd shift shaft (7) into the shift control lever (5), and the shift control lever bracket (11).
23. Install pin (6) into the 1st/2nd shift shaft (7).
24. Install the 5th/6th shift fork (9) onto the 5th/6th shift shaft (10) and retain with a new bolt (8).

Tighten
Tighten the bolt to 19 N·m (14 lb ft).



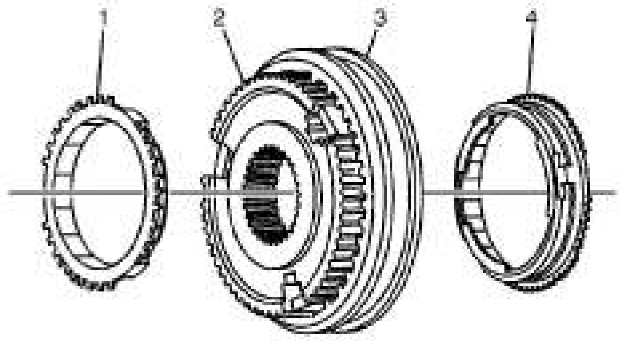
25. Slide the shift shaft detent lever (7) onto the shift control shaft (3).
26. Install a NEW bolt (4) into the shift shaft detent lever (7).

    Tighten
    Tighten the bolt to 19 N·m (14 lb ft).

27. Apply an approved lubricant and insert the shift shaft detent spring (6) and the shift shaft detent (5) into the lever (7).
28. Apply an approved lubricant and slide the shift shaft detent cam (8) onto the shift control shaft (3).
29. Insert the assembled shift shaft detent lever assembly (7, 6, 5) into the opening in the shift shaft detent cam (8).
30. Install the dynamic damper weight (2) onto the shift control shaft (3).
31. Insert the pin (1) into the dynamic damper weight (2).
32. Check the function of assembled components. The shift shaft detent (5) should slide on the shift shaft detent cam (8).

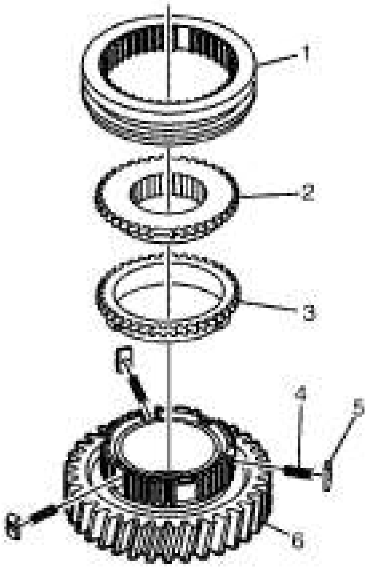
Synchronizers Assemble

5th / 6th Gear Synchronizer



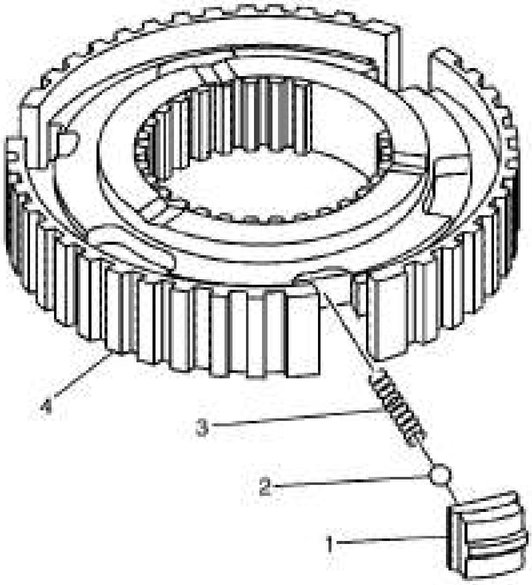
Important: Ensure that the hub slides easily.

1. Apply an approved lubricant to the 5th/6th synchronizer hub. Install the following components into the 5th/6th synchronizer hub (2 and 3):
   - the 5th gear blocking ring (4)
   - the 6th gear blocking ring (1)

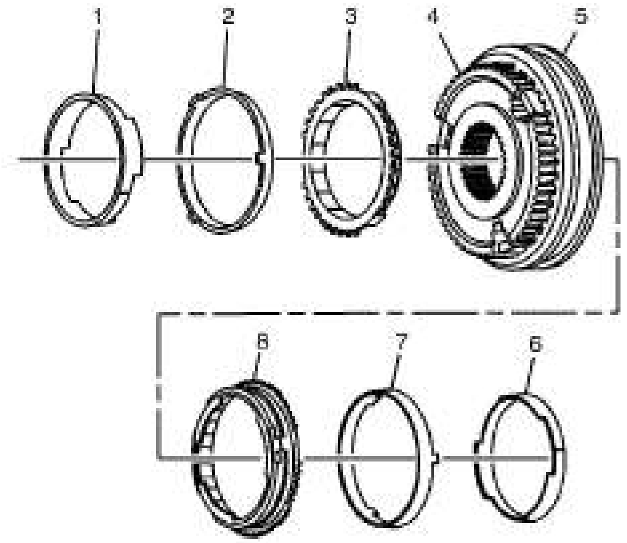


2. Apply an approved lubricant to the blocking ring (3), driven gear (2) and sleeve (1). Install the following components into the reverse gear (6):
   - the reverse gear insert (5) and the spring (4)
   - the reverse gear blocking ring (3)
   - the reverse driven gear (2)
   - the synchronizer sleeve (1)

1st / 2nd, 3rd / 4th Gear Synchronizer

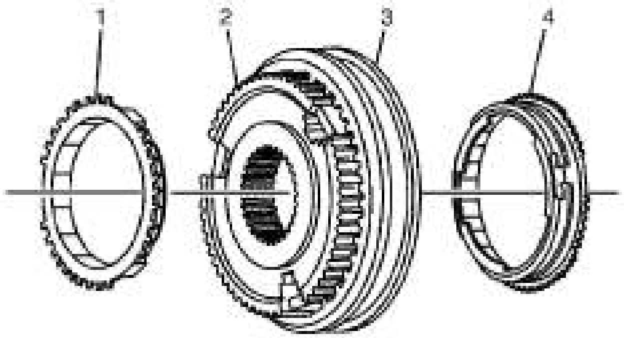


1. Install the synchronizer insert (1) and spring (3) into the synchronizer hub (4). Press the spring and slide the insert in.



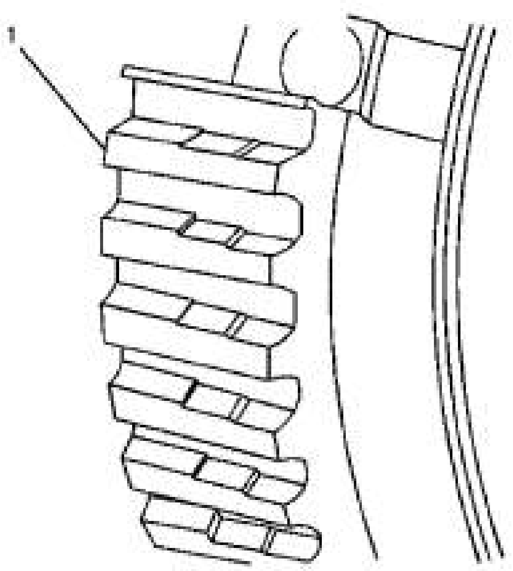
Important: When you service the synchronizers, retain them in the same order that they are removed. Keep the synchronizer components together and mark them to identify correct location.

2. Apply an approved lubricant to the cones and blocking rings. Align and install the following components into the 1st/2nd gear synchronizer hub (4 and 5):
   - the 1st gear synchronizer inner cone (1)
   - the 1st gear synchronizer outer cone (2)
   - the 1st gear outer blocking ring (3)
   - the 2nd gear outer blocking ring (8)
   - the 2nd gear synchronizer outer cone (7)
   - the 2nd gear synchronizer inner cone (6)



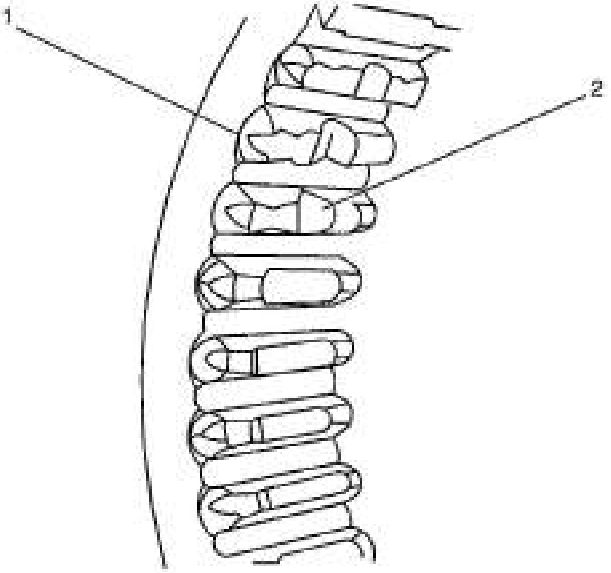
3. Apply an approved lubricant to the blocking rings. Install the following components into the 3rd/4th gear synchronizer hub (2 and 3):
    - the 3rd gear blocking ring (4)
    - the 4th gear blocking ring (1)

Synchronizers Cleaning and Inspection

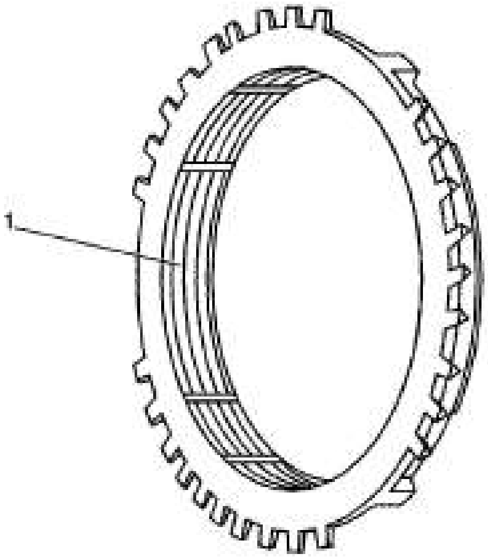


Important: When you service the synchronizers, retain them in the order that they are removed. Mark the parts to ensure the correct position for inspection and assembly.

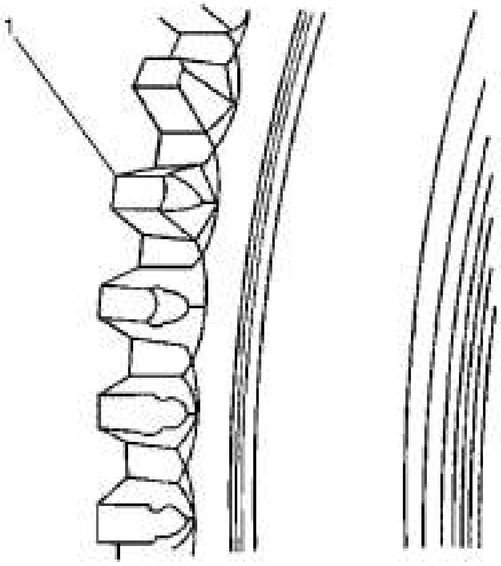
1. Clean all the synchronizer parts in a suitable cleaning solvent and air dry all the parts.
2. Inspect the 1st/2nd gear and the 3rd/4th gear synchronizer hubs for a force fit on the output shaft.
3. Replace synchronizer hubs that do not require a force fit.
4. Inspect the synchronizer hub for wear on the external splines. A stepped effect on the teeth (1), due to wear, may cause shift concerns.
5. Replace a worn hub.
6. Correct the cause, such as, but not limited to the following conditions:
   - Engine related vibrations.
   - Driving at a low speed in a high gear.
   - Defective vibration damper or crankshaft.



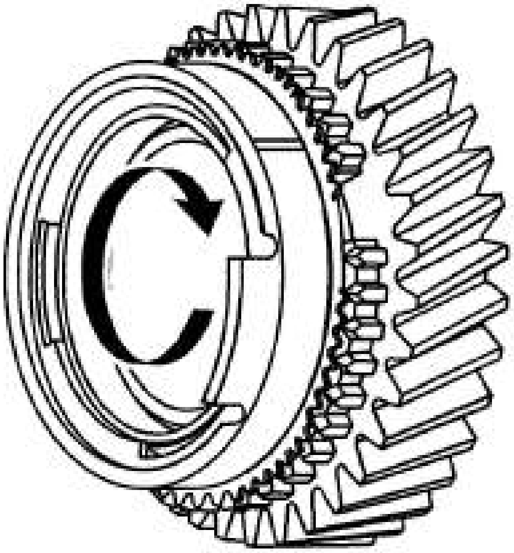
7. Inspect the synchronizer sleeve teeth (1) for the following conditions, which may cause shift concerns:
   - Grated teeth
   - Chipped off teeth
   - Blunted teeth
8. Inspect the synchronizer sleeve detent stops (2) for wear or for being chipped off.
9. Replace the synchronizer assembly if the teeth or stops show the above conditions.



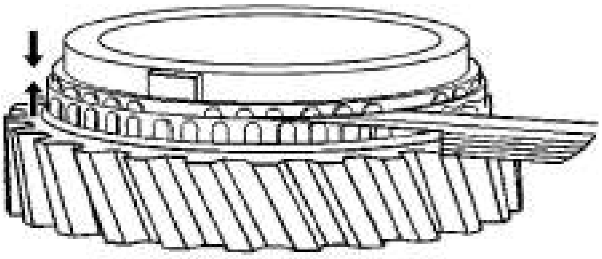
10. Inspect the synchronizer blocker rings for worn away grooves (1).
11. Replace the blocker ring assembly if the blocker ring grooves are worn.



12. Inspect the synchronizer blocker rings for worn shift teeth (1).
13. Inspect the internal ring for being warped or damaged.
14. Inspect the outer ring for worn grooves.
15. Replace the synchronizer assembly for any of the above conditions.



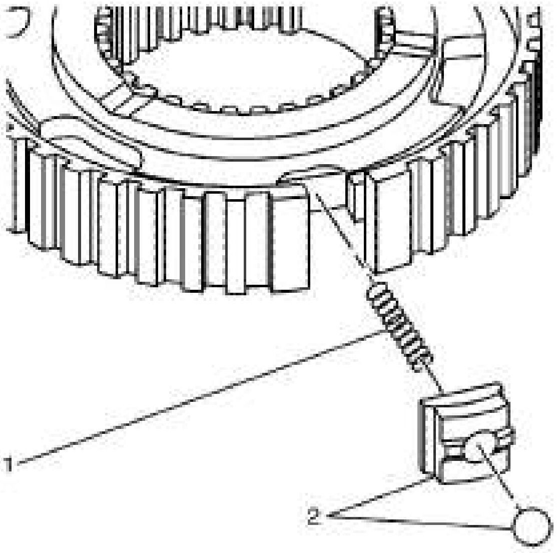
16. Install the synchronizer blocking rings to the correct speed gear.
17. Inspect the braking effect of the blocking ring. Turn the blocking ring in one direction while pushing to the gear cone. Ensure the ring locks.
18. If the ring does not lock, replace the synchronizer assembly.



19. Except for 5th gear, measure the blocker ring to gear clearance.
    1. 19.1. Assemble the correct blocker ring to the correct gear.
    2. 19.2. Apply pressure to the blocker ring to fully seat the ring.
    3. 19.3. Using a feeler gage, measure between the blocker ring teeth and the teeth on the gear.

    Specification

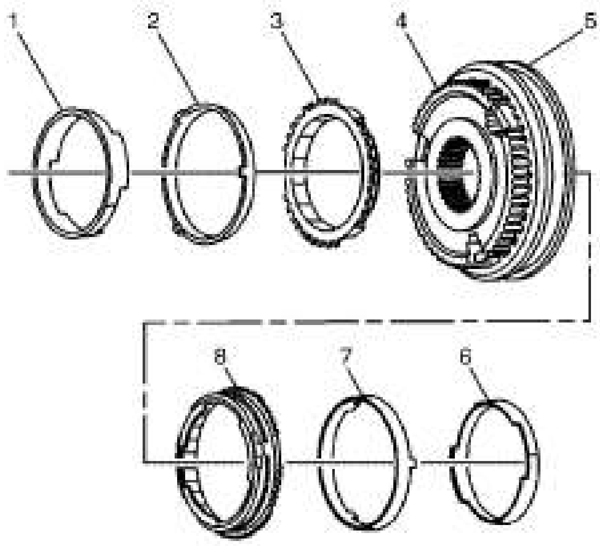
    - Minimum Clearance 4th Gear: 0.8 mm (0.031 in)
    - Minimum Clearance 3rd Gear: 0.8 mm (0.031 in)
    - Minimum Clearance 2nd Gear: 0.8 mm (0.031 in)
    - Minimum Clearance 1st Gear: 0.8 mm (0.031 in)
20. If using a NEW blocker ring and the standard clearance can not be obtained, replace the gear.



21. Inspect the pressure pieces (2) for wear or damage.
22. Inspect the springs (1) for distortion.
23. Replace the worn pressure pieces or faulty springs.

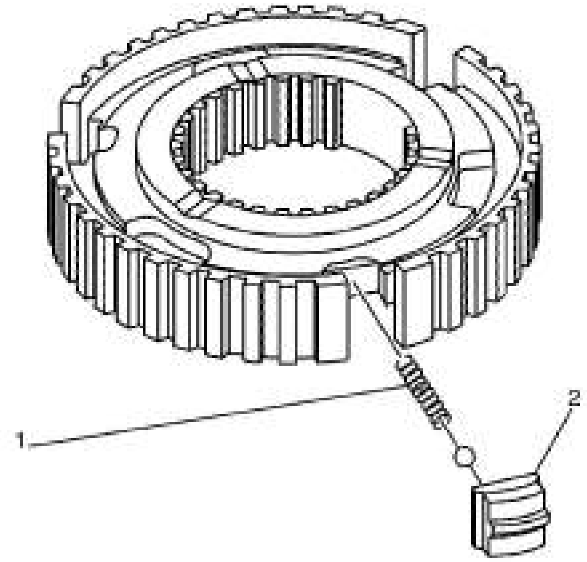
Synchronizers Disassemble

1st / 2nd, 3rd / 4th Gear Synchronizer

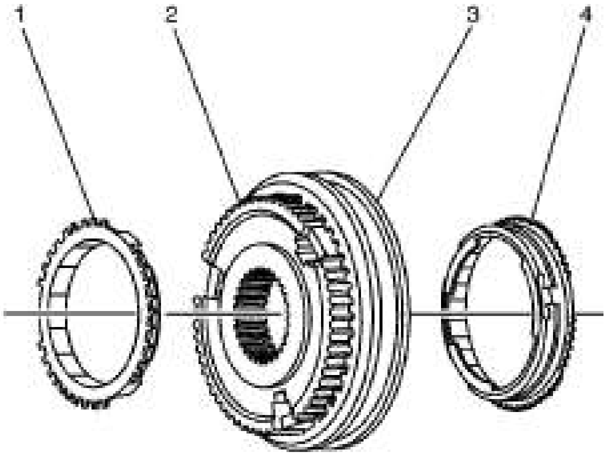


Important: When you service the synchronizers, retain them in the same order that they are removed. Keep the synchronizer components together and mark them to identify correct location.

1. Remove the following components from the 1st/2nd gear synchronizer hub (4 and 5):
   - the 1st gear synchronizer inner cone (6)
   - the 1st gear synchronizer outer cone (7)
   - the 1st gear synchronizer outer blocking ring (8)
   - the 1st gear synchronizer outer blocking ring (8)
   - the 1st gear synchronizer outer cone (2)
   - the 1st gear synchronizer inner cone (1)

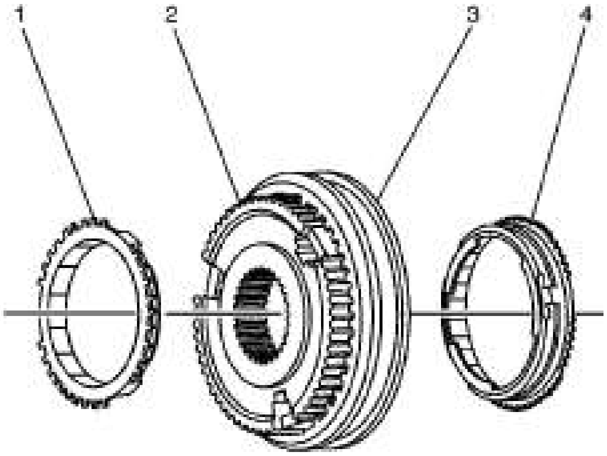


2. Remove the synchronizer insert (2) and spring (1) from the synchronizer hub. Press the spring and slide the insert out.

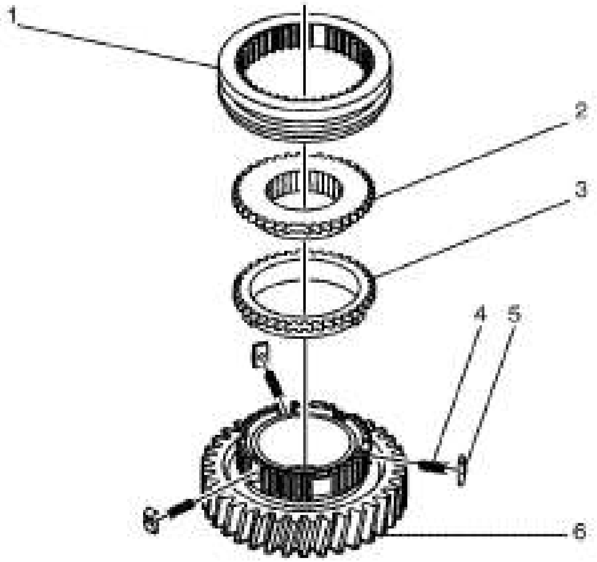


3. Remove the following components from the 3rd/4th gear synchronizer hub (2 and 3):
   - the 4th gear blocking ring (1)
   - the 3rd gear blocking ring (4)

5th / 6th Gear Synchronizer



1. Remove the following components from the 5th/6th synchronizer hub (2 and 3):
   - The 6th gear blocking ring (1)
   - The 5th gear blocking ring (4)

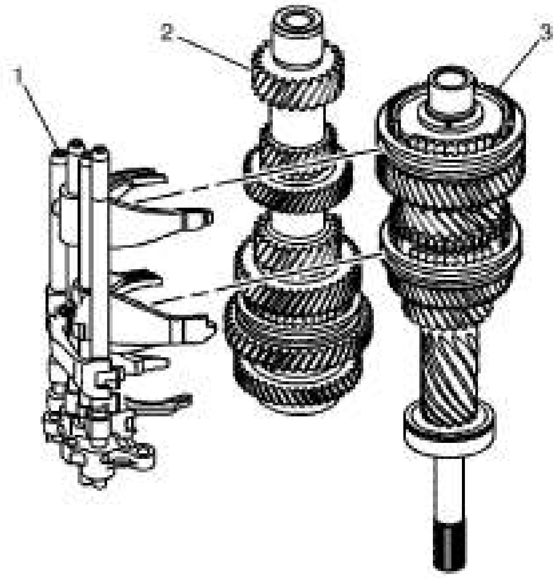


2. Remove the following components from the reverse gear (6):
   - the synchronizer sleeve (1)
   - the reverse driven gear (2)
   - the reverse gear blocking ring (3)
   - the reverse gear synchronizer insert (5) and the spring (4)

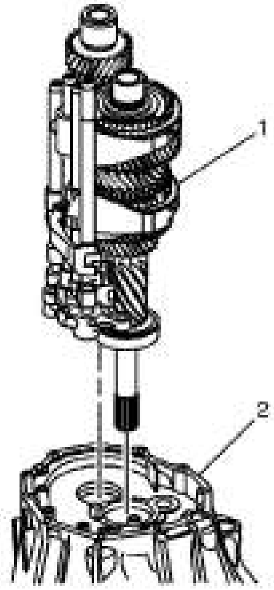
Transmission Assemble

Tools Required

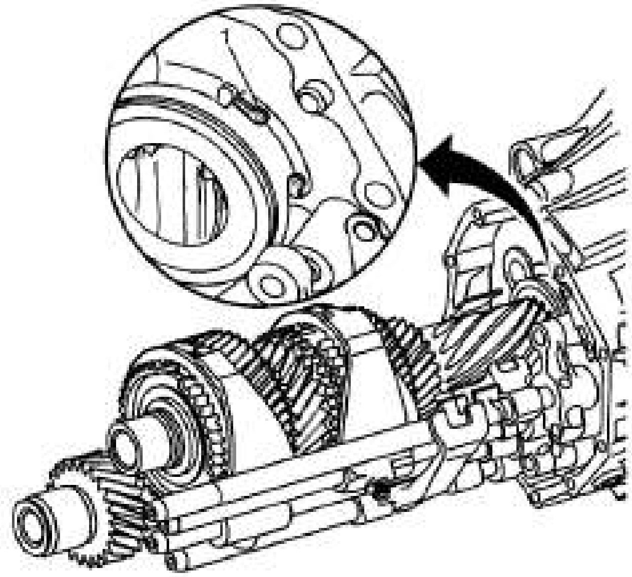
- DT-47735 Pinion Flange Holder
- J 35467 One-Way Clutch Tester
- J 44731 Input Shaft Seal Installer



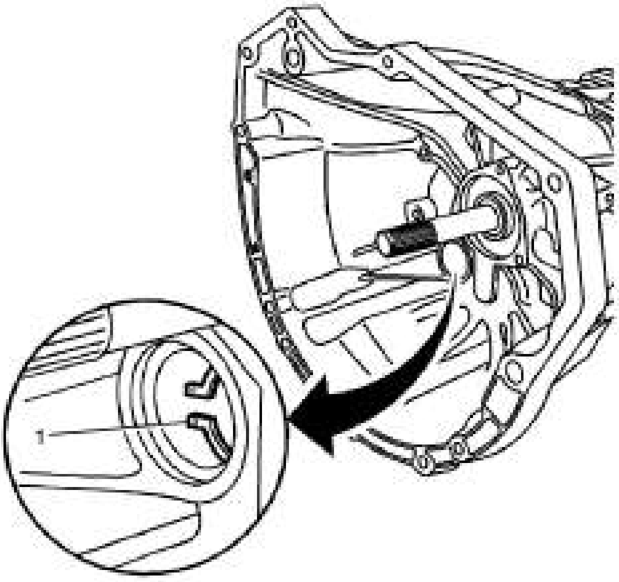
1. Apply an approved lubricant to each gear shift fork and gear shift head (1).
2. Join the shift rail assembly to the input shaft (3) and countershaft assembly (2).



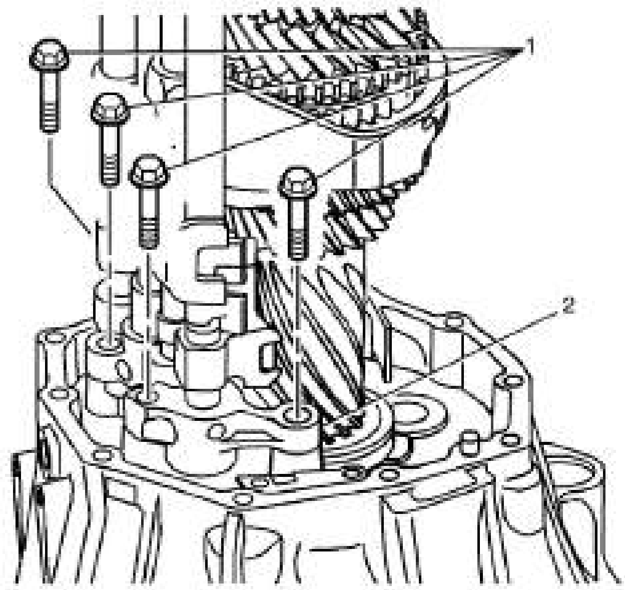
3. Install the input shaft, countershaft and shift rails as an assembly (1) in the clutch housing (2).



4. Install the snap ring (1) into the groove of the input shaft radial ball bearing.



5. Install the snap ring (1) into the groove of the countershaft radial ball bearing.

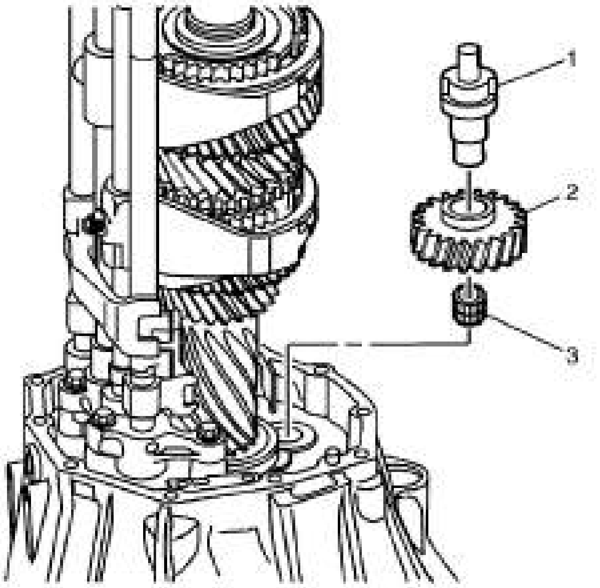


6. Apply an approved threadlocker to the shift rail retaining bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.

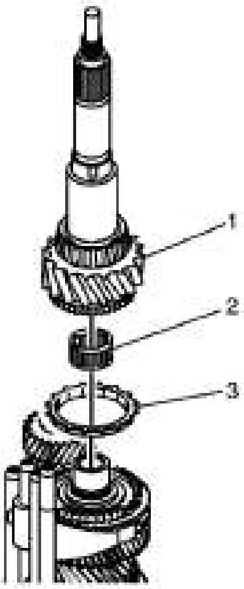
7. Install the shift rail (2) to clutch housing retaining bolts (1)

   Tighten
   Tighten the bolts to 21 N·m (15 lb ft).

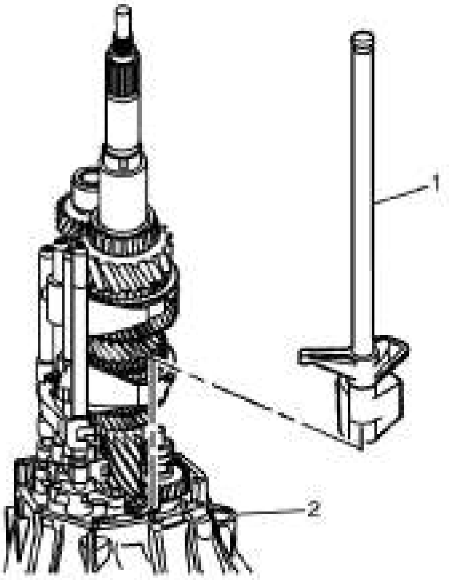


Important: During alignment, ensure that the thread hole of the reverse idler gear shaft (1) aligns with the thread hole of the middle case.

8. Apply an approved lubricant and install the following components:
   - the reverse idler gear bearing (3)
   - the reverse idler gear (2) with the higher boss facing the rear
   - the reverse idler gear shaft (1) with its hole facing outward

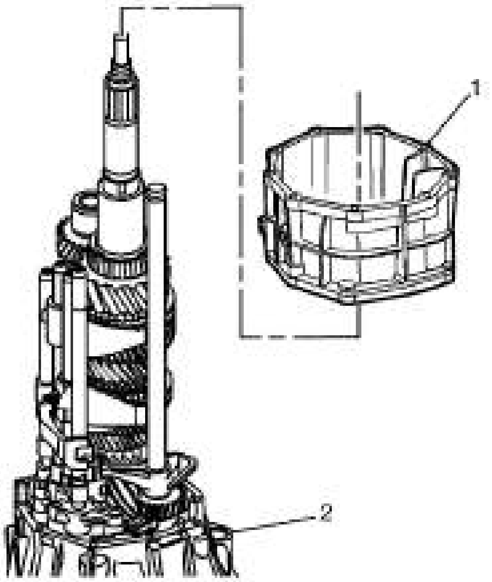


9. Apply an approved lubricant and install the input shaft bearing (2), blocking ring (3) and the rear output shaft (1).

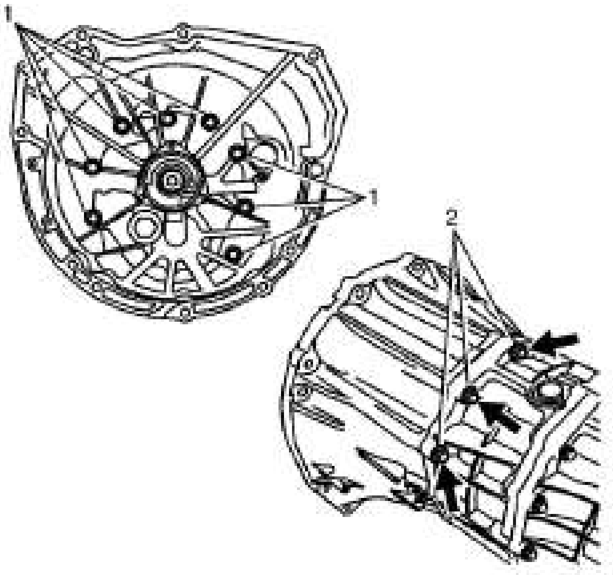


10. Install the shift shaft selector lever (1) to the clutch housing (2).

Notice: Refer to Machined Surface Damage Notice in the Preface section.



11. Apply an approved sealer the interface of the clutch housing (2) and the intermediate case (1).
12. Apply an approved lubricant to the shift and select lever shaft bearing.
13. Install the intermediate case (1) to the clutch housing.

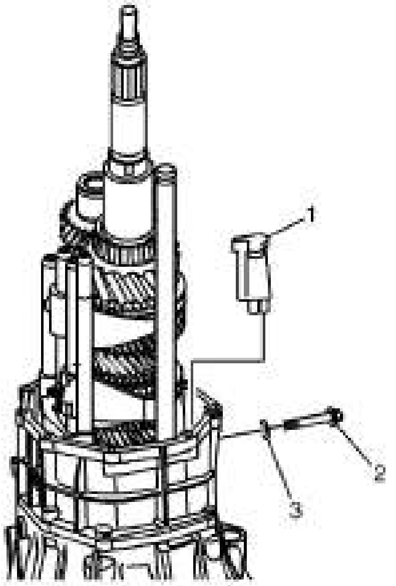


14. Install the inner clutch housing to intermediate case retaining bolts (1).

Tighten
Tighten the bolts to 40 N·m (29 lb ft)

15. Install the outer clutch housing to intermediate case retaining bolts (2).

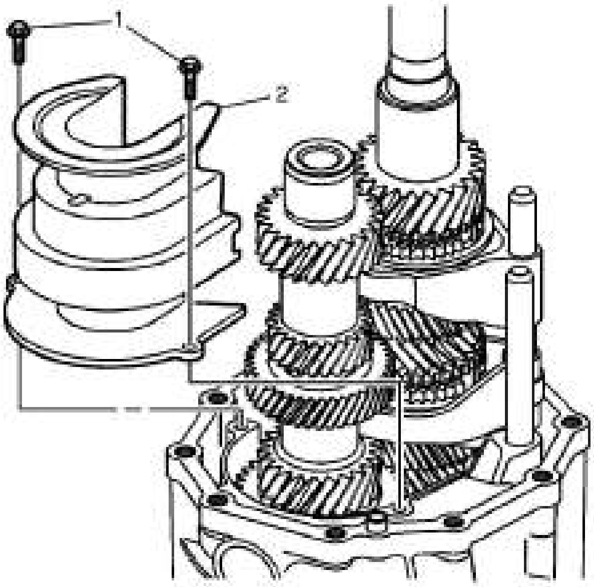
Tighten
Tighten the bolts to 40 N·m (29 lb ft)



16. Install the oil trough pipe (1) to the intermediate case.
17. Install a NEW gasket (3) to the reverse idler gear shaft retaining bolt (2).
18. Install the reverse idler gear shaft retaining bolt (2) to the intermediate case.

Tighten

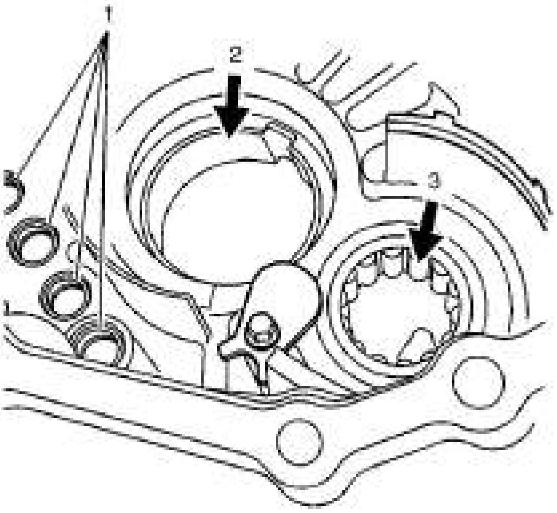
Tighten the bolt to 40 N·m (30 lb ft)



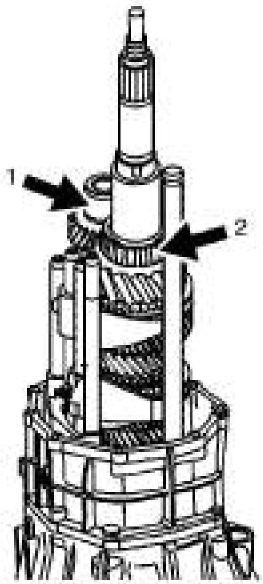
19. Install the oil trough (2) to the intermediate case.
20. Install the oil trough (2) to intermediate case retaining bolts (1).

Tighten

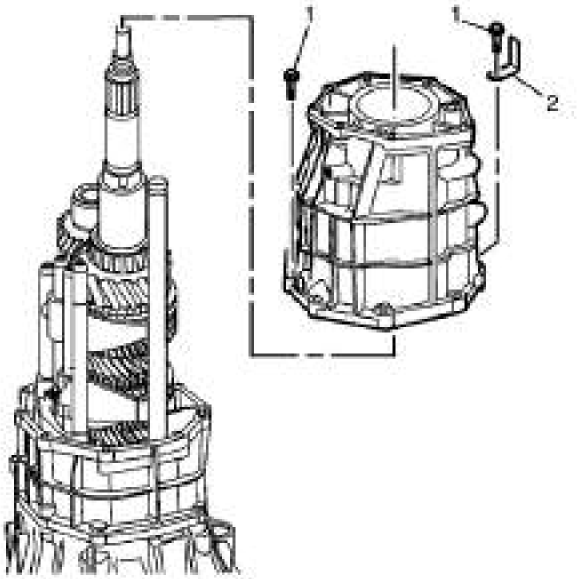
Tighten the bolts to 8.5 N·m (75 lb in)



21. Apply an approved lubricant to the following components:
    - the tapered roller bearing outer race (2)
    - the cylindrical roller bearing (3)
    - the control sub-assembly holes (1)



22. Apply an approved lubricant to the following components:
    - the tapered roller bearing of the output shaft (1)
    - the cylindrical roller bearing inner race of counter gear (2)

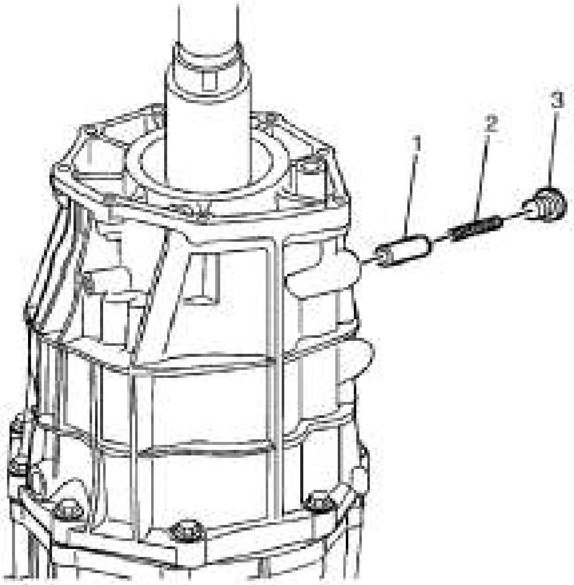


23. Apply an approved sealer to the interface of either case.

    Notice: Refer to Machined Surface Damage Notice in the Preface section.

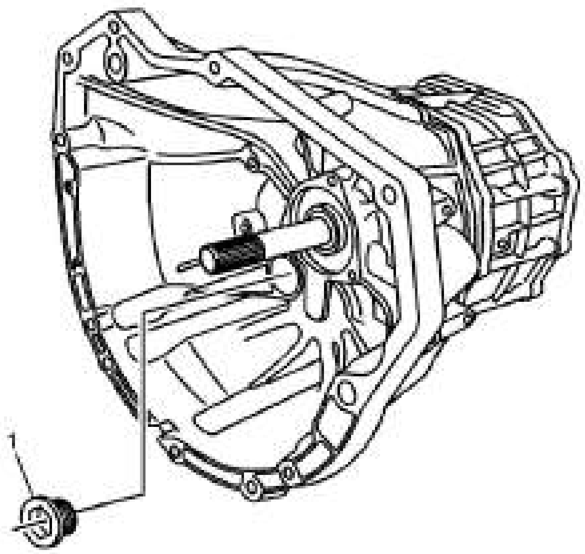
24. Install the rear case to the intermediate case.
25. Install the rear case to intermediate case retaining bolts (1).

    Tighten
    Tighten the bolts to 40 N·m (29 lb ft)



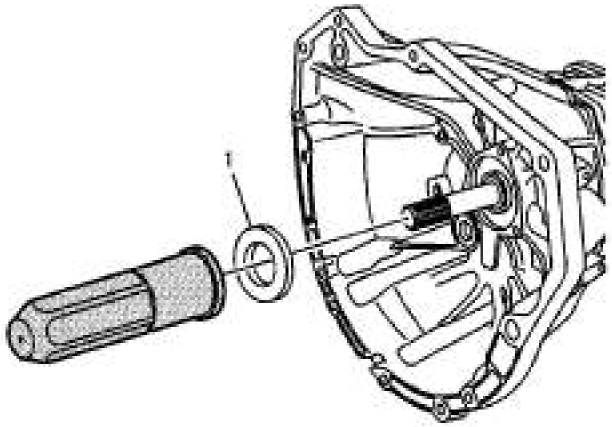
26. Apply an approved lubricant and install the lock ball pin (1).
27. Install the spring (2) and a NEW plug (3) to the rear case.

Tighten
Tighten the plug to 24 N·m (18 lb ft)

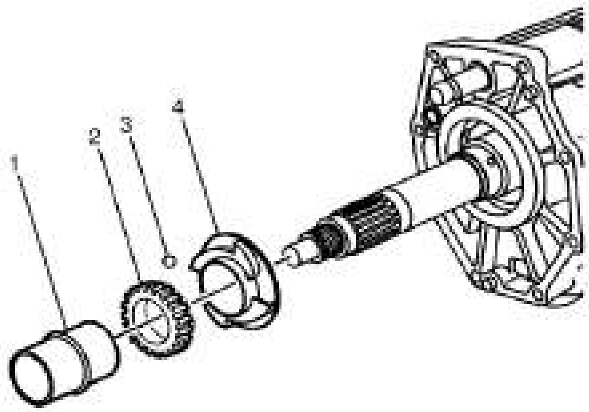


28. Using J 35467 , install a NEW clutch housing hole plug (1) into the clutch housing.

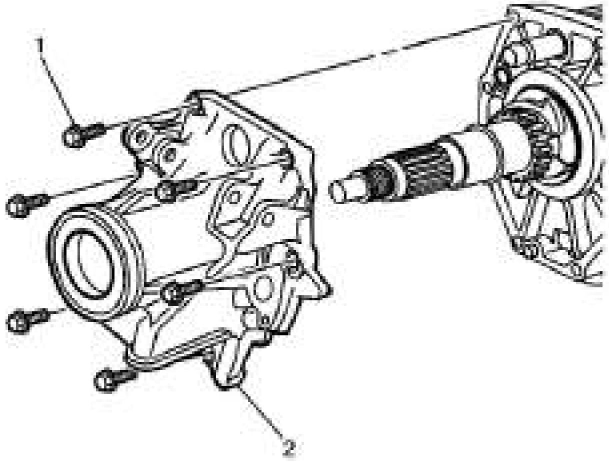
Tighten
Tighten the bolt to 39 N·m (29 lb ft).



29. Using J 44731 , install a NEW input shaft seal (1) to the clutch housing.

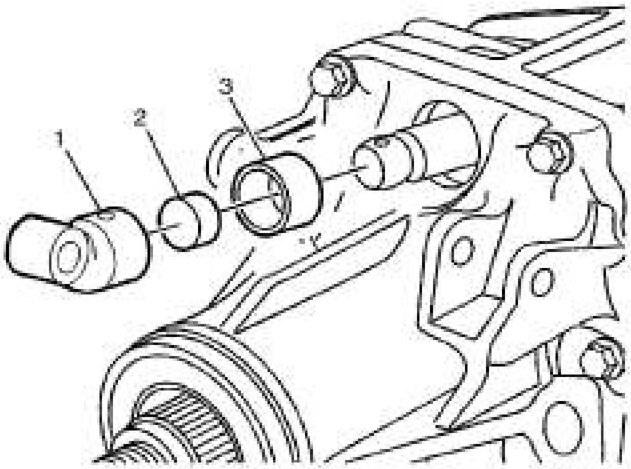


30. Align and install the main shaft bearing oil slinger (4) to the output shaft.
31. Grease and install the locking ball (3) to the output shaft.
32. Align and install the vehicle speed sensor drive gear (2) to the output shaft.
33. Install a NEW rear output shaft rear bearing spacer (1) to the output shaft.

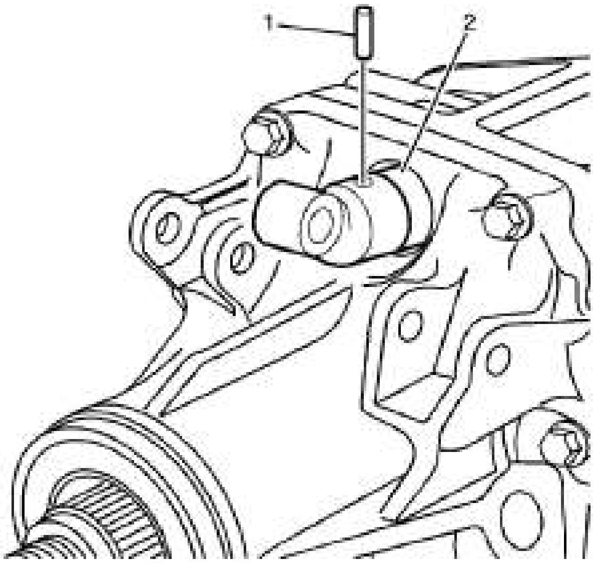


34. Apply an approved sealer to the interface of either case.
35. Install the rear extension housing (2) to the rear case.
36. Install the rear extension housing to rear case retaining bolts (1).

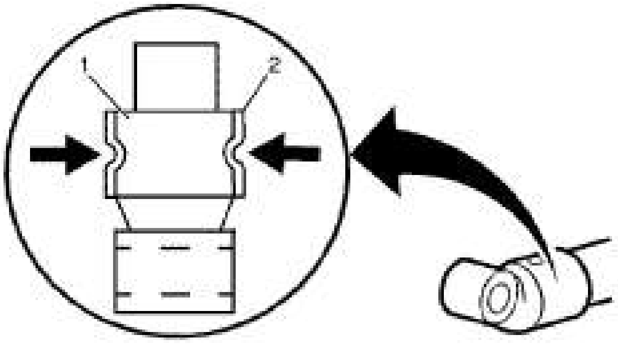
    Tighten
    Tighten the bolts to 29 N·m (21 lb ft)



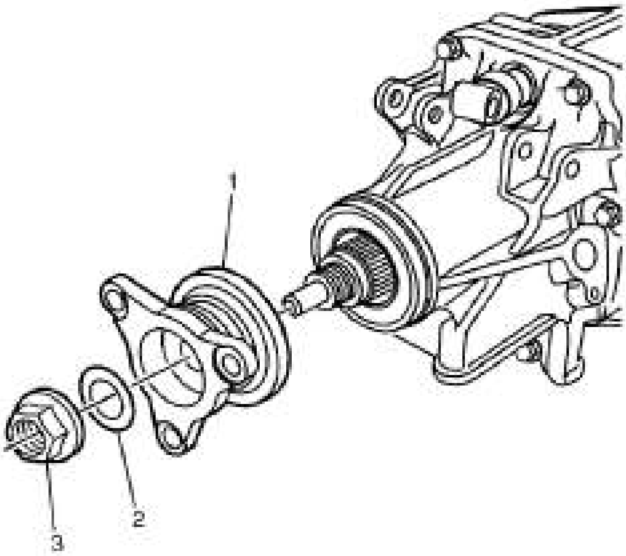
37. Install a NEW select shift lever retainer (3), the damper (2) and shift lever rod universal joint (1) into the end of the shift selector.



38. Install the shift lever pin (1) to the select shift lever rod universal joint (2).
39. With a suitable tool, rotate the shift lever retainer (2) backward.

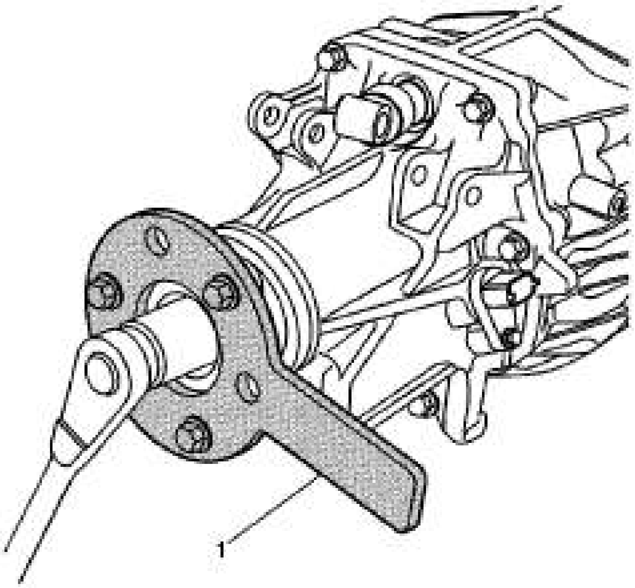


40. Stake the retainer (2) in place using pliers and 2 roll pins held in place with assembly lube.

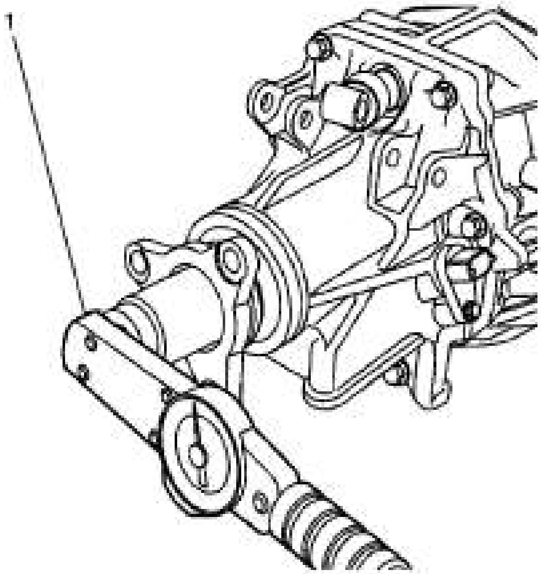


41. Install the propshaft flange (1) to the output shaft.
42. Grease and install a NEW propshaft flange thrust washer (2) to the output shaft.
43. Install a NEW propshaft flange nut (3) to the output shaft.

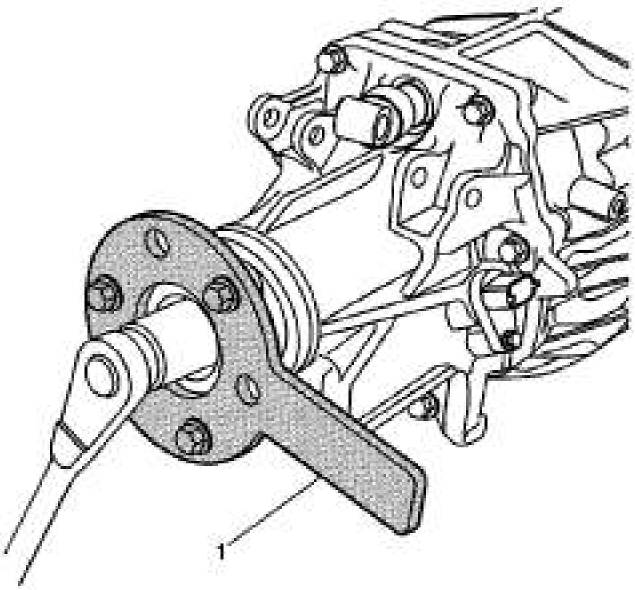
Preload Adjustment Procedure



1. Shift the transmission into any gear.
2. Attach DT-47735 (1) to the output flange.
3. Hold DT-47735 in order to prevent the output flange from rotating. Install and tighten the output flange nut. Tighten until the looseness is minimum.
4. Verify looseness by shaking the output shaft longitudinally.



5. Remove DT-47735 from the output flange.
6. Shift the transmission into NEUTRAL.
7. Rotate the output flange several times in order to break in the gears, synchronizers and bearings.
8. Measure the rotational torque/drag torque of the output flange by using a suitable tool (1). Record this initial rotational torque measurement as value A.



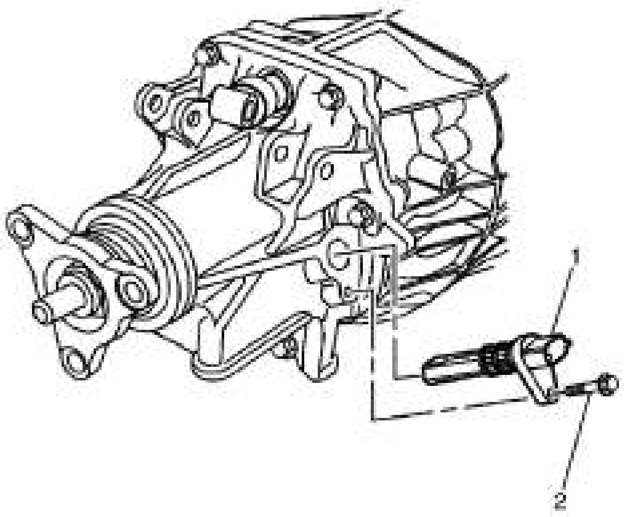
9. Attach DT-47735 (1) to the output flange.
10. Shift the transmission into any gear.
11. Tighten the propshaft flange to output shaft retaining nut.

    Tighten
    Tighten the nut 220-565 N·m (162-417 lb ft).

12. Remove the DT-47735 from the output flange.
13. Shift the transmission into NEUTRAL.
14. Rotate the output flange several times in order to seat the bearings.
15. Measure the rotational torque/drag torque of the output flange by using a suitable tool. Record this measurement as value B.
16. Subtract value A from value B. Verify that the resulting measurement is within the specified range.

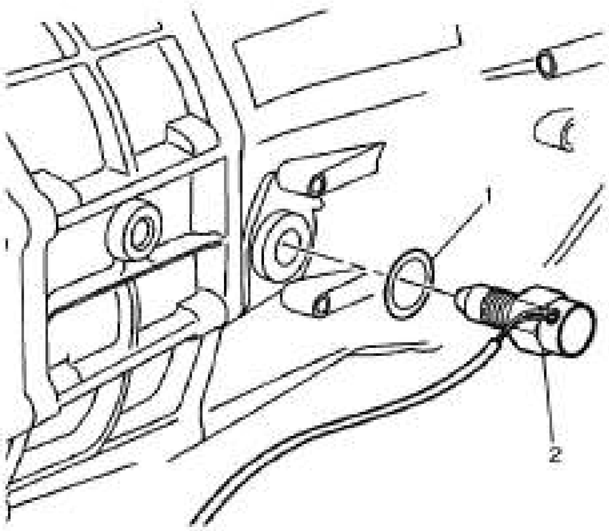
    Specification
    The rotational torque specification is.45-1.35 N·m (4-12 lb in).

17. Repeat the previous steps until you have confirmed that the rotational torque specification is reached then stake the nut in place. If the rotational torque requirement has been exceeded, replace the output shaft spacer and repeat steps 2-16.



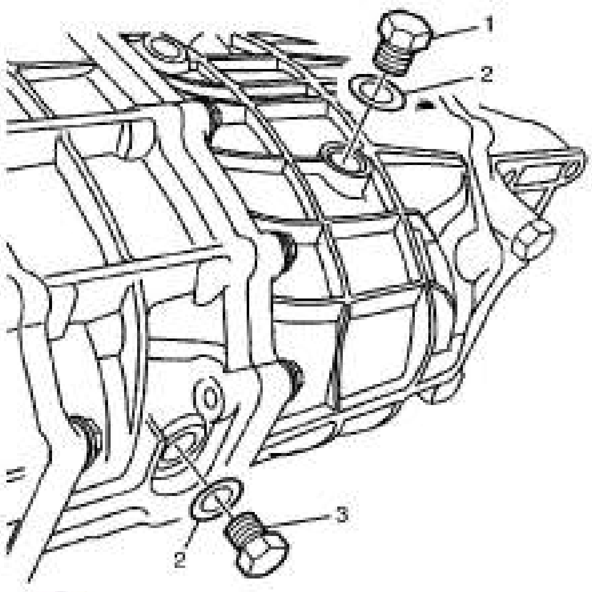
18. Install the output sensor (1) to the extension housing.
19. Install the output sensor to extension housing retaining bolt (2).

Tighten
Tighten the bolt to 8 N·m (71 lb in).



20. Install a NEW backup lamp washer (1) to the backup switch.
21. Install the backup switch to the extension housing.

Tighten
Tighten the switch to 44 N·m (32 lb ft).



22. Install the NEW gaskets (2), drain plug (3) and fill plug (1).
    - Install the drain plug (3) to the rear case.

Tighten
Tighten both plugs to 37 N·m (27 lb ft).

- Install the fill plug (1) to the intermediate case.

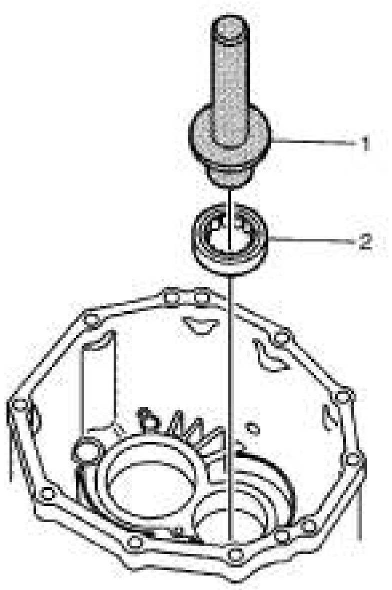
Tighten
Tighten both plugs to 37 N·m (27 lb ft).

Transmission Case Assemble

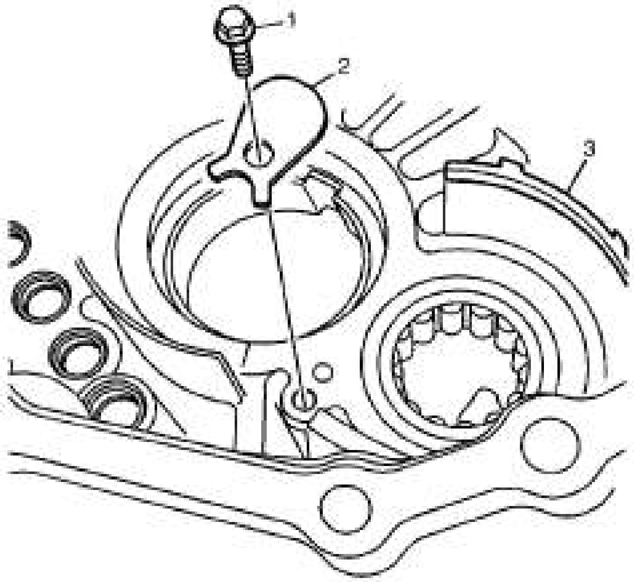
Tools Required

- DT-47721 Shift Shaft Seal Installer
- DT-47722 Shift Rail Bushing Remover and Installer
- DT-47723 Output Shaft Bearing Installer
- DT-47724 Output Shaft Bearing Cup Installer
- DT-47725 Extension Housing Bearing Cup Installer
- DT-47726 Countershaft Rear Bearing Installer

Rear Case Assemble



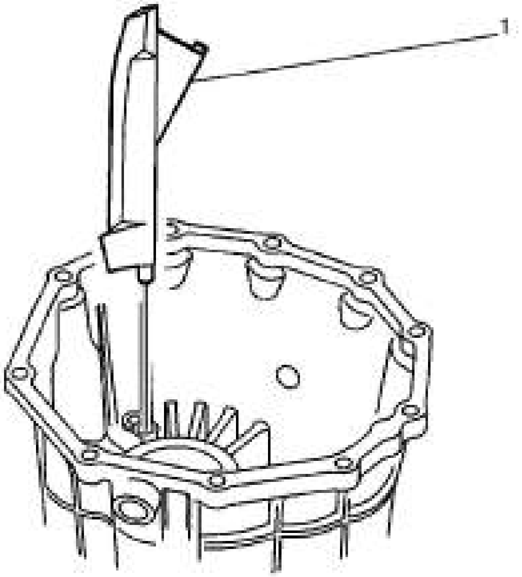
1. Apply gear oil to bearing. Use DT-47726 (1) to install bearing (2).



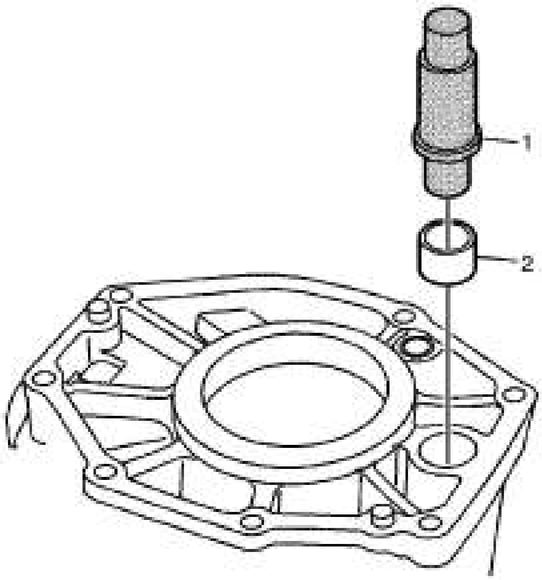
2. Install the bearing retainer (2) and bolt (1).

   Tighten
   Tighten the bolt to 11 N·m (96 lb in).

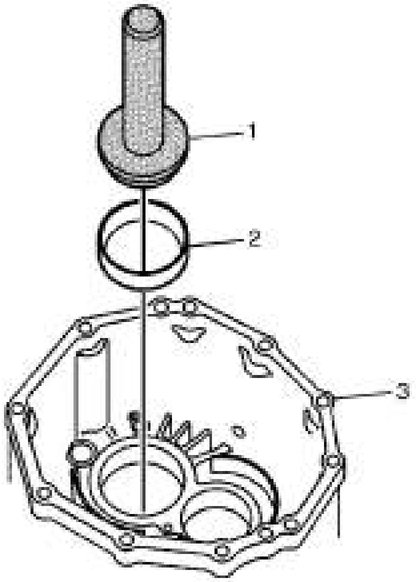
3. Install the gasket (3) to the rear case.



4. Install the oil trough (1) to the rear case.

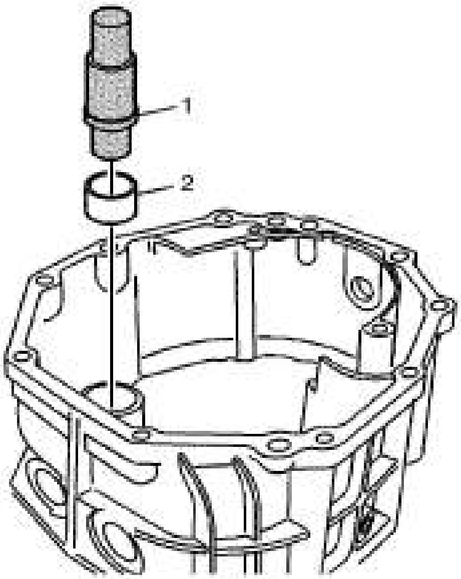


5. Using DT-47722 (1), install the bearing (2) in the rear case.



6. Using DT-47724 , install the tapered bearing race (1) into the rear case.

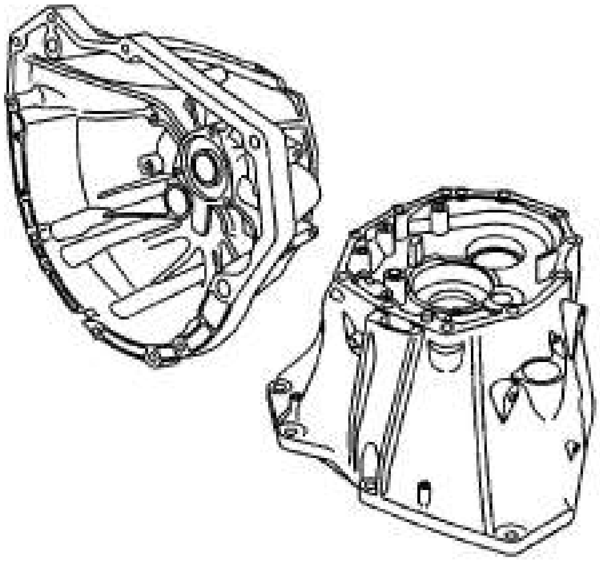
Middle Case Assemble



Using DT-47722 (1), install the bearing (2) in the intermediate case.

Transmission Case Cleaning and Inspection

Clutch Housing

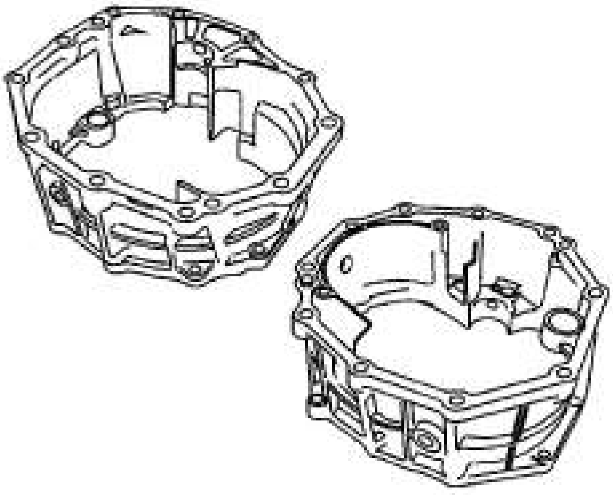


1. Clean the clutch housing in a suitable cleaning solvent and air dry.
2. Inspect the clutch housing for the following conditions:
   - Cracks
   - Damaged mounting flanges
   - Damaged bolt holes

Notice: Refer to Machined Surface Damage Notice in the Preface section.

3. Remove the sealer from the case sealing surfaces.
4. Inspect the case for being broken or cracked.
5. Inspect the bearing bore for the following conditions:
   - A spun bearing
   - Cracks
6. Replace the case assembly if any of the above conditions are found.
7. Inspect the sealing surfaces for damage.
8. Repair small scratches or nicks with a soft stone.
9. Inspect the case threaded bolt holes for damage.
10. Repair any damaged threads.
11. Inspect the location pins for being loose or missing.
12. Repair or replace any damaged location pins.

Middle Case

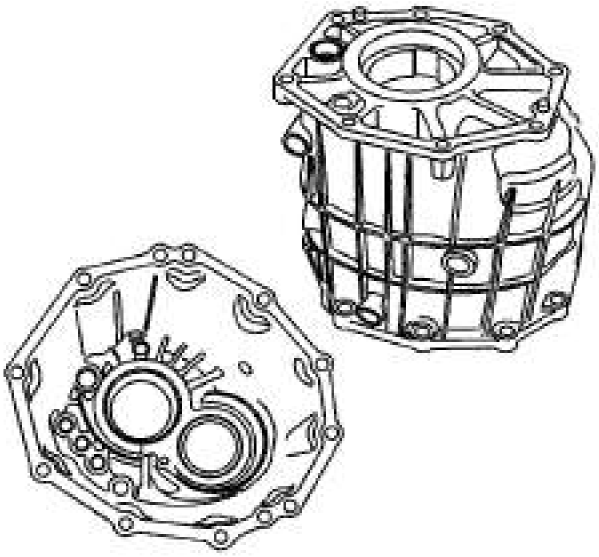


1. Clean the middle case in a suitable cleaning solvent and air dry.

   Notice: Refer to Machined Surface Damage Notice in the Preface section.

2. Remove the sealer from the case sealing surfaces.
3. Inspect the case for being broken or cracked.
4. Inspect the input shaft bearing bore for the following conditions:
   - A spun bearing
   - Cracks
5. Inspect the countershaft front bearing bore for the following conditions:
   - A spun bearing
   - Cracks
6. Replace the case assembly if any of the above conditions are found.
7. Inspect the sealing surfaces for damage.
8. Repair small scratches or nicks with a soft stone.
9. Inspect the case threaded bolt holes for damage.
10. Repair any damaged threads.
11. Inspect the location pins for being loose or missing.
12. Repair or replace any damaged location pins.

Rear Case

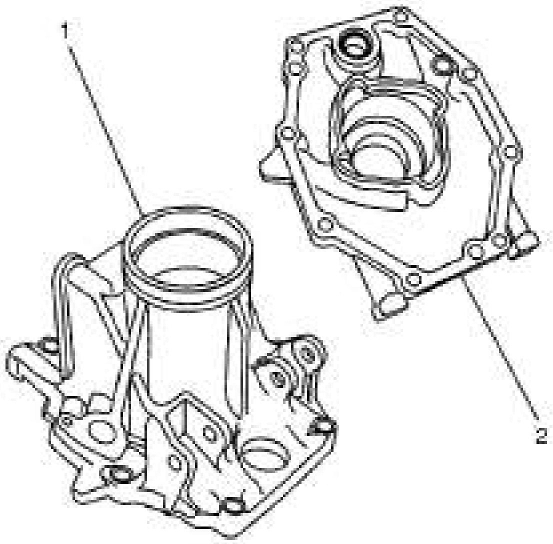


1. Clean the rear case in a suitable cleaning solvent and air dry.

   Notice: Refer to Machined Surface Damage Notice in the Preface section.

2. Remove the sealer from the case sealing surfaces.
3. Inspect the sealing surfaces for damage.
4. Inspect the case threaded bolt holes for damage.
5. Repair any damaged threads.
6. Inspect the location pins for being loose or missing.
7. Repair or replace any damaged location pins.
8. Inspect the shift shaft bushings for excessive wear.
9. Inspect the bearing bore.
10. Replace the case assembly if the shift shaft bushings are faulty.

Extension Housing



1. Clean the extension housing in a suitable cleaning solvent and air dry.

   Notice: Refer to Machined Surface Damage Notice in the Preface section.

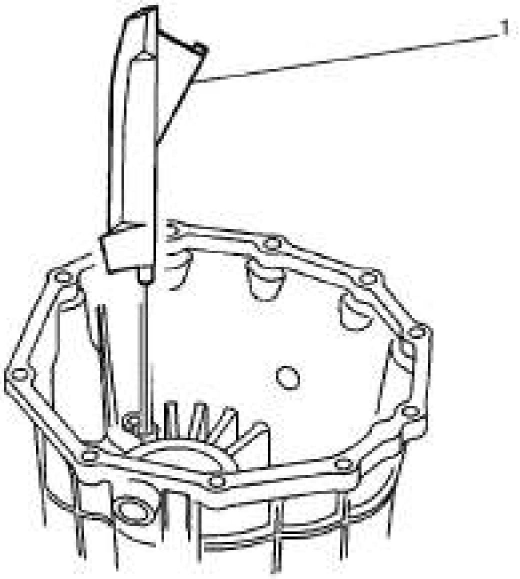
2. Remove the sealer from the extension sealing surfaces (2).
3. Inspect the sealing surfaces for damage.
4. Inspect the extension for being broken or cracked.
5. Inspect the oil seal (1) for wear or damage. The oil seal is serviced only with the extension housing.
6. Inspect the bearing bore.
7. Replace the extension if any of the above conditions are found.
8. Inspect the case threaded bolt holes for damage.
9. Repair any damaged threads.
10. Repair or replace any damaged location pins.

Transmission Case Disassemble

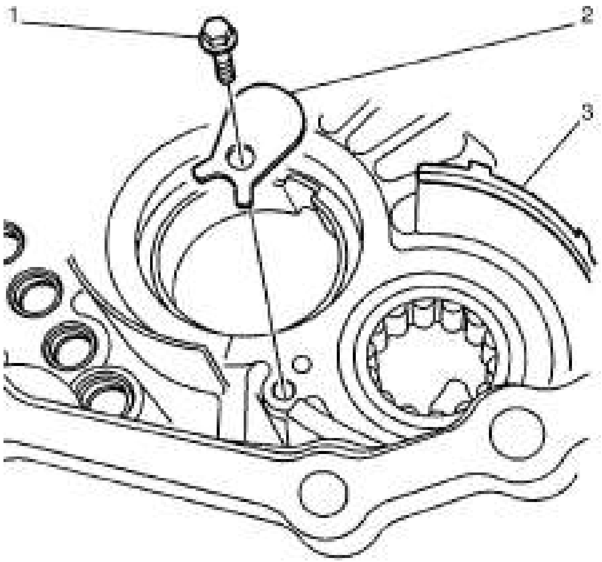
Tools Required

- DT-47722 Shift Rail Bushing Remover and Installer
- J 2619-01 Slide Hammer
- J 26941 Bushing and Bearing Remover 3-4 in

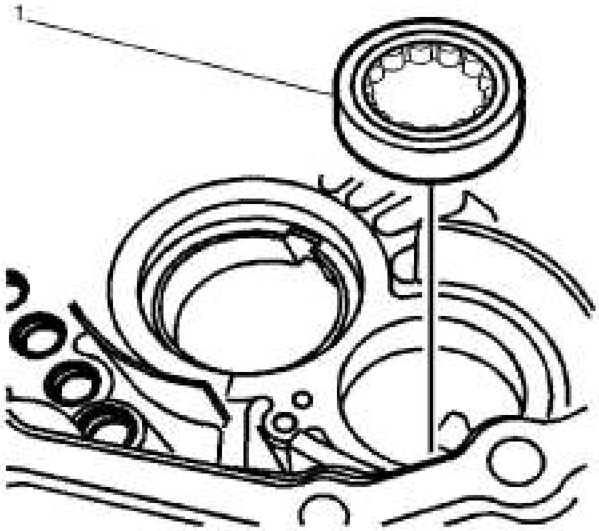
Rear Case Disassemble



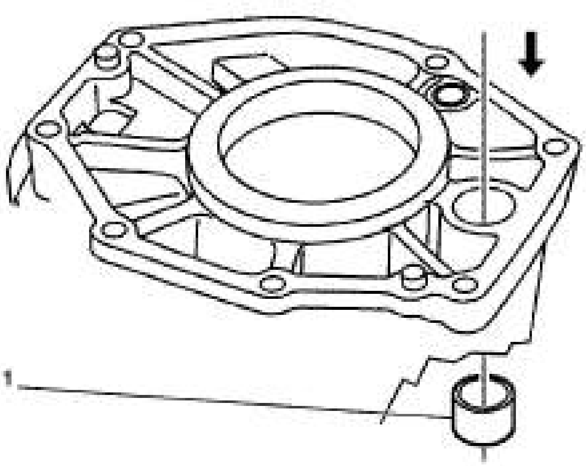
1. Remove the oil trough (1) from the rear case.



2. Remove the counter gear roller bearing retainer to rear case retaining bolt (1).
3. Remove the counter gear roller bearing retainer from the rear case.
4. Remove the gasket (3) from the rear case.

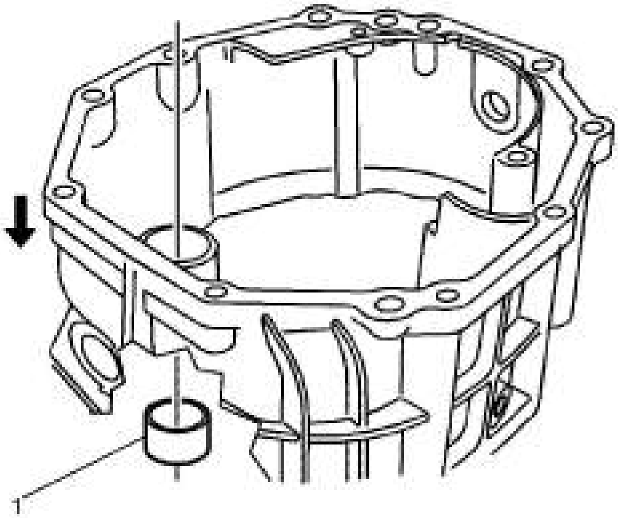


5. Using J 26941 and J 2619-01 , remove the counter gear roller bearing (1) from the rear case.



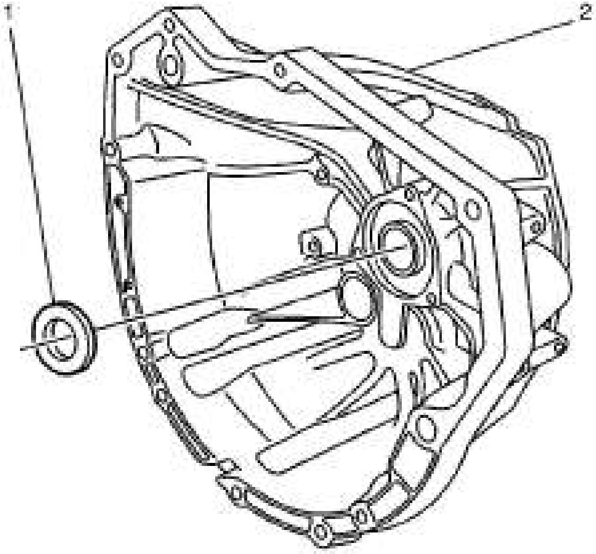
6. Using DT-47722 , remove the shift shaft bearing (1) from the rear case.

Middle Case Disassemble



Using DT-47722 , remove the shift shaft bearing (1) from the middle case.

Clutch Housing Disassemble



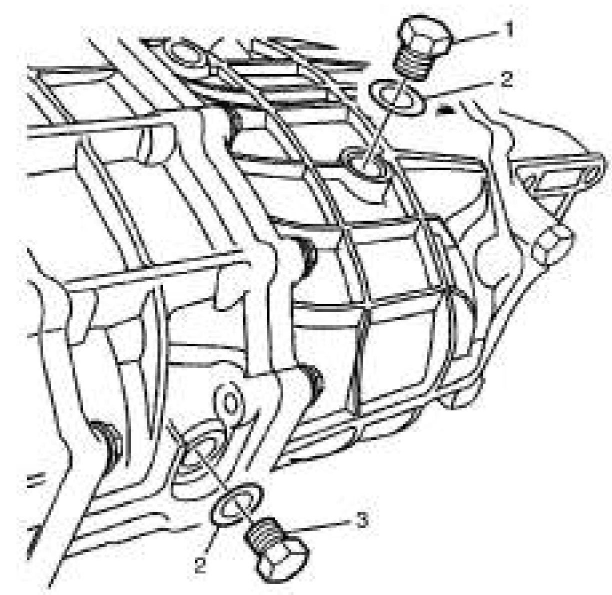
Using a suitable tool, remove the input shaft seal (1) from the front case (2).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Repair Instructions - Off Vehicle | **Document ID: 1996679**

Transmission Disassemble

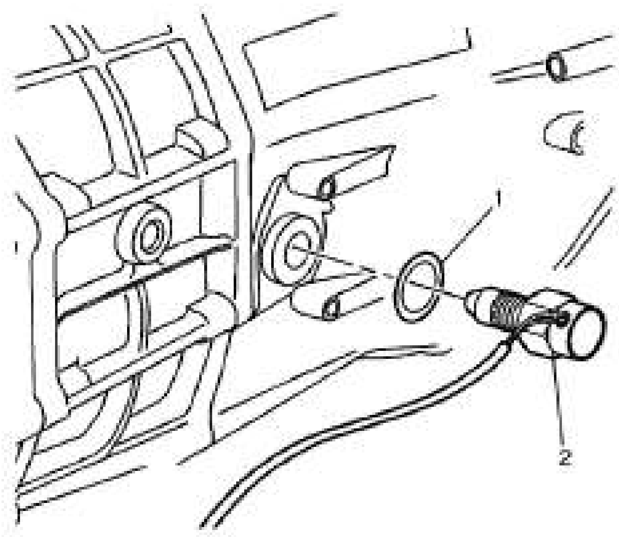
Tools Required

J 8433 Two Jaw Puller



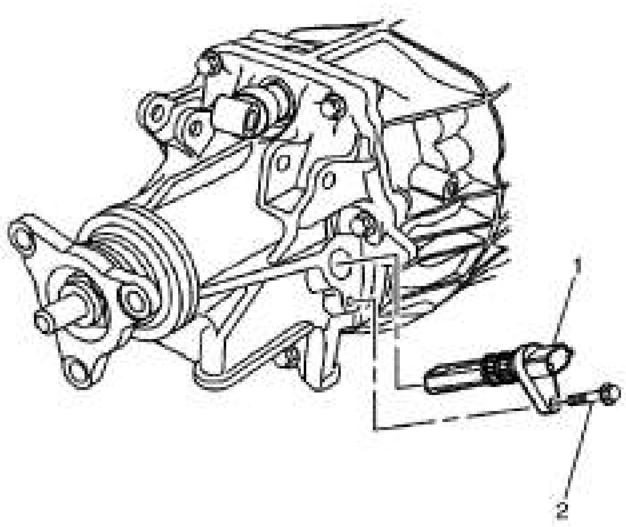
1. Remove the drain plug (3) and drain the transmission fluid and discard washer.

   Discard the washer.

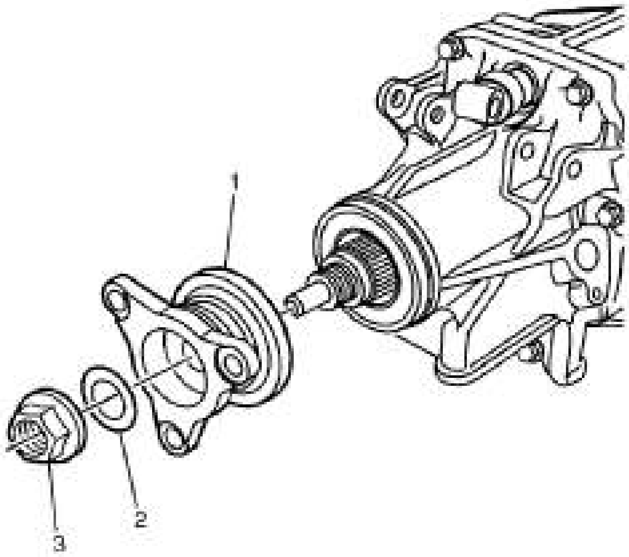


2. Remove the backup lamp switch (2) and washer (1) from the case.

   Discard the washer.

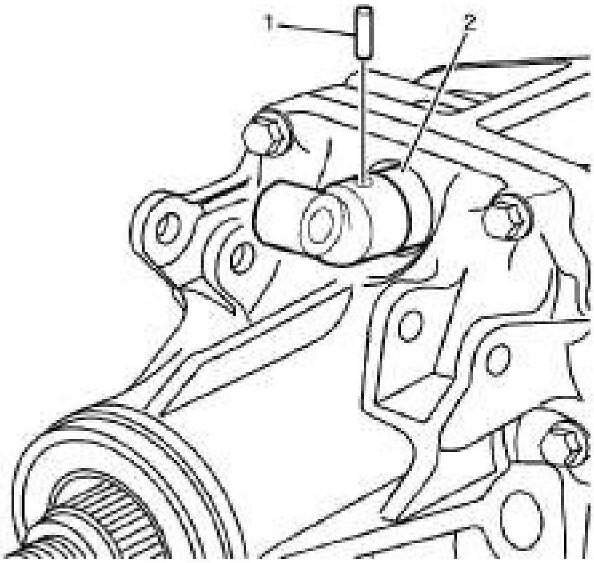


3. Remove the output sensor (1) and bolt (2) from the rear extension housing.

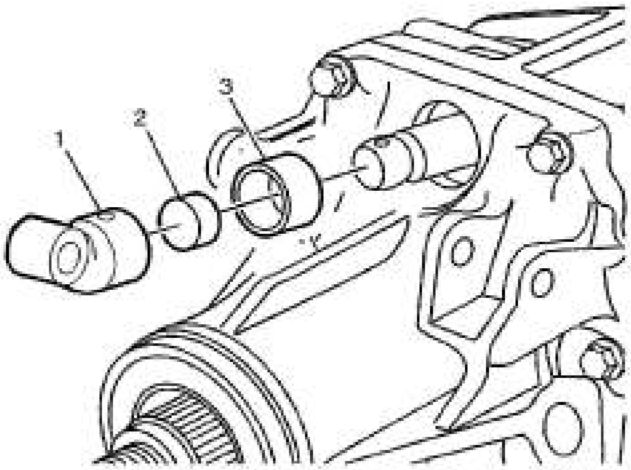


4. Using a suitable tool, release the staking of the propshaft flange nut (3).
5. Remove the thrust washer (2) from the propshaft flange assembly.
6. Remove the propshaft flange nut (3) and propshaft flange assembly (1).

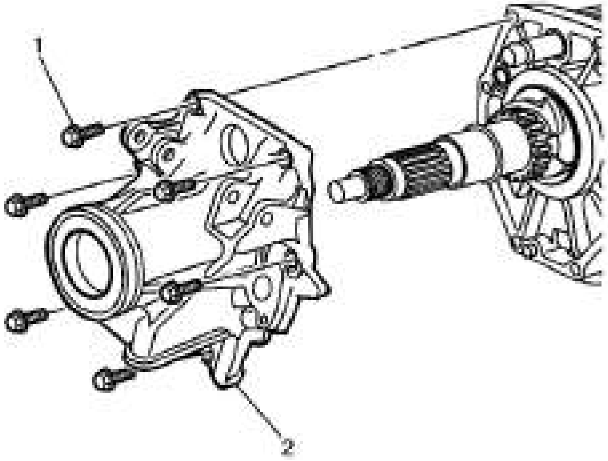
Notice: Refer to General Repair Instructions in the Preface section.



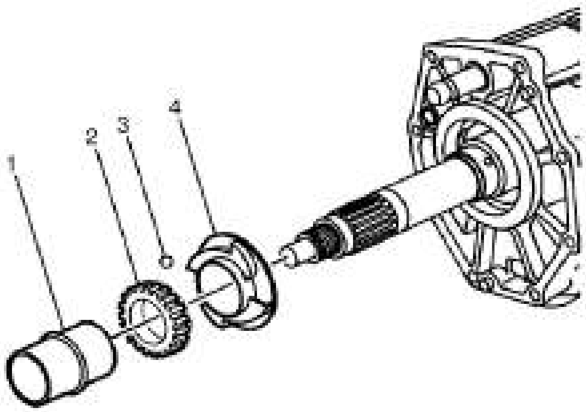
7. To release the staking, insert a suitable tool into the gap between the select shift lever retainer (2) and the rod.
8. Using a suitable tool, rotate the select shift lever retainer (2) forward.
9. Using a suitable tool, remove the shift lever pin (1).



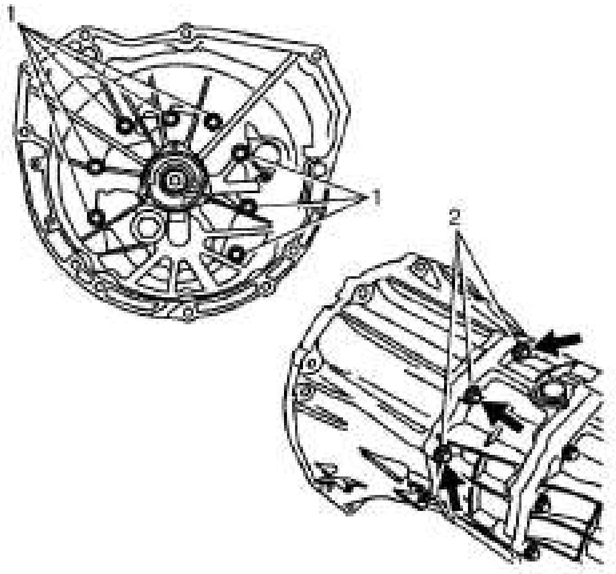
10. Remove the shift lever rod universal joint (1), damper (2) and select shift lever retainer (3) from the end of the shift selector.



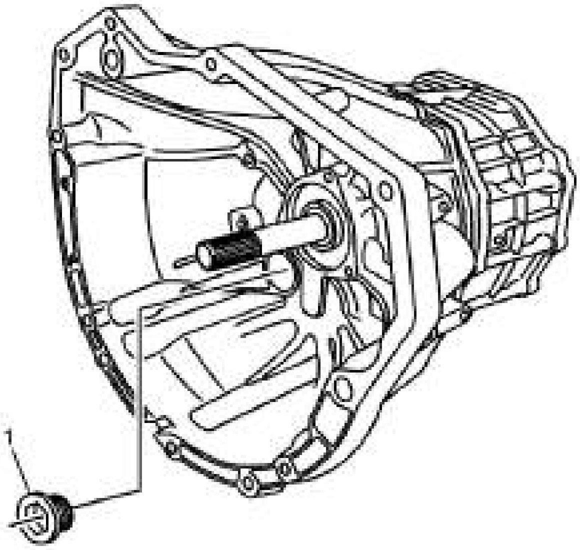
11. Remove the transmission housing to extension housing retaining bolts (1).
12. Remove the extension housing (2) from the transmission..



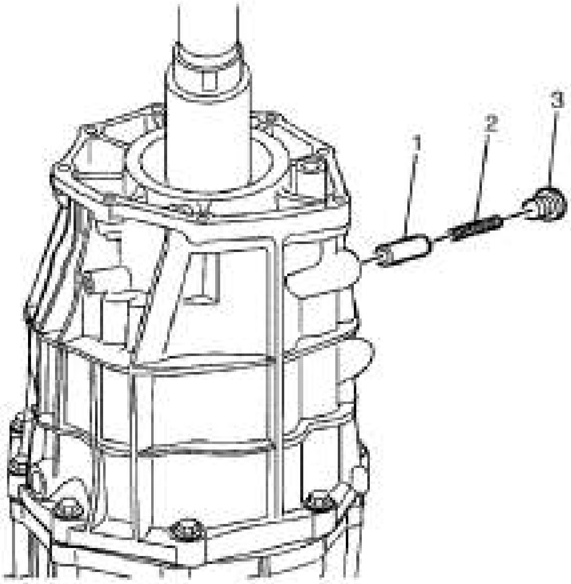
13. Remove the rear output shaft rear bearing spacer (1) from the main shaft.
14. Remove the vehicle speed sensor drive gear (2) from the main shaft.
15. Remove the locking ball (3) from the main shaft.
16. Remove the main shaft bearing oil slinger (4) from the main shaft.



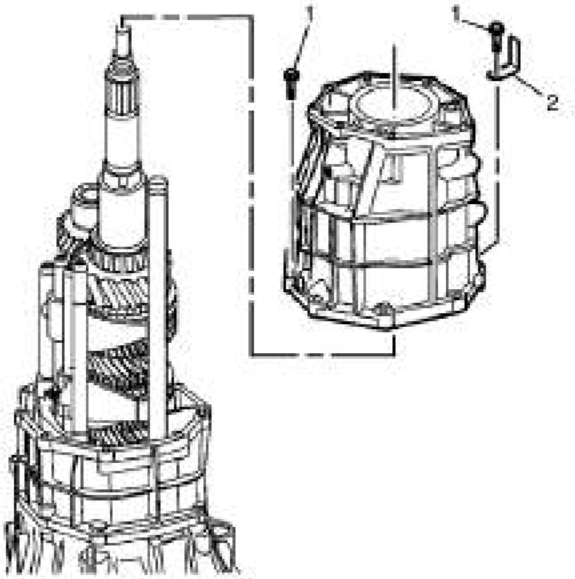
17. Remove the transmission case to clutch housing inner retaining bolts (1).
18. Remove the transmission case to clutch housing outer retaining bolts (2).



19. Remove the clutch housing hole plug (1) from the clutch housing.



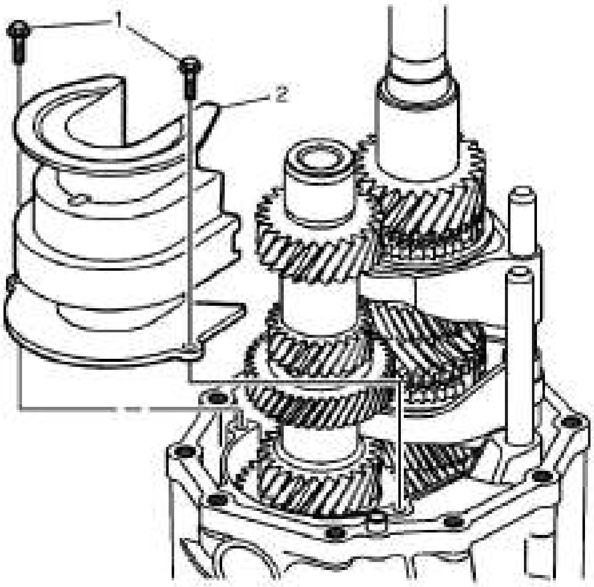
20. Remove the following components from the rear case housing:
    - the shift shaft detent plug (3)
    - the shift shaft detent spring (2)
    - the shift shaft detent pin (1)



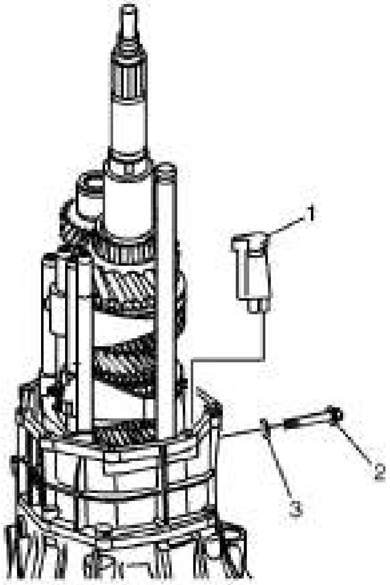
21. Remove the intermediate case to rear case housing retaining bolts (1).

    Notice: Refer to Machined Surface Damage Notice in the Preface section.

22. Using a suitable tool, separate the rear case housing from the intermediate case housing.
23. Remove the rear case housing.



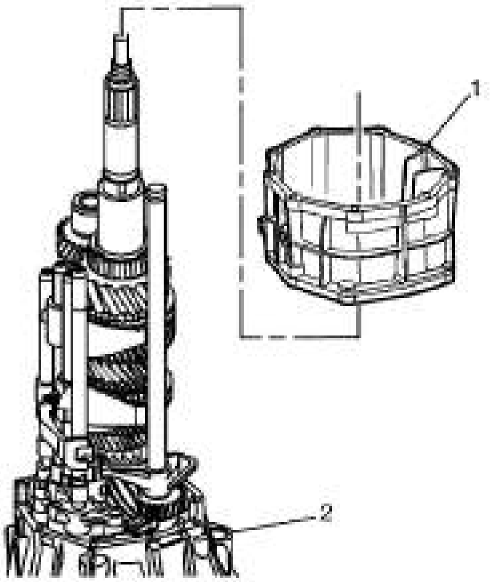
24. Remove the oil trough to intermediate case housing retaining bolts (1).
25. Remove the oil trough (2) from the intermediate case housing.



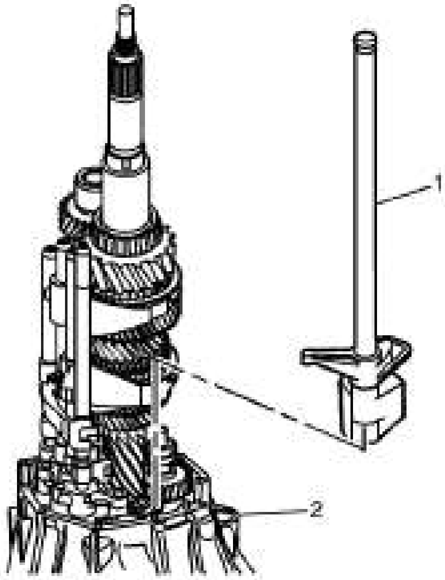
26. Remove the oil trough pipe (1) from the intermediate case.
27. Remove the reverse idler gear shaft to intermediate case retaining bolt (2).
28. Remove the reverse idler gear shaft washer (3) from the retaining bolt and discard.

    Discard the washer.

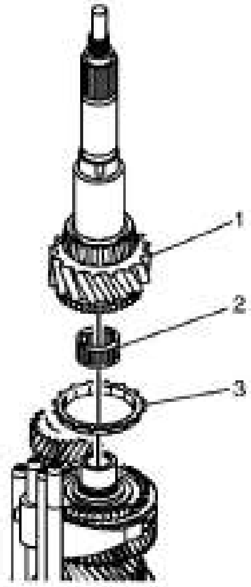
    Notice: Refer to Machined Surface Damage Notice in the Preface section.



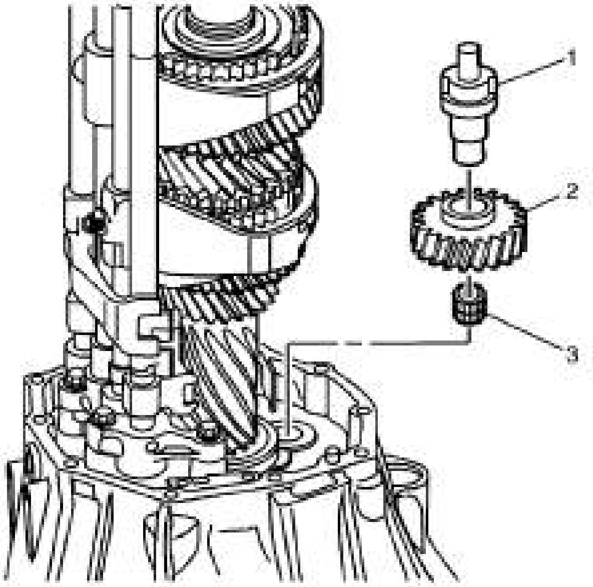
29. Using a suitable tool, separate the intermediate case (1) from the front clutch housing (2).
30. Remove the intermediate case housing (1) from the clutch housing.



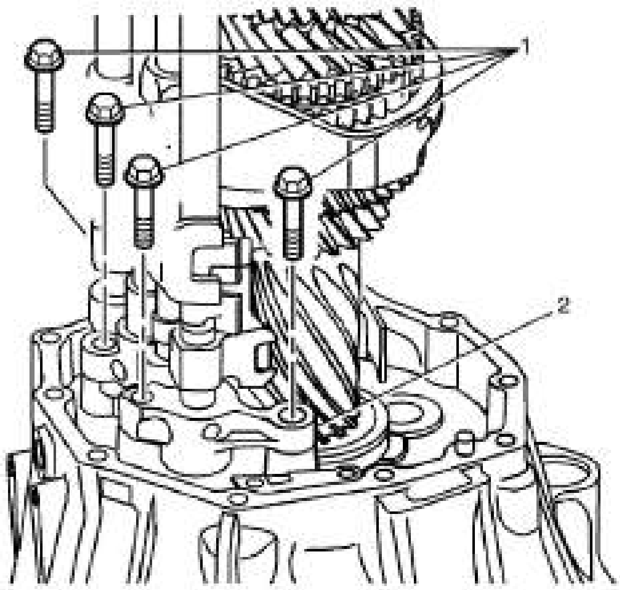
31. Remove the shift shaft selector lever (1) from the clutch housing (2).



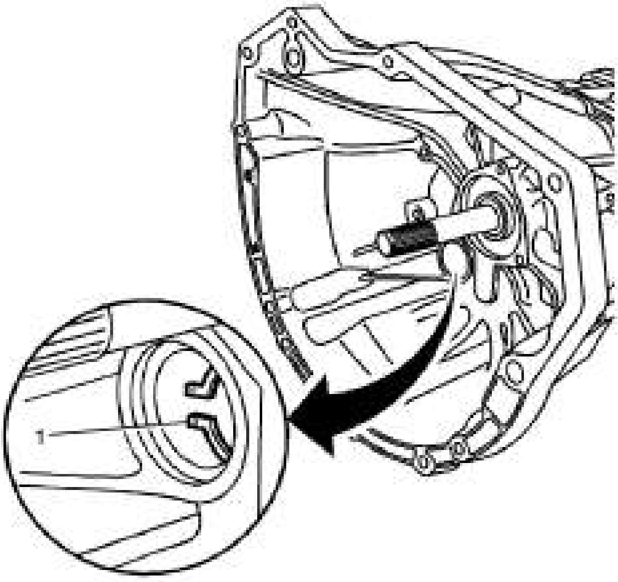
32. Remove the rear output shaft (1), input shaft bearing (2) and blocking ring (3) from the 6th gear synchronizer assembly.



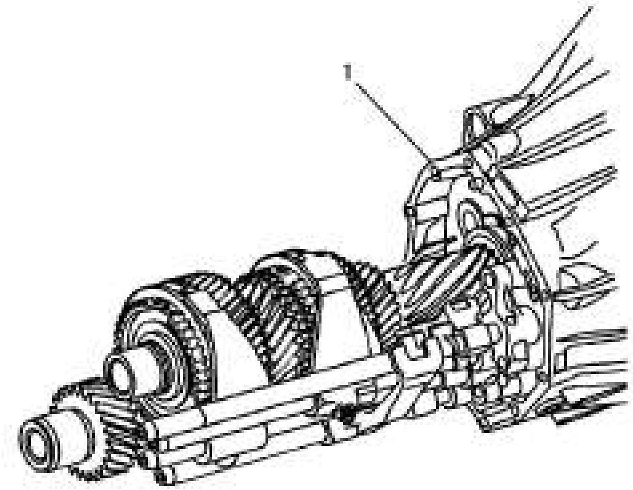
33. Remove the reverse idler gear bearing (3), reverse idler gear (2) and the reverse idler gear shaft (1).



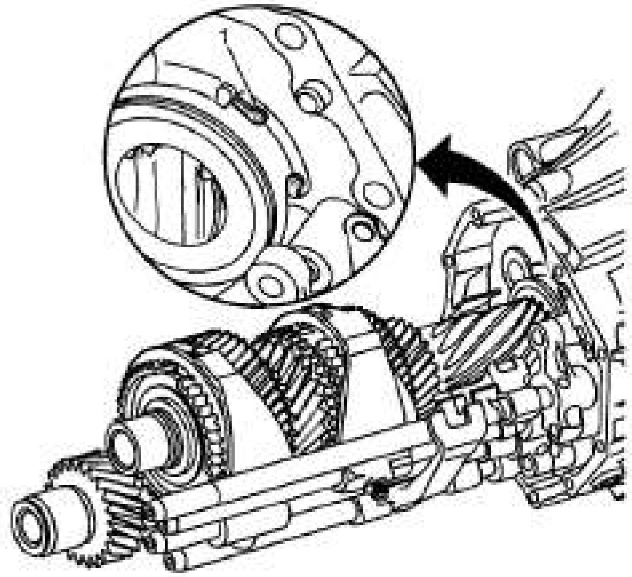
34. Remove the shift counter lever bracket (2) to clutch housing retaining bolts (1).



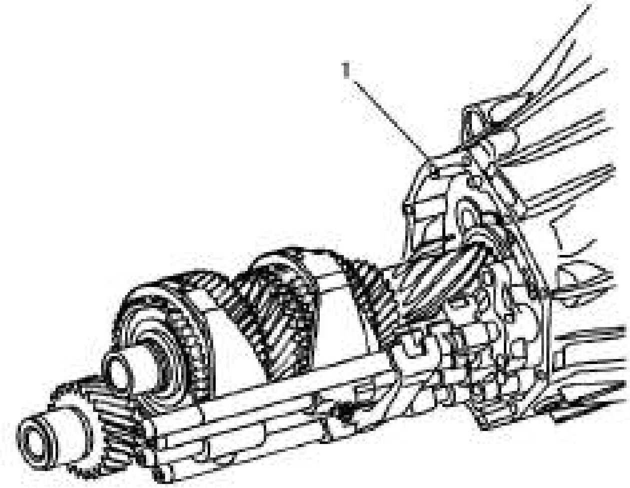
35. Remove the front counter shaft bearing to clutch housing snap ring (1).



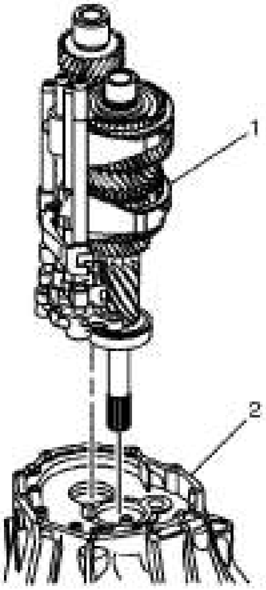
36. Using a suitable tool, tap on transmission front case (1) in order to disengage the countershaft bearing's snap ring.



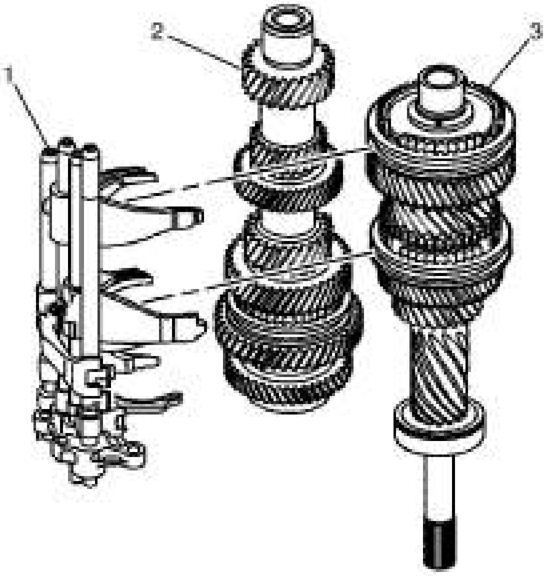
37. Remove the rear input shaft bearing to clutch housing snap ring (1).



38. Hold the countershaft. Using a suitable tool tap on the transmission front case (1) in order to disengage the snap ring. Separate the input shaft and countershaft from clutch housing.



39. Remove the input shaft (1), countershaft and shift rails as an assembly from the clutch housing (2).



40. Separate the shift rails (1), the input shaft (2) and countershaft (3).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Aisin AY6 | Description and Operation | **Document ID: 1992240**

Transmission System Description and Operation

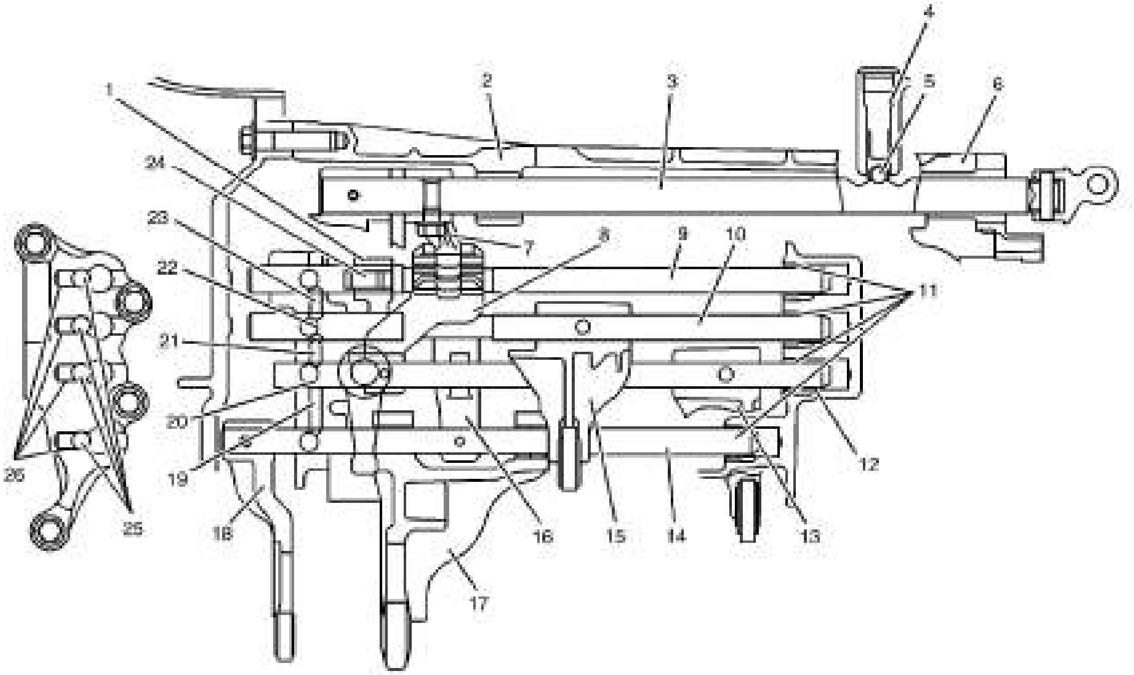
General Description

The Aisin AY6 manual transmission is a 6-speed unit with 6th gear being an overdrive ratio. All gear positions are synchronized. The transmission has a speed reflector wheel on the output shaft for the vehicle speed sensor. Roller, tapered roller, and ball bearings support the input shaft, countershaft, and output shaft. No shimming is required. For proper set up, selective thickness retaining rings are used. All of the speed gears use needle bearings. The AY6 uses a special 75W-90 transmission fluid. The transmission has a 4 piece aluminum housing which consists of the following components:

- The input shaft
- The mainshaft gears
- The countershaft
- The reverse idler gear
- The shift forks
- The shift shaft components

The Aisin transmission is used in cars.

Shifting Operation



The AY6 has a unique shift system. A single shift control shaft (3) operates 4 shift shafts. Shift control lever fits into a coupling on the shift control shaft (3). Positioning a bolt holds the lever (7) in place on the shift control shaft (3), in the gates of the shift shafts, operates the 1st/2nd shift shaft (9), the 3rd/4th shift shaft (10), the 5th/6th shift shaft (12) and the reverse shift shaft (14). Moving the shift control lever side to side allows the lever (7) on the shift control shaft (3) to engage into one of the 4 gates. Moving the shift control lever forward and reverse selects either position of the particular shift shaft. When shifted in position, a detent ball (25) and spring (26) located in the interlock bracket, holds the shift shaft, and a detent ball (5) and spring (4) located in the rear case, holds the shift control shaft (3). To aid in easy shift operation, the middle case shift control shaft bearing (2) and the rear case shift control shaft bearing (6) support the shift control shaft (3). In addition, the rear case shift shaft bushings (11) support the 1st/2nd shift shaft (9), the 3rd/4th shift shaft (10) and the 5th/6th shift shaft (12).

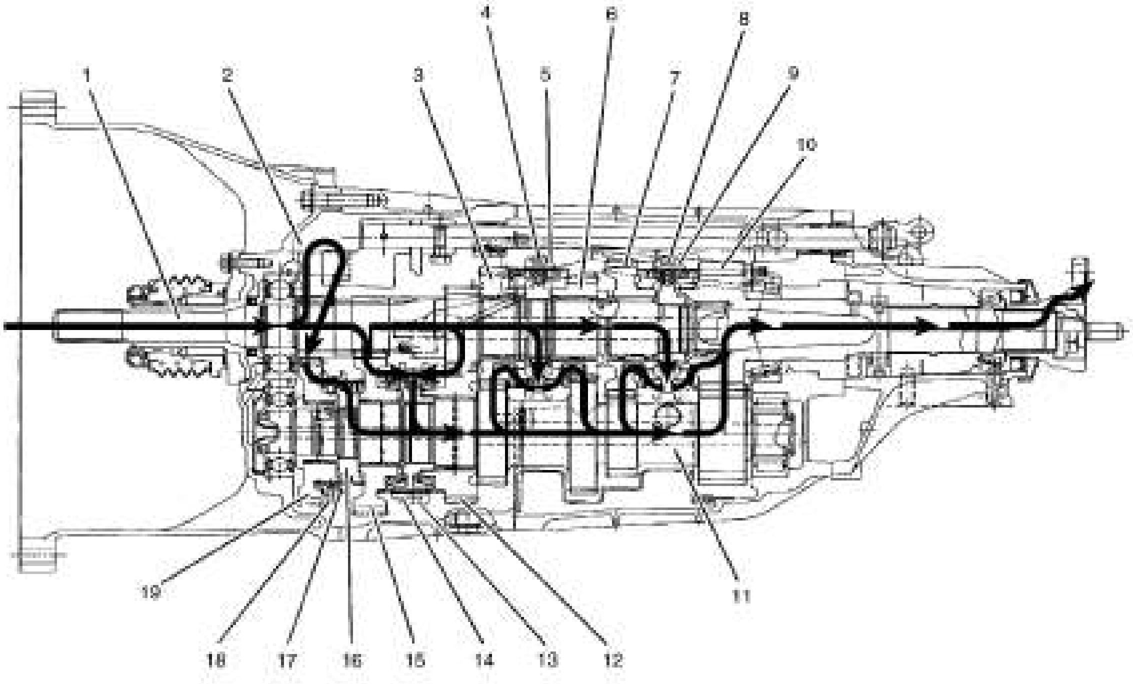
The 1st/2nd shift shaft (9) is the top shift shaft. A pin holds the no.3 head (1) in place on the shift shaft. No.3 head (1) links with 1st/2nd shift fork (17) via the reversal arm (24). The 1st/2nd shift fork (17) slides on the reverse shift shaft (14).

The 3rd/4th shift shaft (10) is the second shaft from the top. A bolt holds the 3rd/4th shift fork (15) in place on the shift shaft. A small shift shaft interlock pin (22) in the 3rd/4th shift shaft (10) prevents the other shafts from moving. Interlock pins (23 or 21), located in the interlock bracket, contact the small interlock pin (22) and lock into a notch on the shift shaft, preventing multiple shift shaft movement.

The 5th/6th shift shaft (12) is located third from the top. A pin holds the 5th/6th shift head (8) in place on the shift shaft. A bolt holds the 5th/6th shift fork (13) in place on the shift shaft. A small shift shaft interlock pin (20) in the 5th/6th shift shaft (12) prevents the other shafts from moving. Interlock pins (21 or 19), located in the interlock bracket, contact the small interlock pin (20) and lock into a notch on the shift shaft, preventing multiple shift shaft movement.

The reverse shift shaft (14) is the bottom shift shaft. Pins hold the reverse shift head (16) and the reverse shift fork (18) in place on the shift shaft.

Power Flow



1st Gear

Moving the 1st/2nd shift fork (13) forward moves the 1st/2nd synchronizer sleeve (14). The synchronizer sleeve (14) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer rings to contact, and the 1st gear (15) and the countershaft to match speeds. The synchronizer sleeve (14) then engages the selector teeth on 1st gear (14). The synchronizer hub is pressed on the countershaft (11). Power flow is now from the input shaft (1) to the 1st gear (15), through the synchronizer to the countershaft (11) and to the output shaft (10).

2nd Gear

Moving the 1st/2nd shift fork (13) rearward moves the 1st/2nd synchronizer sleeve (14). The synchronizer sleeve (14) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer rings to contact, and the 2nd gear (12) and the countershaft to match speeds. The synchronizer sleeve (14) then engages the selector teeth on 2nd gear (12). The synchronizer hub is pressed on the countershaft (11). Power flow is now from the input shaft (1) to the 2nd gear (12), through the synchronizer to the countershaft (11) and to the output shaft (10).

3rd Gear

Moving the 3rd/4th shift fork (4) rearward moves the 3rd/4th synchronizer sleeve (5). The synchronizer sleeve (5) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer ring to contact, and the 3rd gear (6) and the input shaft to match speeds. The synchronizer sleeve (5) then engages the selector teeth on 3rd gear (6). The synchronizer hub is pressed on the input shaft (1). Power flow is now from the input shaft (1) through the synchronizer, to the 3rd gear (6) to the countershaft (11) and to the output shaft (10).

4th Gear

Moving the 3rd/4th shift fork (4) forward moves the 3rd/4th synchronizer sleeve (5). The synchronizer sleeve (5) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer ring to contact, and the 4th gear (3) and the input shaft to match speeds. The synchronizer sleeve (5) then engages the selector teeth on 4th gear (3). The synchronizer hub is pressed on the input shaft (1). Power flow is now from the input shaft (1) through the synchronizer, to the 4th gear (3) to the countershaft (11) and to the output shaft (10).

5th Gear

In 5th gear, the power flow goes directly from the input shaft (1) to the output shaft (10) through the 5th/6th synchronizer. This happens because 5th gear is the same ratio as the engine speed. Moving the 5th/6th shift fork (8) rearward moves the 5th/6th synchronizer sleeve (9). The synchronizer sleeve (9) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth for output shaft (10). Matching the input shaft (1) to the output shaft (10) allows the synchronizer sleeve to engage to the selector teeth on the output shaft (10). The synchronizer hub is pressed on the input shaft (1).

6th Gear

the 6th gear (7) is an overdrive ratio. Moving the 5th/6th shift fork (8) forward moves the 5th/6th synchronizer sleeve (9). The synchronizer sleeve (9) slides on the synchronizer hub. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer ring to contact, and the 6th gear (7) and the input shaft to match speeds. The synchronizer sleeve (9) then engages the selector teeth on 6th gear (7). The synchronizer hub is pressed on the input shaft (1). Power flow is now from the input shaft (1) through the synchronizer to the 6th gear (7) to the countershaft (11) and to the output shaft (10), which now turns faster than the speed of the input shaft (1).

Reverse Gear

The reverse idler gear (2) is located on the reverse idler shaft and rotates on needle bearings. The reverse idler gear (2) engages with the input shaft (1) and with the reverse gear (19). Moving the reverse shift fork (18) rearward moves the reverse synchronizer sleeve (17). The synchronizer sleeve (17) slides on the spline of the reverse gear. The inner teeth on the synchronizer sleeve push against the synchronizer ring teeth, causing the synchronizer ring to contact, and the reverse gear (19) and the countershaft to match speeds. The synchronizer sleeve (17) then engages the selector teeth (16). The selector teeth are pressed on the countershaft (11). Power flow is now from the input shaft (1) to the reverse idler gear (2), to the reverse gear (19), through the synchronizer to the countershaft (11) and to the output shaft (10).

Diagnostic Starting Point - Manual Transmission

Begin the system diagnosis with the Diagnostic System Check - Vehicle in Vehicle DTC Information. The Diagnostic System Check - Vehicle. This will provide the following information:

- The identification of the control module or modules which command the system.
- The ability of the control module or modules to communicate through the serial data circuit.
- The identification of any stored diagnostic trouble codes (DTCs) and the status of the codes.

Use the Diagnostic System Check - Vehicle.

DTC P0502 or P0503

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0502: Vehicle Speed Sensor (VSS) Circuit Low Voltage

DTC P0503: Vehicle Speed Sensor (VSS) Circuit Intermittent

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
VSS Low Signal	--	P0502, P0503	--	--
VSS High Signal	P0502, P0503	P0502, P0503	P0502, P0503	--

Circuit/System Description

The vehicle speed information is provided to the engine control module (ECM) by the vehicle speed sensor (VSS). The VSS is a permanent magnet generator that is mounted to the transmission and produces a pulsing voltage. The AC voltage amplitude and frequency increases with vehicle speed. The ECM converts the pulsing voltage into km/h (mph). The ECM supplies the VSS signal to the following components:

- The instrument panel for speedometer and odometer operation
- The cruise control module

Conditions for Running the DTC

P0502

- DTC P0120, P0220 or P0503 are not set.
- The TP sensor angle is more than 3.5 percent.
- The engine is running.
- The system voltage is 8-18V.
- TFT is more than -40°C (-40°F)

- The engine speed is 1,500-6,500 RPM.
- Vehicle speed is less than 200 km/h (124 mph).
- Engine torque is 68-8192 N·m (50-6,042 lb ft).

P0503

- The system voltage is 8-18V.
- The engine speed is 500-7,500 RPM.
- Transmission output speed change is less than 146 RPM for 2 seconds.

Conditions for Setting the DTC

P0502

The transmission output speed is 58 RPM or less for 5 seconds.

P0503

The transmission output speed drops 351 RPMs in less than 3 seconds.

Action Taken When the DTC Sets

P0502 and P0503 are Type B DTCs.

Conditions for Clearing the DTC

P0502 and P0503 are Type B DTCs.

Special Tools

J 35616 GM-Approved Terminal Test Kit

Circuit/System Verification

1. Raise and support the drive wheels.

   Caution: Support the lower control arms in the normal horizontal position in order to avoid damage to the drive axles. Do not operate the vehicle in gear with the wheels hanging down at full travel.

2. Support the lower control arms so that the drive axles are in a horizontal position.
3. Start and idle the engine.
4. Place the transmission in second gear and release the clutch pedal.
5. Monitor VSS parameter on the scan tool. The VSS parameter should increase as the drive wheel speed increases.
6. Operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records List.

Circuit/System Testing

1. Disconnect the ECM harness connector X1.
2. Measure for 1,300-1,500 ohms at 25°C (77°F) between the VSS high signal circuit terminal 71 and the VSS low signal circuit terminal 72.

   If the value is greater than 1,500 ohms test the VSS high signal circuit and the VSS low signal circuit for an open/high resistance. If the circuits/connections test normal, replace the vehicle speed sensor.

   If the value is less than 1,300 ohms test the VSS high signal and the VSS low signal circuits for a shorted together condition. If the circuits/connections test normal, replace the vehicle speed sensor.
3. Measure for more than 10 ohms between the VSS high signal circuit terminal 71 and ground.

   If the value is less than the specified range, repair the short to ground.
4. Measure for more than 10 ohms between the VSS low signal circuit terminal 72 and ground.

   If the value is less than the specified range, repair the short to ground.
5. Reconnect the ECM connector. Disconnect the VSS connector.
6. Ignition ON, test the VSS high signal circuit terminal B for a short to voltage.

   If all circuits/connections test normal, test or replace the VSS.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Vehicle Speed Sensor Replacement
- Engine Control Module Replacement or Engine Control Module Replacement
- Engine Control Module Programming and Setup

DTC P0712 or P0713

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P0712: Transmission Fluid Temperature (TFT) Sensor Circuit Low Voltage

DTC P0713: Transmission Fluid Temperature (TFT) Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
TFT Sensor Signal	P0712	P0713	P0713[1]	--
Low Reference	--	P0713	P0713[1]	--
[1] Internal ECM damage may occur if the circuit is shorted to B+.				

Circuit/System Description

The transmission fluid temperature (TFT) sensor is a variable resistor that measures the temperature of the transmission fluid. The engine control module (ECM) supplies 5 V to the TFT signal circuit and supplies a ground to the low reference circuit.

The following table illustrates the difference between temperature, resistance, and voltage:

TFT	TFT Resistance	TFT Signal Voltage
Cold	High	High
Warm	Low	Low

Conditions for Running the DTC

P0712

- The engine speed is above 1,000 RPM for 7 seconds.
- This DTC runs continuously when the above condition is met.

P0713

- The engine speed is above 1,000 RPM for 7 seconds.
- This DTC runs continuously when the above condition is met.

Conditions for Setting the DTC

P0712

The TFT is greater than 145°C (299°F) for more than 5 seconds.

P0713

The TFT is less than -35°C (-31°F) for more than 5 seconds.

Action Taken When the DTC Sets

DTC P0712 and P0713 are Type C DTCs.

Conditions for Clearing the MIL/DTC

DTC P0712 and P0713 are Type C DTCs.

Scan Tool Reference

Engine Control Module Scan Tool Information

Circuit/System Verification

1. Engine running, DTC P0712 or P0713 should not set.
2. If the vehicle passes the Circuit/System Verification Test, then operate the vehicle within the conditions for running the DTC. You may also operate the vehicle within the conditions that are captured in the Freeze Frame/Failure Records List.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the TFT sensor.
2. Ignition OFF, test for less than 5 ohms between the low reference circuit terminal A and ground.

   If greater than 5 ohms, test the low reference circuit for a short to voltage or an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, using a scan tool verify that the TFT sensor parameter is at -40°C (-40°F).

   If greater than -40°C (-40°F), test the signal circuit terminal B for a short to ground. If the circuit tests normal, replace the ECM.

   Note: If the signal circuit of the TFT sensor is shorted to voltage the TFT sensor may be damaged.
4. Install a 3 A fused jumper wire between the signal circuit terminal B and the low reference circuit terminal A. Verify the TFT sensor parameter is greater than 128°C (262°F).

   If less than 128°C (262°F), test the signal circuit of the TFT sensor for a short to voltage or an open/high resistance. If the circuit test normal, replace the ECM.
5. If all circuits test normal, test or replace the TFT sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Transmission Fluid Temperature Sensor Replacement
- Engine Control Module Replacement or Engine Control Module Replacement
- Engine Control Module Programming and Setup

Reverse Lockout Solenoid Control Circuit	P0801	P0801	P0801	--

Typical Scan Tool Data

Reverse Inhibit Solenoid

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine Running. *Parameter Normal Range:* ON or OFF.			
Reverse Inhibit Solenoid Command	OFF	OFF	OFF

Circuit/System Description

Battery voltage (B+) is supplied directly to the reverse lockout solenoid. The engine control module (ECM) controls the reverses lockout solenoid by grounding the control circuit via an internal switch called a low side driver. The low side driver has a fault line which monitors the control circuit. When the ECM commands the reverse lockout solenoid ON, the voltage on the control circuit should be low, near 0 V. When the ECM commands the control circuit to the reverse lockout solenoid OFF, the voltage should be high, near battery voltage.

Conditions for Running the DTC

- The engine is running.

- The vehicle speed is less than 3 km/h (2 mph).

Conditions for Setting the DTC

- The ECM detects that the commanded state of the driver and the actual state of the control circuit does not match.
- The condition exists for 2 seconds.

Action Taken When the DTC Sets

P0801 is a Type C DTC.

Conditions for Clearing the MIL/DTC

P0801 is a Type C DTC.

Diagnostic Aids

- The battery must be fully charged and pass a battery test. Refer to Battery Inspection/Test.
- The reverse lockout solenoid is referred to as the reverse inhibit solenoid on the scan tool.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Engine Control Module Scan Tool Information

Circuit/System Verification

1. Ignition ON, command the reverse lockout solenoid ON and OFF, with a scan tool, while observing the following reverse lockout circuit status parameters.
   - Reverse lockout solenoid control Ckt. Short Gnd Test Status
   - Reverse lockout solenoid control Ckt. Open Test Status
   - Reverse lockout solenoid control Ckt. Short Volts Test Status

   Each parameter should toggle between OK and Not Run or Not Run and OK.
2. Operate the vehicle within the Conditions for Running the DTC, to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification first.

1. Disconnect the reverse lockout solenoid harness connector.
2. Ignition ON, verify that a test lamp illuminates between the B+ circuit terminal B and ground.

   If the test lamp does not illuminate, test the B+ circuit for a short to ground or an open/high resistance. If the circuit tests normal and the circuit fuse is open, replace the reverse lockout solenoid.
3. Verify that a test lamp does not illuminate between the B+ circuit terminal B and the control circuit terminal A.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the reverse lockout solenoid ON with a scan tool. Verify with a scan tool that the reverse lockout solenoid Ckt. Short Volts Test Status parameter is OK.

   If not the specified value, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Install a 3 A fused jumper wire between the reverse lockout control circuit terminal A and the B+ circuit terminal B. Command the reverse lockout solenoid ON with a scan tool. Verify with a scan tool that the affected reverse lockout solenoid Ckt. Short Volts Test Status parameter is displaying Fault.

   If not the specified value, test the control circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all the circuits test normal, test or replace the reverse lockout assembly.

Repair Instructions

- Reverse Lockout Solenoid Replacement
- Engine Control Module Programming and Setup
- Engine Control Module Replacement or Engine Control Module Replacement

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.
4. Turn OFF the ignition for 60 seconds.
5. Engine running, command the reverse lockout solenoid ON and OFF with a scan tool, while observing the reverse inhibit circuit status parameters. The circuit status parameters should change from OK to Not Run or Not Run to OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

DTC P0803

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

Circuit/System Verification

1. Ignition ON, command the skip shift solenoid ON and OFF, with a scan tool, while observing the following skip shift circuit status parameters.
   - Skip shift solenoid control Ckt. Short Gnd Test Status
   - Skip shift solenoid control Ckt. Open Test Status
   - Skip shift solenoid control Ckt. Short Volts Test Status

   Each parameter should toggle between OK and Not Run or Not Run and OK.
2. Operate the vehicle within the Conditions for Running the DTC, to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit/System Testing

Note: You must perform the Circuit/System Verification first.

1. Disconnect the skip shift solenoid harness connector.
2. Ignition ON, verify that a test lamp illuminates between the voltage circuit terminal B and ground.

   If the test lamp does not illuminate, test the voltage circuit for a short to ground or an open/high resistance. If the circuit tests normal and the circuit fuse is open, replace the skip shift solenoid.
3. Verify that a test lamp does not illuminate between the voltage circuit terminal B and the control circuit terminal A.

   If the test lamp illuminates, test the control circuit for a short to ground. If the circuit tests normal, replace the ECM.
4. Remove the test lamp.
5. Command the skip shift solenoid ON with a scan tool. Verify with a scan tool that the skip shift solenoid Ckt. Short Volts Test Status parameter is OK.

   If not the specified value, test the control circuit for a short to voltage. If the circuit tests normal, replace the ECM.
6. Install a 3 A fused jumper wire between the skip shift control circuit terminal A and the voltage circuit terminal B. Command the skip shift solenoid ON with a scan tool. Verify with a scan tool that the affected skip shift solenoid Ckt. Short Volts Test Status parameter is displaying Fault.

   If not the specified value, test the control circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
7. If all the circuits test normal, replace the skip shift assembly.

Repair Instructions

- Gear Select/Skip Shift Solenoid Replacement
- Engine Control Module Programming and Setup
- Engine Control Module Replacement or Engine Control Module Replacement

Repair Verification

1. Install any components or connectors that have been removed or replaced during diagnosis.
2. Perform any adjustment, programming, or setup procedures that are required when a component or module is removed or replaced.
3. Clear the DTCs.

4. Turn OFF the ignition for 60 seconds.
5. Engine running, command skip shift solenoid ON and OFF with a scan tool, while observing the skip shift circuit status parameters. The circuit status parameters should change from OK to Not Run or Not Run to OK.

   If another DTC is present, refer to Diagnostic Trouble Code (DTC) List - Vehicle and perform the appropriate diagnostic procedure.

CPP Sensor Signal	P0807	P0807	P0808	P0806
CPP Sensor 5 V Reference	P0651, P0807	P0807	P0651, P0808	--
CPP Sensor Low Reference	--	P0808	P0808	--

Typical Scan Tool Information

CPP Sensor Voltage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Voltage Parameter Normal Range:* 0 V with clutch pedal applied to 5 V when clutch pedal is released.			
CPP Sensor 5 V Reference	0 V	0 V	5 V
CPP Sensor Signal	0 V	0 V	5 V
CPP Sensor Low Reference	--	5 V	--

CPP Sensor Percentage

Circuit	Short to Ground	Open	Short to Voltage
Operating Conditions: Ignition ON. *CPP Sensor Percent Parameter Normal Range:* 0% with clutch pedal released to 100% when clutch pedal is applied.			
CPP Sensor 5 V Reference	100%	100%	0-100%
CPP Sensor Signal	100%	100%	100%

CPP Sensor Low Reference	--	0%	--

Circuit/System Description

The clutch pedal position (CPP) sensor is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released, to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

DTCs P0335, P0336, P0502, P0503, P0607, P0808, or P080A are not set.

Conditions for Setting the DTC

The CPP sensor is stuck in range.

Action Taken When the DTC Sets

P0806 is a Type A DTC.

Conditions for Clearing the MIL/DTC

P0806 is a Type A DTC.

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Engine Control Module Scan Tool Information

Circuit / System Verification

1. Ignition ON, observe the scan tool CPP sensor percent parameter. The percentage should vary from 0 percent when the clutch pedal is released, to 100 percent when the clutch pedal is in the apply position.
2. Perform the CPP learn procedure. Refer to Clutch Pedal Position Sensor Learn.
3. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Ignition ON, observe the scan tool CPP sensor voltage parameter for 0.1 V.

   If less than the specified value, replace the CPP sensor.

   If greater than the specified value, replace the ECM.

Component Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Measure the resistance between the signal terminal B and the low reference terminal A of the CPP sensor. Sweep the CPP sensor through the entire range. The resistance should vary low to high and high to low without any spikes or dropouts.

   If the resistance is erratic with spikes or dropouts, replace the CPP sensor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Clutch Pedal Replacement
- Engine Control Module Replacement or Engine Control Module Replacement
- Engine Control Module Programming and Setup

Circuit/System Description

The clutch pedal position (CPP) is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

P0807 and P0808

- DTCs P0641 or P0651 are not set.
- The system voltage is more than 9 V.
- The ignition is in the RUN position.

Conditions for Setting the DTC

P0807

The CPP sensor voltage is less than 0.1 V for more than 1 second.

P0808

The CPP sensor voltage is more than 5.2 V for more than 1 second.

Action Taken When the DTC Sets

P0807 and P0808 are Type A DTCs.

Conditions for Clearing the MIL/DTC

P0807 and P0808 are Type A DTCs.

Scan Tool Reference

Engine Control Module Scan Tool Information

Circuit / System Verification

1. If DTC P0641 or P0651 is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle.
2. Ignition ON, observe the scan tool CPP sensor percent parameter. The percentage should vary from 0 percent when the clutch pedal is released, to 100 percent when the clutch pedal is in the apply position.
3. Perform the CPP learn procedure. Refer to Clutch Pedal Position Sensor Learn.
4. Operate the vehicle within the conditions for running the DTC to verify the DTC does not reset. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Ignition OFF, test for less than 1 ohm between the low reference circuit terminal A and the negative post of the battery.

   If greater than the specified value, test the low reference circuit for an open/high resistance. If the circuit tests normal, replace the ECM.
3. Ignition ON, test for 4.8-5.2 V between the 5 V reference circuit terminal C and ground.

   If less than the specified range, test the 5 V reference circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

   If greater than the specified range, test the 5 V reference circuit for a short to voltage. If the circuit tests normal, replace the ECM.
4. Ignition ON, verify that the scan tool CPP sensor parameter is less than 0.1 V.

   If greater than the specified value, test the signal circuit for a short to voltage. If the circuit tests normal, replace the ECM.
5. Install a 3 A fused jumper wire between the signal circuit terminal B and the 5 V reference circuit terminal C. Verify that the scan tool CPP sensor parameter is between 4.8-5.2 V.

   If less than the specified range, test the signal circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the ECM.

6. If all circuits test normal, test or replace the CPP sensor.

Component Testing

1. Ignition OFF, disconnect the harness connector of the CPP sensor.
2. Measure the resistance between the signal terminal B and the low reference terminal A of the CPP sensor. Sweep the CPP sensor through the entire range. The resistance should vary low to high and high to low without any spikes or dropouts.

   If the resistance is erratic with spikes or dropouts, replace the CPP sensor.

- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P080A: Clutch Pedal Position (CPP) Not Learned

Circuit/System Description

The clutch pedal position (CPP) is a three wire sensor, connected to a 5 V reference circuit, a low reference circuit, and a signal circuit. The engine control module (ECM) supplies 5 V to the CPP sensor, and also provides a sensor ground path on the low reference circuit. The CPP sensor sends a voltage signal to the ECM on the signal circuit. The voltage on the signal circuit will vary from a voltage less than or equal to 5 V when the clutch pedal is released to a voltage less than or equal to 1.5 V when the clutch pedal is applied.

Conditions for Running the DTC

Clutch pedal fully applied.

Conditions for Setting the DTC

Clutch pedal position not learned.

Action Taken When the DTC Sets

P080A is a Type B DTC.

Conditions for Clearing the MIL/DTC

P080A is a Type B DTC.

Circuit / System Verification

Perform the clutch pedal position sensor learn procedure. Refer to Clutch Pedal Position Sensor Learn.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Clutch Pedal Position Sensor Learn
- Engine Control Module Replacement or Engine Control Module Replacement
- Engine Control Module Programming and Setup

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Diagnostic Information and Procedures | **Document ID: 1892131**

Clutch Pedal Position Sensor Learn

Important: The clutch pedal position (CPP) sensor learn procedure is required when the following service procedures have been performed regardless of whether DTC P080A is set:

- An engine control module (ECM) replacement
- A CPP sensor replacement
- Any repairs which affect the CPP sensor relationship

1. Install a scan tool.
2. Monitor the ECM for DTCs with a scan tool. If other DTCs are set, except DTC P080A, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC that set.
3. With a scan tool, select Clutch Pedal Position Learn under Module Setup in Manual Transmission, and perform the following instructions displayed on the scan tool screen.

   Important: The CPP sensor learn procedure cannot be performed more than once per ignition cycle. The clutch pedal needs to be fully depressed and held steady throughout this procedure in order to perform a correct learning.

4. The scan tool will display under CPP Learn Status: Not Learned, In Process, Complete, Fail - Low Volt, Fail - High Volt, or Fail Moving. The scan tool will display under CPP Learn Status Complete if the process was successful.
5. If the scan tool indicates that DTC P080A ran and passed this ignition the CPP sensor learn procedure is complete. If the scan tool indicates DTC P080A failed or did not run this ignition, refer to DTC P080A. If any other DTC is set, refer to Diagnostic Trouble Code (DTC) List - Vehicle for the applicable DTC.
6. Turn OFF the ignition for 30 seconds after the learn procedure has successfully completed in order to store the CPP sensor variation values in ECM history.

Scan Tool Data Definitions

Clutch Pedal Switch: This parameter displays the state of the clutch pedal switch circuit input. The scan tool will display APPLIED when the clutch pedal is depressed, and RELEASED when the clutch pedal is released.

Reverse Inhibit Solenoid Command: This parameter displays the commanded state of the reverse inhibit solenoid. When the vehicle speed is greater than 5 km/h (3 mph), the solenoid is commanded ON, inhibiting shifts to Reverse. When the vehicle speed is less than 5 km/h (3 mph), the solenoid is commanded OFF, allowing shifts to Reverse. The scan tool will display ON/OFF.

Reverse Inhibit Solenoid Command: This parameter displays the commanded state of the reverse inhibit solenoid. When the vehicle speed is greater than 5 km/h (3 mph), the solenoid is commanded ON, inhibiting shifts to Reverse. When the vehicle speed is less than 5 km/h (3 mph), the solenoid is commanded OFF, allowing shifts to Reverse. The scan tool will display ON/OFF.

Vehicle Speed: This parameter displays the speed at which the vehicle is traveling. The scan tool displays vehicle speed as kilometers per hour (km/h), miles per hour (MPH). The vehicle speed is calculated based on the input signal from the vehicle speed sensor.

Symptoms - Manual Transmission

Strategy Based Diagnostics

Review the system operations in order to familiarize yourself with the system functions. Refer to Manual Transmission Description and Operation

Visual/Physical Inspection

- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect the manual transmission for the correct fluid level and type.
- Inspect the manual transmission for fluid leaks.
- Inspect the manual transmission for broken or loose transmission mounts.

Intermittent

Test the vehicle under the same conditions that the customer reported in order to verify the system is operating properly.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Transmission Shifts Hard .
- Transmission Gear Clash When Shifting Gears .
- Transmission Noisy .
- Transmission Jumps Out of Gear .
- Transmission Does Not Shift into One Gear .
- Transmission Locked in One Gear .
- Transmission Clunk on Acceleration or Deceleration .
- Transmission Fluid Leak Diagnosis .

Transmission Does Not Shift into One Gear

Diagnostic Aids

If the transmission shifts into gear and then jumps out of gear, refer to Transmission Jumps Out of Gear . If it is an intermittent condition, other driveline components may be faulty.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This test is to confirm that the clutch is not slipping. During certain conditions, the clutch may slip and feel as though the transmission is not in gear.

3. A static shift test is performed by shifting into all gears with the engine not operating. While performing the test, you should note how the shift lever movement feels. Also feel for the shift rails moving freely, the detent plungers operating when coming out of a gear and going into the next gear, and for the synchroniser sleeve movement.

6. A dynamic shift test is performed by shifting into all gears with the engine operating. Test for the correct mesh of the synchronisers sleeve and the speed gear selector teeth. Move the shift lever and feel for the synchroniser sleeve to just release from the gear, then let up on the clutch pedal. Press the clutch pedal and move the shift lever to engage that gear again, to Make sure full travel of the shift components.

Step	Action	Yes	No
DEFINITION: The shift lever will not move into a particular gear position, or when in a gear position, power is not delivered through the transmission.			
1	Did you review the and perform the necessary inspections? Refer to Symptoms - Manual Transmission	Go to Step 2	Go to Symptoms - Manual Transmission .
2	Inspect the clutch system for slipping. Refer to Clutch Slipping . Is the clutch operating properly?	Go to Step 2	Go to Clutch Assembly Replacement
3	1. Perform a static shift test on the transmission. 2. Test for the following conditions: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. • Synchronizer sleeve moving on the hub and pressure pieces. • Shift linkage binding.		

	• Shift linkage proper adjustment. Were you able to shift into the gear position with the concern?	Go to Step 5	Go to Step 4
4	Remove the shift control shift closeout boot. Refer to Shift Control Shift Closeout Boot Replacement . Inspect for the following: • Loose mounting. • Foreign debris. Did you find and repair the condition?	Go to Step 8	Go to Step 5
5	1. Perform a dynamic shift test on the transmission. 2. Test for the following conditions: • Detent plungers or shift rails binding. • Synchroniser sleeve binding. • Synchroniser sleeve engaging on the speed gear selector teeth. Were you able to shift into the gear position with the concern?	Go to Step 7	Go to Step 6
6	1. Remove the transmission. Refer to Transmission Replacement . 2. Disassemble the transmission. Refer to one of the following: Transmission Disassemble . 3. Inspect the following transmission internal components for wear or damage: • The shift forks. • The internal shift control lever. Did you find and repair the condition?	Go to Step 8	Go to Step 7
7	1. Remove the transmission. Refer to Transmission Replacement . 2. Disassemble the transmission. Refer to one of the following: Transmission Disassemble . 3. Inspect the following transmission internal components for wear or damage: • The synchroniser sleeve selector teeth. • The speed gear selector teeth. • The speed gear axial clearance for being excessive. • The speed gear to mainshaft bearings and journals. • The countershaft for being broken. • The mainshaft for being broken.		

	- The countershaft gear for being stripped. - The mainshaft gear for being stripped. Did you find and repair the condition?	Go to Step 8	Go to Diagnostic Aids
8	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Diagnostic Information and Procedures | **Document ID: 1978101**

Transmission Fluid Leak Diagnosis

Diagnostic Aids

Using the incorrect type of transmission fluid may affect the sealing ability of the seals. Make sure the use of the correct type of transmission fluid. The incorrect type of sealer may not be compatible with the transmission fluid or may not have the correct characteristics for sealing the affected components. Make sure the use of the correct type of sealers. Refer to Adhesives, Fluids, Lubricants, and Sealers .

Test Description

The number below refers to the step number on the diagnostic table.

5. Use an approved method to clean the transmission to make sure the leak location is correctly identified. If using a powder method or dye method, make sure the products are compatible with the transmission fluid.

Step	Action	Yes	No
DEFINITION: Visible sign of the transmission fluid leaking from the transmission.			
1	Did you review and perform the necessary inspections? Refer to Symptoms - Manual Transmission .	Go to Step 2	Go to Symptoms - Manual Transmission
2	1. Inspect for the transmission fluid level higher than the recommended level. Refer to Transmission Fluid Replacement . 2. Adjust the transmission level if incorrect. Was the transmission fluid level too high?	Go to Step 19	Go to Step 3
3	Inspect the transmission vent for a blockage. Is the transmission vent blocked?	Go to Step 4	Go to Step 5
4	Repair or replace the transmission vent. Refer to Transmission Vent Tube Replacement Did you find and repair the condition?	Go to Step 19	Go to Step 5
5	Verify the location of the leak. 1. Clean the transmission assembly. 2. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached. 3. Visual inspect or use the powder method or dye and black light method to locate the leak. Is the leak occurring at the drain or fill plug?	Go to Step 6	Go to Step 7
	Replace the drain or fill plug. Refer to Transmission Fluid Replacement		

6	Did you find and repair the condition?	Go to Step 19	Go to Diagnostic Aids
7	Is the leak at the transmission output shaft seal?	Go to Step 8	Go to Step 9
8	Remove the output shaft seal and inspect for the following. Refer to Mainshaft Rear Oil Seal Replacement . • Damaged or worn seal. • Damaged seal bore. • Improper installation. • Cracks in the component. • Propeller shaft yoke sealing surface is scratched, nicked, damaged, or worn. • Loose or worn bearing causing excessive seal wear. • Yoke flange nut loose. Did you find and repair the condition?	Go to Step 19	Go to Diagnostic Aids
9	Is the leak at the front of the transmission?	Go to Step 10	Go to Step 12
10	1. Inspect for the leak at the input shaft seal. 2. Inspect for the following if the input shaft seal is leaking: • Damaged or worn seal. • Damaged seal bore. • Improper installation. • Cracks in the component. • Input shaft sealing surface is scratched, nicked, damaged or worn. • Loose or worn bearing causing excessive seal wear. 3. Replace the input shaft seal if leaking. Refer to Mainshaft Rear Oil Seal Replacement . Did you find and repair the condition?	Go to Step 19	Go to Step 11
11	1. Inspect the case for cracks or porosity. 2. Replace the transmission front case half if it is faulty. Refer to Transmission Disassemble . Did you find and repair the condition?	Go to Step 19	Go to Diagnostic Aids
12	Is the leak at the backup light switch?	Go to Step 13	Go to Step 15
	1. Remove the backup light switch. Refer to Backup Lamp Switch Replacement . 2. Inspect for the following: • Cross threaded or damaged threads.		

13	• Insufficient sealant. • Leaking switch. • Improper installation. Did you find and repair the condition?	Go to Step 19	Go to Step 1
14	1. Remove the shift shaft detent sleeve. Refer to Transmission Disassemble . 2. Inspect for the following: • Cross threaded or damaged threads. • Insufficient sealant. • Cracked sleeve or case. • Improper installation. Did you find and repair the condition?	Go to Step 19	Go to Step 1
15	Is the leak at the sealing flanges of the transmission case?	Go to Step 16	Go to Step 17
16	1. Remove the transmission. Refer to Transmission Replacement . 2. Disassemble the transmission. Refer to Transmission Disassemble Did you find and repair the condition?	Go to Step 19	Go to Step 17
17	Is the leak coming from a crack or porosity in the transmission case?	Go to Step 18	Go to Diagnostic Aids
18	1. Remove the transmission. Refer to Transmission Replacement . 2. Disassemble the transmission. Refer to Transmission Disassemble 3. Replace the faulty case. Refer to Transmission Assemble Did you find and repair the condition?	Go to Step 19	Go to Diagnostic Aids
19	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Gear Clash When Shifting Gears

Diagnostic Aids

Gear clashing may be caused by shifting at too high of an engine RPM or by rushing the shift. If gear clashing is occurring in more than one gear, the clutch may not be releasing properly for proper synchronizer operation.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step tests for the proper release of the clutch. If the clutch reserve is not correct, the mainshaft gears may be turning, causing the gear to clash.

5. This step inspects for the proper transmission fluid. The proper fluid is required for the correct lubrication of the synchronisers.

7. A static shift test is performed by shifting into all of the gear positions with the engine not operating. While performing the test, you should note how the shift lever movement feels. Also, while shifting from one gear to another, feel for binding in the shift rails. You should be able to feel the detent plungers operating when coming out of a gear and going into a gear. Excessive play in the gear shift lever may prevent the shift forks from fully engaging the synchroniser.

10. A dynamic shift test is performed by shifting into all of the gear positions with the engine operating. Test for the correct mesh of the synchronisers and for the clutch releasing correctly. Move the shift lever and feel for the synchroniser sleeve to just release from the gear then let up on the clutch pedal. Press the clutch pedal and move the shift lever to engage that gear again. If the transmission shifts back into the gear without clashing, the clutch is releasing correctly and the synchroniser is operating. If clashing occurs, test another gear. If all gears clash, the clutch is not releasing correctly.

Step	Action	Yes	No
DEFINITION: Noise from the transmission when shifting gears. A grinding or grating sound when the synchronizer sleeve is engaging with the selector teeth on the speed gear. A suspected internal transmission condition if the noise is only happens in one gear.			
1	Did you review and perform the necessary inspections? Refer to Symptoms - Manual Transmission.	Go to Step 2	Go to Symptoms - Manual Transmission.
2	With the engine operating, does the transmission shift from neutral to any gear without the vehicle lurching or gear clashing?	Go to Step 5	Go to Step 3
3	Inspect for proper clutch operation. Refer to Clutch System Description and Operation. Does the clutch operate properly?	Go to Step 5	Go to Step 4
	Repair the clutch system. Refer to Symptoms -		

4	Clutch. Did you find and repair the condition?	Go to Step 11	Go to Step 5
5	Inspect for the correct transmission fluid level and for the correct fluid. Refer to Transmission Fluid Replacement Is the transmission fluid level correct and at the correct level?	Go to Step 7	Go to Step 6
6	Fill the transmission to the correct level or change the fluid if it is the incorrect type. Refer to Transmission Fluid Replacement. Does the transmission still have gear clash?	Go to Step 7	Go to Step 11
7	1. Perform a static shift test on the transmission. 2. Test for the following conditions: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. • Shift linkage binding. • Shift linkage proper adjustment. Did the transmission shift smoothly into the gear that is clashing?	Go to Step 9	Go to Step 8
8	1. Remove the shift lever. 2. Inspect for damaged or worn components. Refer to Shift Control Assembly Replacement. Did you find and repair the condition?	Go to Step 11	Go to Step 9
9	1. Perform a dynamic shift test on the transmission. 2. Test for the following conditions: • Detent plungers or shift rails binding. • Synchronizer sleeve binding. • Gear clashing in more than the suspected gear. Is the transmission hard to shift into all gears?	Go to Transmission Shifts Hard	Go to Step 10
	1. Disassemble the transmission. Refer to Transmission Disassemble 2. Inspect the following transmission components for the suspect gear that is clashing:		

10	- Excessive synchroniser blocking ring to gear clearance. - Synchroniser sleeve to hub lash or rock excessive. - Excessive axial clearance in the speed gear. - Mainshaft to speed gear bearing or journal worn. - Shift fork worn or damaged. - Internal shift control worn or damaged. - Mainshaft bearing worn or damaged. - Input gear bearing or pilot bearing worn. Did you find and repair the condition?	Go to Step 11	Go to Diagnostic Aids
11	Operate the system and verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Jumps Out of Gear

Diagnostic Aids

If the transmission jumps out of gear during deceleration, inspect the components that may allow for the gears or shafts to tip. If the gears or shafts tip, the synchronizer sleeve can disengage from the selector teeth on the speed gear. If the transmission jumps out of gear during acceleration, inspect the components that may not allow full engagement of the synchroniser sleeve to the selector teeth on the speed gear. Insufficient engagement of the selector teeth under torque may cause the transmission to jump out of gear.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. A static shift test is performed by shifting into all gear positions with the engine not operating. While performing the test, slowly move the shift lever. Feel for proper movement of the shift lever and transmission internal shift components.

5. A dynamic shift test is performed by shifting into all gear positions with the engine operating. Test for the correct mesh of the synchroniser sleeve and the speed gear selector teeth. Move the shift lever, and feel for the synchroniser sleeve to release from the gear, then let up on the clutch pedal. Depress the clutch pedal and move the shift lever to engage the gear again, to Make sure full travel of the shift components.

6. This step inspects for worn or damaged transmission or engine mounts. Loose mounts may cause a shock on the transmission allowing for gear disengagement.

7. This step inspects for the misalignment of the torque tube to transmission. Misalignment may put a bind on the input shaft, allowing for the input shaft or the mainshaft to tip.

9. This step inspects the pilot bearing and the pilot bearing journal on the input shaft. A worn pilot bearing or input shaft may allow the input shaft to tip, causing gear disengagement.

Step	Action	Yes	No
DEFINITION: Gear disengagement occurs during acceleration or deceleration.			
1	Did you review the operations and perform the necessary inspections? Refer to Symptoms - Manual Transmission	Go to Step 2	Go to Symptoms - Manual Transmission
2	1. Perform a static shift test. 2. Test for the following conditions: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Detent plungers engaging in the shift rails. • Synchroniser pressure pieces on the synchronizser sleeves.		

	- Shift linkage binding. - Shift linkage proper adjustment. Did the transmission shift completely into all gears?	Go to Step 5	Go to Step 3
3	Remove the shift control shift closeout boot. Refer to Shift Control Shift Closeout Boot Replacement. Inspect for the following: - Loose mounting. - Foreign debris. Did you find and repair the condition?	Go to Step 10	Go to Step 4
4	1. Perform a dynamic shift test on the transmission. 2. Test for the following conditions: - Synchroniser sleeve engagement to the speed gear selector teeth. - Detent plungers engaging in the shift rails. Did the transmission shift completely into all gears?	Go to Step 5	Go to Step 8
5	Inspect the engine and/or transmission mounts. Refer to Transmission Mount Inspection. Did you find and repair the condition?	Go to Step 10	Go to Step 6
6	Inspect the clutch housing for loose retaining bolts or misalignment. Are there any loose bolts or misalignment?	Go to Step 9	Go to Step 8
7	Tighten any loose housing retaining bolts and/or align the housing . Refer to Clutch Assembly Replacement Did you find and repair the condition?	Go to Step 10	Go to Step 8
8	1. Remove the transmission. Refer to Transmission Replacement 2. Remove the clutch assembly. Refer to Clutch Assembly Replacement. 3. Inspect the pilot bearing for being faulty. 4. Inspect the input shaft for excessive wear at the pilot bearing. Did you find and repair the condition?	Go to Step 10	Go to Step 9
	1. Disassemble the transmission. Refer to Transmission Disassemble. 2. Inspect the following components for wear or damage: - The shift rails.		

9	- The detent plungers and springs. - The shift forks. - The synchroniser sleeve and speed gear selector teeth. - The mainshaft to input shaft bearing and journals. - The speed gear bearings and journals. - The speed gear axial clearance. - The mainshaft center and rear bearings. Did you find and repair the condition?	Go to Step 10	Go to Diagnostic Aids
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Locked in One Gear

Test Description

The numbers below refer to the step numbers on the diagnostic table.

2. This step is to make sure the use of the proper transmission fluid. DEXRON® VI fluid is used to Make sure proper synchroniser operation, and for sufficient lubrication. Improper fluid may cause the synchronisers to stick or cause overheating of the transmission components.

4. A static shift test is performed by shifting into all gears with the engine not operating. By confirming that the transmission can be shifted into all positions, Make sures that the shift lever is not excessively worn or damaged.

6. A dynamic shift test is performed by shifting into all of the gear positions with the engine operating. Test to Make sure that the internal shift components are properly functioning.

Step	Action	Yes	No
DEFINITION: The transmission cannot be shifted out of a gear or the vehicle will not move because the transmission is locked.			
1	Did you review and perform the necessary inspections? Refer to Transmission Replacement	Go to Step 2	Go to Transmission Replacement.
2	Inspect for the correct type of transmission fluid. Is the correct type of transmission fluid being used?	Go to Step 6	Go to Step 5
3	Drain and fill the transmission with the correct type of fluid. Refer to Transmission Fluid Replacement Did you find and repair the condition?	Go to Step 9	Go to Step 6
4	1. Perform a static shift test on the transmission. 2. Test for the shift lever moving to all positions. Were you able to shift into all positions?	Go to Step 6	Go to Step 5
5	1. Remove the shift lever. Refer to Shift Control Assembly Replacement. 2. Inspect for worn or faulty components. Did you find and repair the conditions?	Go to Step 9	Go to Step 6
6	1. Perform a dynamic shift test on the transmission. 2. Test for being able to shift in and out of the gear with the concern. Were you able to shift the transmission correctly?	Go to Step 7	Go to Step 8
7	1. Remove the transmission. Refer to Transmission Replacement. 2. Inspect the clutch system for the clutch not releasing properly. Refer to Clutch System		

	Description and Operation Did you find and repair the condition?	Go to Step 9	Go to Step 8
8	1. Disassemble the transmission. Refer to Transmission Disassemble. 2. Inspect the following transmission internal components for wear or damage: - The shift rail. - The internal shift control lever. - The synchroniser components for being broken or faulty. - The speed gears for being seized to the mainshaft. Did you find and repair the conditions?	Go to Step 9	Go to Diagnostic Aids
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Diagnostic Information and Procedures | **Document ID: 1992867**

Transmission Noisy

Diagnostic Aids

If the transmission is in neutral with the engine operating, and a whirling noise - a neutral gear rattle is heard outside the vehicle, the sound is a normal condition.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

5. This step inspects for the correct transmission fluid level. If the transmission fluid level is excessively low, damage may have occurred to the transmission components.
7. This step inspects for the correct type of transmission fluid. The transmission uses DEXRON® III fluid. If the incorrect fluid was used, there may have been an overheating condition. Overheating may cause damage to the transmission components.
9. This step inspects for noise coming into the driver compartment. Improper sealing of the shift tower may be allowing normal transmission noise to be heard by the driver.
13. This step tests to determine if clutch components are making the noise. Press the clutch pedal slowly and listen for the change in noise. If the noise changes while pressing the pedal, it may be a faulty clutch component. If the noise does not change until the clutch is completely disengaged, the transmission component is faulty.

Step	Action	Yes	No
DEFINITION: The transmission is making a noise. The noise may be a whine or a growl caused by faulty bearings or gears. The noise may also be caused from a faulty component causing a vibration noise.			
1	Did you review the operations and perform the necessary inspections? Symptoms - Manual Transmission	Go to Step 2	Go to Symptoms - Manual Transmission.
2	Is the noise present while in neutral, with the engine operating?	Go to Diagnostic Aids	Go to Step 3
3	Is the noise present in all gears?	Go to Step 5	Go to Step 4
4	Is the noise present in just one gear?	Go to Step 15	Go to Step 5
5	Inspect the transmission fluid level. Is the fluid level correct?	Go to Step 7	Go to Step 6
6	Add transmission fluid. Refer to Transmission Fluid Replacement Did you find and repair the condition?	Go to Step 16	Go to Step 7

7	Inspect the transmission for the correct fluid type. Refer to Lubrication Specifications. Is the transmission fluid the correct type?	Go to Step 9	Go to Step 8
8	Drain and fill the transmission with the correct type of fluid. Refer to Transmission Fluid Replacement. Did you find and repair the condition?	Go to Step 16	Go to Step 9
9	Inspect the shift tower boot. Is the closeout boot loose or damaged?	Go to Step 10	Go to Step 11
10	Position and tighten the shift tower boot to specifications. Refer to Shift Control Assembly Replacement. Did you find and repair the condition?	Go to Step 16	Go to Step 11
11	Inspect for torque tube to transmission alignment and loose transmission mounting retaining bolts. Are there any loose transmission mounting bolts?	Go to Step 12	Go to Step 15
12	Replace and tighten the transmission mounting retaining bolts. Refer to Fastener Tightening Specifications Is the noise still present?	Go to Step 13	Go to Step 16
13	With the engine operating, press the clutch pedal. Is the noise still present?	Go to Step 14	Go to Step 15
14	1. Remove the clutch. Refer to Clutch Assembly Replacement. 2. Inspect the following components for being the cause of the noise: • The release bearing. • The pilot bearing. • The dual mass flywheel, if equipped. • The pressure plate. • The clutch disc. • The input shaft bearing. • The engine crankshaft end play. Did you find and repair the condition?	Go to Step 16	Go to Step 15
15	1. Remove the transmission. Refer to Transmission Replacement. 2. Disassemble the transmission. Refer to Transmission Disassemble. Use the information in the Cleaning and Inspection section to determine if any of the transmission components are faulty.		--

	Did you find and repair the condition?	Go to Step 16	
16	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

Transmission Shifts Hard

Diagnostic Aids

An intermittent hard shift may be caused by an intermittent clutch condition. With a self adjusting clutch, the clutch may be between adjustments and not give full clutch release. This might be felt by a low clutch pedal. After several applications, the clutch may adjust properly to give the proper pedal feel.

Test Description

The numbers below refer to the step numbers on the diagnostic table.

3. A static shift test is performed by shifting into all of the gear positions with the engine not operating. While performing the test, one should note how the shift lever movement is felt. Also while shifting from one gear to the other, feel for binding in the shift rails. You should be able to feel the detent plungers operating when coming out of a gear and when going into a gear.

6. A dynamic shift test is performed by shifting into one of the gear positions with the engine operating. Test for the correct mesh of the synchronizers and for the clutch releasing correctly. When shifting into a gear, and shifting out of a gear, you should feel the shift detent plungers operating, and the synchronizer sleeve moving freely.

8. The transmission uses DEXRON® III transmission fluid that allows proper synchronizer operation. The incorrect fluid may cause hard shifting from varnish build up, or from not enough lubrication for proper synchronizer operation.

Step	Action	Yes	No
DEFINITION: The transmission does not shift smoothly or without difficulty from one gear to the other.			
1	Did you review the operations and perform the necessary inspections? Refer to Symptoms - Manual Transmission.	Go to Step 2	Go to Symptoms - Manual Transmission
2	Inspect the clutch system for proper operation. Refer to Clutch System Description and Operation. Did you find or repair the condition?	Go to Step 11	Go to Step 3
3	1. Perform a static shift test on the transmission. 2. Test for the following conditions: • Blockage preventing full shift lever movement. • Excessive movement in the shift lever. • Binding in the shift lever. • Detent plungers or shift rails binding. • Shift linkage binding.		

	- Shift linkage proper adjustment. Are you able to shift into all gears?	Go to Step 7	Go to Step 4
4	Remove the shift control shift closeout boot. Refer to Shift Control Shift Closeout Boot Replacement. Inspect for the following: - Loose mounting. - Foreign debris. Did you find and repair the condition?	Go to Step 11	Go to Step 5
5	1. Perform a dynamic shift test on the transmission. 2. Test for the following conditions: - Detent plungers or shift rails binding. - Synchronizer sleeve binding. - Gear clash into only one gear. - Gear clash into all gears. Did the transmission shift hard into all gears?	Go to Step 6	Go to Step 10
6	Inspect the transmission for the correct fluid level and the correct type of transmission fluid. Refer to Transmission Fluid Replacement. Is the transmission at the correct level and proper fluid being used?	Go to Step 8	Go to Step 7
7	Drain and fill the transmission with the correct type fluid. Refer to Transmission Fluid Replacement Did you find and repair the condition?	Go to Step 11	Go to Step 8
8	Remove the transmission. Refer to Transmission Replacement. Inspect the clutch pressure plate and/or clutch driven plate. Is the clutch pressure plate and/or clutch driven plate worn or faulty?	Go to Step 9	Go to Step 10
9	Replace the clutch assembly. Refer to Clutch Assembly Replacement. Did you find and repair the condition?	Go to Step 11	Go to Step 10
	1. Disassemble the transmission. Refer to Transmission Disassemble. 2. Inspect the transmission for the following faulty components in the gear that is hard to shift or clashing:		

10	• Excessive synchronises blocking ring to gear clearance. • Synchroniser hub external splines worn or damaged. • Excessive axial clearance in the speed gear. • Mainshaft to speed gear bearing or journal worn. • Shift rail and the internal shift control lever components for wear or damage. 3. Replace worn or damaged components as necessary. Did you find and repair the condition?	Go to Step 10	Go to Diagnostic Aids
11	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 1

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977489**

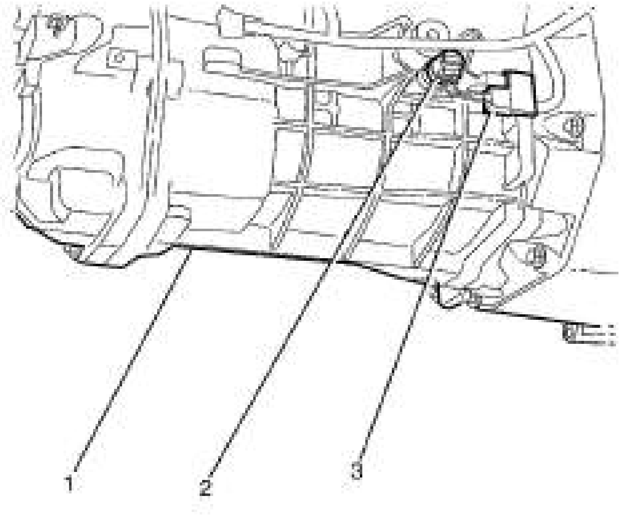
Backup Lamp Switch Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

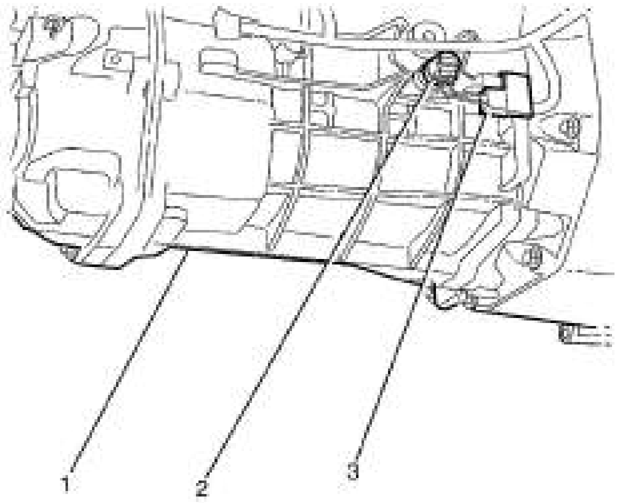
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Disconnect the reverse lamp switch electrical connector (3).
3. Using a suitable tool remove the reverse lamp switch (2) from the transmission (1).

Installation Procedure



1. Apply a suitable pipe sealant with Teflon® to the threads of the backup lamp switch (2).

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the backup lamp switch (2) to the transmission (1).

   Tighten
   Tighten the switch to 27 N·m (20 lb ft).

3. Connect the reverse lamp switch electrical connector (3).
4. Lower the vehicle.

Mainshaft Rear Oil Seal Replacement

Tools Required

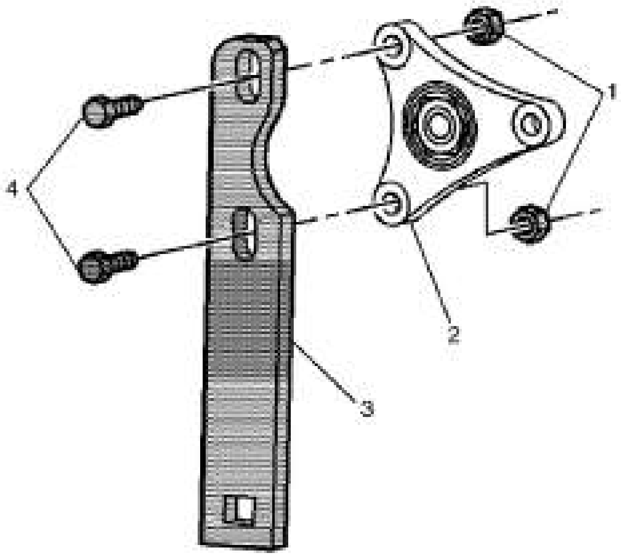
- J 23907 Slide Hammer
- J 23129 Universal Seal Remover
- J 29873 Injector Nozzle Socket 30 mm
- J 44765 Seal Installer
- J 45012 Holding Fixture
- J 45019 Flange and Pinion Gage Remover

Removal Procedure

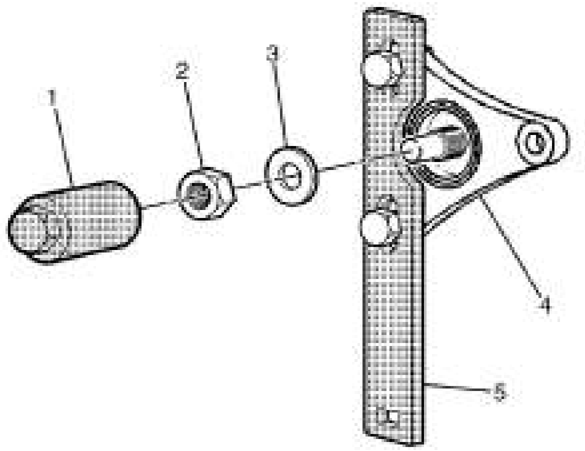
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle .
2. Remove the exhaust system. Refer to Exhaust System Replacement .
3. Remove the propeller shaft. Refer to Propeller Shaft Replacement .



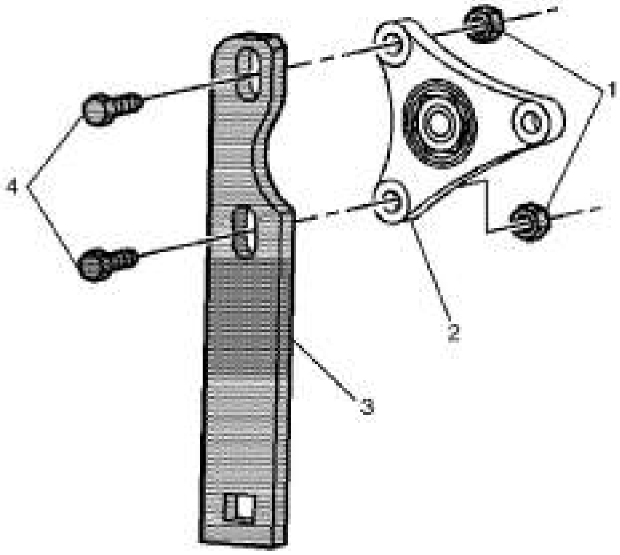
4. Install the J 45012 (3) to the drive flange (2).
5. Install the J 45012 to drive flange retaining bolts (4) and nuts (1) and tighten until firm.



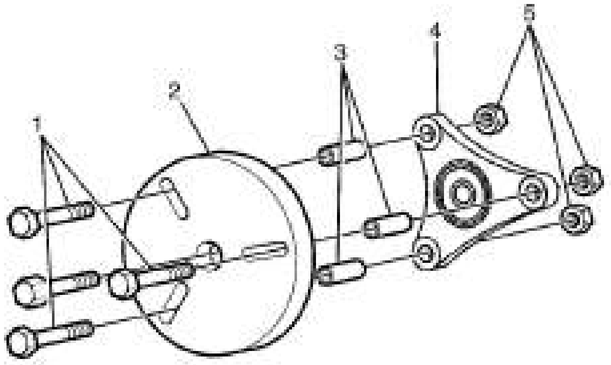
6. While holding the J 45012 (5), remove the flange retaining nut (2) using the J 29873 (1) from the flange (4).

   Discard the nut.

7. Remove the drive flange thrust washer (3).



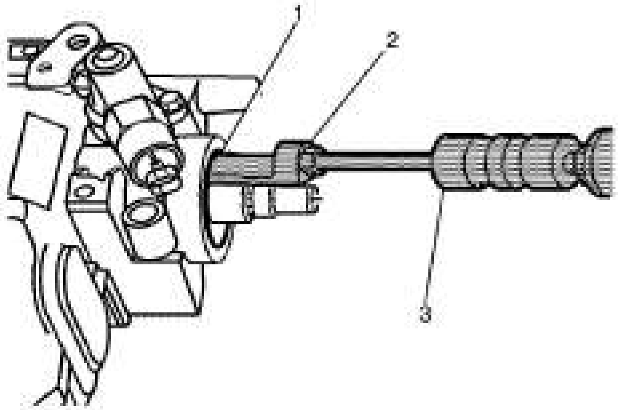
8. Remove the J 45012 to drive flange retaining bolts (4) and nuts (1).
9. Remove the J 45012 (3) from the drive flange (2).



10. Install the J 45019 (2) to the drive flange (4).

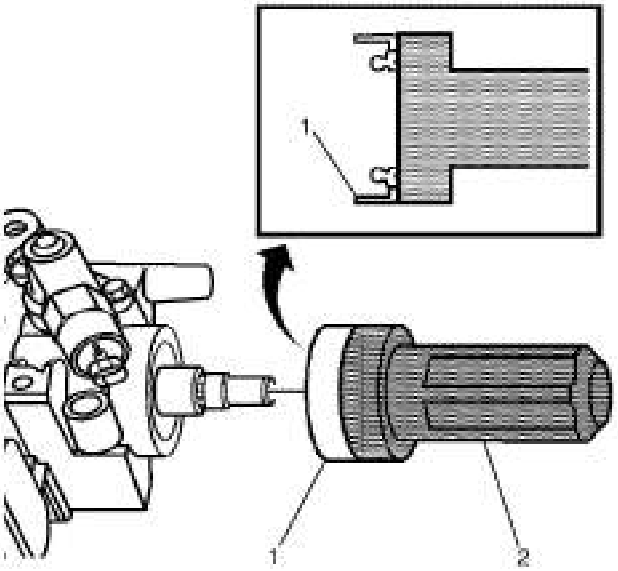
    Remove the drive flange (1) using the J 45019 (2).

11. Install the J 45019 to drive flange retaining bolts (1), spacers (3) and nuts (5) and tighten until firm.
12. Remove the drive flange (4) using the J 45019 (2).



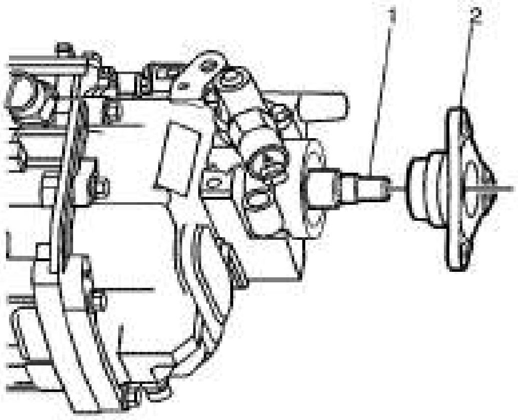
13. Use the J 23907 (3) and J 23129 (2) to remove the mainshaft rear oil seal (1) from the transmission extension housing.

Installation Procedure

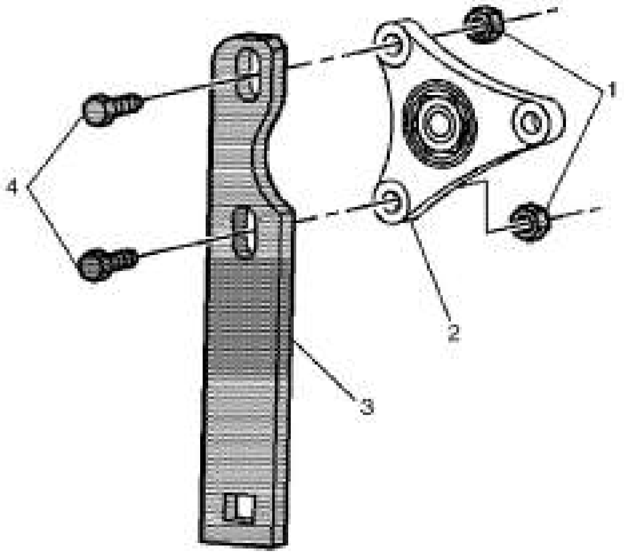


Important: Install the mainshaft rear oil seal (1) onto the tool before installing into the transmission extension housing to prevent damage to the mainshaft rear oil seal (1).

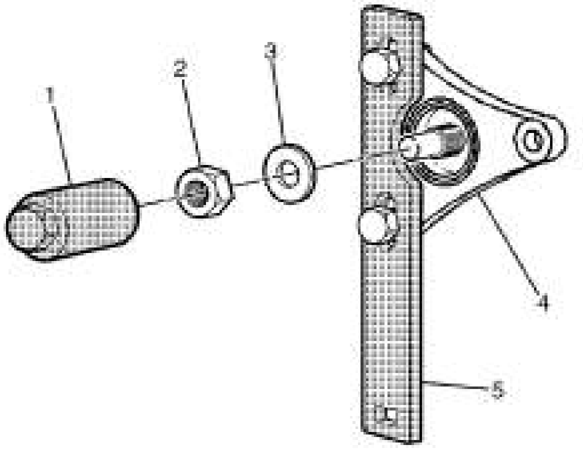
1. Using J 44765 (2) install the new mainshaft rear oil seal (1).



2. Install the drive flange (2) to the transmission output shaft (1).



3. Install the J 45012 (3) to the drive flange (2).
4. Install the J 45012 to drive flange retaining bolts (4) and nuts (1) and tighten until firm.

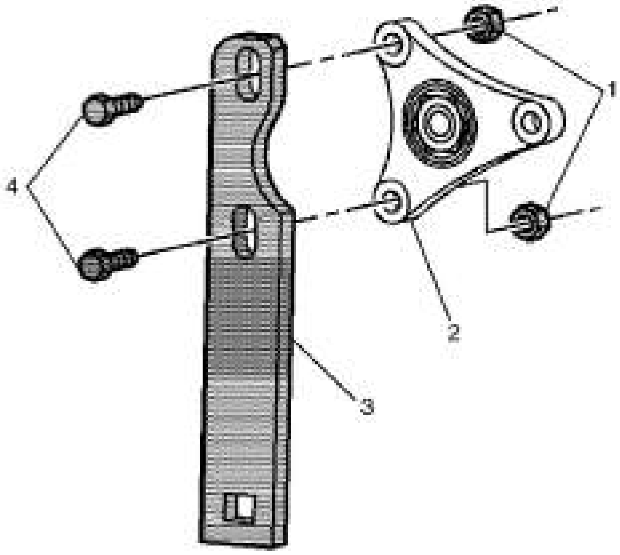


5. Install the drive flange thrust washer (3).

   Notice: Refer to Fastener Notice in the Preface section.

6. While holding the J 45012 (5), install the NEW flange retaining nut (2) using the J 29873 (1) to the flange (4).

   Tighten
   Tighten the nut to 135 N·m (100 lb ft).



7. Remove the J 45012 to drive flange retaining bolts (4) and nuts (1).
8. Remove the J 45012 (3) from the drive flange (2).
9. Install the propeller shaft. Refer to Propeller Shaft Replacement .
10. Install the exhaust system. Refer to Exhaust System Replacement .
11. Lower the vehicle.

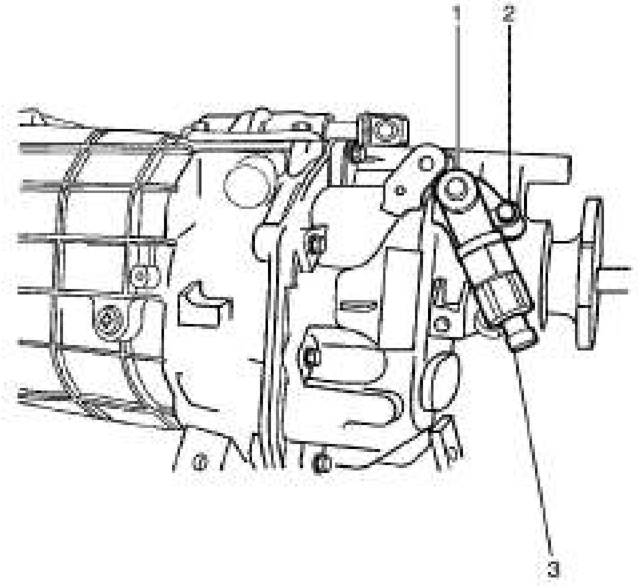
Reverse Lockout Solenoid Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

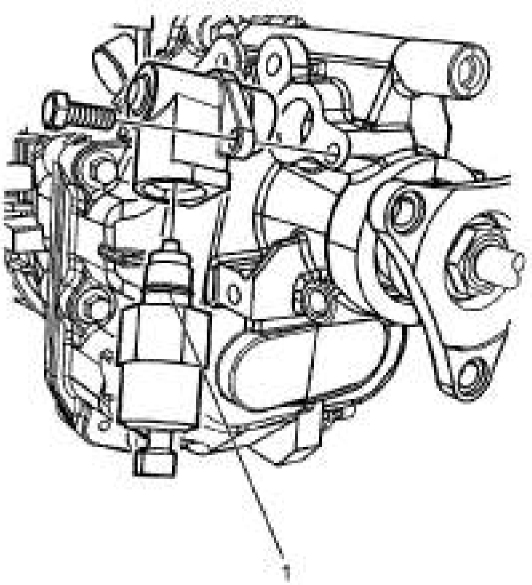
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the exhaust system. Refer to Exhaust System Replacement.
3. Support the transmission with a suitable jack.
4. Remove the transmission support. Refer to Transmission Support Replacement.
5. Remove the transmission mount. Refer to Transmission Rear Mount Replacement.

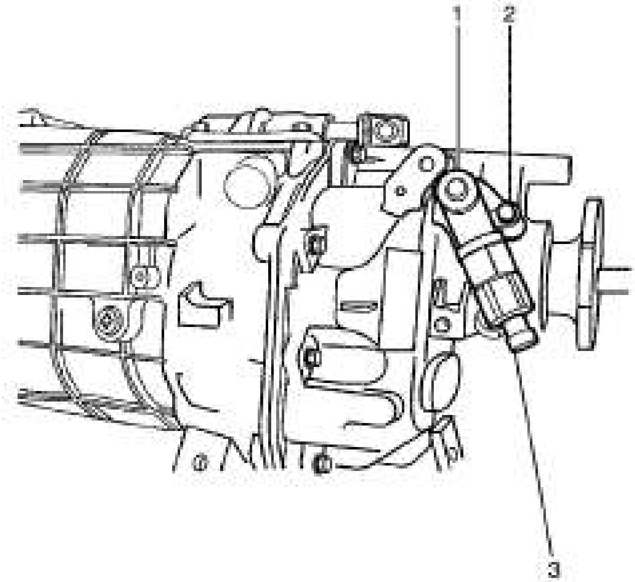


6. Disconnect the reverse lockout solenoid electrical connector (3).
7. Remove the reverse lockout solenoid to transmission extension housing retaining screw (2).
8. Remove the reverse lockout solenoid (1) from the transmission extension housing.

Installation Procedure



1. Inspect the reverse lockout assembly O-ring (1). Replace the reverse lockout assembly O-ring if necessary.



2. Install the reverse lockout solenoid (3) to the transmission extension housing.

   Notice: Refer to Fastener Notice in the Preface section.

3. Install the reverse lockout solenoid to transmission extension housing retaining bolt (2).
4. Connect the reverse lockout solenoid electrical connector.
5. Install the transmission mount. Refer to Transmission Rear Mount Replacement.
6. Install the transmission support. Refer to Transmission Support Replacement.
7. Remove the transmission jack.
8. Install the exhaust system. Refer to Exhaust System Replacement.
9. Lower the vehicle.

Shift Control Assembly Replacement

Tools Required

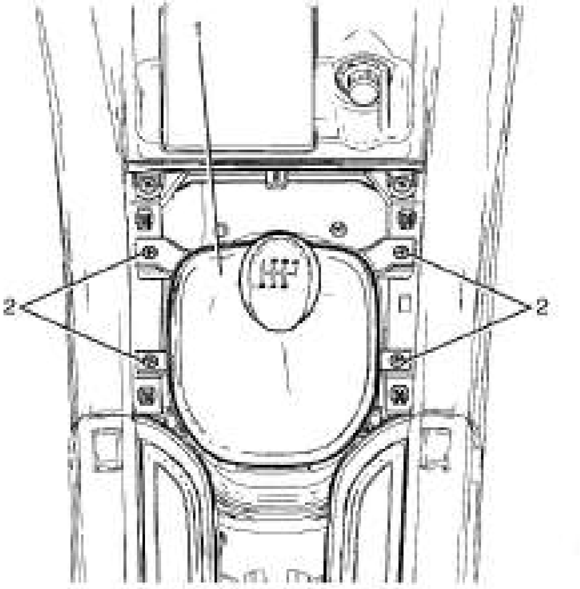
EN-48536 Frame Support Tool (Engine Lower 65mm Kit)

Removal Procedure

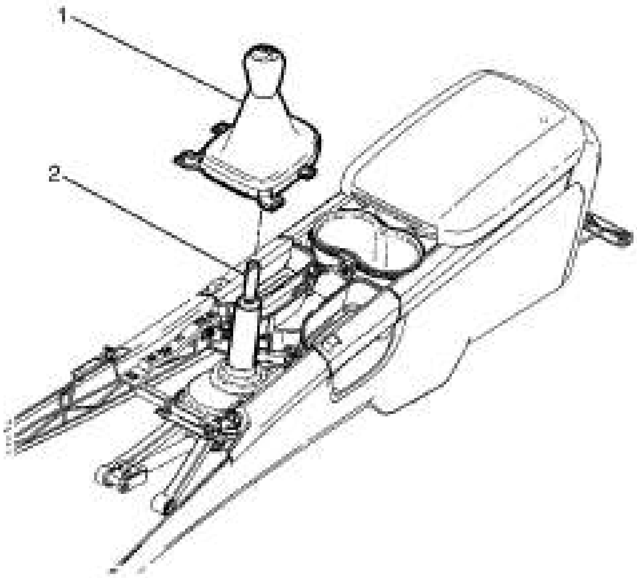
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

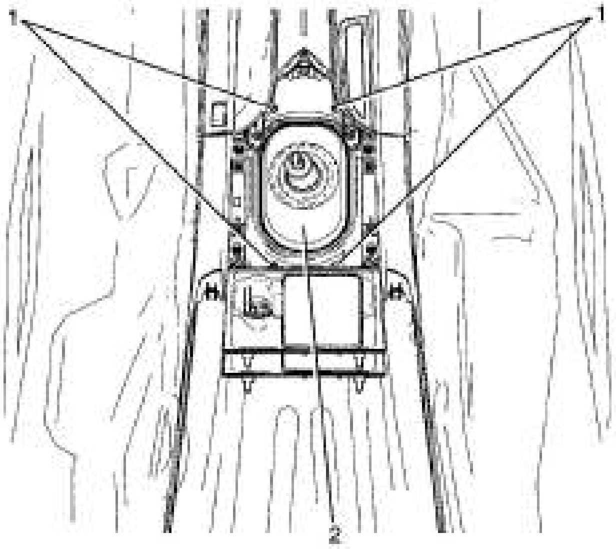
1. Remove the trim plate. Refer to Console Trim Plate Replacement.



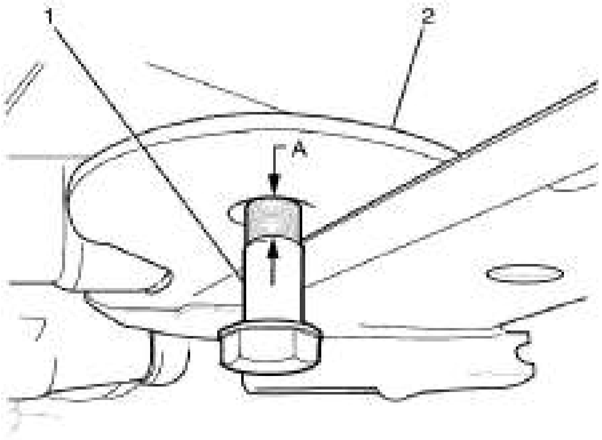
2. Remove the gearshift lever boot to front console retaining screws (2).



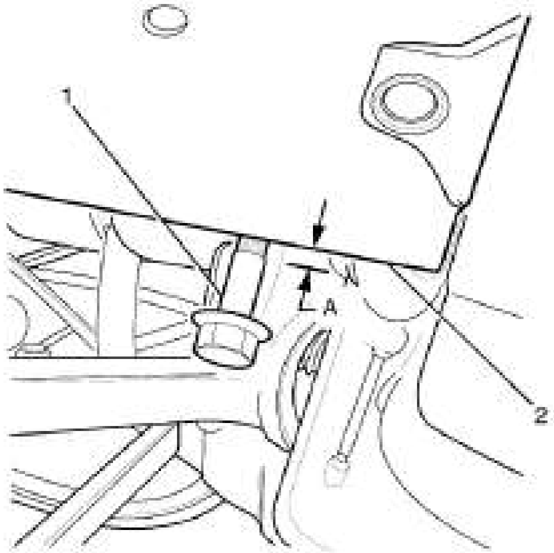
3. Lift the gearshift lever boot (1) enough to enable a firm grasp to be made on the gearshift lever (2) with the left hand, then grasp the gearshift knob with the right.
4. While rocking the knob sideways, and with an upward force applied, dislodge the knob retaining claws from the lever.
5. Remove the gearshift lever knob and boot assembly, from the gearshift lever.



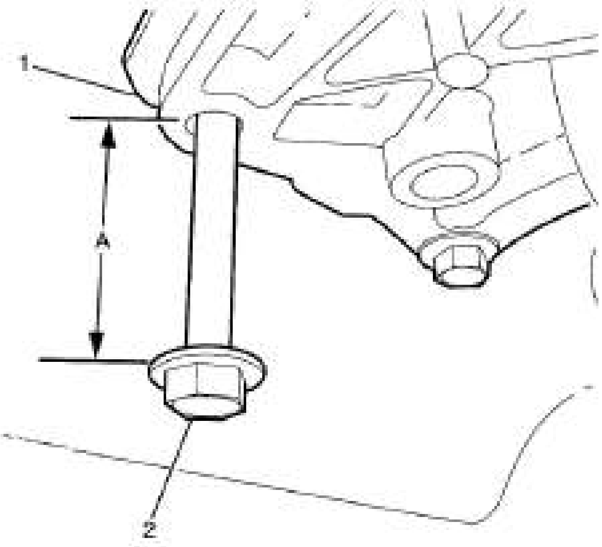
6. Remove the shift control assembly to shift control adapter plate retaining nuts (1).
7. Raise the vehicle. Refer to Lifting and Jacking the Vehicle.
8. Remove the exhaust system. Refer to Exhaust System Replacement.
9. Remove the propeller shaft. Refer to Propeller Shaft Replacement.
10. Support the power train with a suitable jack or table.
11. Support the transmission with a suitable jack.



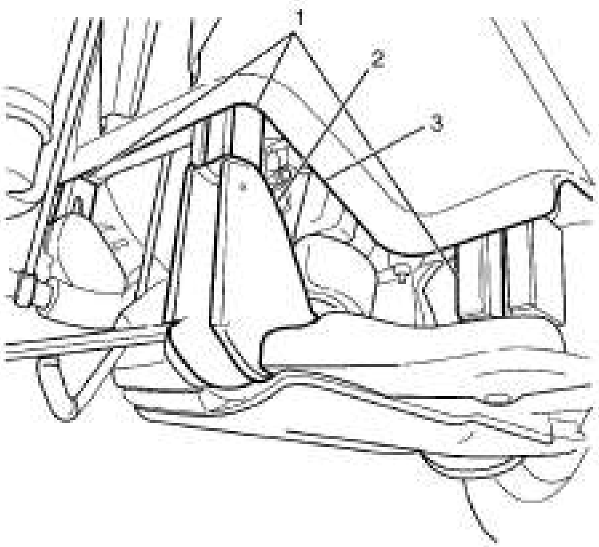
12. Replace the front sub frame rear bolts and fit bolts from the EN-48536 .
13. Install the retaining bolt (1) until the stepped shank (A) is two millimetres below sub frame (2).



14. Replace the front sub frame front bolts and fit bolts from the EN-48536 .
15. Install the retaining bolt (1) until the stepped shank (A) is two millimetres below chassis rail flange (2).



16. Remove the left front and right rear retaining bolts from the transmission mount and install two retaining bolts from the EN-48536 in diagonal holes e.g Left hand front and Right hand rear.
17. Install the retaining bolt (2) in until a 65 millimetre gap is achieved (A).
18. Remove front sub frame middle bolts.
19. Lower power train slowly until the subframe and transmission mount are resting on the bolts (2).



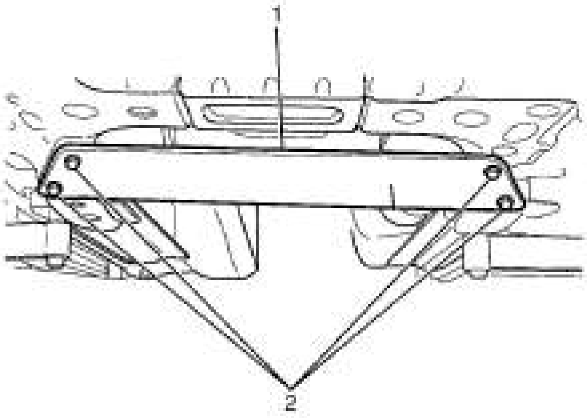
20. Insert the 65 millimetre spacer blocks (1) from the EN-48536 between the subframe (2) and the chassis rails (3).
21. Tension front sub frame front and rear retaining bolts.

Tighten
Tighten the bolts to 95 N·m (70 lb. ft).

22. Install and tension middle sub frame retaining bolts.

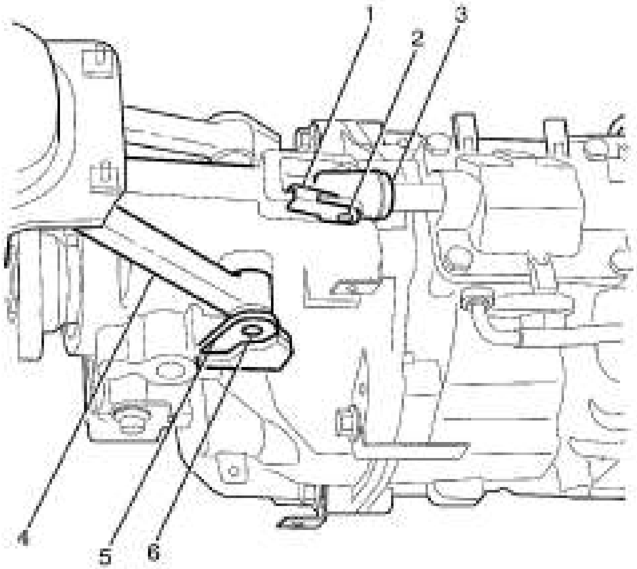
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

23. Remove suitable supporting jack.

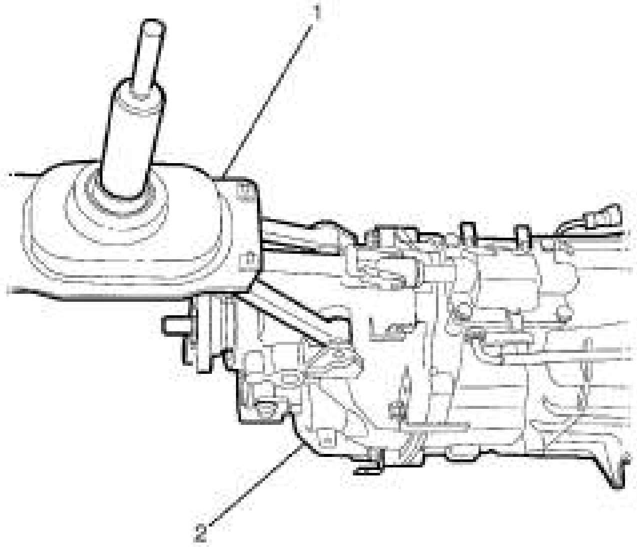


24. Install the engine support plate (1) from the EN-48536 to the front sub frame (2).
25. Install the engine support plate to front subframe retaining bolts (3).

    Tighten
    Tighten the bolts to 10 N·m (89 lb. in).

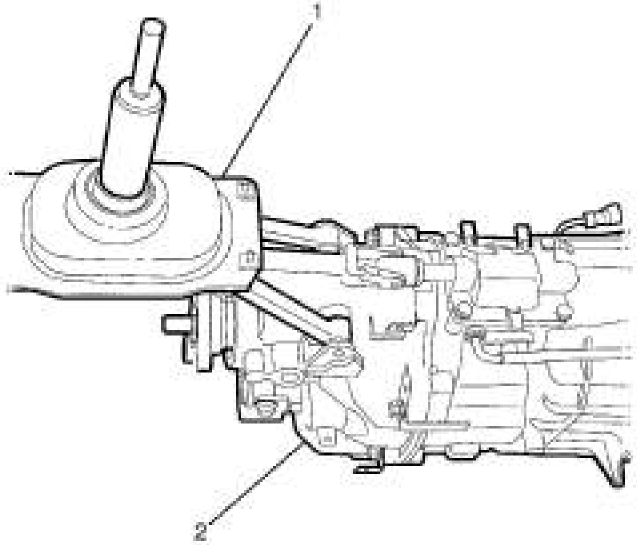


26. Use a suitable tool to rotate the selector shaft rod retaining clip (1) upwards.
27. Use a suitable tool to remove the selector shaft rod retaining pin (2) from the selector shaft rod (3).
28. Use a suitable tool to rotate the shift control assembly rod retaining clip (5) upwards.
29. Use a suitable tool to remove the retaining pin (6) from the shift control assembly rod (4). Repeat for opposite side.

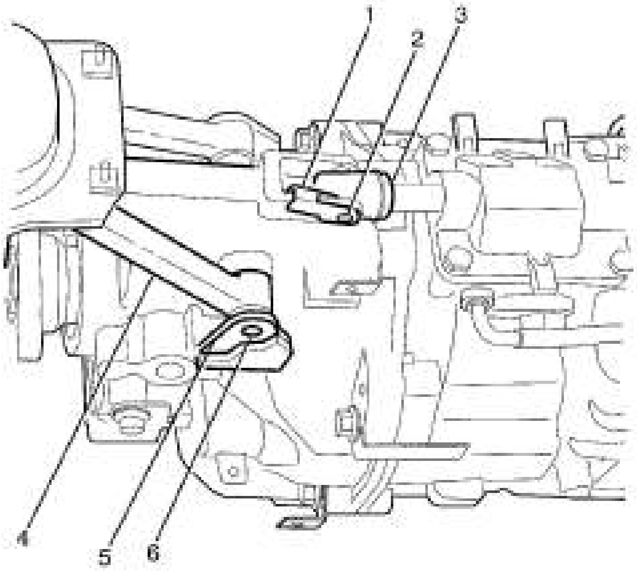


30. Remove the shift control assembly (1) from the transmission (2).

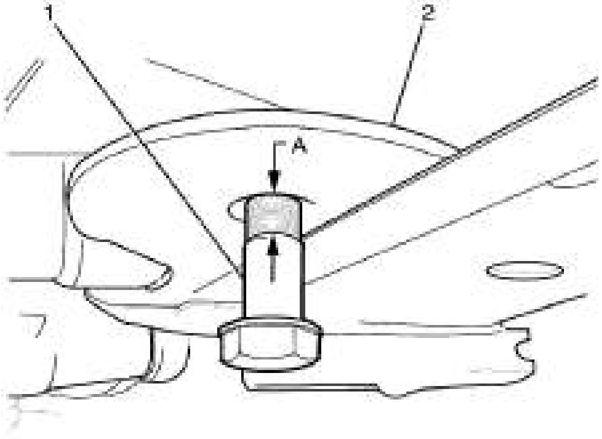
Installation Procedure



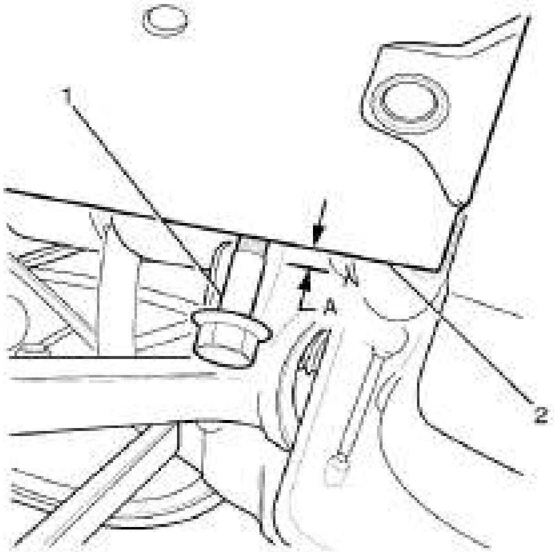
1. Install the shift control assembly (1) to the transmission (2).



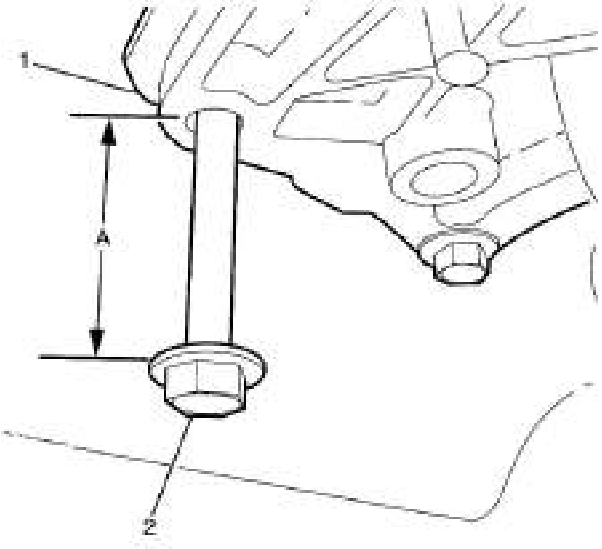
2. Use a suitable tool to install the retaining pin (6) to the shift control assembly rod (4).
3. Rotate the shift control assembly rod retaining clip (5) downwards to lock the retaining pin (6). Repeat for opposite side.
4. Use a suitable tool to install the retaining pin (2) to the selector shaft rod (3).
5. Rotate the selector shaft rod retaining clip (1) downwards to lock the retaining pin (2).
6. Support the power train with a suitable jack or table.
7. Support the transmission with a suitable jack.



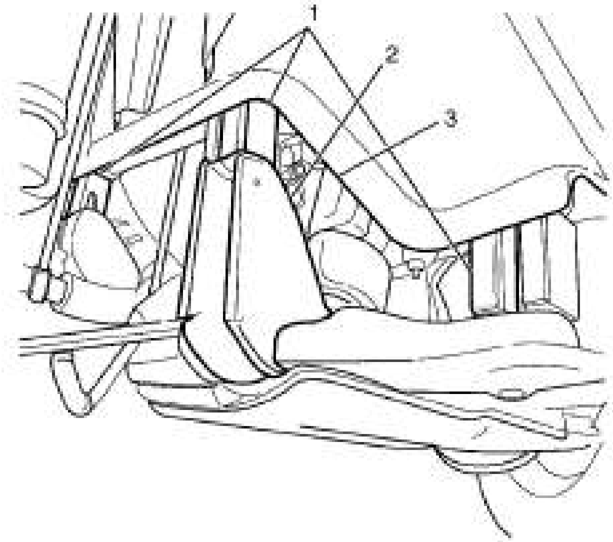
8. Loosen the EN-48536 retaining bolt (1) until the stepped shank (A) is two millimetres below subframe (2).



9. Loosen the EN-48536 retaining bolt (1) until the stepped shank (A) is two millimetres below the subframe (2).



10. Loosen the EN-48536 transmission mount to body retaining bolts (2) in the diagonal holes (ie. Left hand front and Right hand rear).
11. Remove EN-48536 front sub frame middle bolts.



12. Remove the EN-48536 six 65 millimetre spacer blocks (1) between subframe (2) and chassis rails (3).
13. Install the front sub frame to chassis rail retaining bolts.

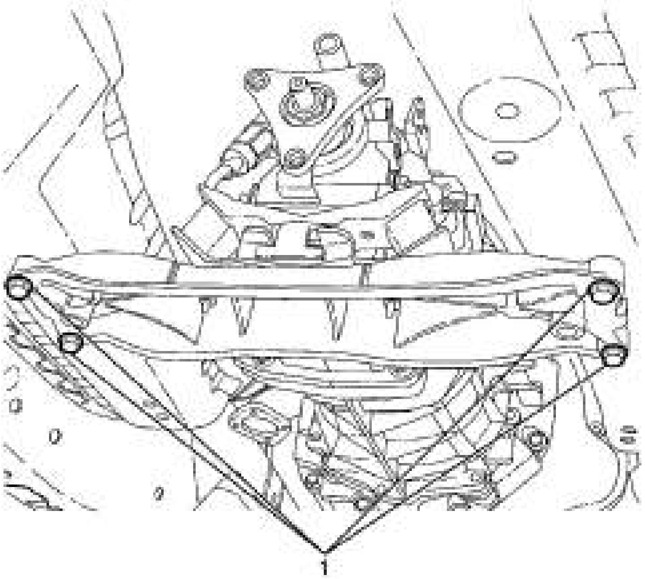
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

14. Install the rear sub frame to chassis rail retaining bolts.

    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).

15. Install the centre sub frame to chassis rail retaining bolts.

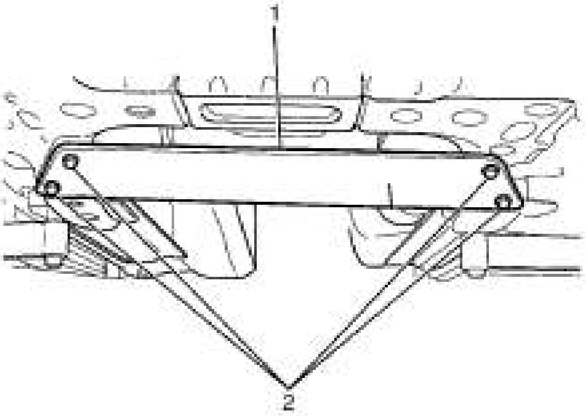
    Tighten
    Tighten the bolts to 95 N·m (70 lb. ft).



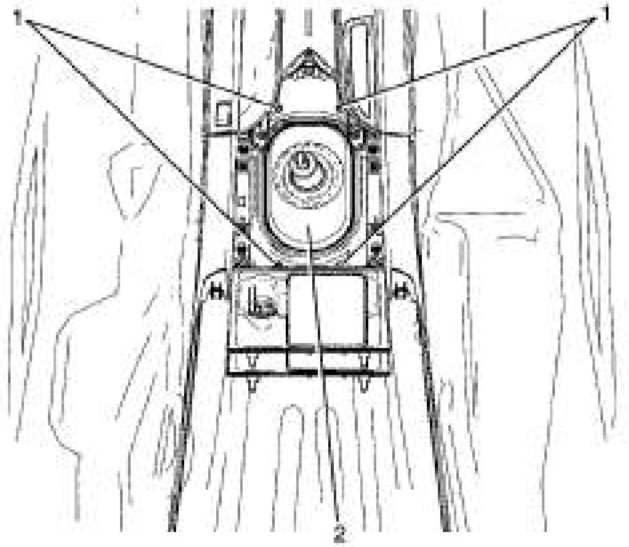
16. Install the transmission mount to body retaining bolts (1).

    Tighten
    Tighten the bolts to 58 N·m (43 lb ft).

17. Raise the vehicle.
18. Remove supporting jack or table.

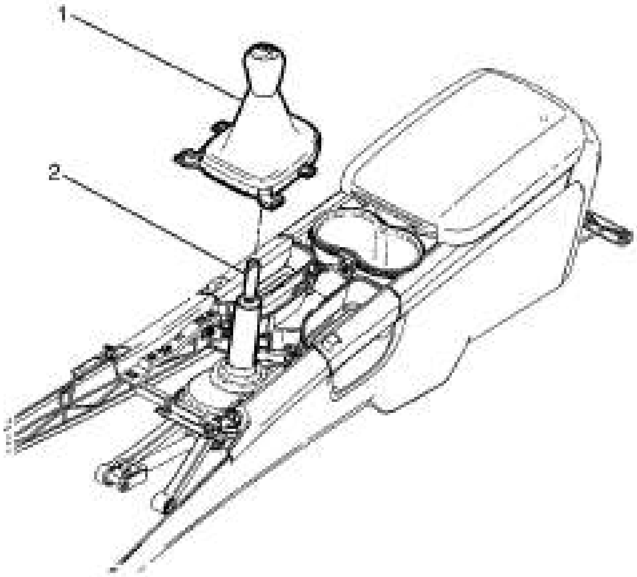


19. Remove the EN-48536 engine support plate (1) to front sub frame retaining bolts (2).
20. Remove the EN-48536 engine support plate from the vehicle.
21. Install the propeller shaft. Refer to Propeller Shaft Replacement.
22. Install the exhaust system. Refer to Exhaust System Replacement.
23. Lower the vehicle.

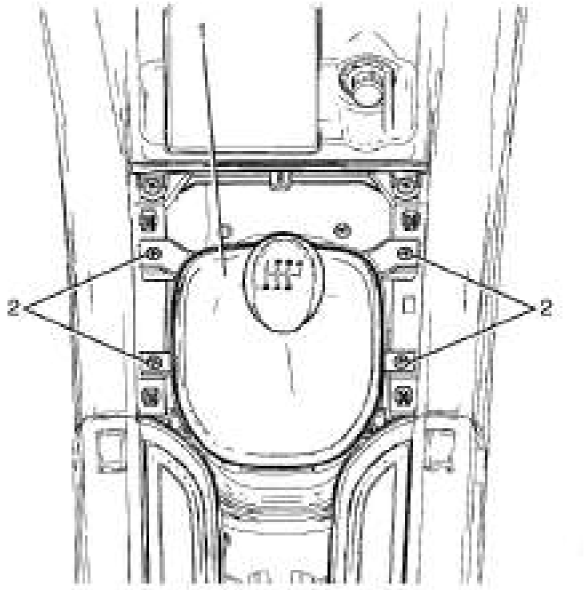


24. Install the shift control assembly to shift control adapter plate retaining nuts (1).

    Tighten
    Tighten the bolts to 12 N·m (106 lb in).



25. Install the gearshift lever knob and boot assembly (1) to the gearshift lever.
26. Align the gearshift lever knob to the gearshift lever (2).
27. Apply pressure to the top of the gearshift knob to engage into the gearshift lever.



28. Install the gearshift lever boot to front console retaining screws (2).

    Tighten
    Tighten the screws to 2 N·m (18 lb in).

29. Install the trim plate. Refer to Console Trim Plate Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977492**

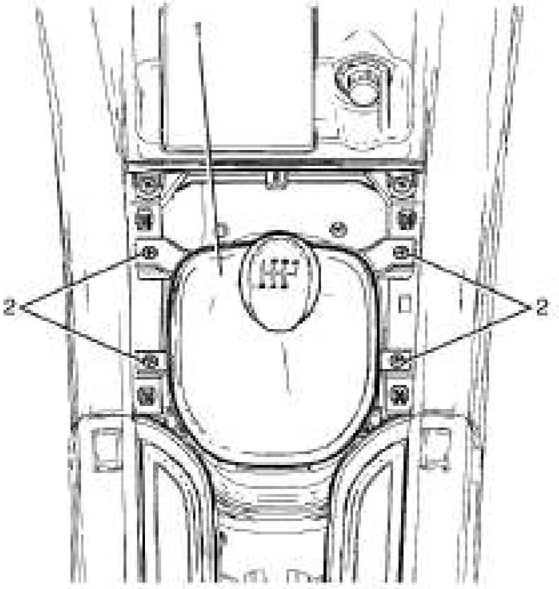
Shift Control Shift Closeout Boot Replacement

Removal Procedure

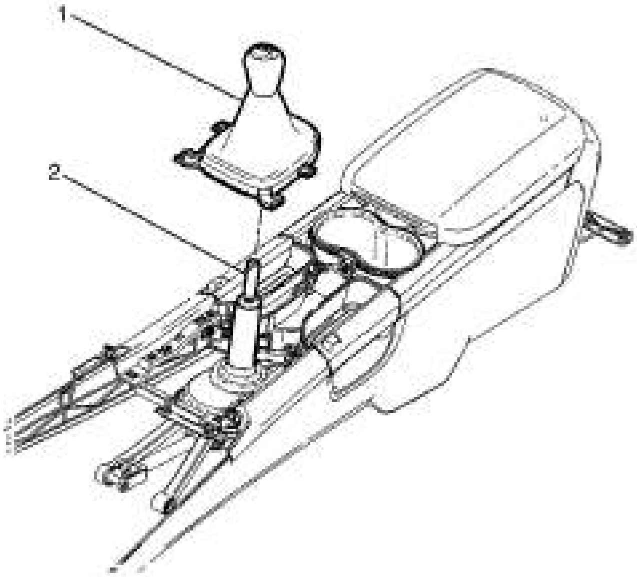
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Remove the trim plate. Refer to Console Trim Plate Replacement.

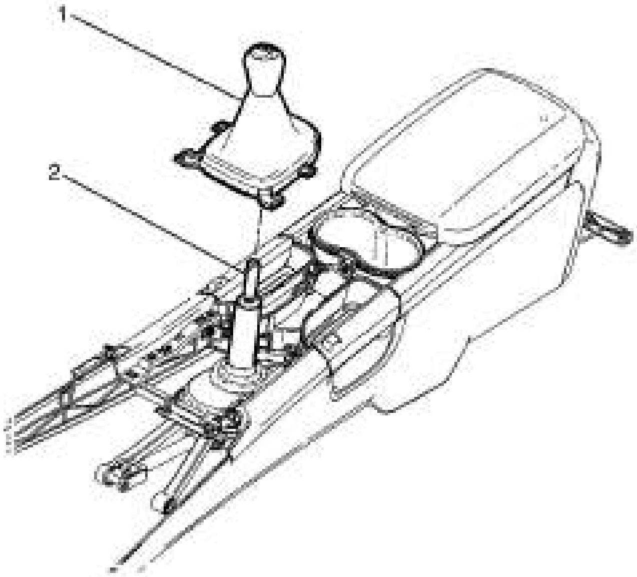


2. Remove the gearshift lever boot to front console retaining screws (2).

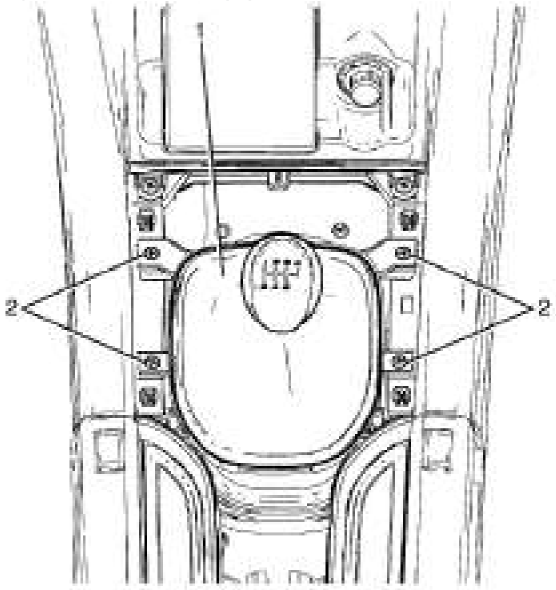


3. Lift the gearshift lever knob and boot assembly (1) enough to enable a firm grasp to be made on the gearshift lever (2) with the left hand, then grasp the gearshift lever knob and boot assembly (1) with the right.
4. While rocking the gearshift lever knob and boot assembly (1) sideways, and with an upward force applied, dislodge the gearshift lever knob and boot assembly (1) retaining claws from the gearshift lever (2).
5. Remove the gearshift lever knob and boot assembly (1) from the gearshift lever (2).

Installation Procedure



1. Install the gearshift lever knob and boot assembly (1) to the gearshift lever (2).
2. Align the gearshift lever knob and boot assembly (1) to the gearshift lever (2).
3. Apply pressure to the top of the gearshift lever knob and boot assembly (1) to engage into the gearshift lever (2).



4. Install the gearshift lever boot to front console retaining screws (2).

   Tighten
   Tighten the screws to 2 N·m (18 lb in).

5. Install the trim plate. Refer to Console Trim Plate Replacement.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977503**

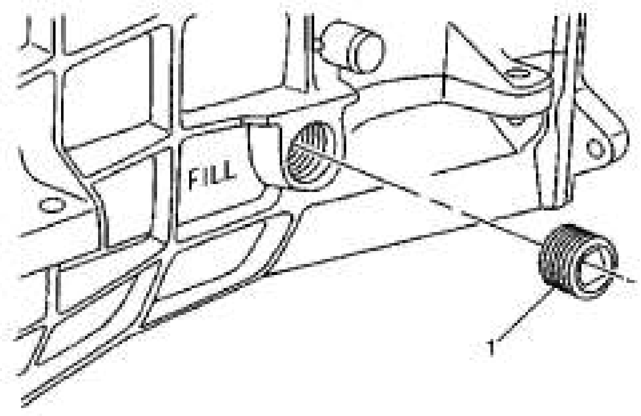
Transmission Fluid Level Inspection

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

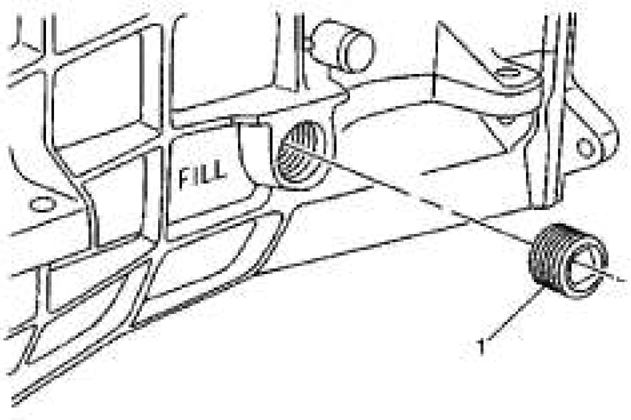
Important: This transmission is classified as being a "Fill for Life" transmission and checking the lubricant level is not recommended. The only time that fluid level checking would be appropriate, would be after correction of a fluid leak that did not require the transmission to be fully drained and/or removed from the vehicle.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.



2. Clean any dirt from around the transmission fill plug (1).
3. Remove the transmission fill plug (1).
4. Allow excess fluid to drain until flow stops. If required, top up fluid level until it does flow out of the transmission fill plug.

Notice: Refer to Fastener Notice in the Preface section.



5. Install the transmission fill plug (1).

   Tighten
   Tighten the plug to 28 N·m (20 lb ft).

6. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977484**

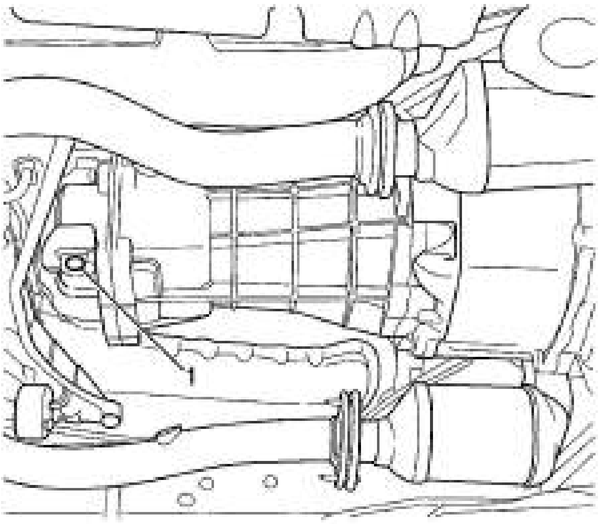
Transmission Fluid Replacement

Draining Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.



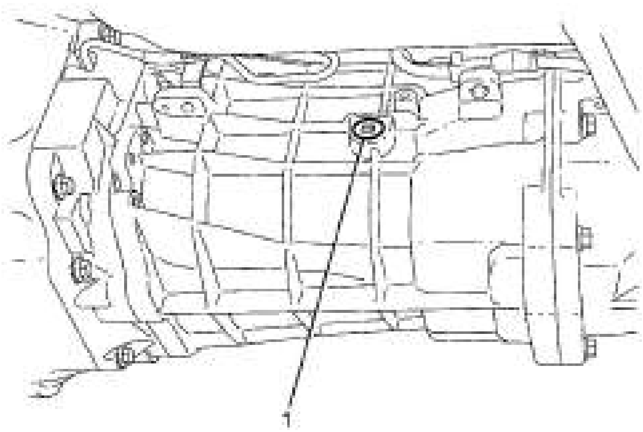
2. Clean away all dirt and debris from the transmission drain plug (1).
3. Place a suitable container under the transmission.
4. Remove the drain plug (1).
5. Allow the system to drain completely.

Notice: Refer to Fastener Notice in the Preface section.

6. Install the transmission drain plug (1).

Tighten
Tighten the transmission drain plug to 28 N·m (20 lb ft).

Filling Procedure



1. Clean away all dirt and debris from the transmission fluid fill plug area (1).
2. Remove the transmission fluid fill plug (1).
3. Fill the transmission with DEXRON®-III transmission fluid, until even with the bottom of the fill plug hole.

   Notice: Refer to Fastener Notice in the Preface section.

4. Install the transmission fluid fill plug (1).

   Tighten
   Tighten the transmission fluid fill plug to 18 N·m (13 lb ft).

5. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1992882**

Transmission Mount Inspection

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Raise the transmission in order to remove the weight from the transmission mount and create slight tension in the rubber.
3. Observe the transmission mount while raising the transmission. Replace the transmission mount if the transmission mount exhibits any of the following conditions:
   - The hard rubber surface is covered with heat check cracks.
   - The rubber is separated from the metal plate of the transmission mount.
   - The rubber is split through the center of the transmission mount.
4. If there is movement between the metal plate of the transmission mount and its attaching points, lower the transmission on the transmission mount. Tighten the retaining bolts or retaining nuts attaching the transmission mount to the frame or transmission mount bracket. Refer to Transmission Rear Mount Replacement.
5. Lower the vehicle.

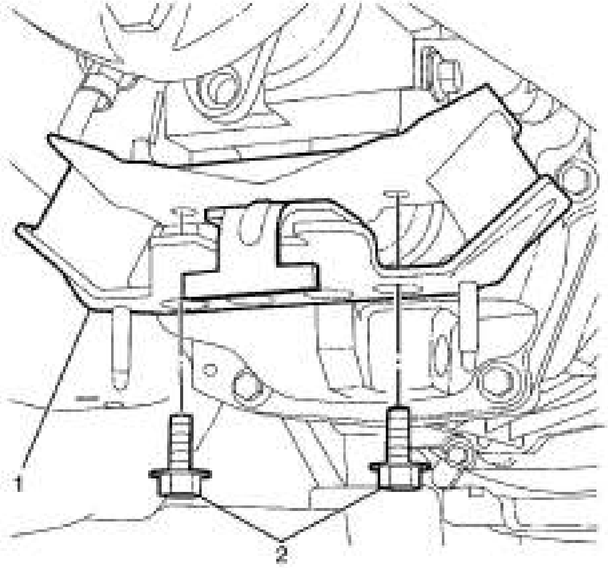
Transmission Rear Mount Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

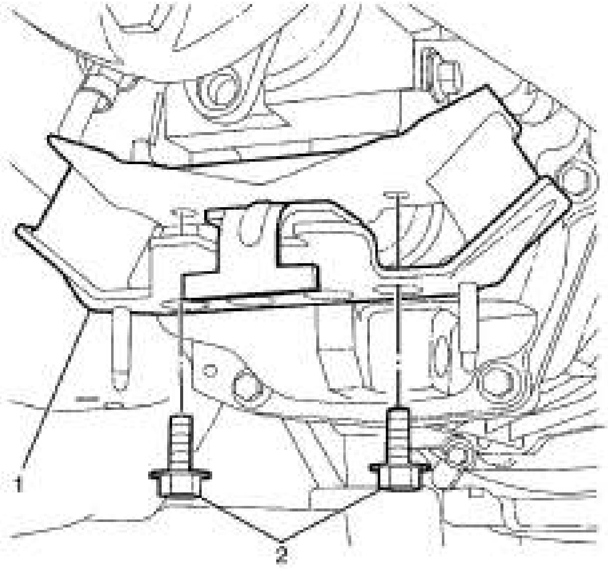
Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the transmission support. Refer to Transmission Support Replacement.



3. Remove the transmission mount to transmission upper retaining bolts (2).
4. Remove the transmission mount (1).

Installation Procedure



1. Install the transmission mount (1) to the transmission.

   Notice: Refer to Fastener Notice in the Preface section.

2. Install the transmission mount to transmission upper retaining bolts (2).

   Tighten
   Tighten the bolts to 60 N·m (44 lb ft).

3. Install the transmission support. Refer to Transmission Support Replacement.
4. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977479**

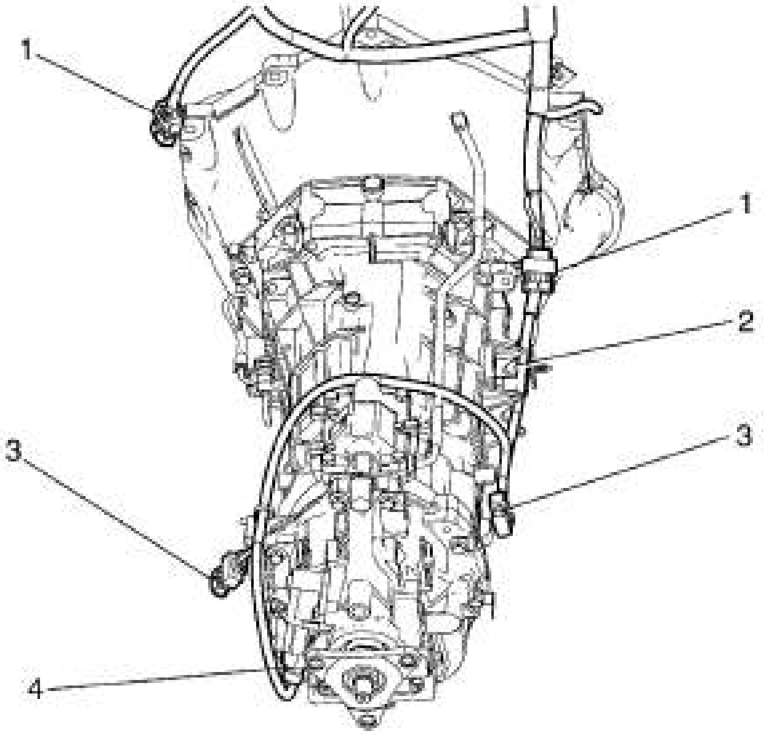
Transmission Replacement

Removal Procedure

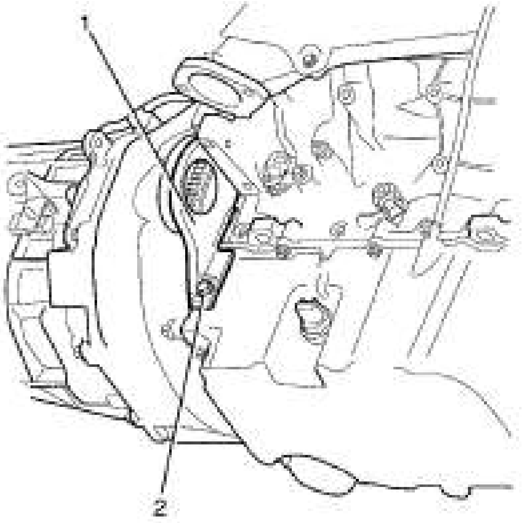
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

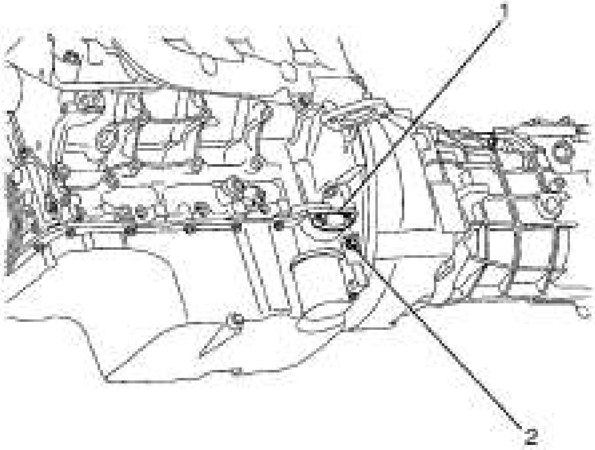
1. Remove the shift control assembly. Refer to Shift Control Assembly Replacement .
2. Remove the propeller shaft. Refer to Propeller Shaft Replacement .



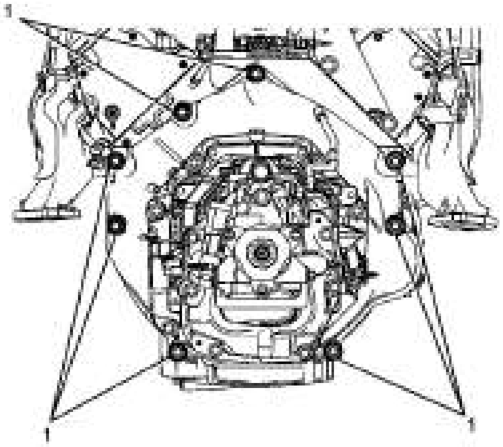
3. Disconnect the following electrical connectors:
   - Backup lamp switch (3).
   - Reverse lockout solenoid (4).
   - Oxygen sensor wiring harness (1 and 2).
4. Disconnect the clutch slave cylinder. Refer to Clutch Concentric Actuator Cylinder Replacement .
5. Remove the starter motor. Refer to Starter Motor Replacement .



6. Remove the transmission close out panel to transmission retaining bolt (2).
7. Remove the transmission close out panel (1) from the transmission.



8. Remove the transmission close out panel to transmission retaining bolt (1).
9. Remove the transmission close out panel (2) from the transmission.

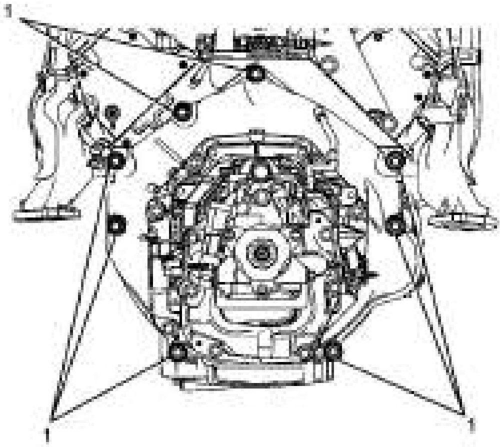


10. Remove the transmission to engine block retaining bolts (1)
11. Remove the transmission from the vehicle.

Installation Procedure

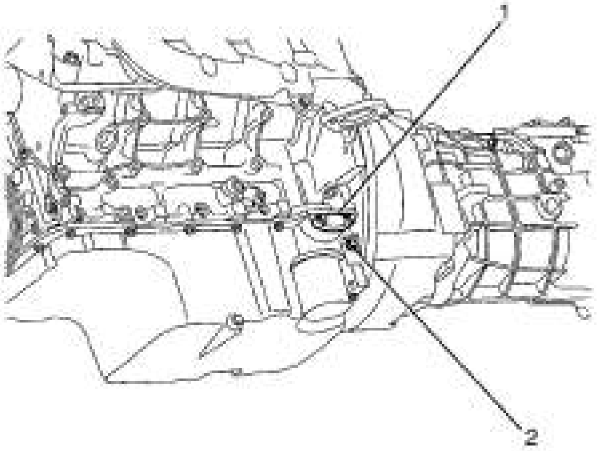
Important: Engage third gear on the transmission to allow for alignment of the input spline of the transmission to the clutch assembly.

1. Install the transmission to the vehicle.



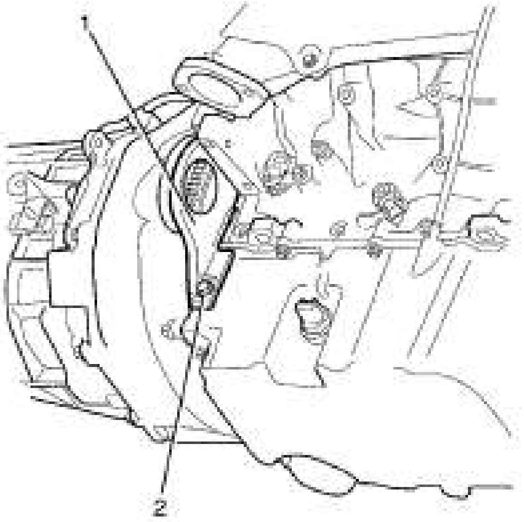
2. Install the transmission to engine block retaining bolts (1)

Tighten
Tighten the bolts to 48 N·m (35 lb ft).



3. Install the transmission close out panel (1) to the transmission.
4. Install the transmission close out panel to transmission retaining bolt (2).

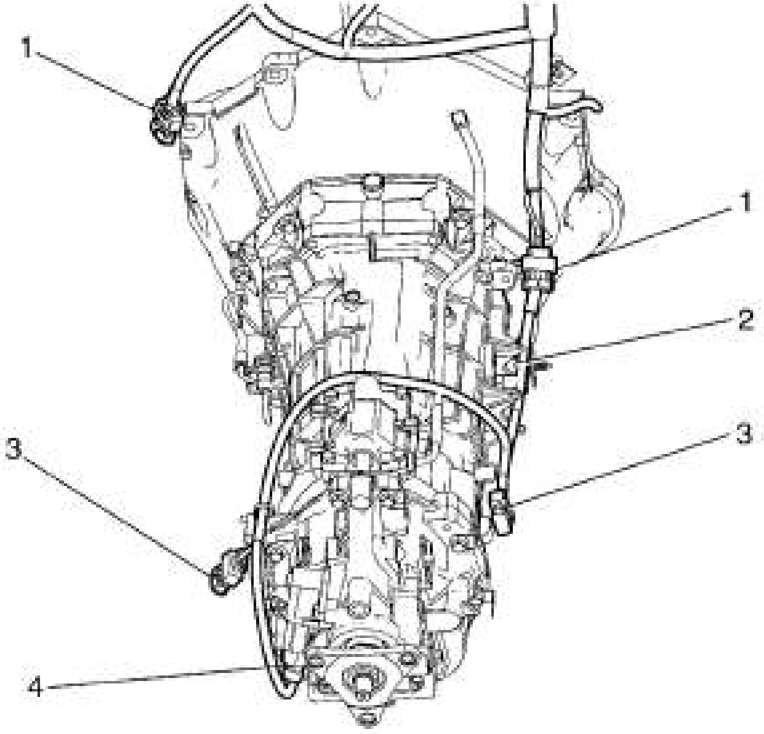
Tighten
Tighten the bolt to 20 N·m (15 lb ft).



5. Install the transmission close out panel (1) to the transmission.
6. Install the transmission close out panel to transmission retaining bolt (2).

Tighten
Tighten the bolt to 20 N·m (15 lb ft).

7. Connect the clutch slave cylinder. Refer to Clutch Concentric Actuator Cylinder Replacement .
8. Install the starter motor. Refer to Starter Motor Replacement .



9. Connect the following electrical connectors:
    - Backup lamp switch (3).
    - Reverse lockout solenoid (4).
    - Oxygen sensor wiring harness (1 and 2).
10. Install the shift control assembly to the transmission. Refer to Shift Control Assembly Replacement .
11. Install the propeller shaft. Refer to Propeller Shaft Replacement .
12. Check the transmission fluid and fill as necessary. Refer to Transmission Fluid Level Inspection and Transmission Fluid Replacement .
13. Install the exhaust system. Refer to Exhaust System Replacement .
14. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - On Vehicle | **Document ID: 1977481**

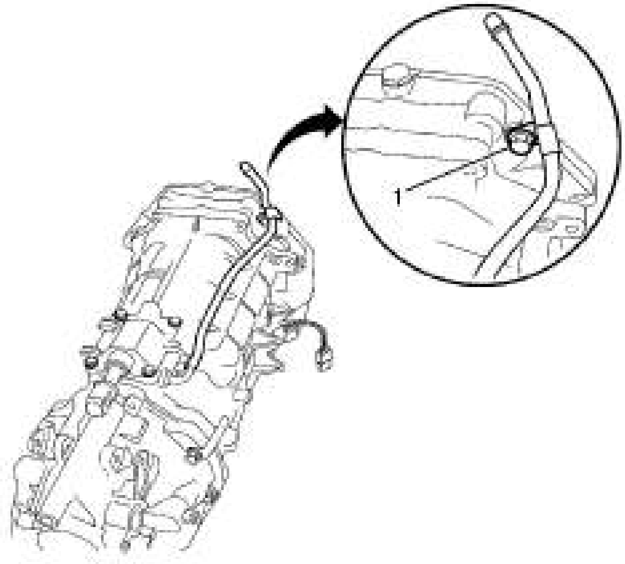
Transmission Vent Tube Replacement

Removal Procedure

Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

1. Raise and suitably support the vehicle. Refer to Lifting and Jacking the Vehicle.
2. Remove the exhaust system. Refer to Exhaust System Replacement.
3. Remove the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.

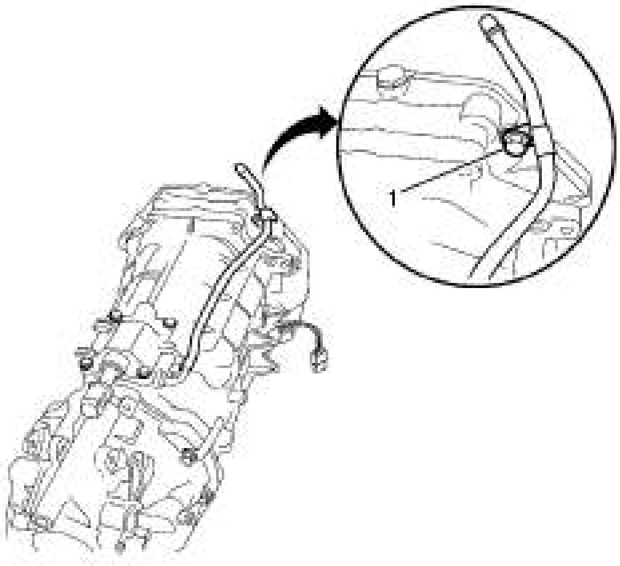


4. Remove the transmission vent tube to transmission case retaining bolt (1).
5. Remove the transmission vent tube from the vent pipe.

Installation Procedure

1. Install the transmission vent tube to the vent pipe.

Notice: Refer to Fastener Notice in the Preface section.



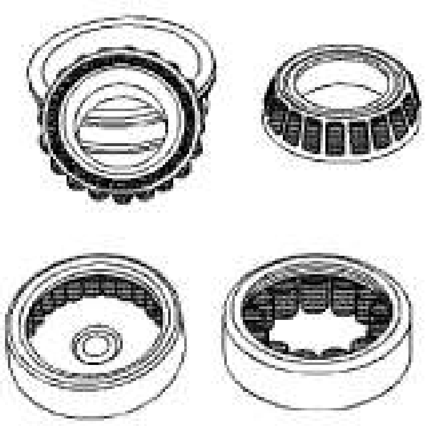
2. Install the transmission vent tube to transmission case retaining bolt (1).

   Tighten
   Tighten the transmission vent tube retaining bolt to 48 N·m (35 lb ft).

3. Install the right catalytic converter. Refer to Catalytic Converter Replacement - Right Side.
4. Install the exhaust system. Refer to Exhaust System Replacement.
5. Lower the vehicle.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1996398**

Bearings and Spacers Cleaning and Inspection



Important: Do not use compressed air to dry the bearings.

Notice: Do not allow the bearings to spin. Turn them slowly by hand. Spinning the bearings may damage the race and the rollers.

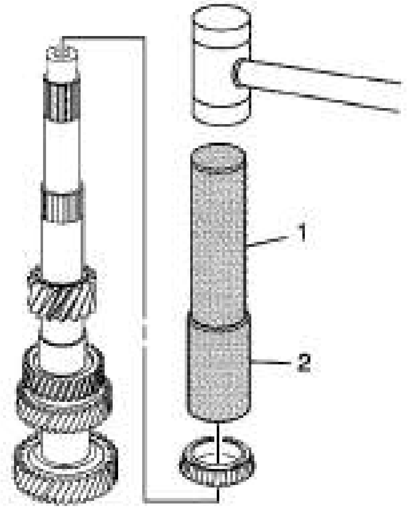
1. Clean all the bearing parts in a suitable solvent. Air dry all the parts.
2. Lubricate the bearings. Use Dexron® III transmission lubricant.
3. Inspect the bearings and journals for roughness and unusual wear or damage.
4. Inspect the mainshaft bearing journals for wear.
5. Inspect the mainshaft speed gear bearings for wear.
6. Inspect the main drive gear pilot bearing rollers for wear.
7. Replace parts which show signs of excessive wear.
8. Do not file surfaces which have been hardened and precision ground.
9. Replace worn or damaged bearings.
10. Replace mated bearing parts when only one part is damaged.

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1982150**

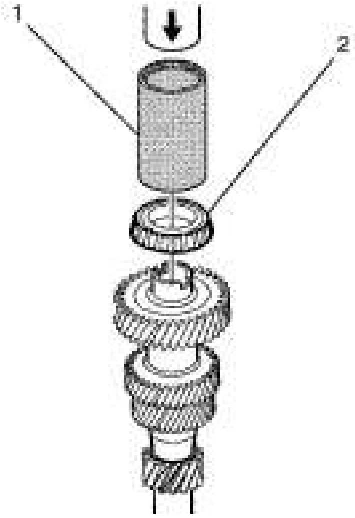
Counter Gear Shaft Assemble

Tools Required

- J 5590 Press Tube
- J 39441-10 5th Gear Installer Adapter



1. Install a new large tapered bearing, using the J 5590 (1), J 39441-10 (2) and a rubber mallet.



2. Install a new small tapered bearing (2), using the J 5590 (1) and a hydraulic press.

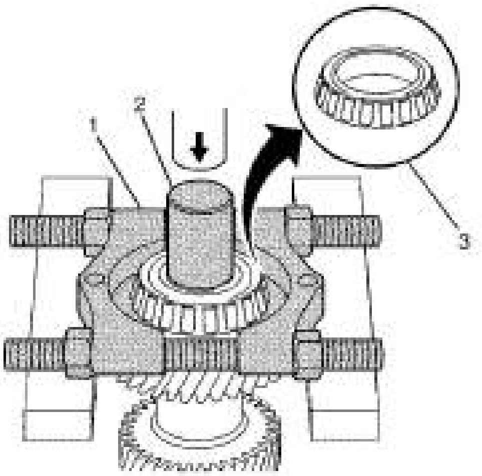
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1996434**

Counter Gear Shaft Disassemble

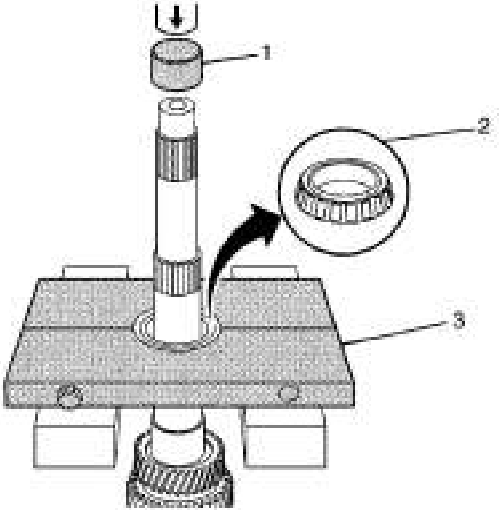
Tools Required

- J-22912-01 Split Plate
- J 39473 Mainshaft Bearing Installer
- J 39511 Split Plate
- J 39547 Press Adapter

Important: Do not replace tapered bearings unless inspection shows bearing damage.



1. Remove the small tapered bearing (3), using the J-22912-01 (1) with the J 39473 (2) and a hydraulic press.
2. Discard the small tapered bearing (3).

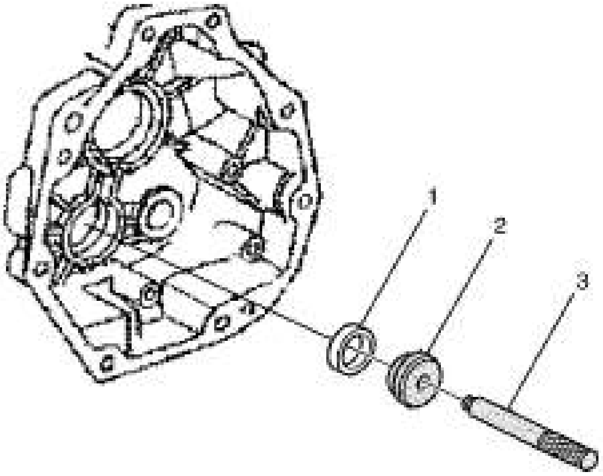


3. Remove the large tapered bearing (2), using the J 39511 (3), the J 39547 (1), and a hydraulic press.
4. Discard the large tapered bearing (2).

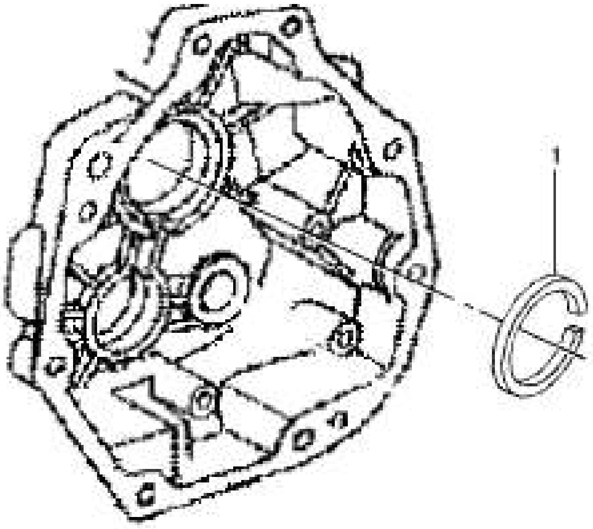
Extension Assemble

Tools Required

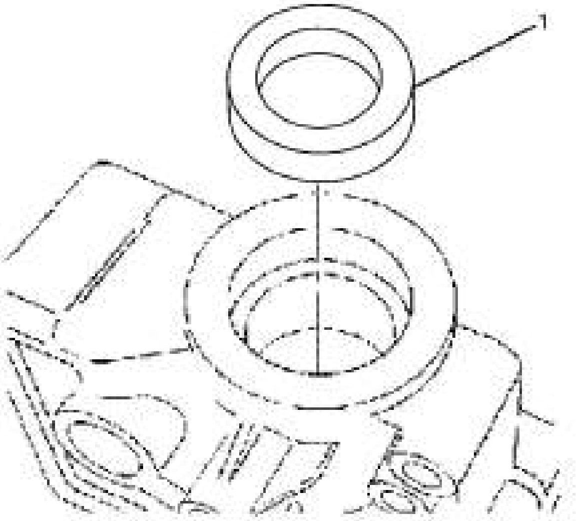
- J 8092 Drive Handle
- J 44765 Seal Installer
- J 39546 Bearing Race Installer
- J 39437 Bushing Installer



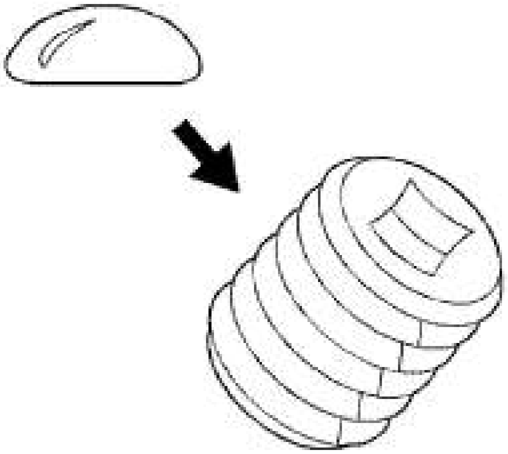
1. Install the mainshaft bearing race (1), using the J 39546 (2) and the J 8092 (3).



2. Install the mainshaft bearing race to extension housing retainer ring (1).

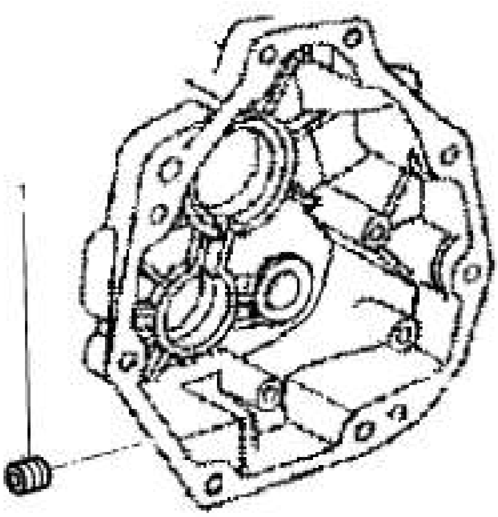


3. Install a NEW output shaft seal to the extension housing using the J 44765 .



4. Apply an approved sealant to the transmission case drain plug.

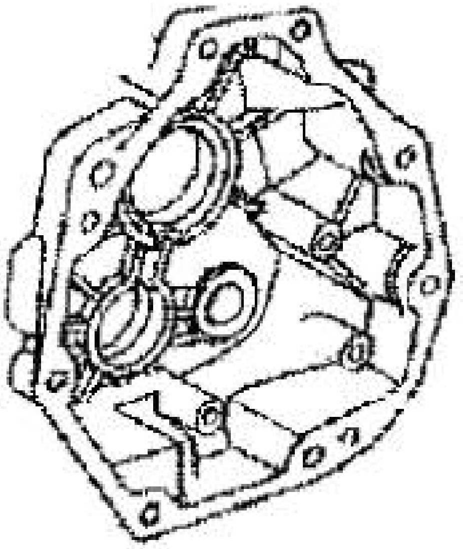
   Notice: Refer to Fastener Notice in the Preface section.



5. Install the transmission case drain plug (1) to the extension housing.

   Tighten
   Tighten the plug to 18 N·m (13 lb ft).

Extension Cleaning and Inspection

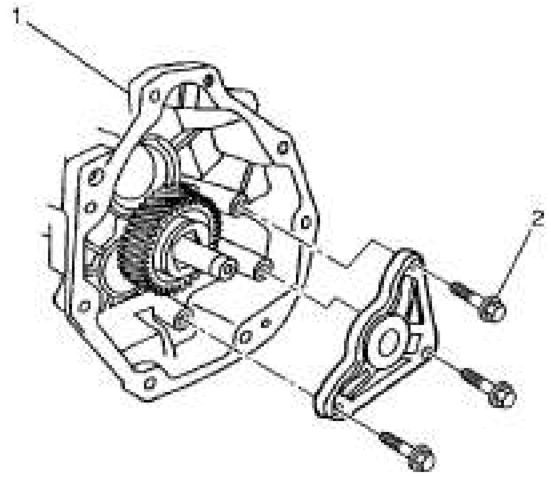


1. Clean the rear extension housing in a suitable solvent. Air dry the housing.
2. Inspect the extension housing for the following:
   - Cracks
   - Scratches
   - Damaged threads
   - Burrs
   - Nicked mounting surfaces
   - Damaged sealing surfaces
   - Damaged front or rear bearing bores
3. If damaged beyond repair replace the extension housing..
4. Clean up damaged threads with the correct size thread tap.
5. Inspect the machined mating surfaces for flatness (Check the mating surfaces with a straight edge).
6. Use a fine mill file to dress minor scratches or burrs.

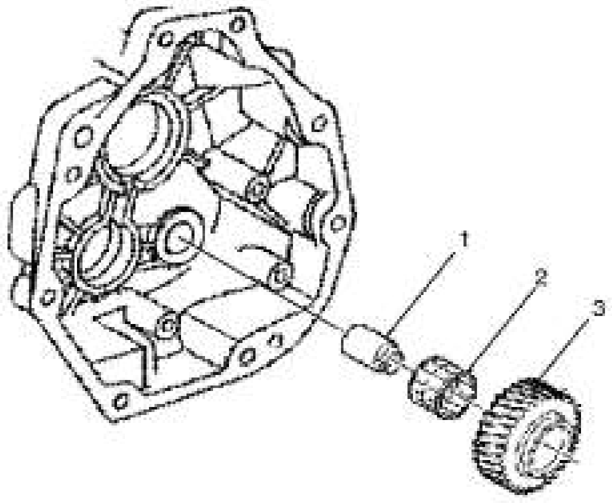
Extension Disassemble

Tools Required

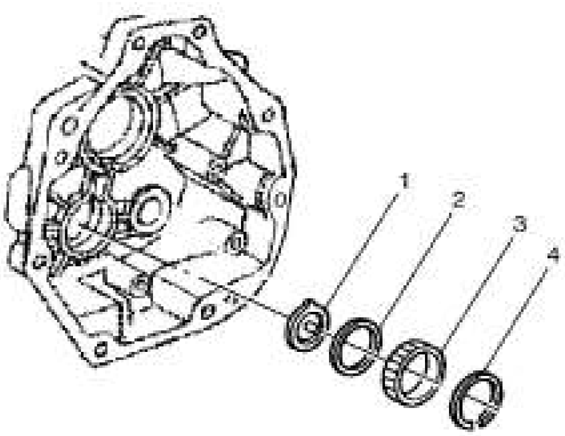
- J 26941 Bearing Race Remover
- J 23907 Slide Hammer



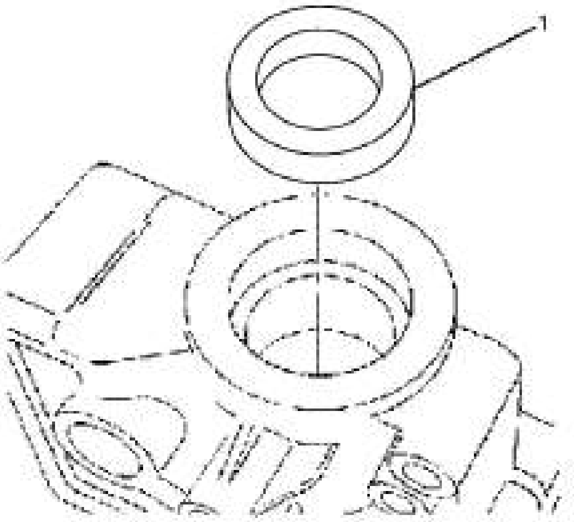
1. Remove the reverse idler shaft bracket bolts (1).
2. Remove the reverse idler shaft bracket (2).



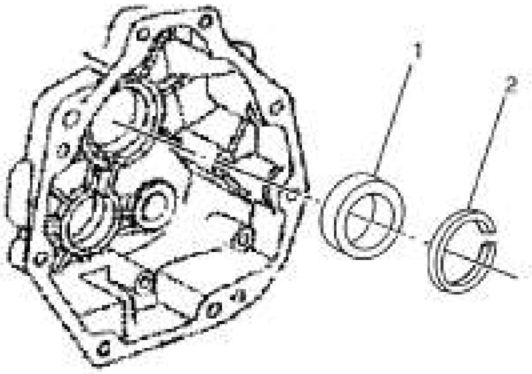
3. Remove the reverse idler gear thrust washer from the reverse idler shaft (1).
4. Remove the reverse idler gear (3) and roller bearing (2) from the reverse idler shaft.
5. Remove the reverse idler rear thrust washer from the reverse idler shaft.
6. Remove the reverse idler shaft from the extension housing.



7. Remove the countershaft bearing race (3) by rotating back and forth while pulling from the extension housing.
8. Remove the countershaft shim (2) from the extension housing.
9. Remove the countershaft oil funnel (1) from the extension housing.



10. Carefully pry the output shaft seal (1) from the extension housing using a suitable tool..

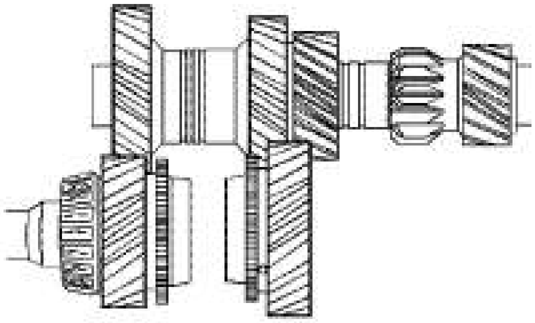


11. Remove the mainshaft bearing race to extension housing retainer ring (2).

    Important: Do not replace the bearing race unless inspection shows bearing race damage.

12. Remove the mainshaft bearing race (1) using J 26941 and J 23907 .

Gears Cleaning and Inspection



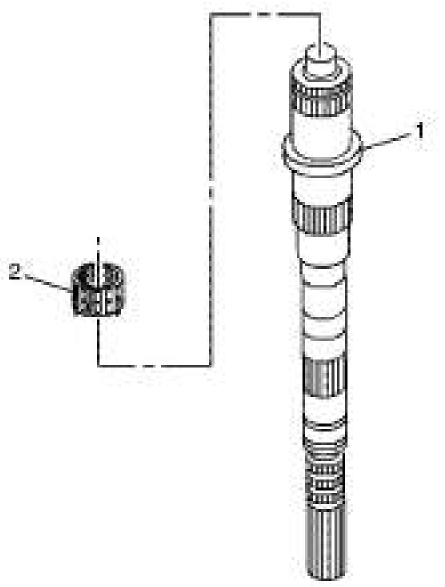
1. Clean all the parts in a suitable solvent. Air dry all the parts.
2. Inspect the gear tooth surfaces on all the gear sets for the following conditions:
   - Cracks
   - Pitting
   - Nicks
   - Chipped gear teeth
   - High spots (Small-shiny spots on the gear teeth mating surface) that could cause gear noise
3. Inspect for damaged splines on the input shaft, mainshaft, and the countershaft extension.
4. Remove nicks and burrs with a soft stone or a crocus cloth.
5. Replace any burred or nicked part that cannot be reconditioned by hand.
6. Replace gears and gear assemblies that are worn or damaged.

Main Shaft and Input Shaft Assemble

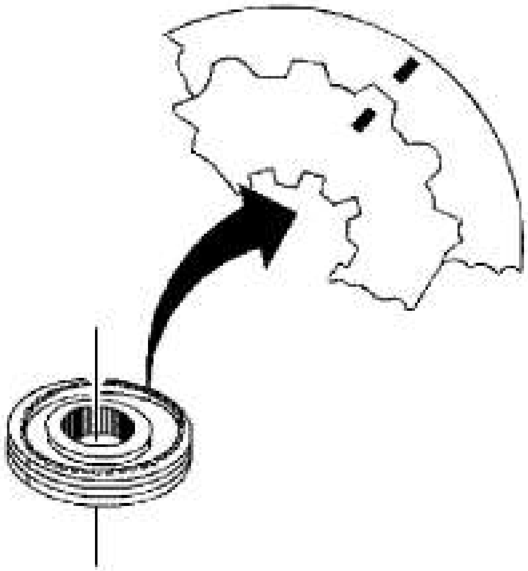
Mainshaft

Tools Required

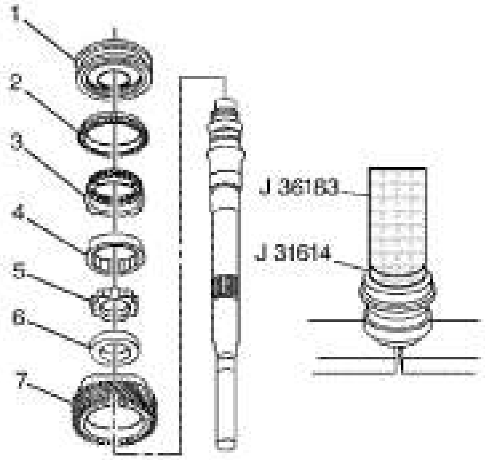
- J 36183 Press Tube.
- J 36184 Press Tube Adapter.
- J 39371 1st/2nd Synchronizer Installer.
- J 39473 Mainshaft Bearing Installer.



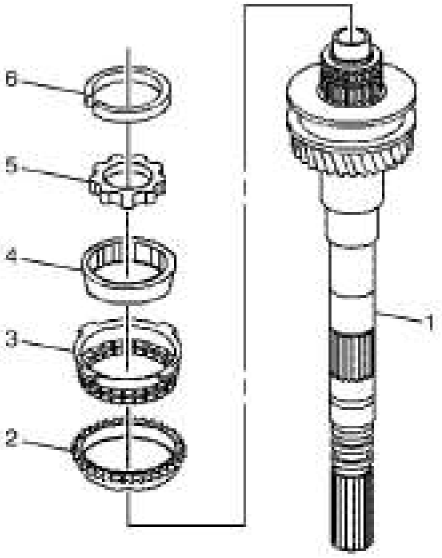
1. Install the 3rd speed gear caged needle bearing and the spacer (2).



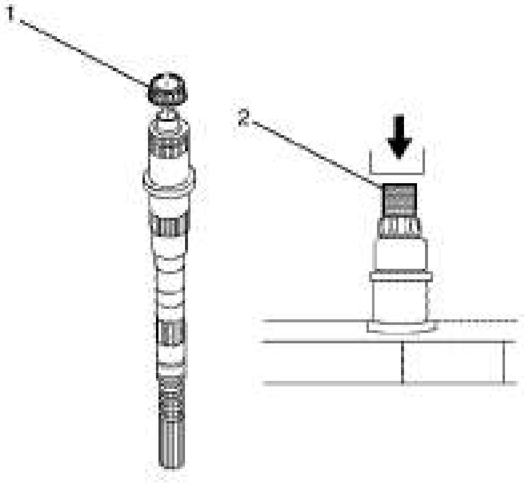
2. Check the 3rd/4th speed gear synchronizer assembly scribe marks for correct positions.



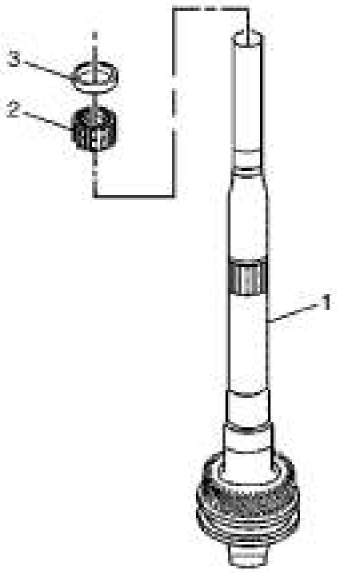
3. Install the 3rd speed gear (7) to the mainshaft.
4. Install the spacer (6) to the mainshaft.
5. Install the thrust washer (5) to the mainshaft.
6. Install the 3rd speed gear inner cone (4) to the mainshaft.
7. Install the 3rd speed gear friction cone (3) to the mainshaft.
8. Install the 3rd speed gear blocking ring (2) to the mainshaft.
9. Install the 3rd/4th speed gear synchronizer assembly (1) to the mainshaft (the groove on the sleeve faces the 3rd speed gear).
10. Start the press operation.
11. Stop pressing before the keys engage the blocking ring slots.
12. Lift and rotate the 3rd speed gear in order to engage the keys with the blocking ring.
13. Continue pressing until the synchronizer is seated.



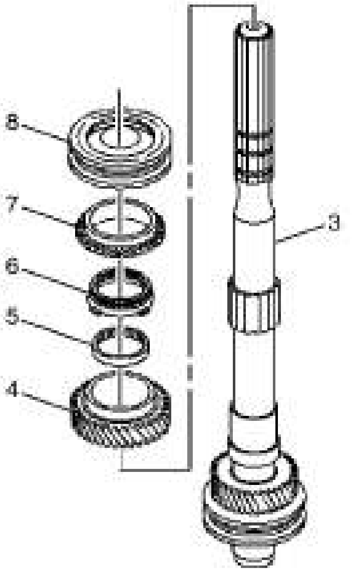
14. Install the 4th gear blocking ring (2) to the mainshaft (1).
15. Install the 4th gear friction cone (3) to the mainshaft (1).
16. Install the 4th gear inner cone (4) to the mainshaft (1).
17. Install the 4th gear thrust washer (5) to the mainshaft (1).
18. Install the 3rd/4th synchronizer circlip (6) to the mainshaft (1).



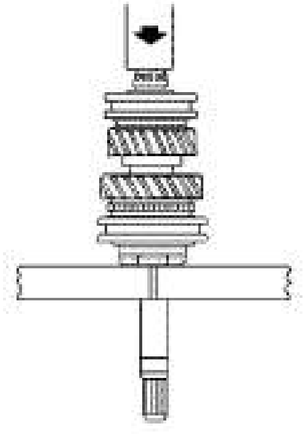
19. Install a NEW small tapered bearing (1) to the mainshaft, using the J 39473 (2), V-blocks, and a hydraulic press.



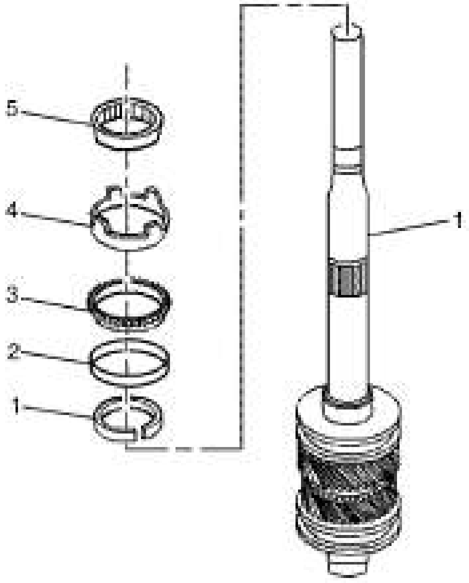
20. Install the 2nd speed gear caged needle bearing (2) to the mainshaft (1).
21. Install the 2nd speed gear spacer (3) to the mainshaft (1).



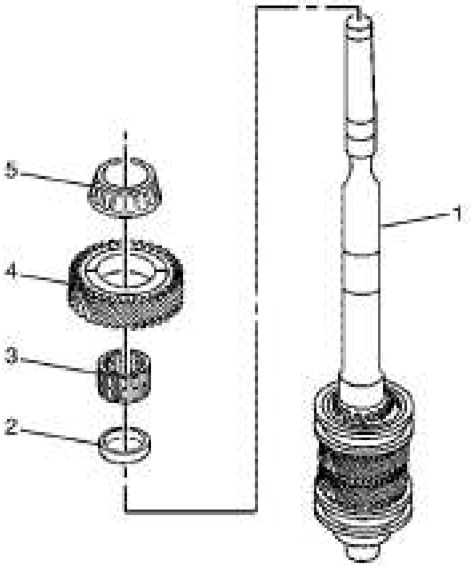
22. Install the 2nd speed gear (2) to the mainshaft (1).
23. Install the 2nd speed gear inner cone (3) to the mainshaft (1).
24. Install the 2nd speed gear friction cone (4) to the mainshaft (1).
25. Install the 2nd speed gear blocking ring (5) to the mainshaft (1).
26. Install the 1st/2nd synchronizer assembly (6) to the mainshaft (1) (The ID groove on the sleeve faces the 1st speed gear.)



27. Start the press operation.
28. Stop pressing before the keys engage the blocking ring slots.
29. Lift and rotate the 2nd speed gear in order to engage the keys with the blocking ring.
30. Continue pressing until the synchronizer is seated.



31. Install the 1st speed gear blocking ring (6) to the mainshaft (1).
32. Install the friction cone (5) to the mainshaft (1).
33. Install the inner cone (4) to the mainshaft (1).
34. Install the the split washers (3) to the mainshaft (1).
35. Install the the split washer retainer (2) to the mainshaft (1).

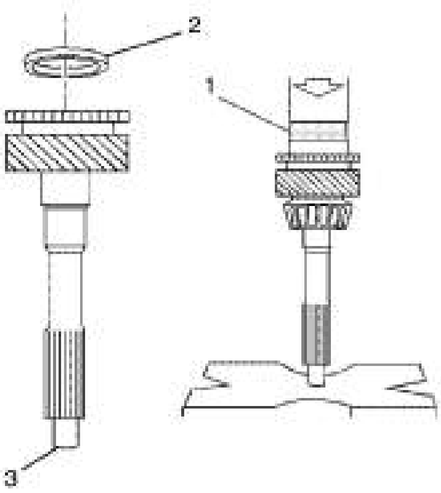


36. Install the 1st speed gear bearing spacer (2) to the mainshaft (1).
37. Install the 1st speed gear caged needle bearing (3) to the mainshaft (1).
38. Install the 1st speed gear (4) to the mainshaft (1).
39. Install the large tapered bearing (5) to the mainshaft (1).

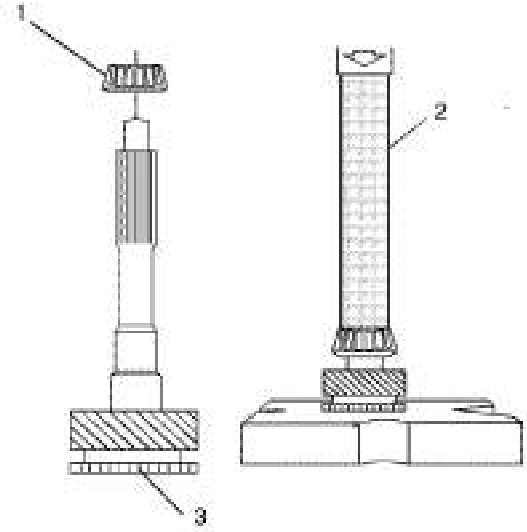
Input Shaft

Tools Required

- J 28537-17 Bearing Race Installer.
- J 25234 Press Tube.



1. Install a NEW bearing race (1) on the input shaft (3), using the J 28537-17 (2) and a hydraulic press.



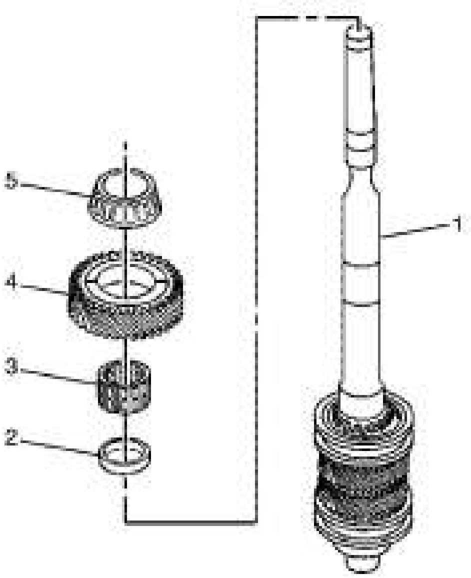
2. Install a NEW tapered bearing (1) on the input shaft (3). Use the J 25234 (2) and a hydraulic press.

Main Shaft and Input Shaft Disassemble

Mainshaft

Tools Required

- J 36513 Split Plate.
- J 39442 Press Adapter.
- J 39443 Split Plate.
- J 39473 Mainshaft Bearing Installer.



Important: Measure the 4th speed gear synchronizer wear gap before disassembling the mainshaft.

Important: Do not mix any of the sychromesh blocker rings or any sychromesh components.

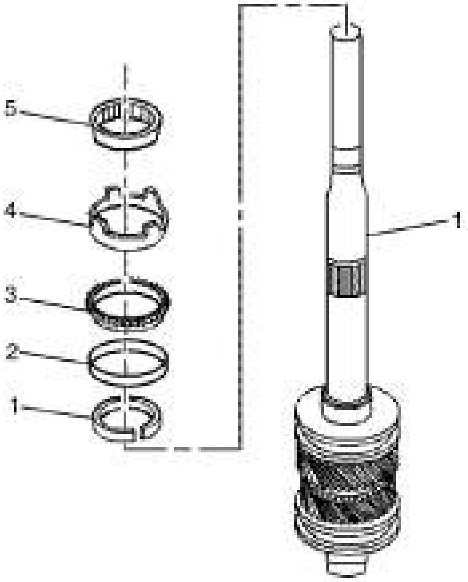
1. Install the input shaft in the adapter plate.
2. Install the mainshaft on the input shaft.
3. Using a feeler gauge measure the gap between the 4th speed gear blocking ring and the 4th speed gear.
4. Replace the 4th speed gear friction cone and blocking ring when the gap is less than 0.38 mm (0.010 in).

Notice: Refer to General Repair Instructions in the Preface section.

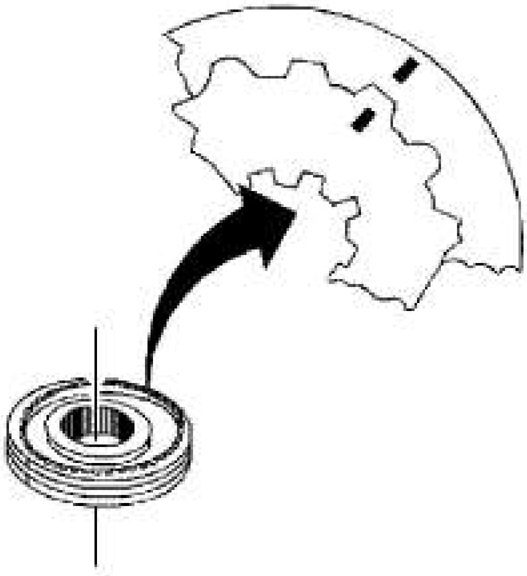
5. Using the J 36513 close the split plate only enough to support the gear teeth, and the J 39442 :

   Important: The O-ring is only used by the manufacturer to assist in assembly. It serves no other purpose and can be discarded after removal. This O-ring is not a serviceable item.

6. If an O-ring is present on the mainshaft, remove and discard the O-ring.
7. Remove the mainshaft tapered bearing (5) from the mainshaft (1) by sliding off.
8. Remove the 1st speed gear (4) from the mainshaft (1) by sliding off.
9. Remove the 1st speed gear caged needle bearing (3) from the mainshaft (1).
10. Remove the 1st speed gear bearing spacer (2) from the mainshaft (1).

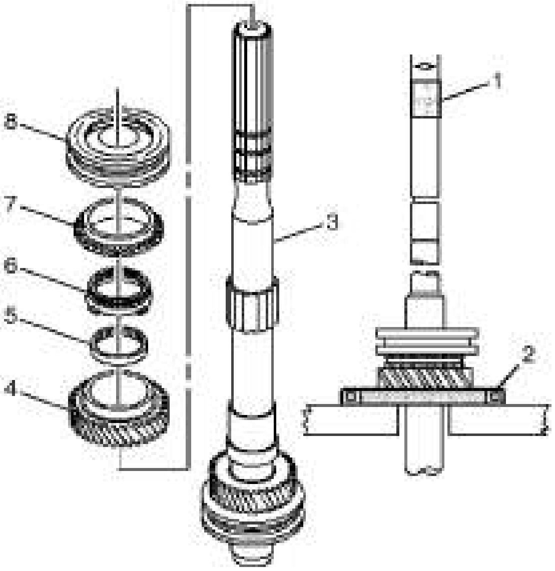


11. Remove the split washer retainer (2) from the mainshaft (1).
12. Remove the split washers (3) from the mainshaft (1).
13. Remove the 1st speed gear inner cone (4) from the mainshaft (1).
14. Remove the 1st speed gear friction cone (5) from the mainshaft (1).
15. Remove the 1st speed gear blocking ring (6) from the mainshaft (1).

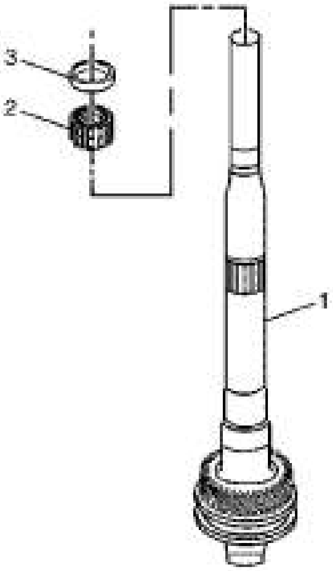


Important: The synchronizer hubs and sliding sleeves are a selected assembly. Keep these parts together as originally assembled.

16. Scribe a mark on the synchronizer hub and on the sleeve. This will help you to reinstall the parts in the same position.

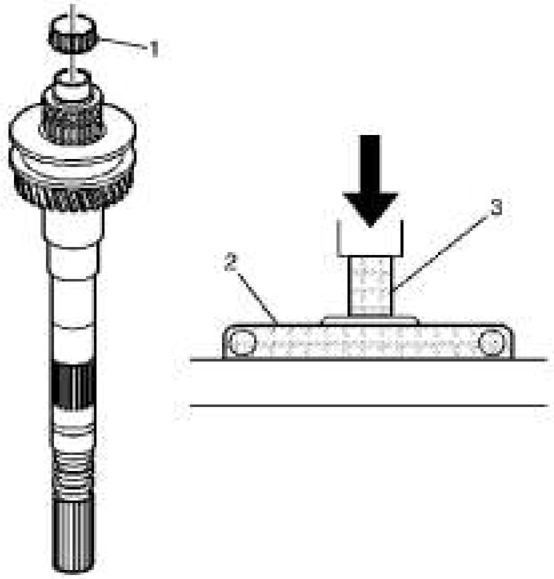


17. Remove the 2nd speed gear (4). The 1st/2nd speed synchronizer assembly (8), the 2nd speed gear blocking ring (7), the 2nd speed gear friction cone (6), and the 2nd speed gear inner cone (5) will press off with the 2nd speed gear (4). Use the J 36513 (2) in an inverted position, J 39442 (1) and a hydraulic press.



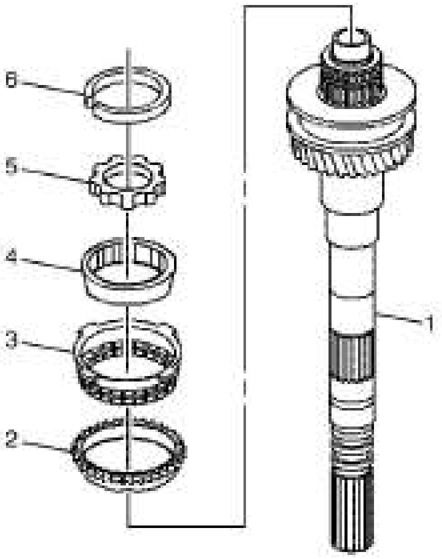
18. Remove the 2nd speed gear spacer (3) from the mainshaft (1).

19. Remove the caged needle bearing (2) from the mainshaft (1).

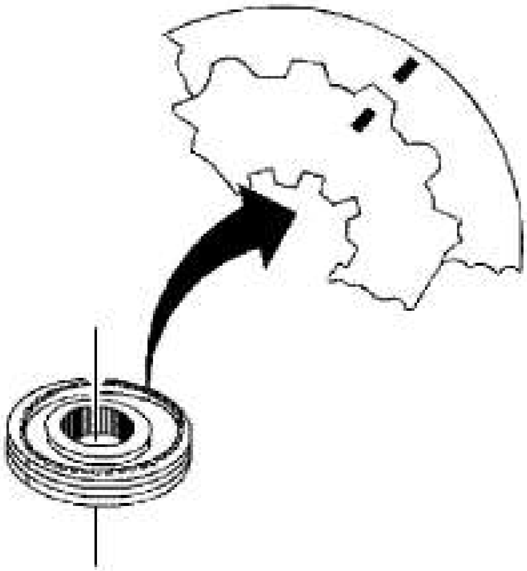


20. Remove the mainshaft small tapered bearing (1). Use the J 39442 (3), the J 39443 (2), and a hydraulic press.

    Discard the small tapered bearing.

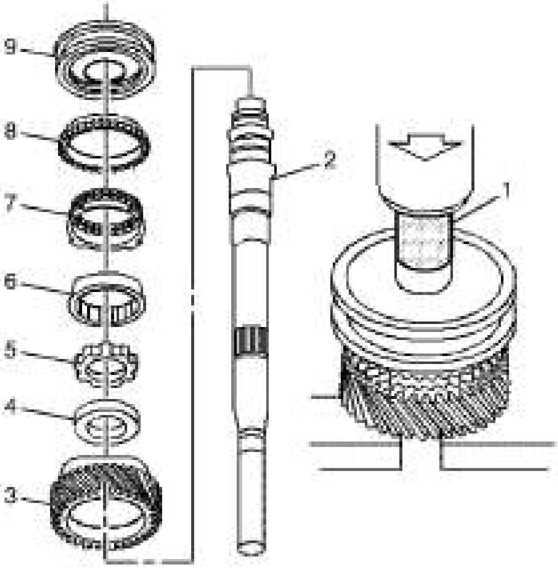


21. Remove the circlip (6) from the mainshaft (1).
22. Remove the 4th gear thrust washer (5) from the mainshaft (1).
23. Remove the 4th gear inner cone (4) from the mainshaft (1).
24. Remove the 4th gear friction cone (3) from the mainshaft (1).
25. Remove the 4th gear blocking ring (2) from the mainshaft (1).

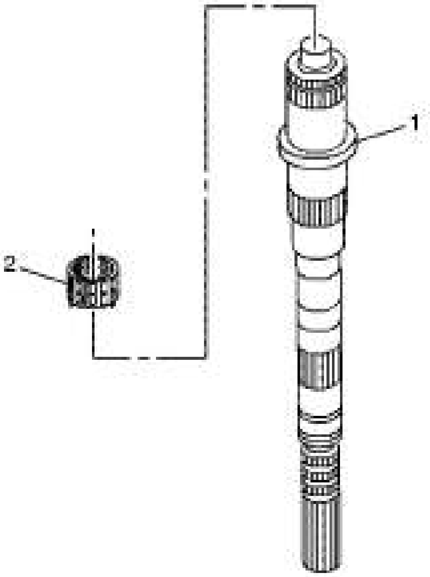


Important: The synchronizer hubs and sliding sleeves are a selected assembly. Keep these parts together as originally assembled.

26. Scribe a mark on the synchronizer hub and on the sleeve. This will help you to reinstall the parts in the same position.



27. Use the J 39473 (1), V-blocks, and a hydraulic press to remove the 3rd speed gear (3). The 3rd/4th speed synchronizer assembly (9), the 3rd speed gear blocking ring (8), the 3rd speed gear friction cone (7), the 3rd speed gear inner cone (6), thrust washer (5), and spacer (4) will press off with the 3rd speed gear (3).



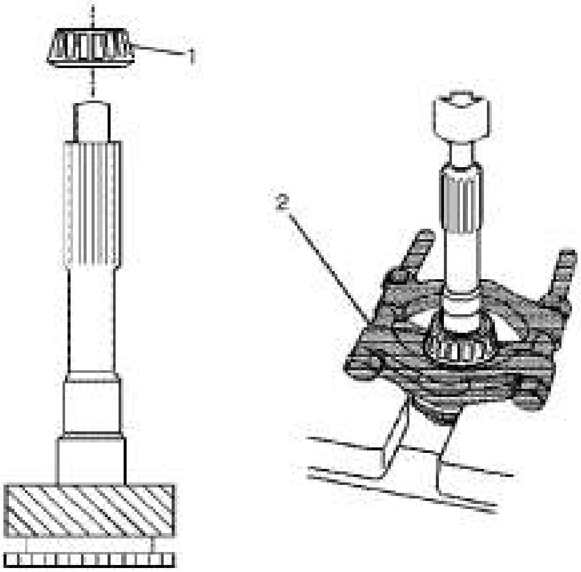
28. Remove the 3rd speed gear caged needle bearing (2) from the mainshaft (1).

Input Shaft

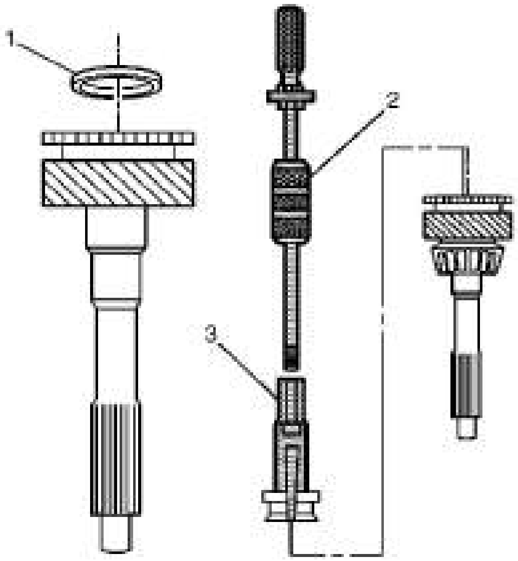
Tools Required

- J-22912-01 Split Plate.
- J 23907 Slide Hammer.
- J 39594 Bearing Race Remover.

Important: Do not replace the tapered bearing or the bearing race unless inspection shows that the bearing or the race are damaged.



1. Remove the tapered bearing (1) using the J-22912-01 (2) and a hydraulic press.



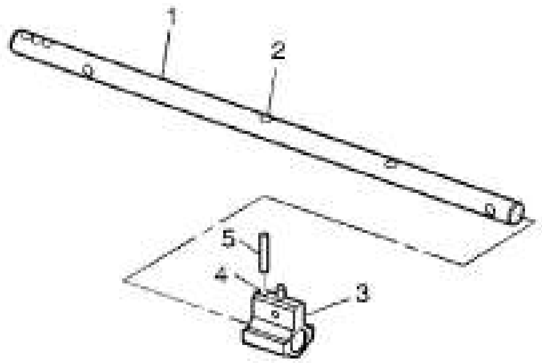
2. Remove the bearing race (1) using the J 23907 (2) and the J 39594 (3).

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1992887**

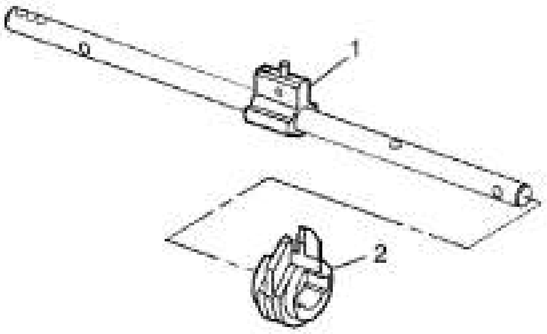
Shift Shaft and Fork Assemblies Assemble

Tools Required

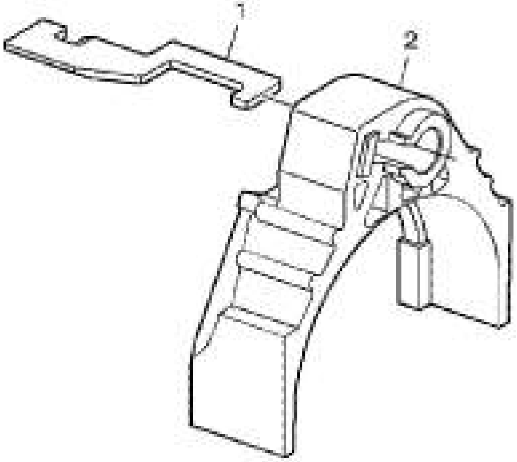
J 36850 Transjel® Assembly Lubricant.



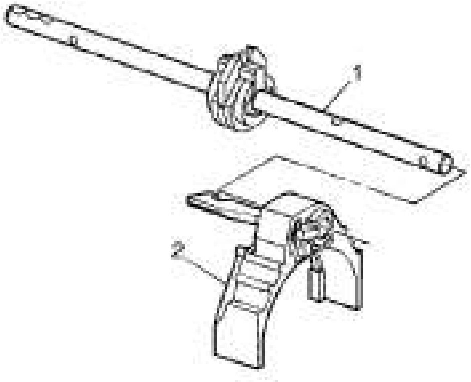
1. Install the selector pin (3) on the shift shaft (1).
2. Align the roll pin hole on the selector pin (4) with the roll pin hole on the shift shaft (2).
3. Install the roll pin (5) through the selector pin (3) and the shift shaft (1).



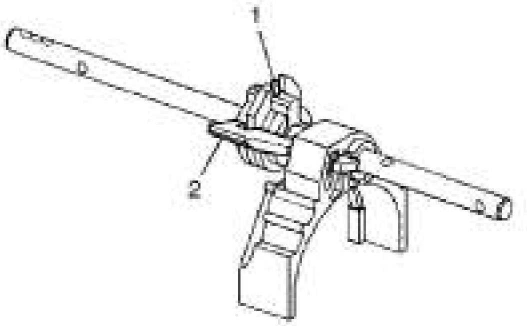
4. Install the interlocking plate (2) on the selector pin (1).



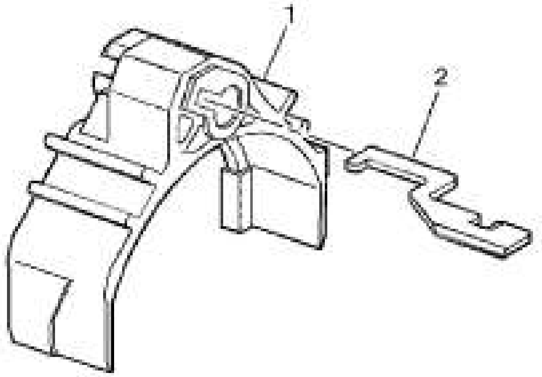
5. Install the shift link (1) in the 3rd/4th shift fork (2).



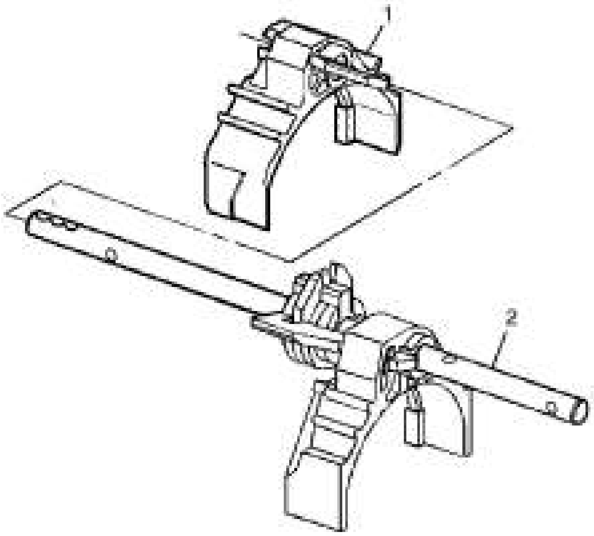
6. Install the 3rd/4th shift fork (2) on the shift shaft (1).



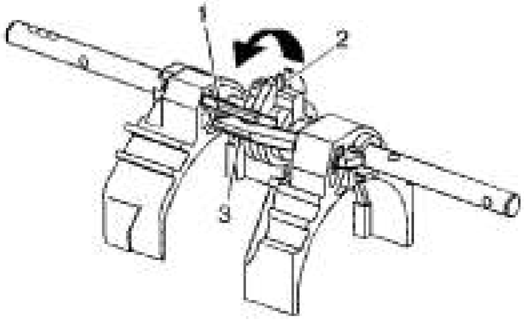
7. Align the notch on the shift link (2) with the selector roll pin (1).



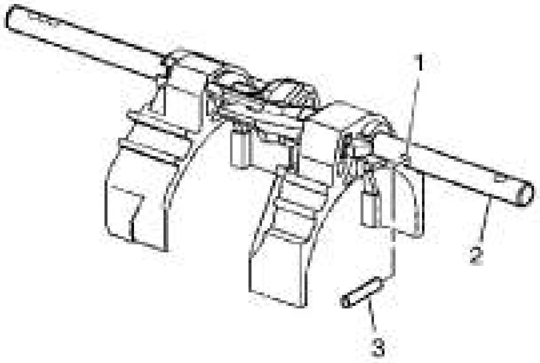
8. Install the shift link (2) with the 1st/2nd shift fork (1).



9. Install the 1st/2nd shift fork (1) on the shift shaft (2).



10. Install the 1st/2nd shift shaft link (1) on top of the 3rd/4th shift shaft link (3) on the interlocking plate and the selector roll pin assembly (2).



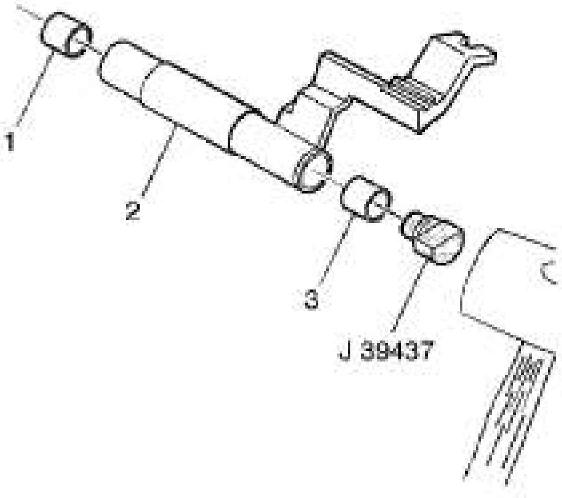
Important: The neutral return cam pin fits loosely in the shift shaft. Use the J 36850 to hold the neutral return cam pin in place.

11. Install the neutral return cam pin (3) in the neutral return can pin hole (1) on the shift shaft (2).

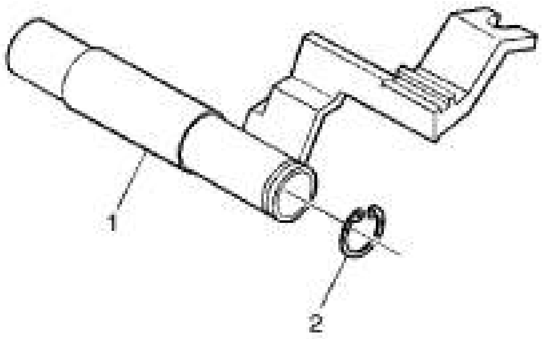
5th / 6th, Reverse Shift Rail Assembly

Tools Required

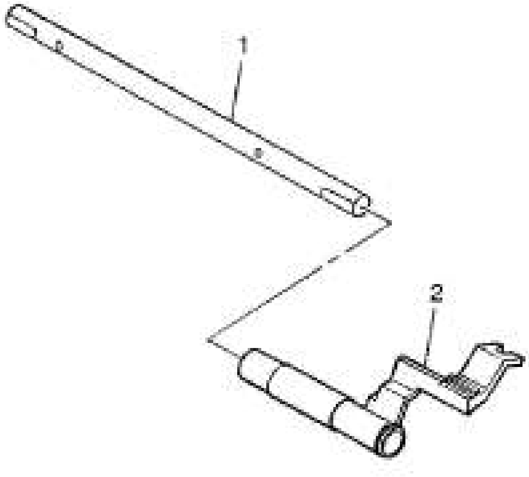
J 39437 Bushing Installer



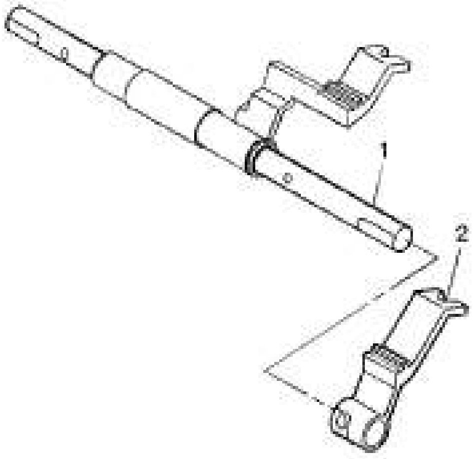
1. Install the 5th/6th shift shaft lever bushings (1) and (3) in the 5th/6th shift lever (2) using the J 39437 (4) and a hammer.



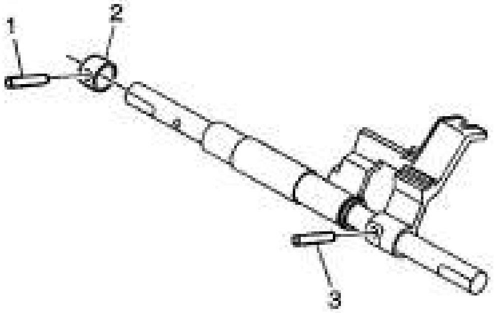
2. Install the retainer ring (1) on the 5th/6th shift lever (2).



3. Install the 5th/6th shift lever (2) on the shift shaft (1).

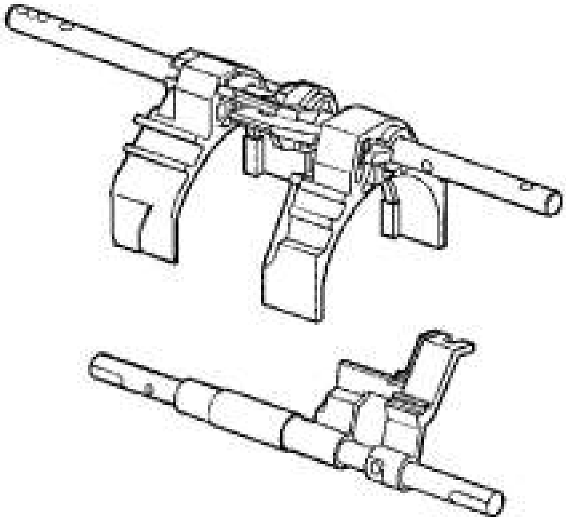


4. Install the reverse shift lever (2) on the shift shaft (1).

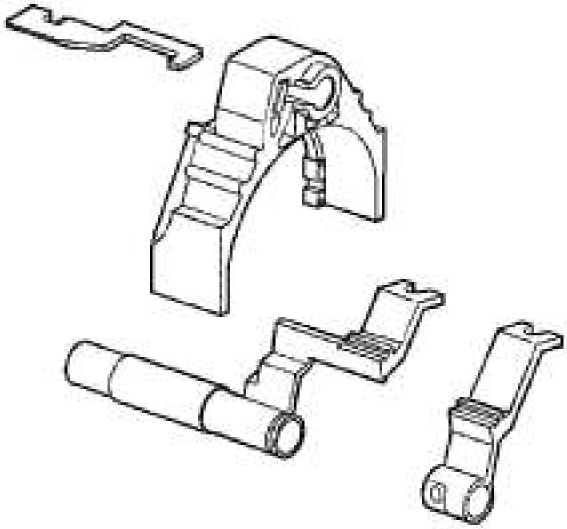


5. Install the reverse lever roll pin (3).
6. Install the reverse collar (2).
7. Install the reverse collar roll pin (1).

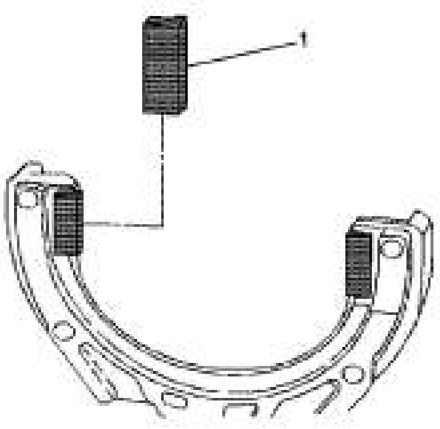
Shift Shaft and Fork Assemblies Cleaning and Inspection



1. Clean the shift shaft and fork assembly parts with a suitable solvent. Air dry all the parts.

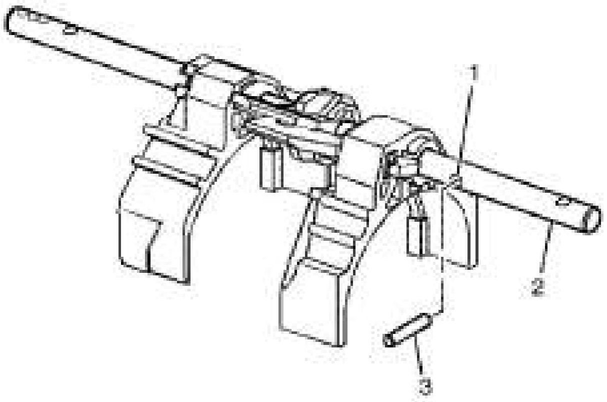


2. Inspect the shift forks and the shift links for excessive wear, fractures or distortion.
3. Inspect the shift shaft lever bushings for excessive wear.

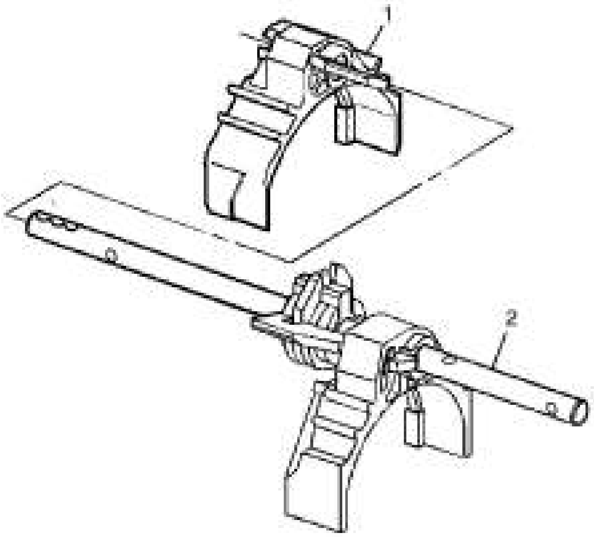


4. Inspect the shift fork nylon inserts (1) for wear.
5. Replace parts that are fractured, excessively worn, or distorted.
6. Replace an excessively worn or burred shift shaft.

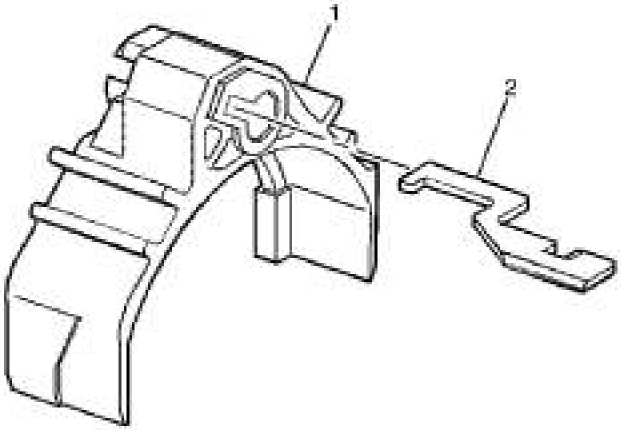
Shift Shaft and Fork Assemblies Disassemble



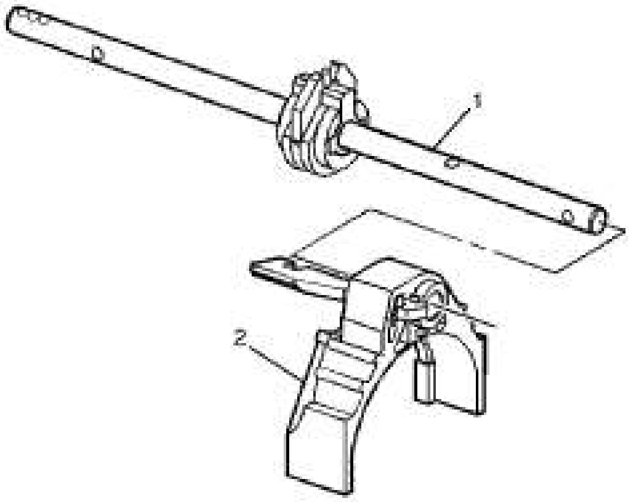
1. Remove the neutral return cam pin (3) from the shift shaft (2).



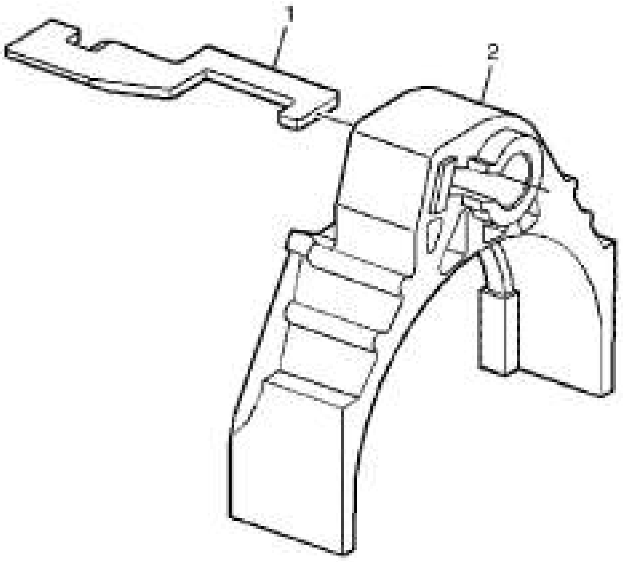
2. Remove the 1st/2nd shift fork (1) from the shift shaft (2).



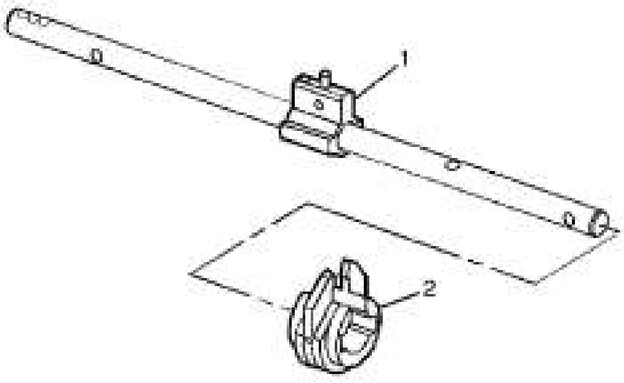
3. Remove the shift link (2) from the 1st/2nd shift fork (1).



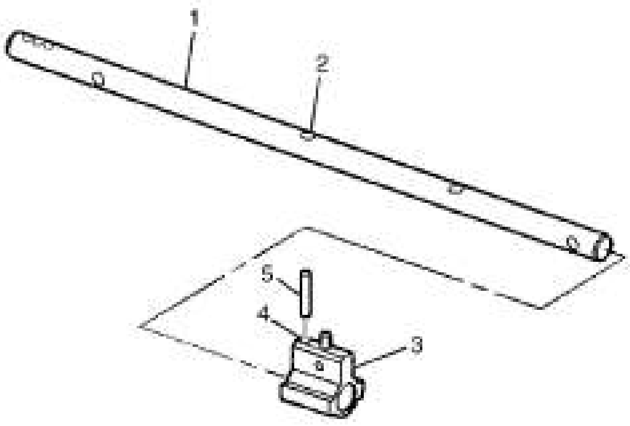
4. Remove the 3rd/4th shift fork (2) from the shift shaft (1).



5. Remove the shift link (1) from the 3rd/4th shift fork (2).



6. Remove the interlocking plate (2) from the selector pin (1).

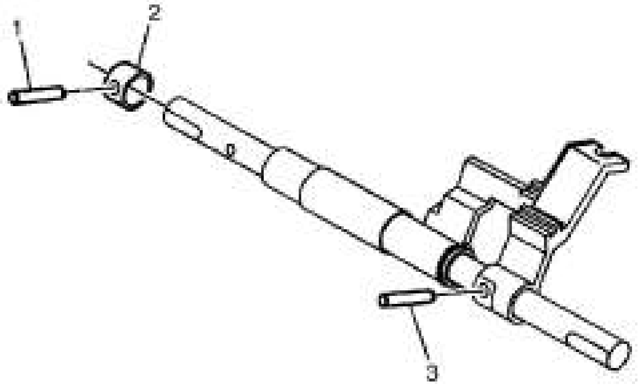


7. Remove the selector roll pin (5).
8. Remove the selector pin (3) from the shift shaft (1).

5th / 6th, Reverse Shift Rail Assembly

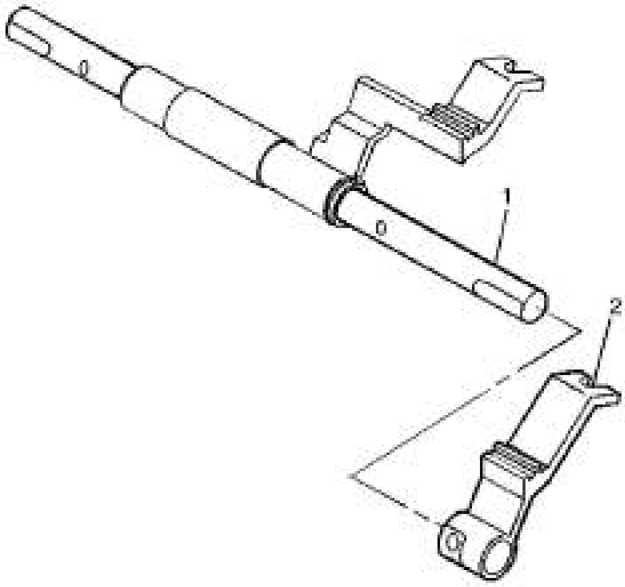
Tools Required

- J 23907 Slide Hammer.
- J 39439-2 Bushing Remover.

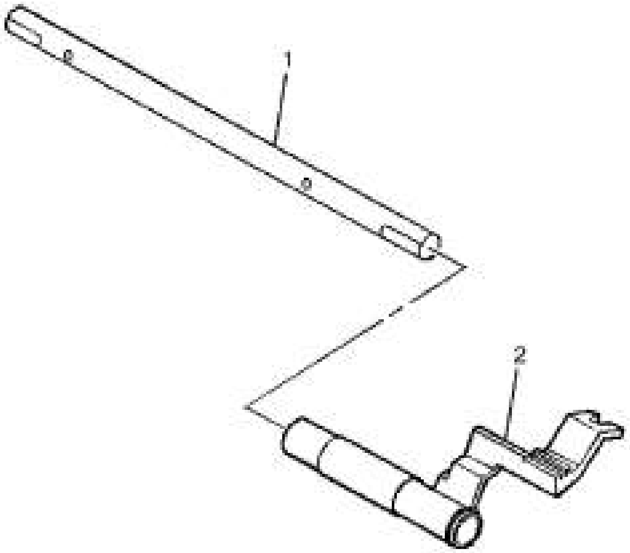


1. Remove the reverse collar roll pin (1).

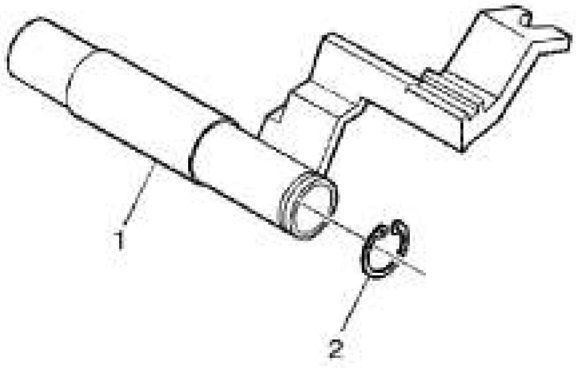
2. Remove the reverse collar (2).
3. Remove the reverse shift lever roll pin (3).



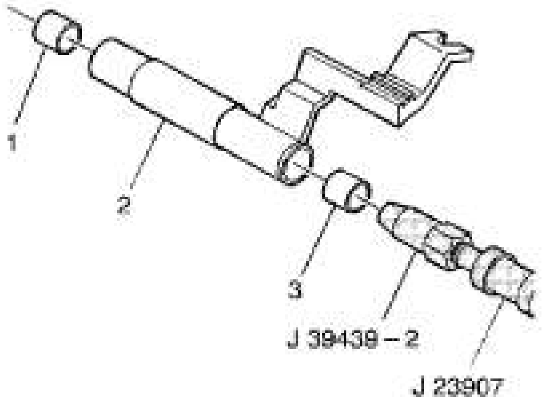
4. Remove the reverse shift lever (2) from the shift shaft (1).



5. Remove the 5th/6th shift lever (2) from the shift rail (1).



6. Remove the snap ring (1) from the 5th/6th shift lever (2).



Important: Do not replace the bushings unless inspection shows bushing damage.

7. Remove the 5th/6th shift shaft lever bushings (1) and (3) from the 5th/6th shift lever (2) using the J 23907 and the J 39439-2 .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1977504**

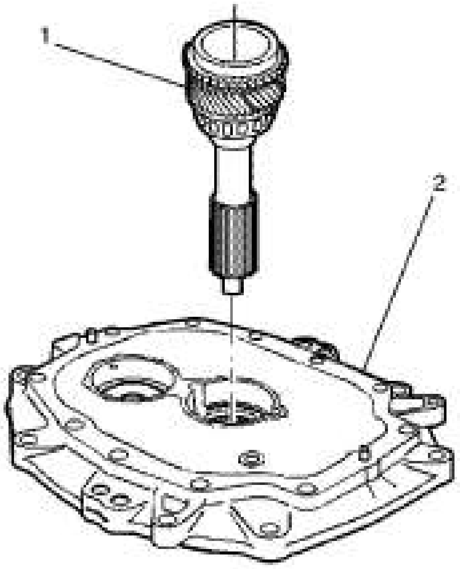
Shimming Procedures

Input Shaft, Mainshaft, and Countershaft

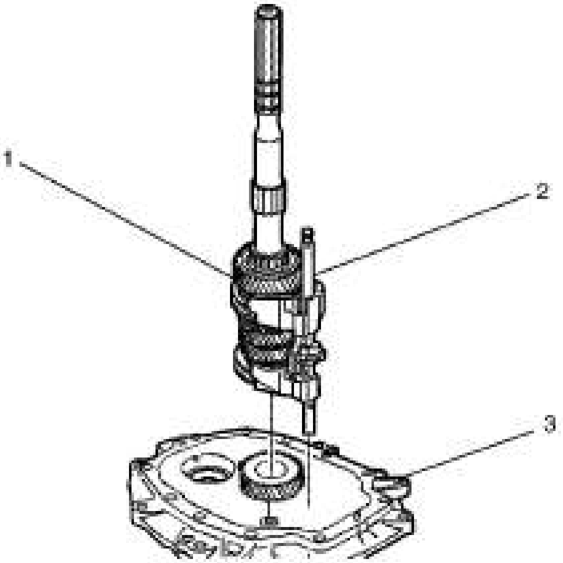
Tools Required

- J 8001 Dial Indicator Set
- J 39444-1 Countershaft End Play Rod

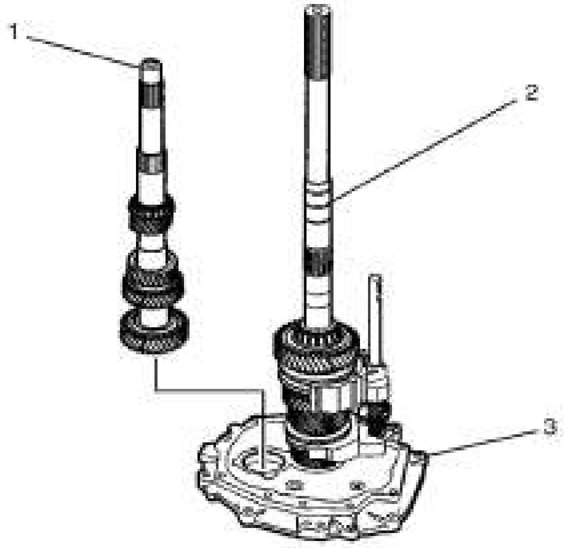
1. Lubricate all components as assembly progresses, using J 36850 .



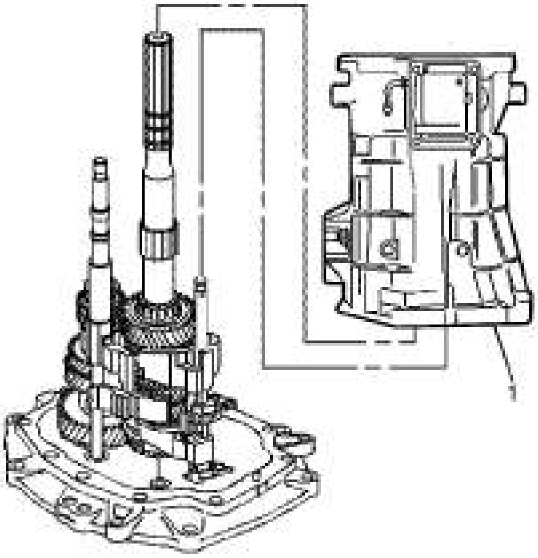
2. Install the input shaft (1) in the adapter plate (2).



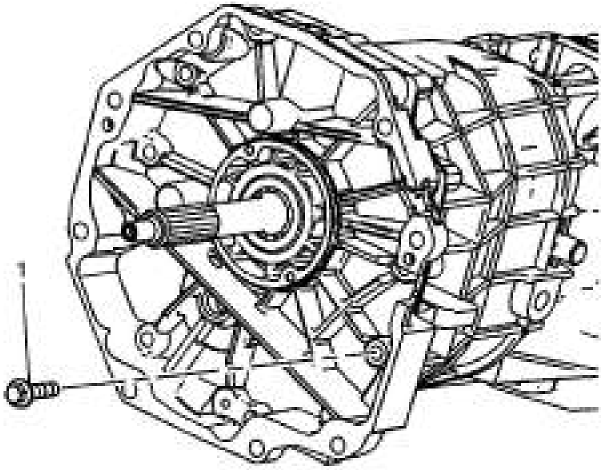
3. Assemble the shift shaft (2) to the mainshaft (1).
4. Install the neutral return roll pin (3) to the shift shaft (2).
5. Install the mainshaft (1) and the shift shaft (2) assembly into the adapter plate (3).



6. Install the countershaft assembly (1) to the adapter plate (3) using the following sequence:
   6.1. Lift up the mainshaft assembly (2) enough in order to install the countershaft assembly (1).
   6.2. Install the countershaft assembly (1).
   6.3. Lift the mainshaft assembly (2) enough in order to rotate the input shaft to engage the synchronizer keys with 4th gear blocking ring.

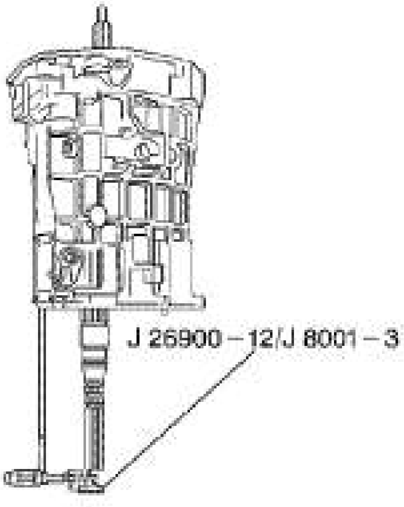


7. Install the transmission case (1).



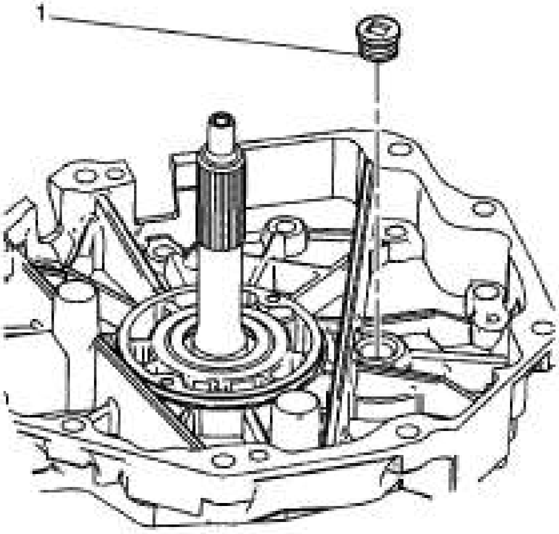
8. Install the adapter plate to transmission case bolts (1).

Tighten
Tighten the bolts to 48 N·m (36 lb ft).

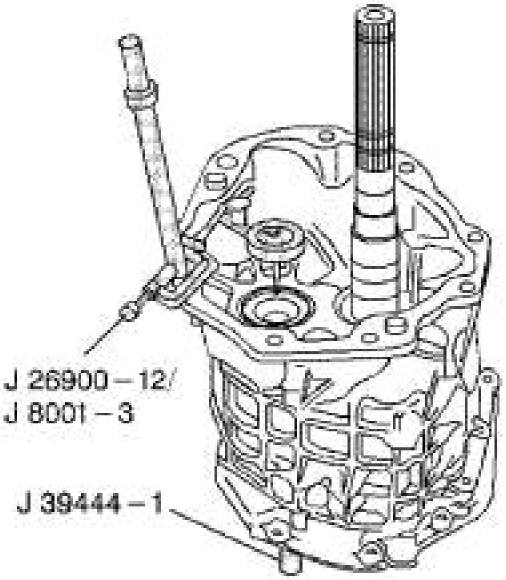


9. Measure the input shaft/mainshaft end play using the following procedure:
   - 9.1. Place the tip of the J 8001 on the end of the mainshaft.
   - 9.2. Move the input shaft up and down.
   - 9.3. Record the measurement.
10. Select a shim to achieve 0.00-0.05 mm (0.000-0.002 in) preload.

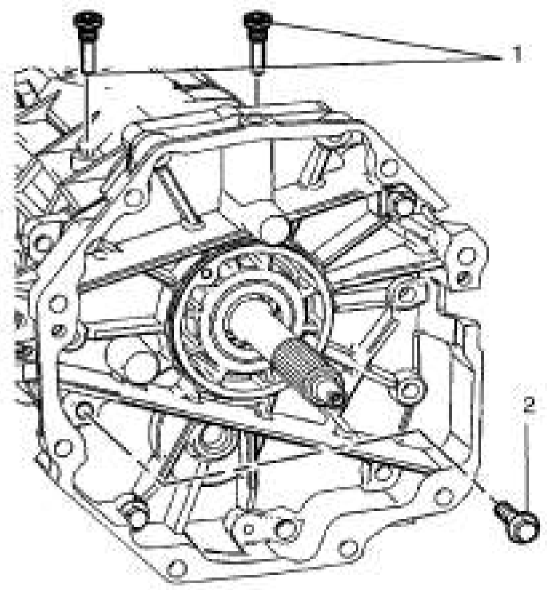
11. Remove the J 8001 .



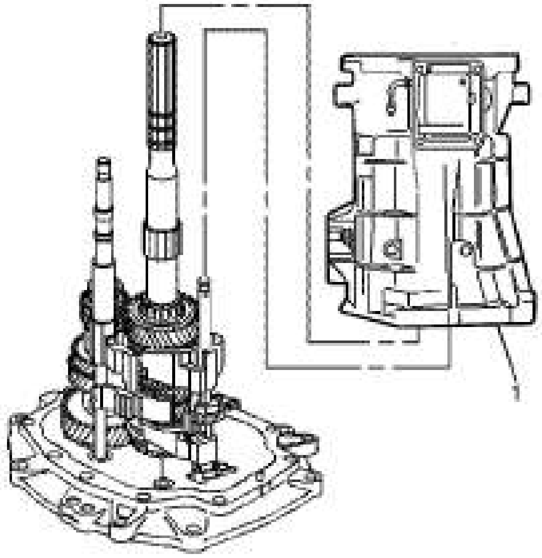
12. Remove the adapter plate plug (1).



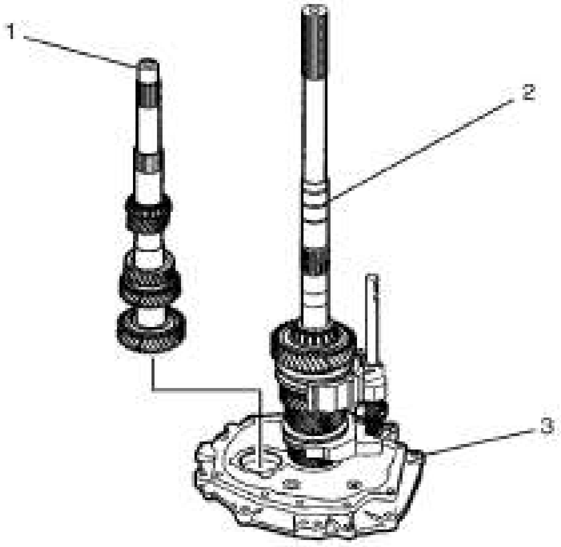
13. Place the tip of the J 8001 on the end of the countershaft.
14. Measure the countershaft end play using the following procedure:
    - 14.1. Install the J 39444-1 through the adapter plate plug hole. Screw the J 39444-1 into the countershaft.
    - 14.2. Move the countershaft up and down with the countershaft end play rod J 39444-1 .
    - 14.3. Record the measurement.
15. Select a shim to achieve 0.00-0.05 mm (0.000-0.002 in) preload.
16. Remove the J 8001 .
17. Remove the J 39444-1 .



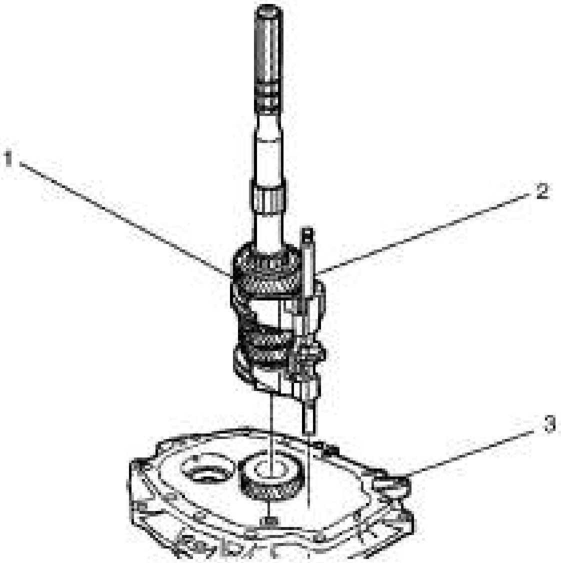
18. Remove the adapter plate to transmission case bolts (2).
19. Remove the shift lever guide bolts (1).



20. Remove the transmission case (1).



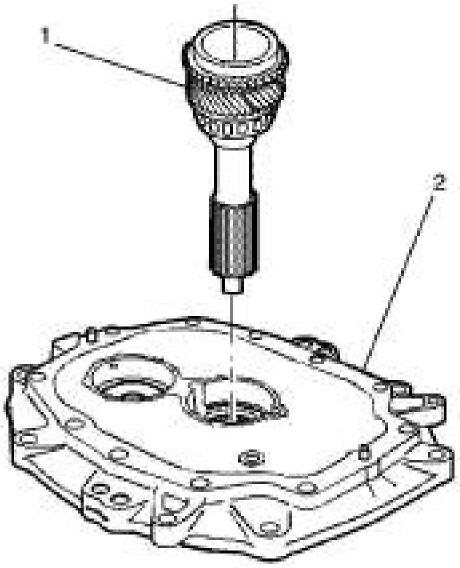
21. Remove the countershaft (1) from the adapter plate (3). Lift up the mainshaft (2) enough in order to remove the countershaft (1).



22. Remove the mainshaft and the shift shaft components as an assembly (1) from the adapter plate.

Important: When removing the shift shaft be careful not to lose the dowel pin.

23. Remove the shift shaft assembly from the mainshaft.



24. Remove the input shaft (1) from the adapter plate (2).

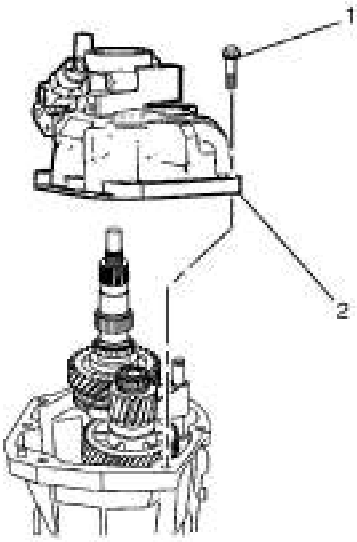
Countershaft

Tools Required

- J 8001 Dial Indicator Set
- J 39444-2 Countershaft End Play Rod

Important: The following procedure cannot be performed accurately until the countershaft shimming procedure has been completed.

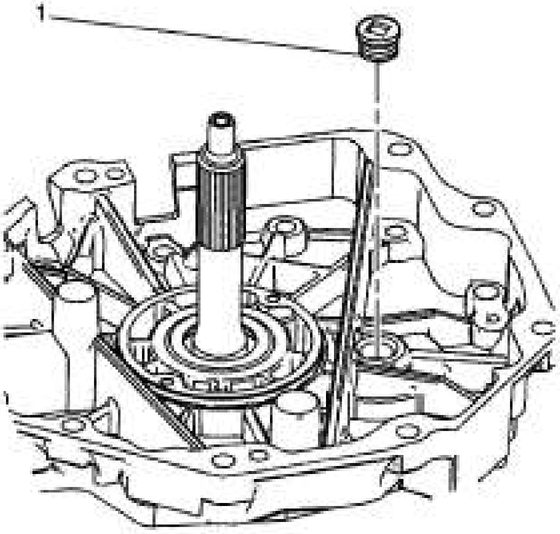
1. Rotate the transmission in the horizontal position.



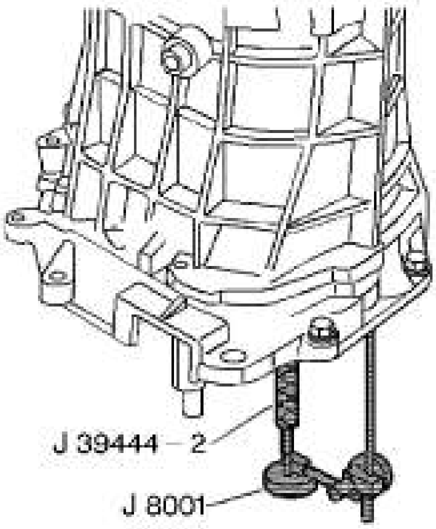
Important: Align the 5th/6th shift shaft to the extension housing bore in order to install the extension housing.

2. Install the extension housing (2).
3. Install the extension housing bolts (1).

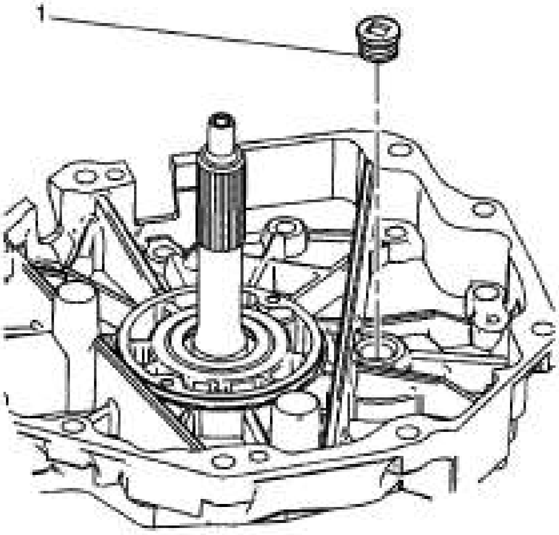
Tighten
Tighten the bolts to 48 N·m (36 lb ft).



4. Remove the adapter plate plug (1).



5. Measure the countershaft end play using the following procedure:
    5.1. Install a J 8001 so the tip is on the end of the countershaft end play rod.
    5.2. Rotate the transmission in the vertical position.
    5.3. Move the countershaft up and down using the J 39444-2 .
    5.4. Record the measurement.
6. Select a shim to achieve 0.05-0.13 mm (0.002-0.005 in) axial play.
7. Remove the J 8001 .
8. Remove the J 39444-2 .



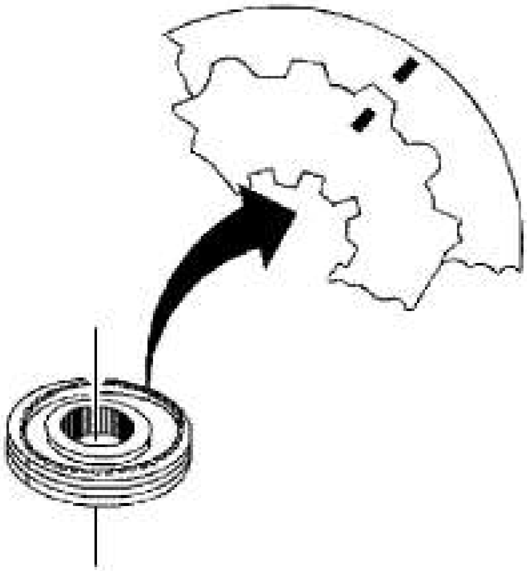
9. Install the adapter plate plug (1).

Tighten
Tighten the plug to 27 N·m (20 lb ft).

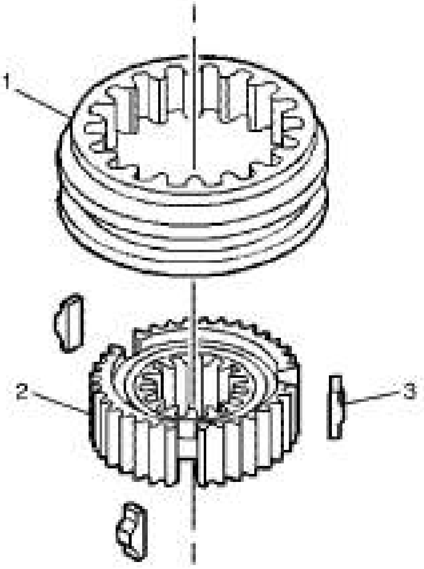
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | Document ID: 1996420

Synchronizers Assemble

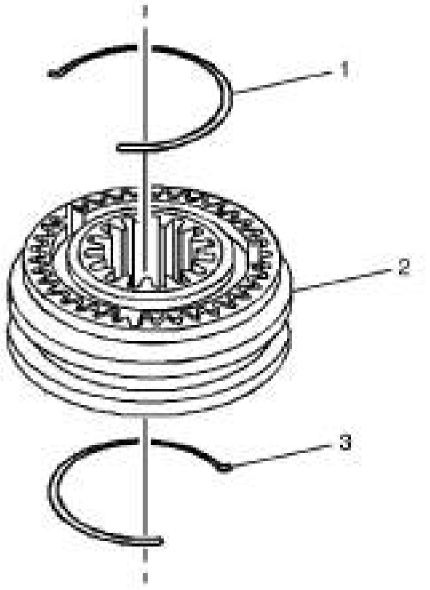
1st / 2nd Synchronizer



1. Check the synchronizer assembly scribe marks for correct positions.

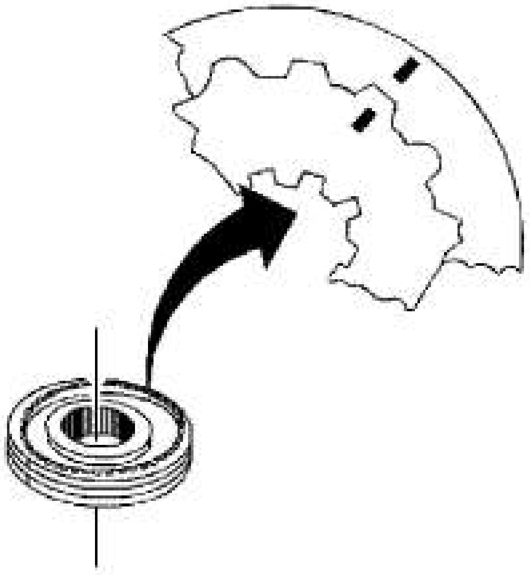


2. Install the synchronizer sleeve (1) to the hub (2) (align the key openings in the hub (2) with the cuts in the synchronizer sleeve (1)).
3. Install the keys (3) with the slots facing the hub (2).

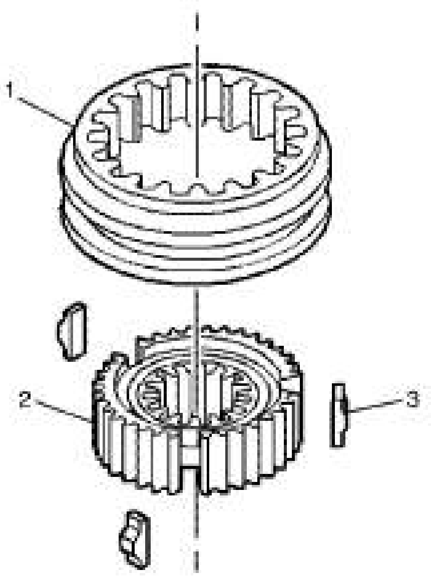


4. Assemble the first spring (1) (assemble the spring tang to one of the key slots in the synchronizer assembly (2)).
5. Assemble the second spring (3) (assemble the spring tang on the same key but in the opposite direction).

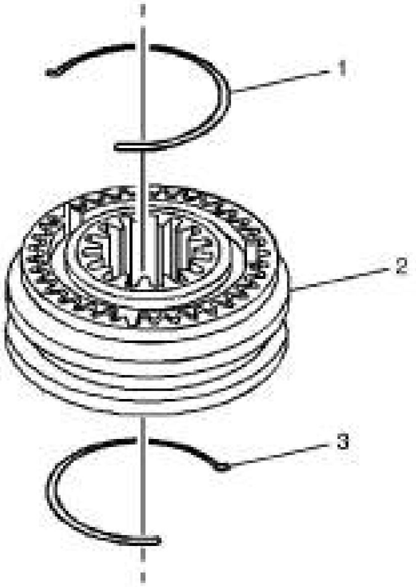
3rd / 4th, 5th / 6th Synchronizers



1. Check the synchronizer assembly scribe marks for correct positions.

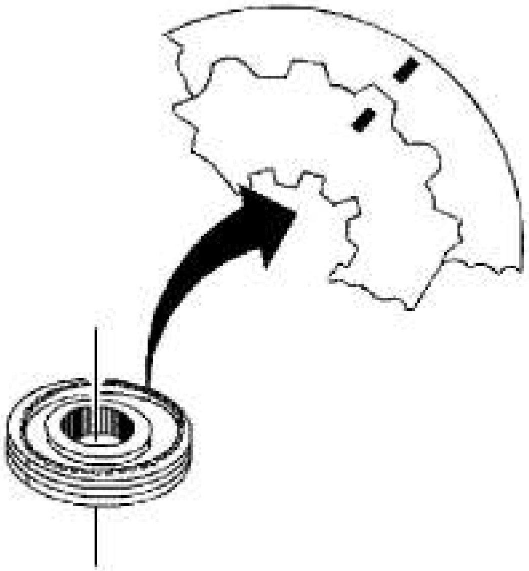


2. Install the synchronizer sleeve (1) to the hub (2) (align the key (3) openings in the hub (2) with the cuts in the synchronizer sleeve (1)).
3. Install the keys (3) with the slots facing the hub (2).

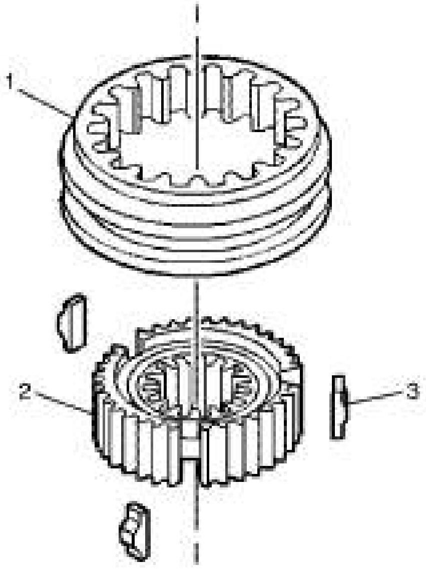


4. Assemble the first spring (1) (assemble the spring tang to one of the key slots in the synchronizer assembly (2)).
5. Assemble the second spring (3) (assemble the spring tang on the same key but in the opposite direction).

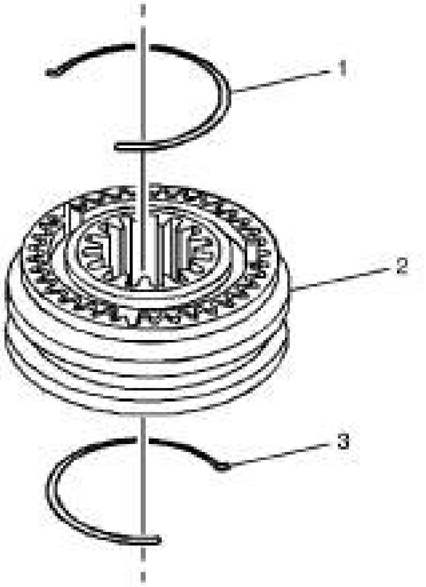
Reverse Synchronizer



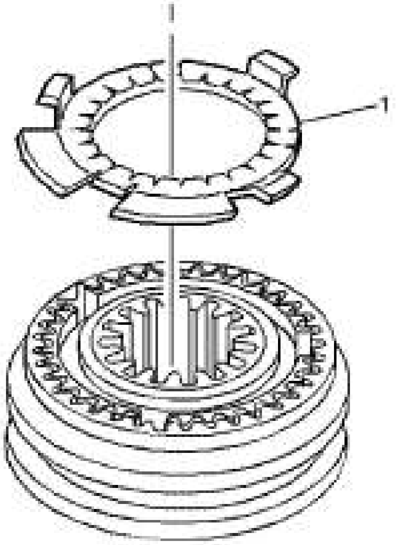
1. Check the synchronizer assembly scribe marks for correct positions.



2. Install the synchronizer sleeve (1) to the hub (2) (align the key (3) openings in the hub (2) with the cuts in the synchronizer sleeve (1)).
3. Install the keys (3) with the slots facing the hub (2).



4. Assemble the first spring (1) (assemble the spring tang to one of the key slots in the synchronizer assembly (2)).
5. Assemble the second spring (3) (assemble the spring tang on the same key but in the opposite direction).



6. Install a new synchronizer key retainer (1) with the key retainer tangs over the synchronizer keys.

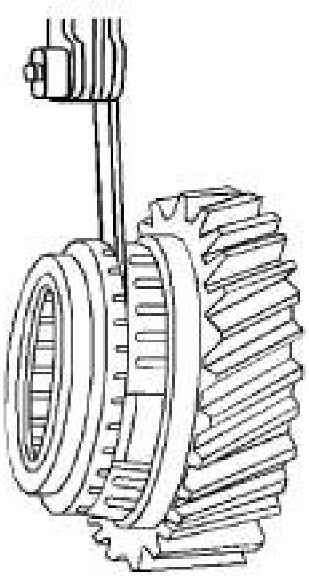
2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1982144**

Synchronizers Cleaning and Inspection

1. Clean all the synchronizer parts in a suitable solvent. Air dry all the synchronizer parts.
2. Inspect the synchronizer parts for the following conditions:
   - Burrs
   - Cracks
   - Chamfer for excessive wear
   - Free movement of the clutching sleeves on their hubs
   - Worn or damaged clutch teeth
   - Distorted springs

   Important: Replace a burred or nicked part that cannot be reconditioned by hand.

3. Replace synchronizer parts that are worn or damaged.



4. Measure the gap between the vertical faces of the blocking ring teeth and the speed gear as follows:
   4.1. Assemble the correct blocking ring with the correct speed gear.
   4.2. The blocking ring must be fully seated on the gear.
   4.3. Use a feeler gauge to measure the forward gear gap.
   4.4. Use a feeler gauge to measure the reverse gear gap.

   Measure the gap without the wave washer in between the blocking ring and the reverse gear.

   The nominal gap is 1.27-2.16 mm (0.050-0.085 in) for the 1st and 2nd gear.

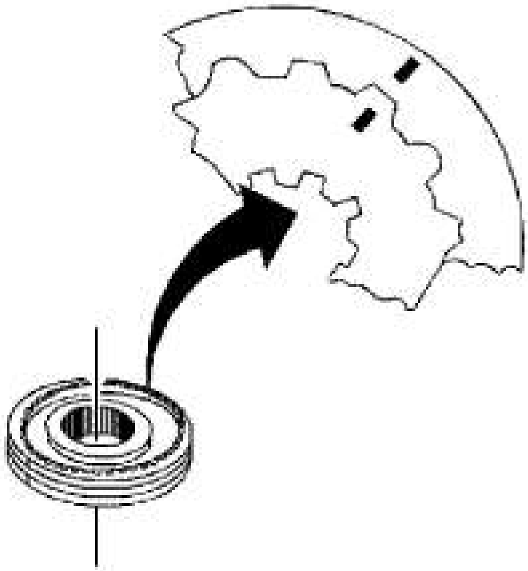
   The nominal gap is 1.27-2.03 mm (0.050-0.080 in) for the 3rd, 4th, 5th and 6th gear.

Replace the friction cones and blocker rings when the gap is significantly less than specified.

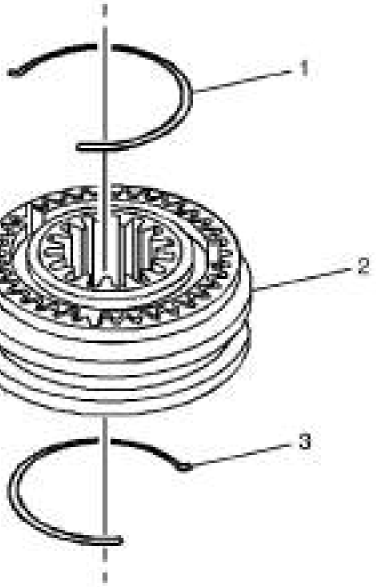
Synchronizers Disassemble

Caution: Refer to Safety Glasses Caution in the Preface section.

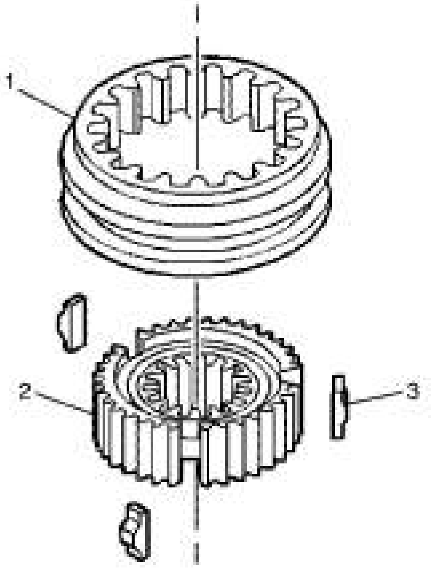
Important: Synchronizer components are not interchangeable. Keep all the synchronizer components separate. The synchronizer hubs and the sliding sleeves are a selected assembly. Keep the hubs and the sliding sleeves together as originally assembled.



1. Scribe a mark on the synchronizer hub and on the sleeve. This will help you to reinstall the parts in the same position.



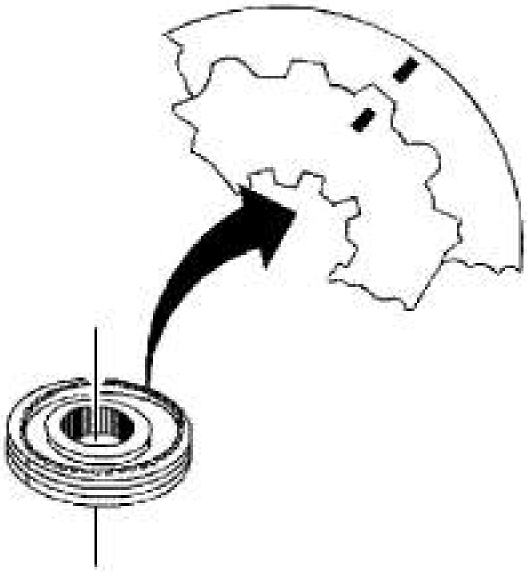
2. Remove the synchronizer retaining springs (1 and 3) from the synchronizer assembly (2) using a suitable tool.



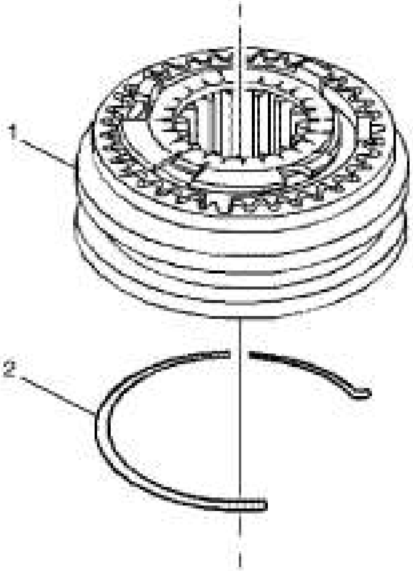
3. Remove the synchronizer sleeve (1) and the keys (3) from the hub (2) by pressing against the inner hub (2).

Reverse Synchronizer

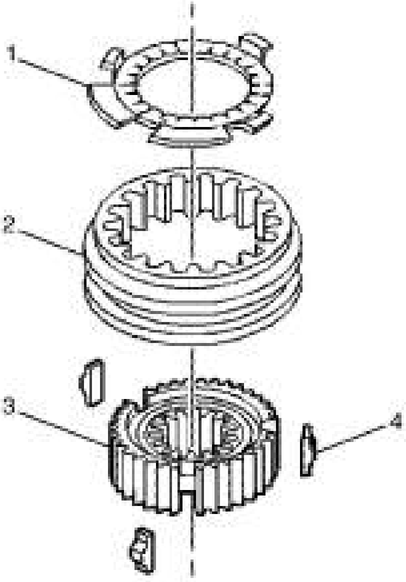
Caution: Refer to Safety Glasses Caution in the Preface section.



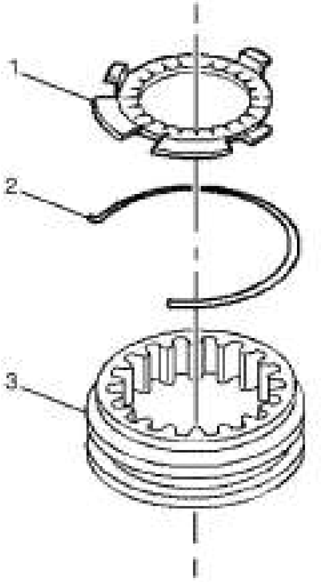
1. Scribe a mark on the synchronizer hub and on the sleeve. This will help you to reinstall the parts in the same position.



2. Remove the synchronizer retaining spring (2) from the synchronizer assembly (1) using a suitable tool.



3. Remove the synchronizer key retainer (1)
4. Remove the synchronizer sleeve (2) from the hub (3) by pressing against the inner hub (3).
5. Turn the hub (3) over. The keys (4) will slide out from the hub (3).



6. Remove the synchronizer key retainer (1) from the synchronizer sleeve (3).

   Discard the synchronizer key retainer.

7. Remove the synchronizer retaining spring (2) from the synchronizer sleeve (3).

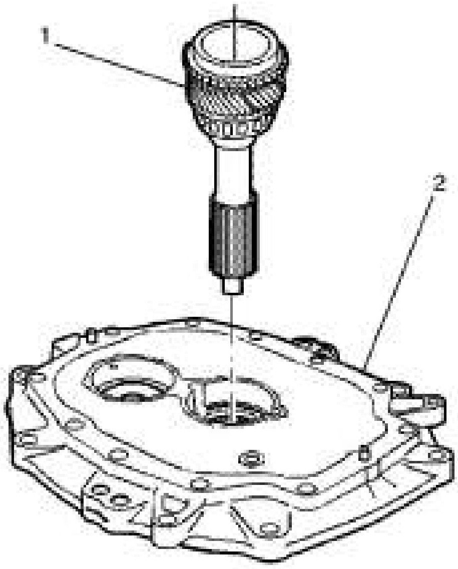
Transmission Assemble

Shift Shaft Assemblies and Gear Clusters Installation

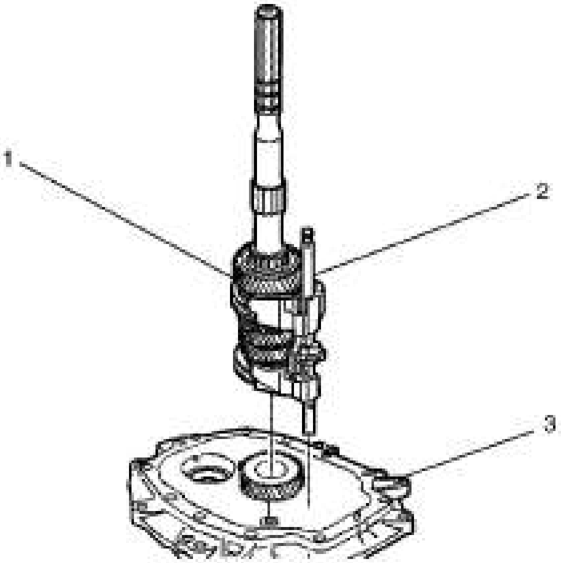
Tools Required

J 36850 Transjel® Assembly Lubricant.

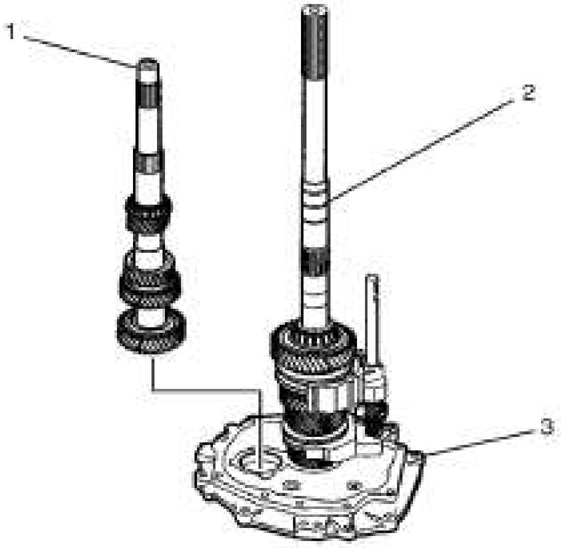
1. Lubricate all components as assembly progresses, using J 36850 .



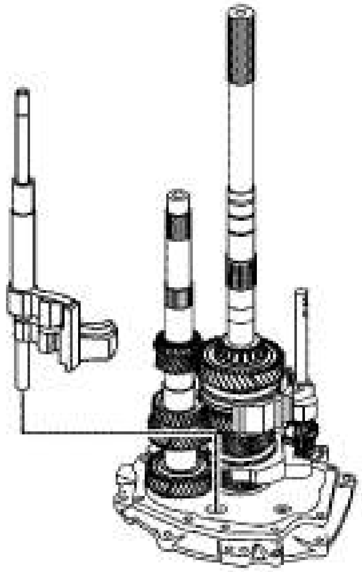
2. Install the input shaft (1) in the adapter plate (2).



3. Assemble the shift shaft (2) to the mainshaft (1).
4. Install the neutral return roll pin to the shift shaft (2).
5. Install the mainshaft (1) and the shift shaft (2) assembly into the adapter plate (3).



6. Install the countershaft assembly (1) to the adapter plate (3) using the following sequence:
    6.1. Lift up the mainshaft assembly (2) enough in order to install the countershaft assembly (1).
    6.2. Install the countershaft assembly (1).
    6.3. Lift the mainshaft assembly (2) enough in order to rotate the input shaft to engage the synchronizer keys with 4th gear blocking ring.

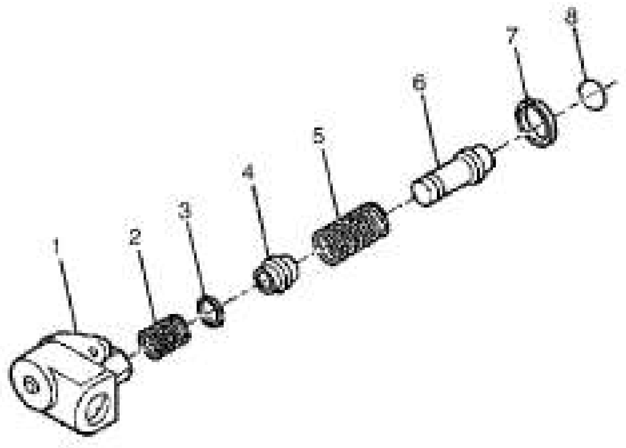


7. Install the 5th/6th and the reverse shift shaft (1).

   Align the slots of the shift shaft levers (2) with the interlock plate (3).

Reverse Lockout Assembly Assemble

Caution: Refer to General Repair Instructions in the Preface section.

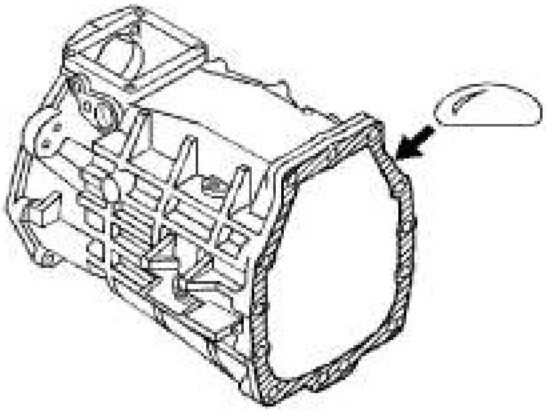


1. Install the reverse lockout outer spring (5) to reverse lockout plunger (6).
2. Install the reverse lockout collar (4) to reverse lockout plunger (6).
3. Compress the reverse lockout plunger and the collar (4) in a vise and install the retainer ring (3).
4. Install the reverse lockout inner spring (2 to reverse lockout body (1)).
5. Install the reverse lockout plunger assembly in the reverse lockout body (1).
6. Install the circlip (7) to reverse lockoutbody (1).
7. Install the O-ring (8) to reverse lockout body (1).

Transmission Case Installation

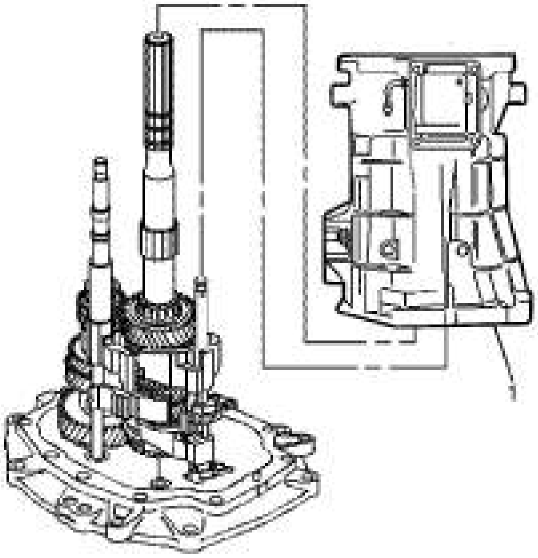
Tools Required

J 36850 .

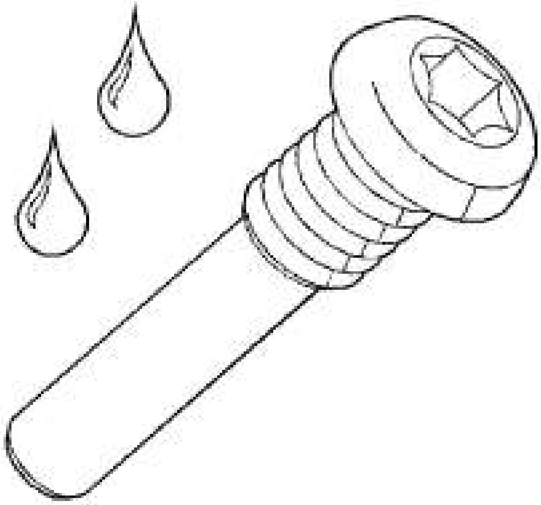


Important: Lubricate all components as the assembly progresses. Use J 36850 or the equivalent.

1. Apply LOCTITE™ "Ultrablack" 598 sealant or equivalent to the transmission case to adapter plate mating surface (1).

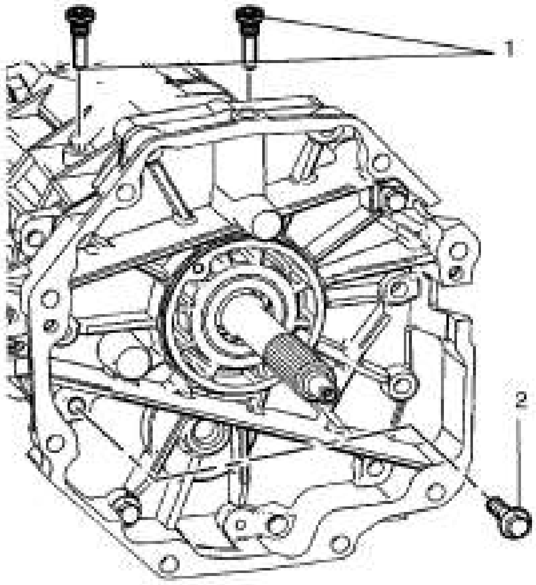


2. Do the following in order to install the transmission case and the offset lever:
    2.1. Shift the transmission into NEUTRAL in order to keep the 3rd/4th shift shaft from engaging.
    2.2. Install the offset lever.
    2.3. Slide the transmission case onto the gear clusters and the shift rail components.



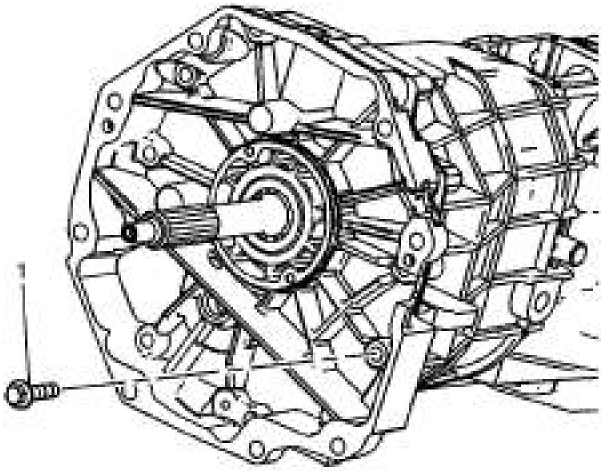
3. Apply thread sealer, LOCTITE™ 242 or equivalent to the threads of the shift lever guide bolts (1).

   Notice: Refer to Fastener Notice in the Preface section.



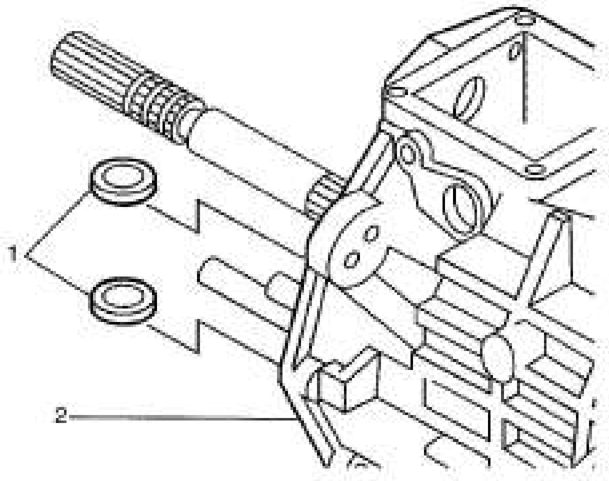
4. Install the shift lever guide bolts (1) and pull up on 5th/6th and reverse shift rail assembly. This will help align the slot of the shift interlock plate with the guide bolt hole.

   Tighten
   Tighten the bolts to 27 N·m (20 lb ft).

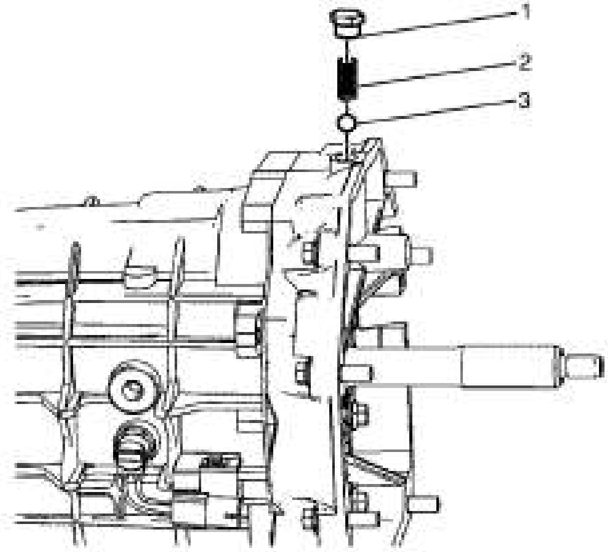


5. Install the adapter plate to transmission case bolts (1).

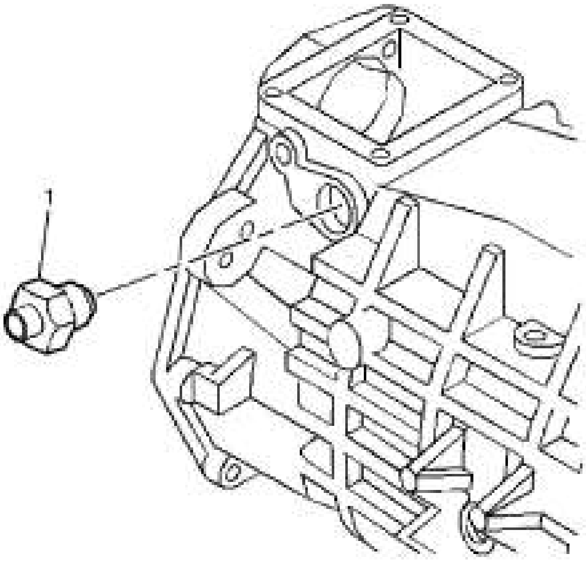
   Tighten
   Tighten the bolts to 48 N·m (36 lb ft).



6. Install the magnets (1) into the transmission case (2).



7. Install the shift detent plug (1), spring (2) and ball (3).



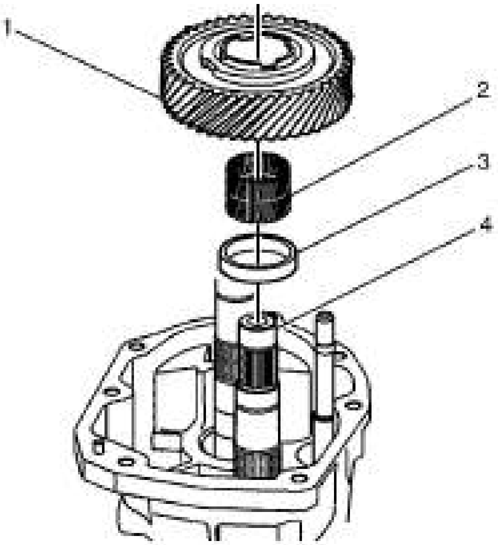
8. Install the shift detent assembly (1).

   Tighten
   Tighten the detent assembly to 40 N·m (30 lb ft).

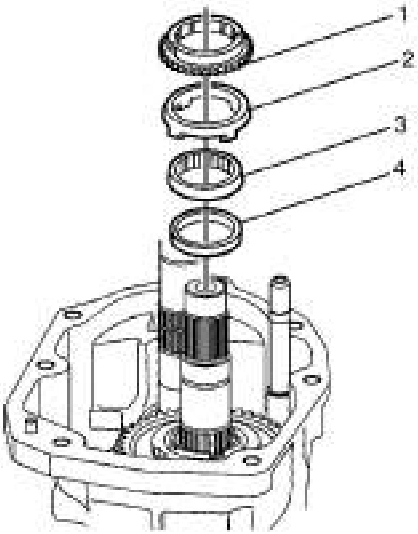
Countershaft Gear Installation

Tools Required

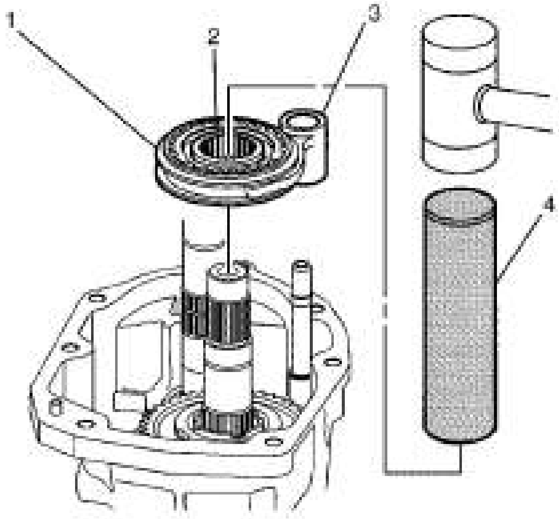
J 5590 Press Tube.



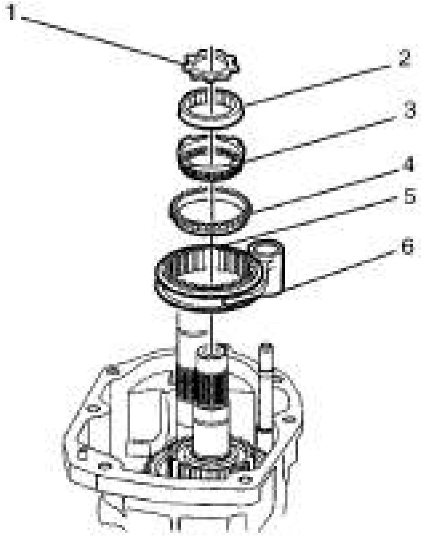
1. Install the spacer (3), caged needle bearing (2), and the 6th driven gear (1) to the countershaft (4).



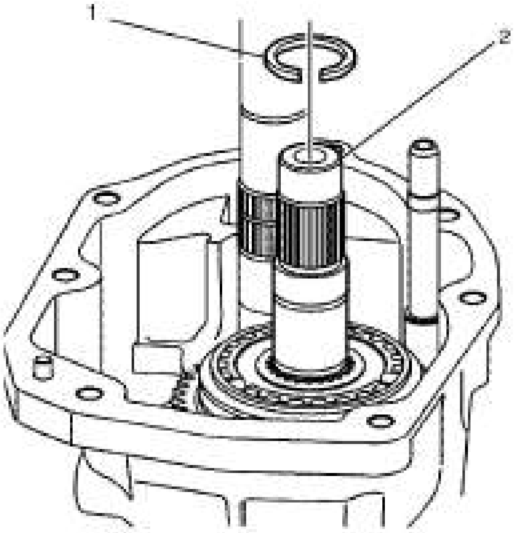
2. Install the 5th/6th speed drive gear thrust washer (4), speed drive gear inner cone (3), speed drive gear friction cone (2) and speed drive gear synchronizer blocking ring (1).



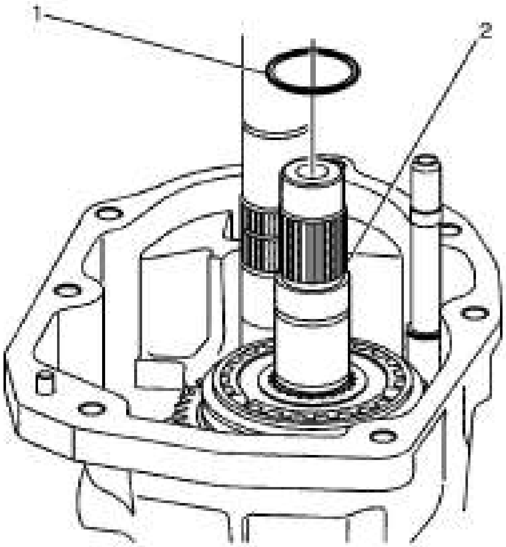
3. Install the 5th/6th shift fork (3), synchronizer sleeve (1) and synchronizer hub (2) assembly using J 5590 (4) and a mallet.



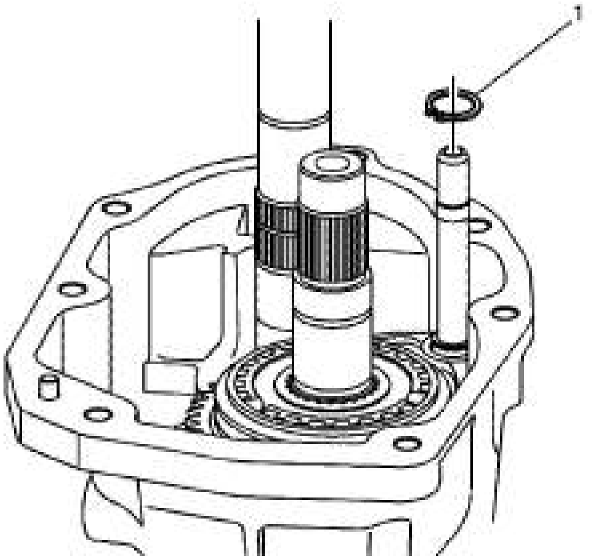
4. Install the speed drive gear synchronizer blocking ring (4), speed drive gear friction cone (3), speed drive gear inner cone (2) and speed drive gear thrust washer (1).



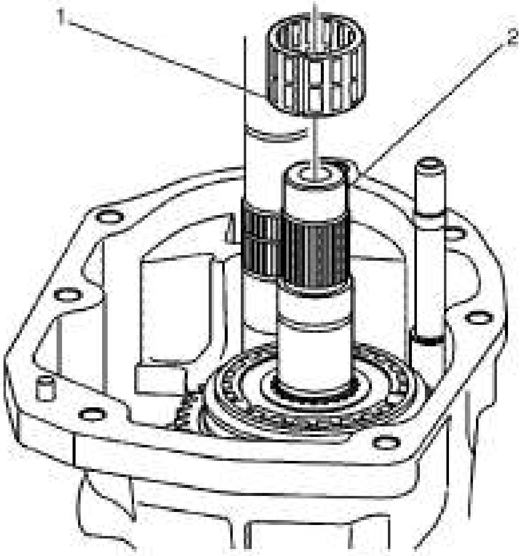
5. Install the retainer clip (1) to the countershaft (2).



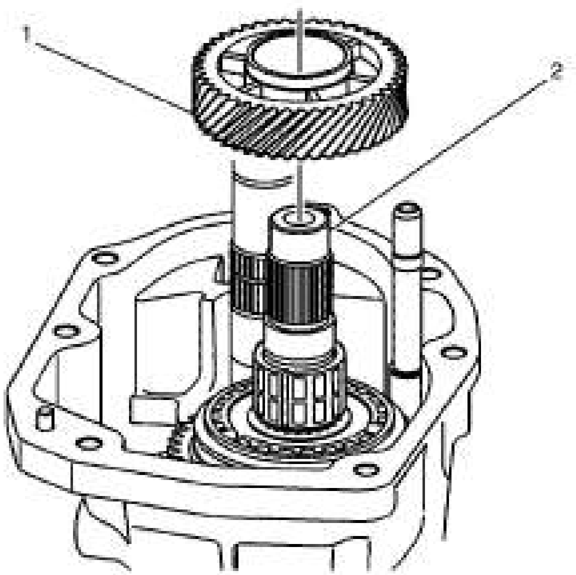
6. Install the spacer (1) to the countershaft (2).



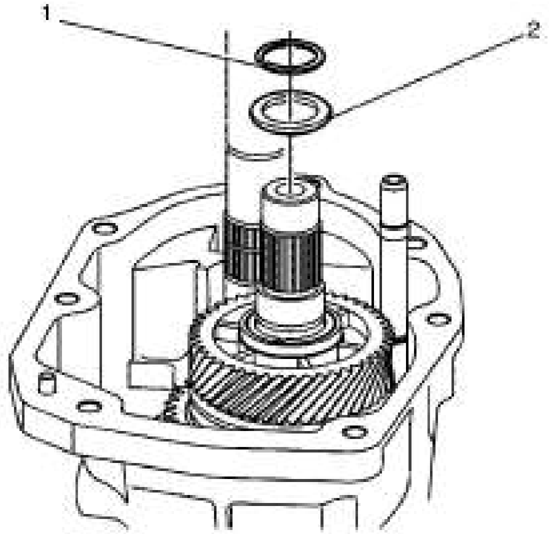
7. Install the 5th/6th speed shift fork retainer ring (1).



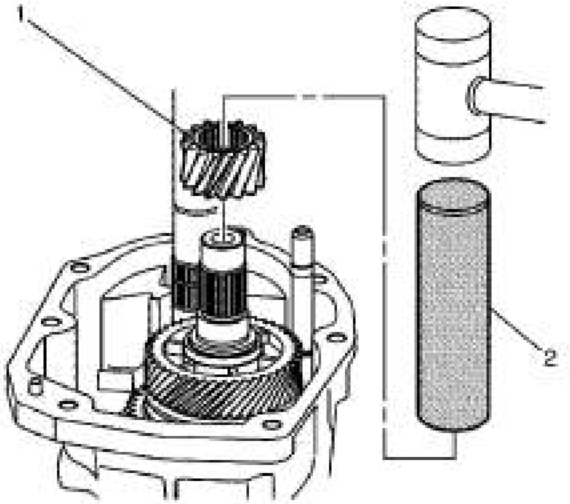
8. Install the needle bearing (1) to the countershaft (2).



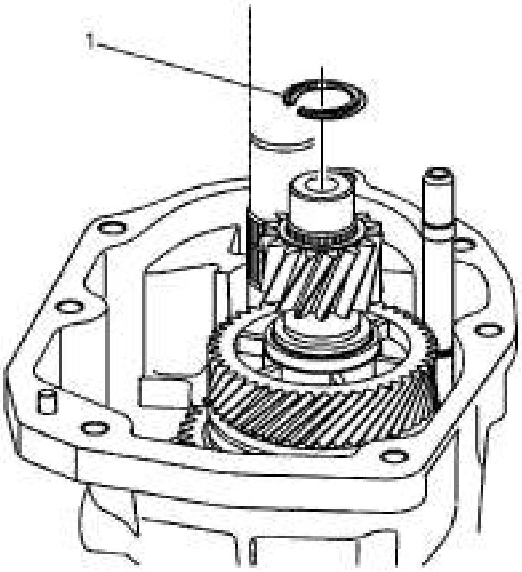
9. Install the 5th gear (1) to the countershaft (2).



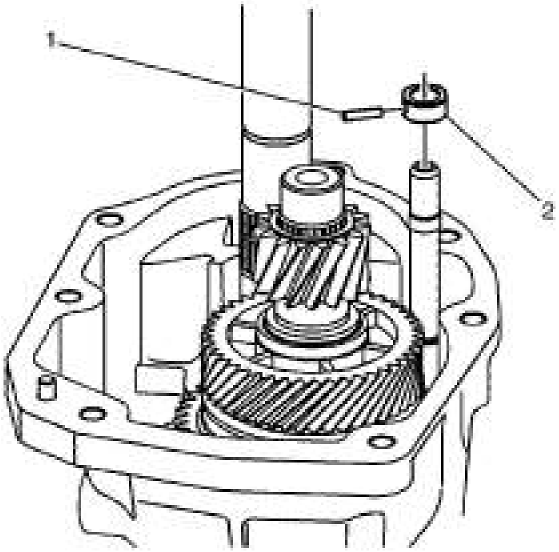
10. Install the spacer (2) and the countershaft retainer (1).



11. Install the countershaft gear (1) using J 5590 (2) and a mallet.



12. Install the countershaft retainer clip (1).

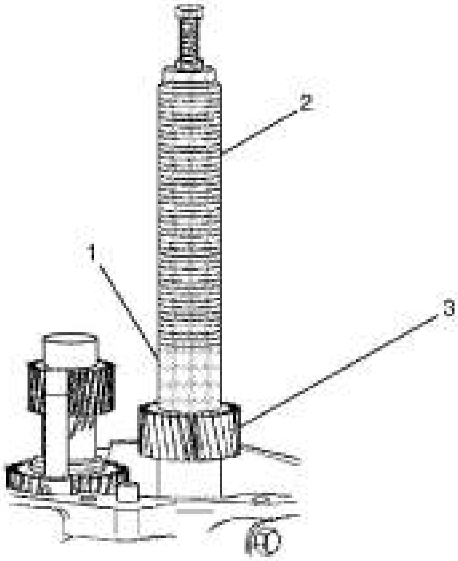


13. Install the collar (2) and the reverse shift shaft pin (1).

5th/6th Speed Driven Gear Installation

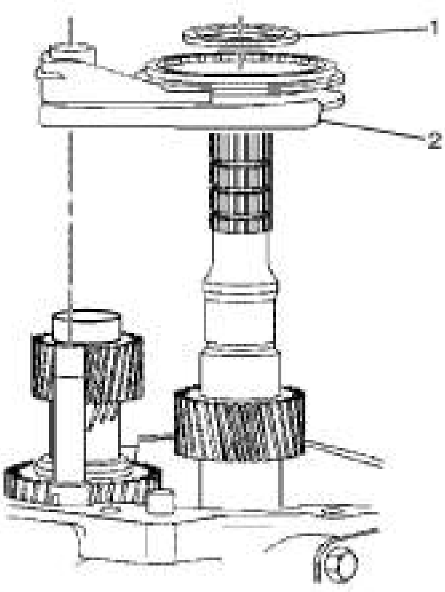
Tools Required

- J 39441 5th/6th Driven Gear Installer.
- J 39441-10 5th Gear Installer Adapter.

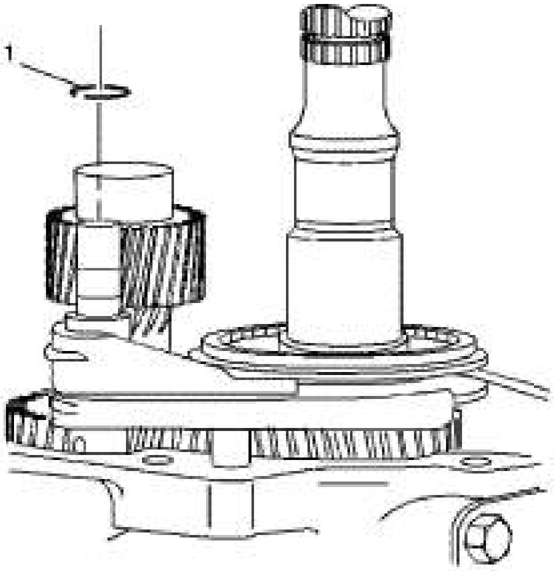


Install the 5th/6th speed driven gear (3) using the J 39441 (1) and J 39441-10 (2). The smaller outside diameter (OD) of the gear faces down.

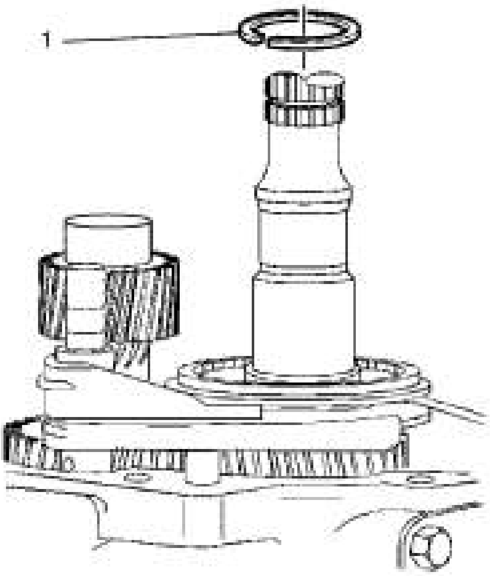
Reverse Shift Fork Installation



1. Install the reverse shift fork (3), the synchronizer (2) and the thrust washer (1).

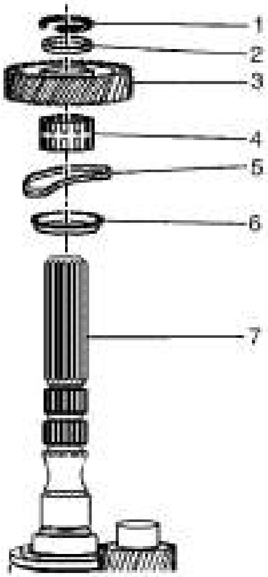


2. Install a new shift fork retainer ring (1).

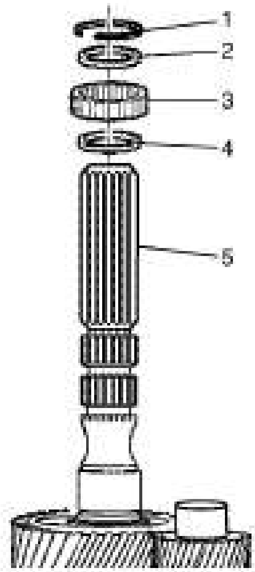


3. Install the reverse synchronizer retainer ring (1).

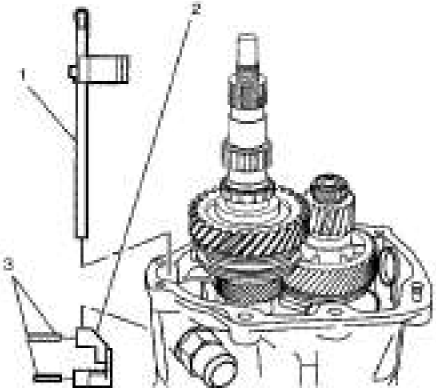
Reverse Speed Gear Installation



1. Install the reverse gear synchronizer blocking ring (6) to the mainshaft (7).
2. Install the wave washer (5) to the mainshaft (7).
3. Install the reverse gear caged needle bearing (4) to the mainshaft (7)
4. Install the reverse gear (3) to the mainshaft (7).
5. Install the reverse gear thrust washer (2) to the mainshaft (7).
6. Install the mainshaft snap ring (1) to the mainshaft (7).



7. Install the mainshaft spacer (4) to the mainshaft (5).
8. Install the mainshaft rear roller bearing (3) to the mainshaft (5).
9. Install the mainshaft spacer (2) to the mainshaft (5).
10. Install the mainshaft snap ring (1) to the mainshaft (5).

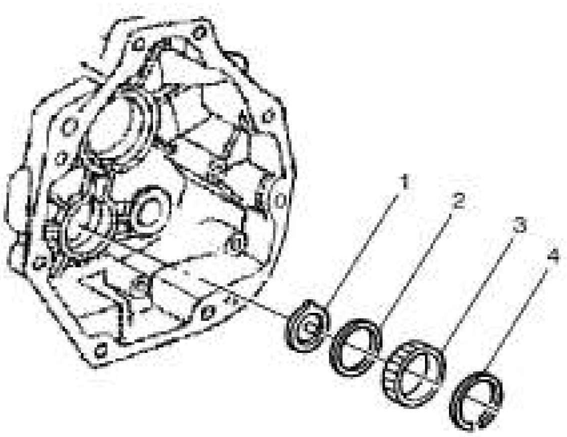


11. Install the shift shaft extension (1).
12. Install the shift guide (2).
13. Install NEW shift guide roll pins (3).

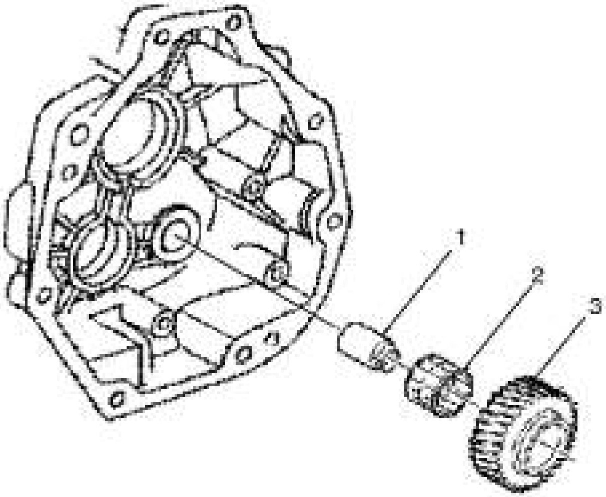
Extension Housing Assemble

Tools Required

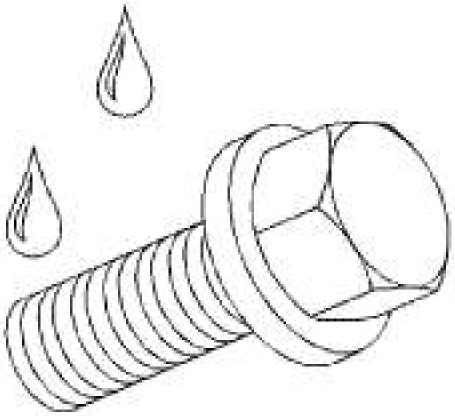
J 44395 Transmission Holding Fixture.



1. Install the countershaft oil funnel (1) to the extension housing.
2. Install the selective shims (2). Refer to Shimming Procedures .
3. Install the countershaft bearing race (3) to the extension housing.
4. Install the countershaft bearing race retaining circlip (4) to the extension housing.

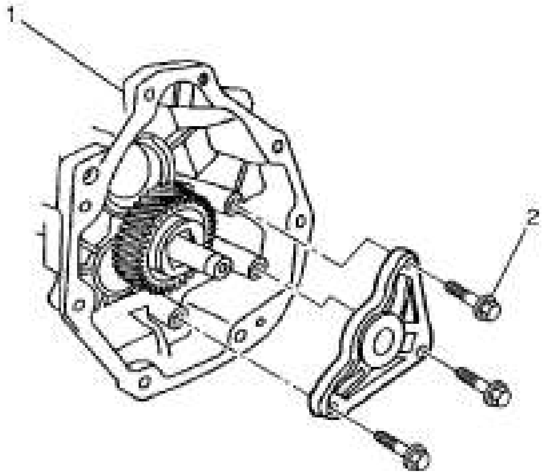


5. Install the reverse idler shaft (1) to the extension housing.
6. Install the roller bearing (2) to the reverse idler shaft.
7. Install the reverse idler gear (3) to the reverse idler shaft.



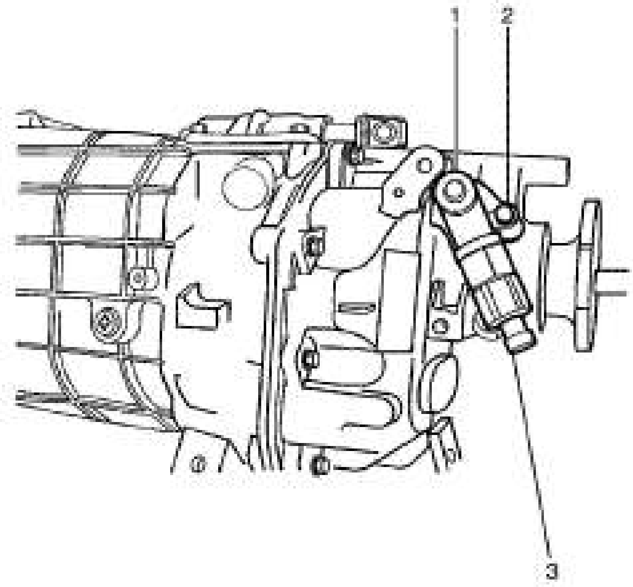
8. Apply thread sealer, LOCTITE™ 242 or equivalent to the reverse idler shaft brackets bolt threads.

Notice: Refer to Fastener Notice in the Preface section.



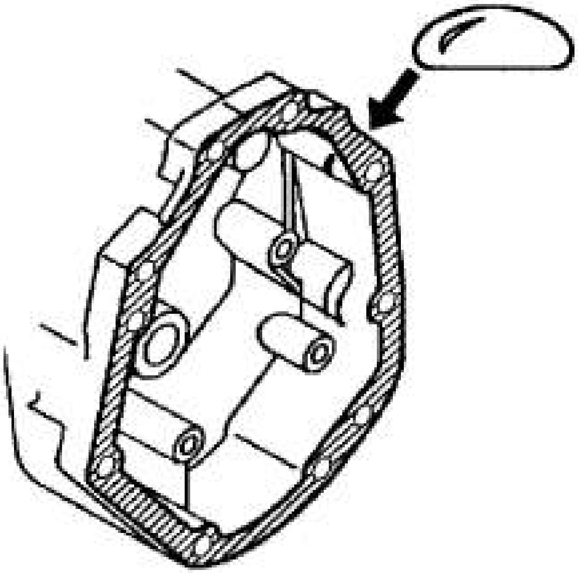
9. Install the reverse idler shaft bracket to the extension housing.
10. Apply an approved threadlock to the reverse idler shaft brackets bolt threads.
11. Install the reverse idler shaft bracket to extension housing retaining bolts.

Tighten
Tighten the bolts to 25 N·m (18 lb ft).

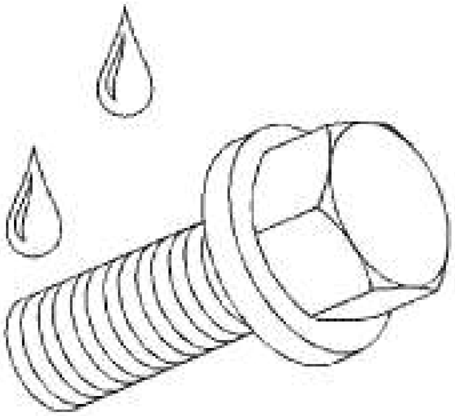


Important: DO NOT damage the reverse lockout solenoid electrical connector (3).

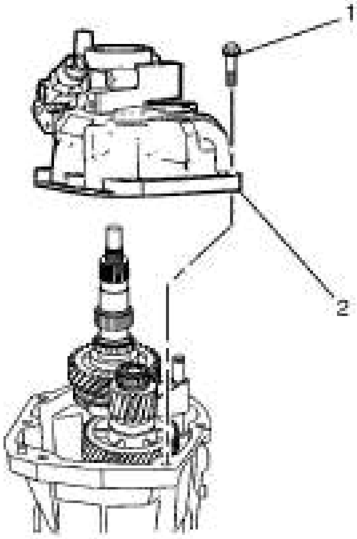
12. Install the reverse lockout solenoid (1) to the transmission extension housing.
13. Install the reverse lockout solenoid to transmission extension housing retaining screw (2).



14. Apply LOCTITE™ "Ultrablack" 598 sealant or equivalent to the extension housing to the transmission case mating surface (1).



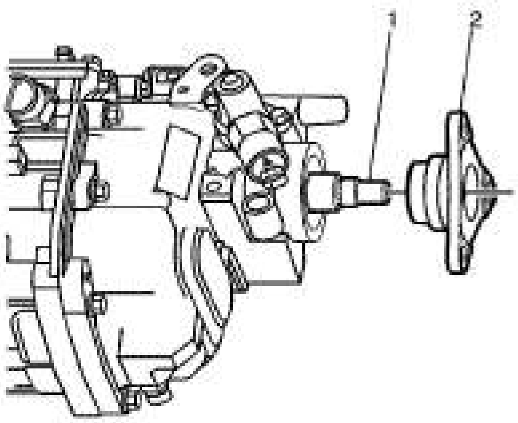
15. Apply thread sealer, LOCTITE™ 242 or equivalent to the top 2 extension housing bolts.



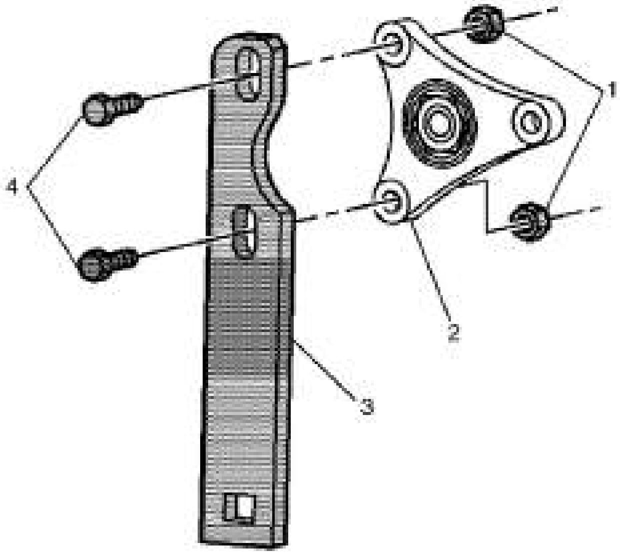
Important: Align the 5th/6th shift shaft to the extension housing bore in order to install the extension housing.

16. Install the extension housing (2).
17. Install the extension housing bolts (1).

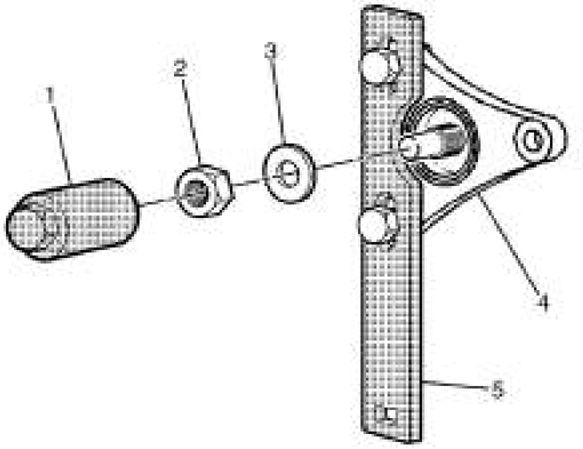
Tighten
Tighten the bolts to 48 N·m (36 lb ft).



18. Install the drive flange (2) to the transmission output shaft (1).



19. Install the J 45012 (3) to the drive flange (2).
20. Install the J 45012 to drive flange retaining bolts (4) and nuts (1) and tighten until firm.

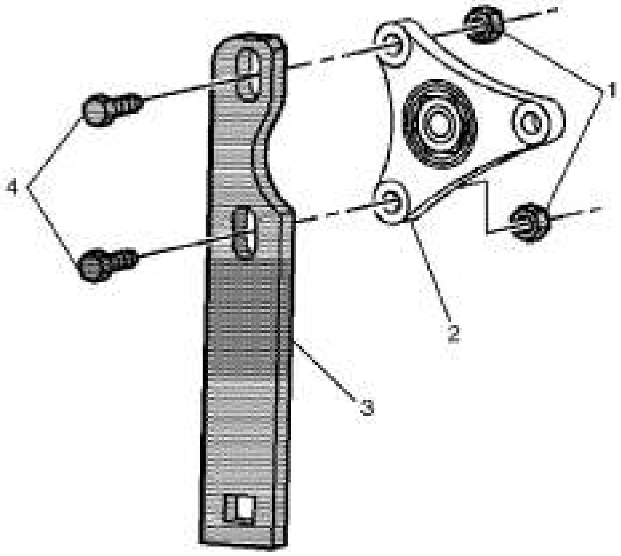


21. Install the drive flange thrust washer (3).

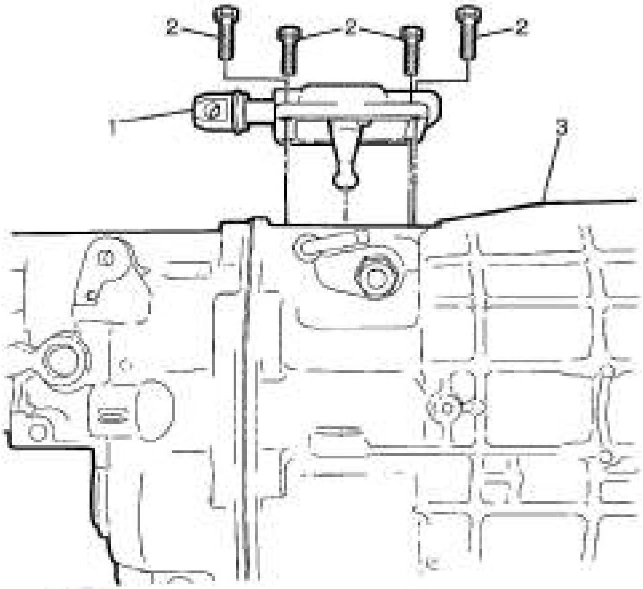
Notice: Refer to Fastener Notice in the Preface section.

22. While holding the J 45012 (5), install the NEW flange retaining nut (2) using the J 29873 (1) to the flange (4).

Tighten
Tighten the nut to 135 N·m (100 lb ft).

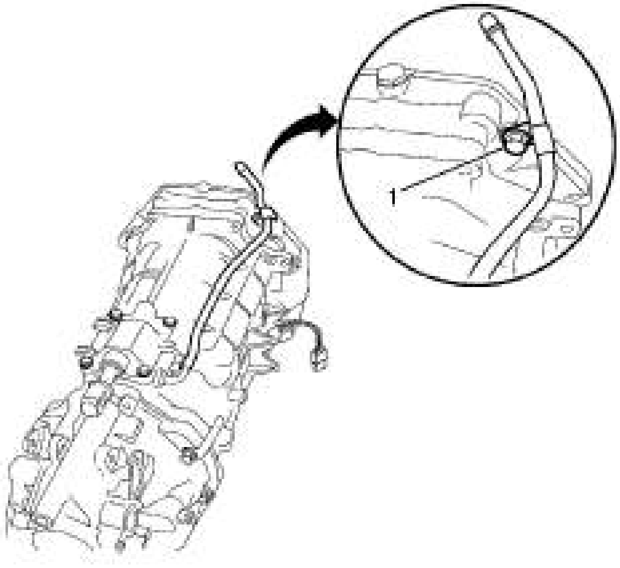


23. Remove the J 45012 to drive flange retaining bolts (4) and nuts (1).
24. Remove the J 45012 (3) from the drive flange (2).



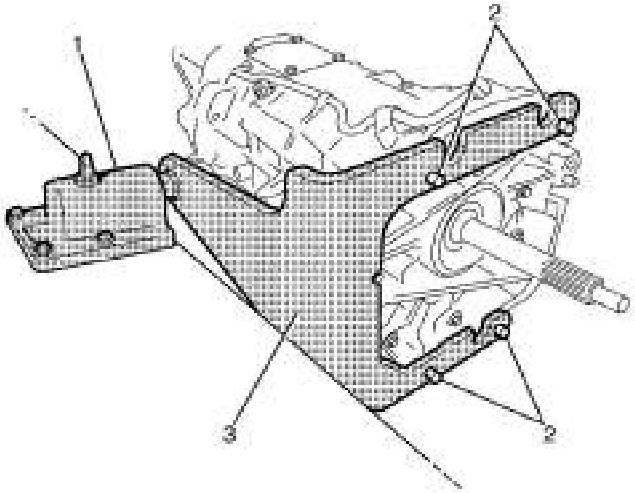
25. Install the shifter cover plate (1) to the transmission (3).
26. Install the shifter cover plate to transmission retaining bolts (2).
27. Install the transmission vent tube to the vent pipe.

Notice: Refer to Fastener Notice in the Preface section.

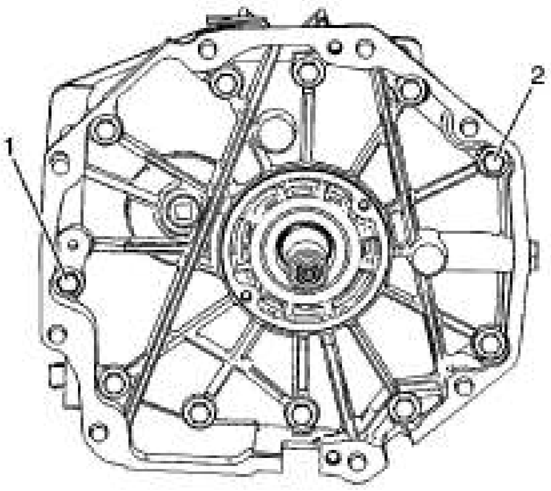


28. Install the transmission vent tube to transmission case retaining bolt (1).

Tighten
Tighten the transmission vent tube retaining bolt to 48 N·m (35 lb ft).



29. Remove the J 44395 .



30. Install the remaining 2 adapter plate bolts (1) and (2).

Tighten
Tighten the adapter plate bolts to 48 N·m (36 lb ft).

31. Install the concentric actuator from the transmission. Refer to Clutch Concentric Actuator Cylinder Replacement .

2009 Holden VE Sedan | VE, WM, Caprice, Statesman, Lumina, Omega, VXR8, Sportwagon Service Manual | Transmission | Manual Transmission - Tremec 6-Speed | Repair Instructions - Off Vehicle | **Document ID: 1992886**

Transmission Disassemble

Extension Housing Removal

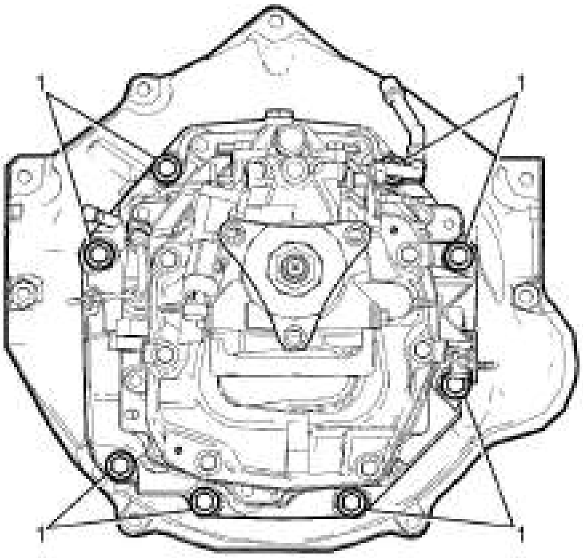
Tools Required

- J 3289-20 Holding Fixture
- J 44395 Transmission Holding Fixture

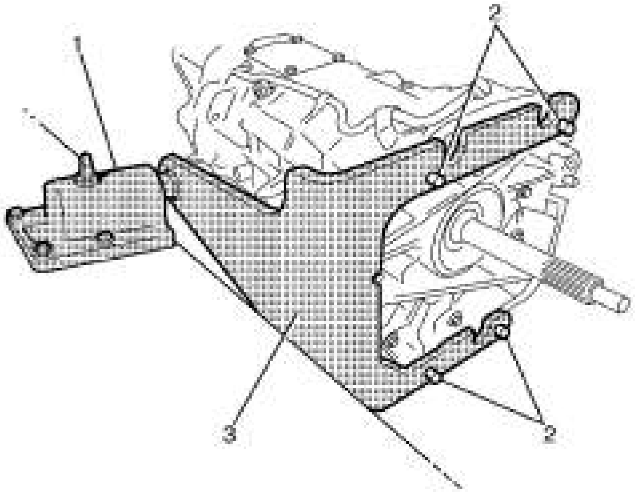
Caution: Refer to Vehicle Lifting Caution in the Preface section.

Caution: Refer to Safety Glasses Caution in the Preface section.

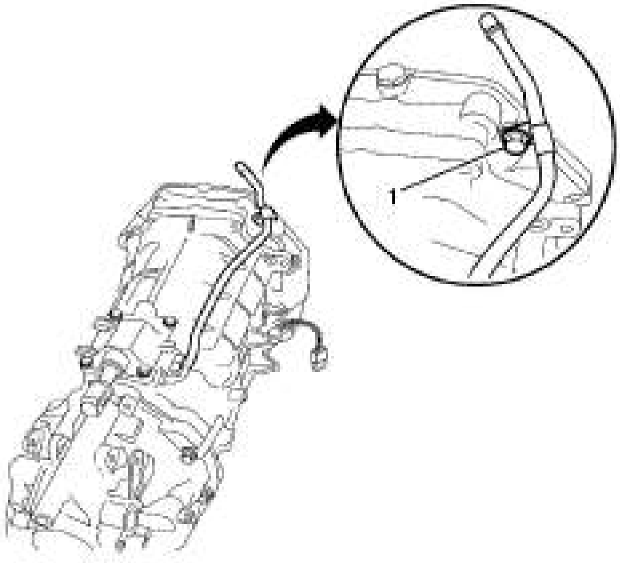
1. Remove the transmission from the vehicle. Refer to Transmission Replacement .
2. Remove the concentric actuator from the transmission. Refer to Clutch Concentric Actuator Cylinder Replacement .



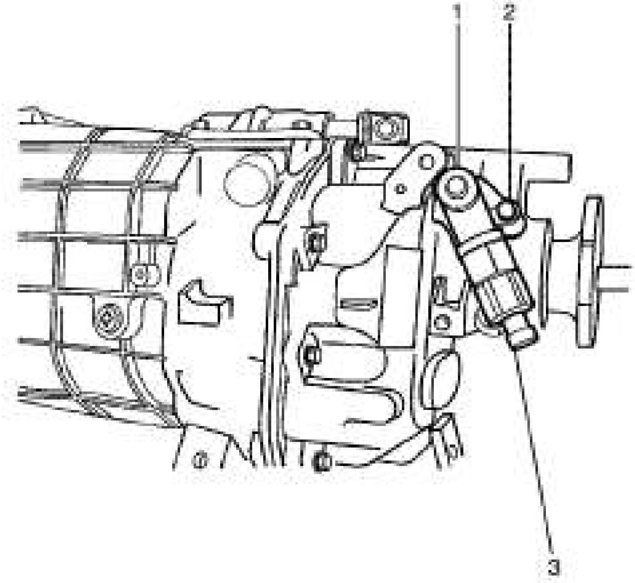
3. Remove the clutch housing to transmission retaining bolts (1).
4. Remove the clutch housing from the transmission.



5. Install the J 44395 (3).
6. Install the J 44395 to transmission retaining bolts (2) and tighten until firm.
7. Mount the transmission on a workbench using the J 3289-20 (1).
8. Rotate the transmission into a horizontal position.
9. Remove the transmission drain plug and drain the transmission fluid.
10. Shift the transmission into NEUTRAL (N).



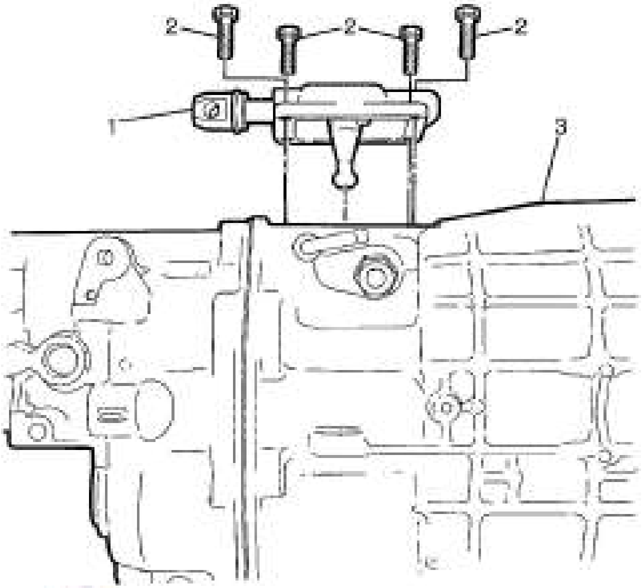
11. Remove the transmission vent tube to transmission case retaining bolt (1).
12. Remove the transmission vent tube from the vent pipe.



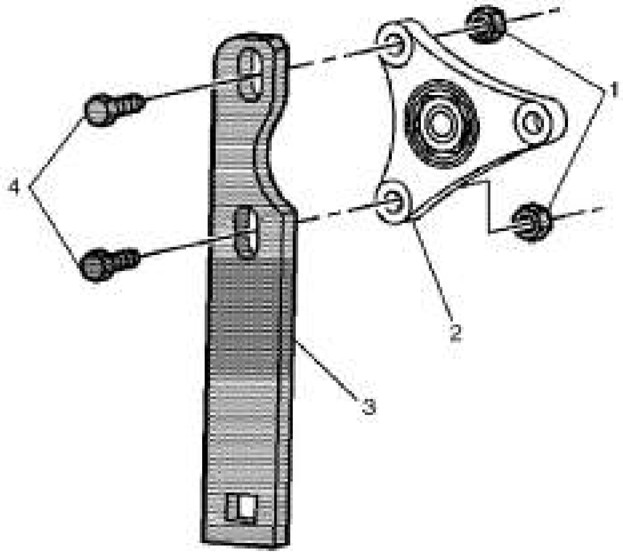
13. Disconnect the reverse lockout solenoid electrical connector (3).

    Important: DO NOT damage the reverse lockout solenoid electrical connector (3).

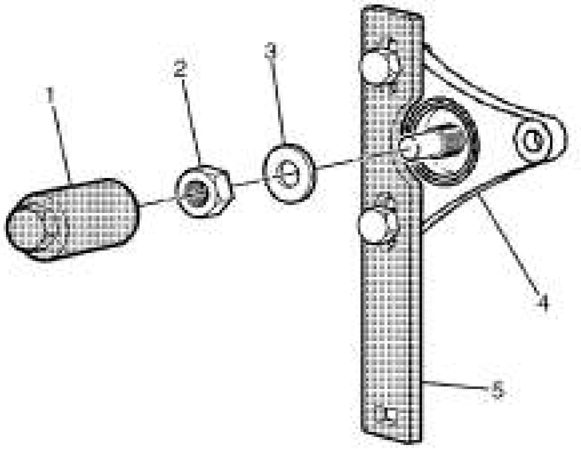
14. Remove the reverse lockout solenoid to transmission extension housing retaining screw (2).
15. Remove the reverse lockout solenoid (1) from the transmission extension housing.



16. Remove the shifter cover plate to transmission retaining bolts (2).
17. Remove the shifter cover plate (1) from the transmission (3).



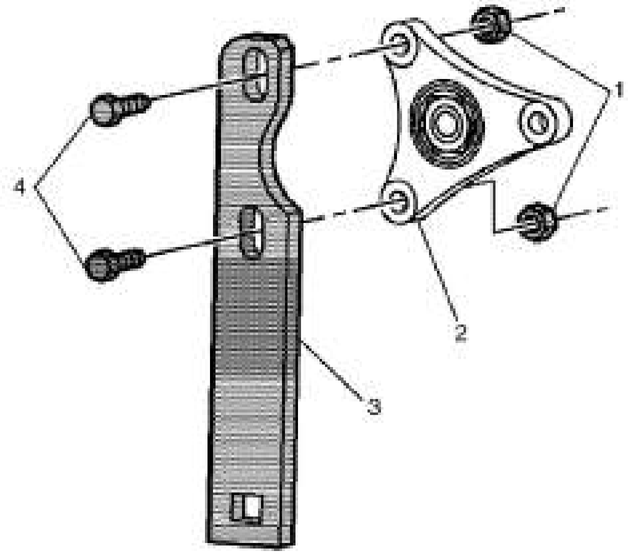
18. Install the J 45012 (3) to the drive flange (2).
19. Install the J 45012 to drive flange retaining bolts (4) and nuts (1) and tighten until firm.



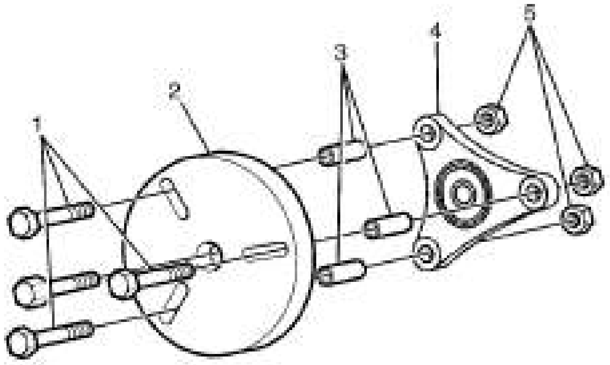
20. While holding the J 45012 (5), remove the flange retaining nut (2) using the J 29873 (1) from the flange (4).

    Discard the nut.

21. Remove the drive flange thrust washer (3).



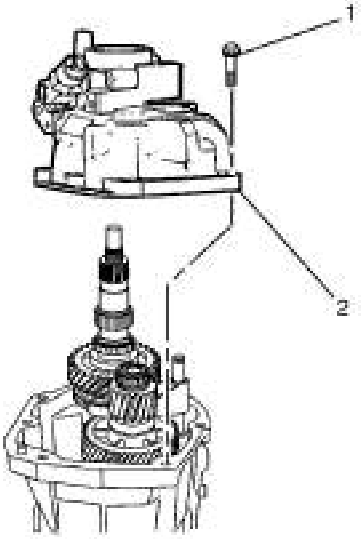
22. Remove the J 45012 to drive flange retaining bolts (4) and nuts (1).
23. Remove the J 45012 (3) from the drive flange (2).



24. Install the J 45019 (2) to the drive flange (4).

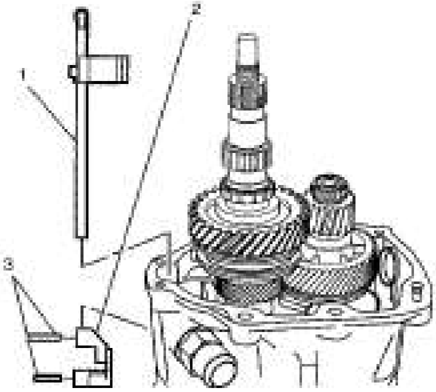
    Remove the drive flange (1) using the J 45019 J 45019 (2).

25. Install the J 45019 to drive flange retaining bolts (1), spacers (3) and nuts (5) and tighten until firm.
26. Remove the drive flange (4) using the J 45019 J 45019 (2).

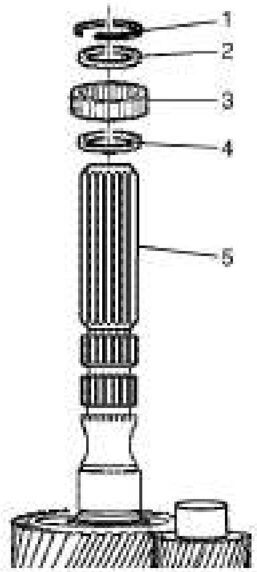


27. Remove the rear extension housing to transmission case retaining bolts (1).
28. Remove the rear extension housing (2).

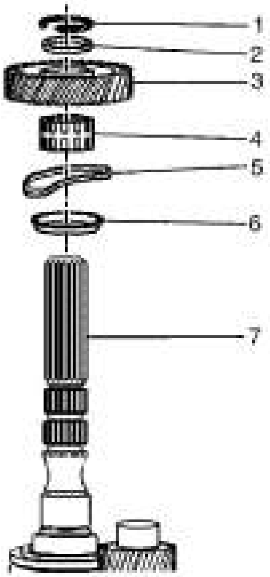
Reverse Speed Gear Removal



1. Roll the shift guide rollpins (3).
2. Remove the shift guide (2).
3. Remove the shift shaft extension (1).

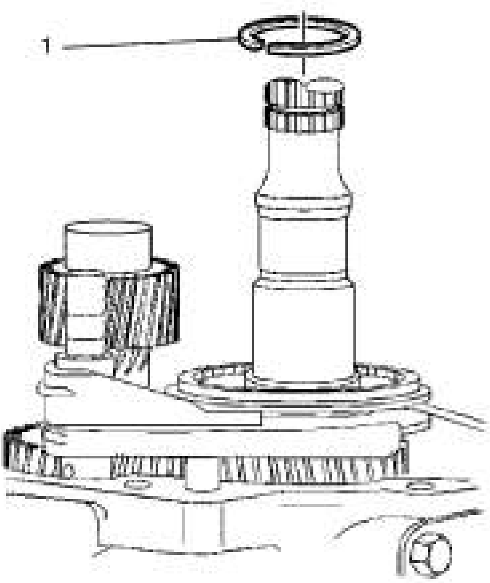


4. Remove the mainshaft snap ring (1) from the mainshaft (5).
5. Remove the mainshaft spacer (2) from the mainshaft (5).
6. Remove the mainshaft rear roller bearing (3) from the mainshaft (5).
7. Remove the mainshaft spacer (4) from the mainshaft (5).

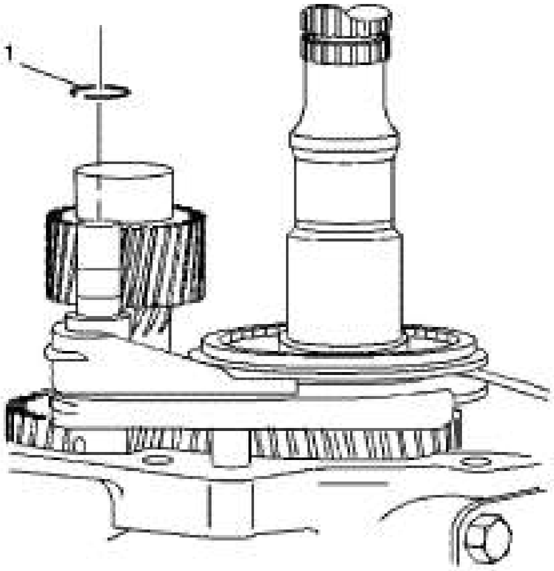


8. Remove the mainshaft snap ring (1) from the mainshaft (7).
9. Remove the reverse gear thrust washer (2) from the mainshaft (7).
10. Remove the reverse gear (3) from the mainshaft (7).
11. Remove the reverse gear caged needle bearing (4) from the mainshaft (7).
12. Remove the wave washer (5) from the mainshaft (7).
13. Remove the reverse gear synchronizer blocking ring (6) from the mainshaft (7).

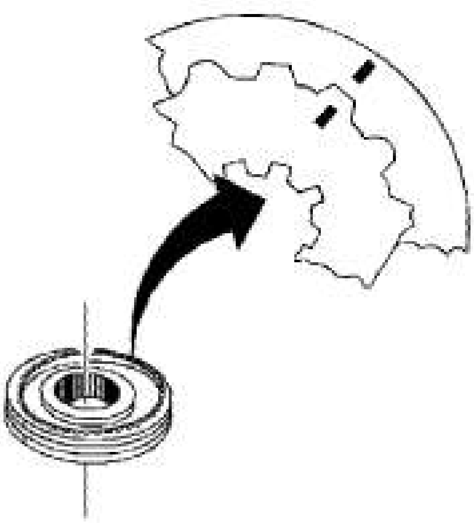
Reverse Shift Fork Removal



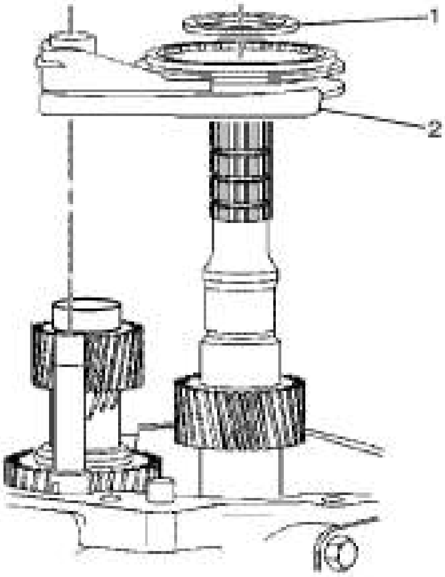
1. Remove the reverse synchronizer retainer ring (1).



2. Remove the reverse shift fork to shift rail snap ring (1) .



3. Scribe a mark on the synchronizer hub and on the sleeve. This will help you to reinstall the parts in the same position.



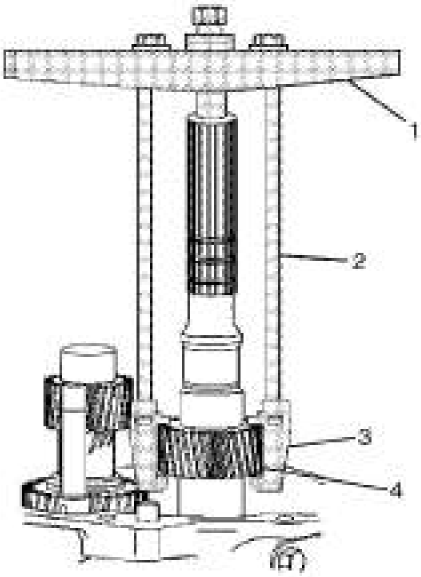
4. Remove the following parts in order:
    - 4.1. The thrust washer (1)
    - 4.2. The reverse synchronizer assembly (2) and the shift fork (3)

5th / 6th Speed Driven Gear Removal

Tools Required

- J 8433 Universal Bridge Puller

- J 39431 Gear Remover and Bolts

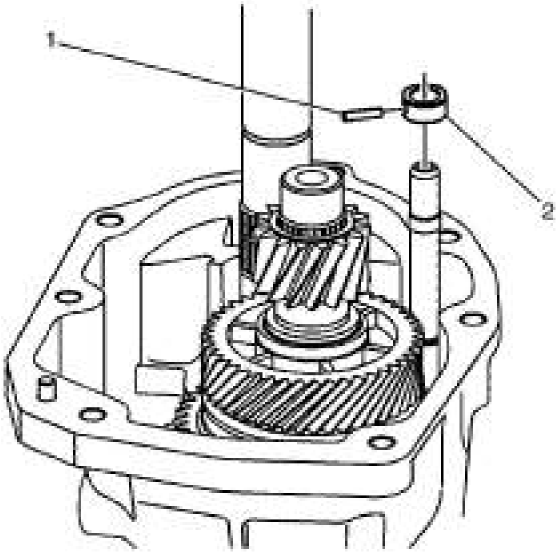


Remove the 5th/6th speed driven gear (4) from the mainshaft. Use the J 8433 (1), the J 39431 (2) and the J 39431 (3).

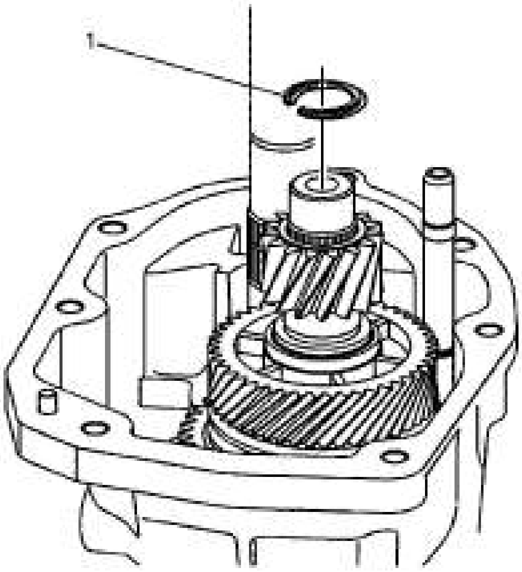
Countershaft Gear Removal

Tools Required

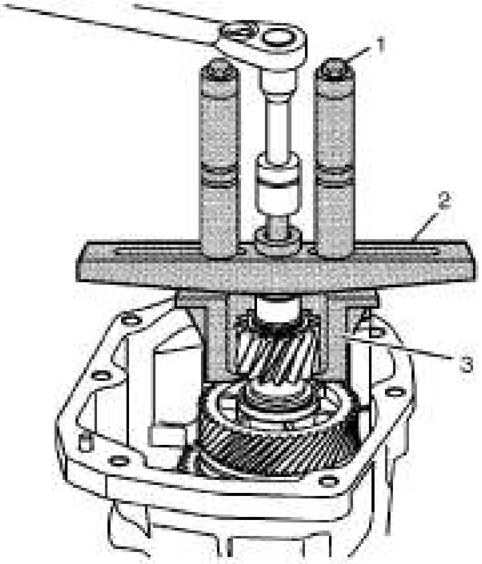
J 25031-A Three Jaw Puller



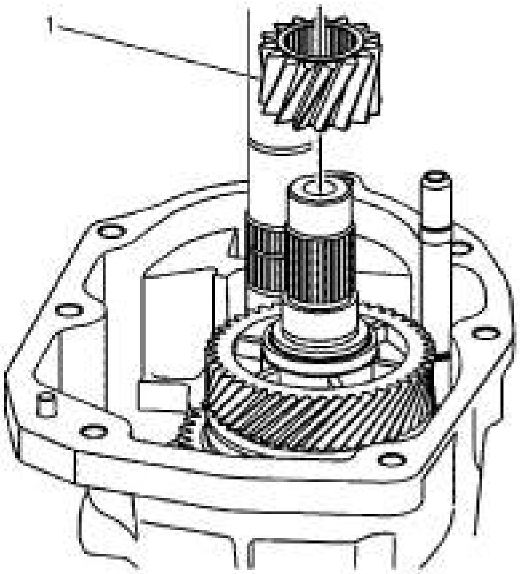
1. Remove the reverse shift shaft pin (1) and collar (2).



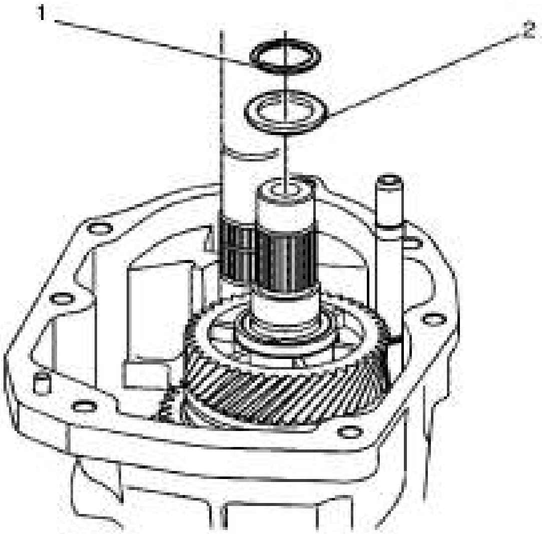
2. Remove the countershaft retainer clip (1).



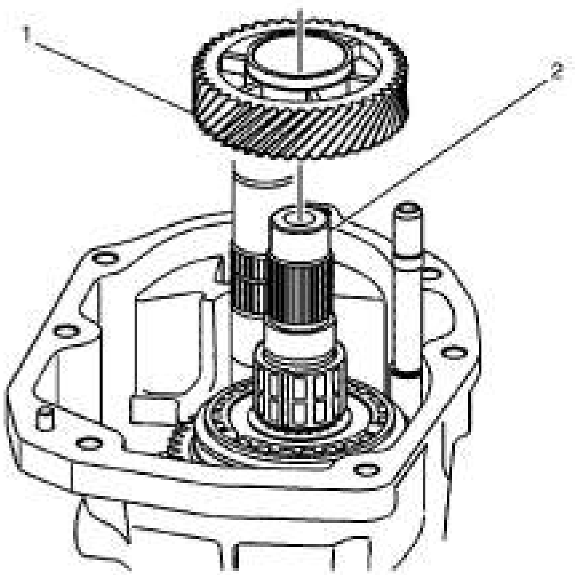
3. Attach the J 8433 (2) , the J 39431 (3) and the J 39431-4 (1).



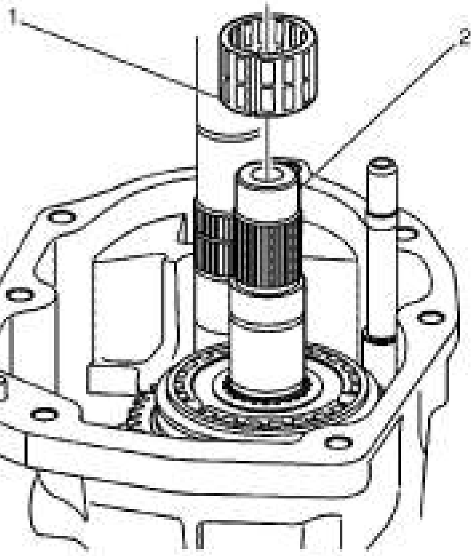
4. Remove the countershaft gear (1).



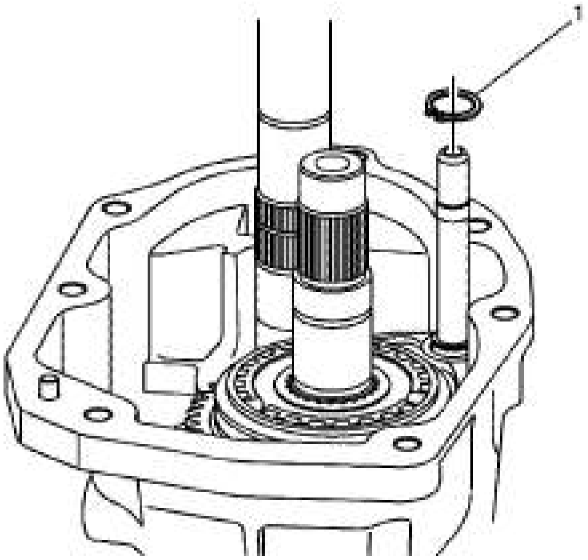
5. Remove the countershaft retainer (1) and spacer (2).



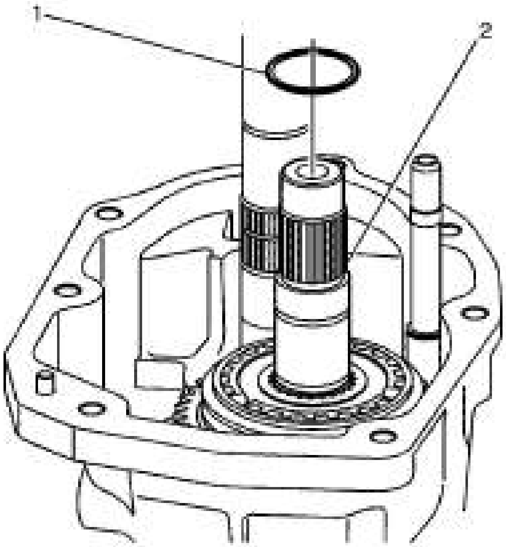
6. Remove the 5th gear (1) from the countershaft (2).



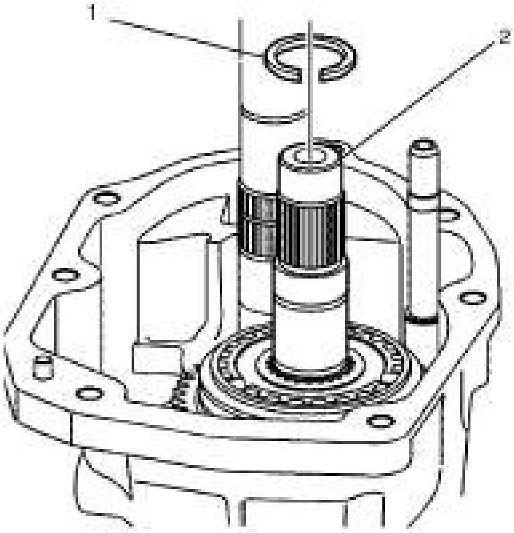
7. Remove the needle bearing (1) from the countershaft (2).



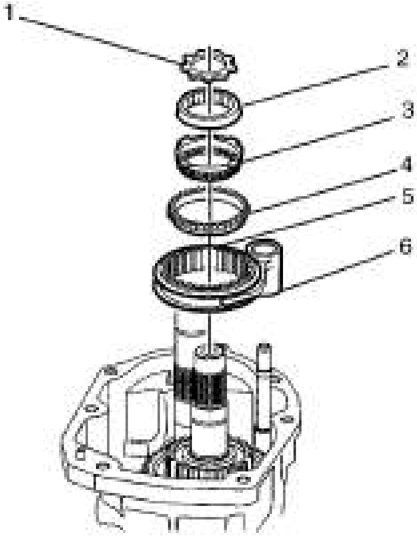
8. Remove the 5th/6th speed shift fork retainer ring (1).



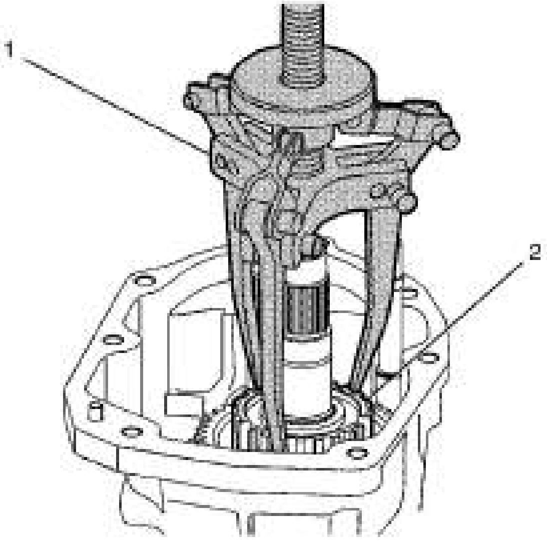
9. Remove the spacer (1) from the countershaft (2).



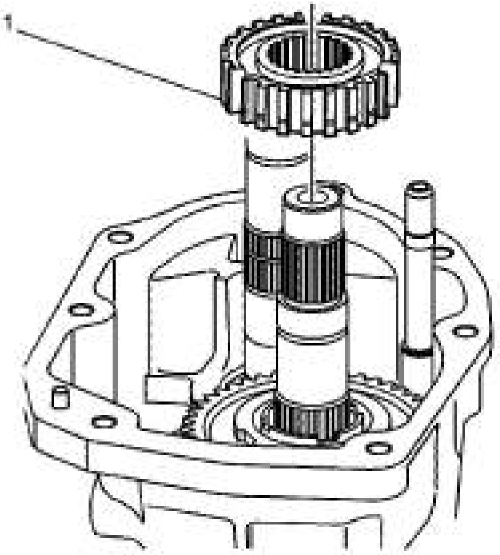
10. Remove the retainer clip (1) from the countershaft (2).



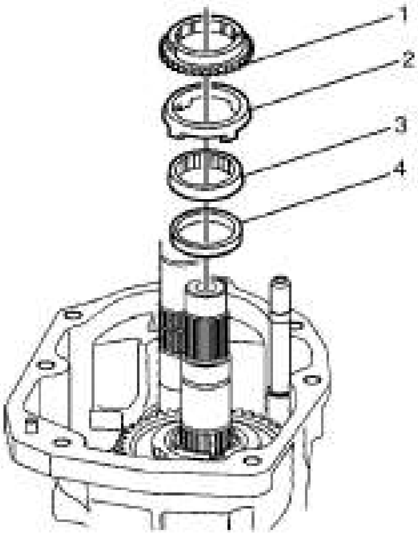
11. Remove the 5th/6th shift fork (6), synchronizer sleeve (5), speed drive gear synchronizer blocking ring (4), speed drive gear friction cone (3), speed drive gear inner cone (2), speed drive gear thrust washer (1).



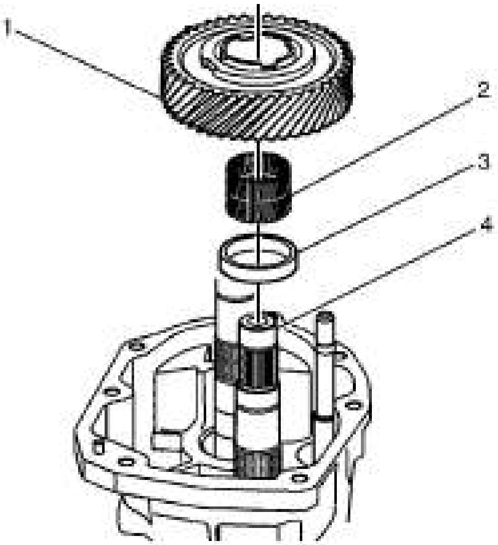
12. Install the J 25031-A (1) to the synchronizer hub assembly (2).



13. Remove the synchronizer hub assembly (1).

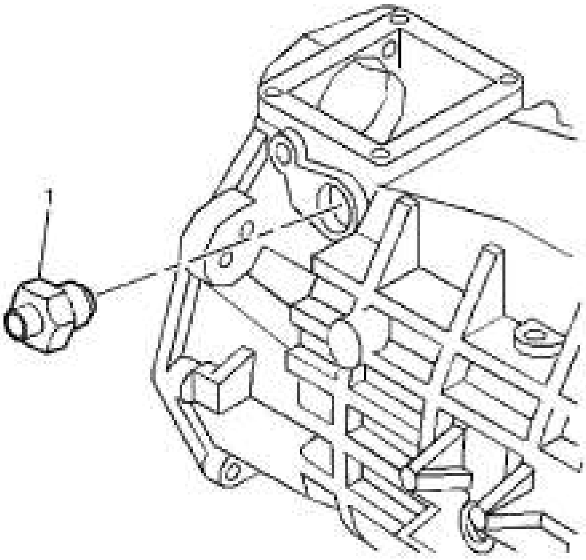


14. Remove the 5th/6th speed drive gear synchronizer blocking ring (1), speed drive gear friction cone (2), speed drive gear inner cone (3) and speed drive gear thrust washer (4).

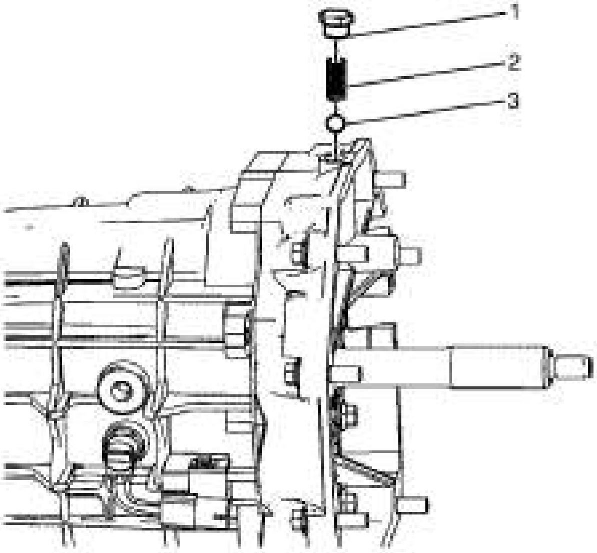


15. Remove the 6th drive gear (1), caged needle bearing (2), and spacer (3) from the countershaft (4).

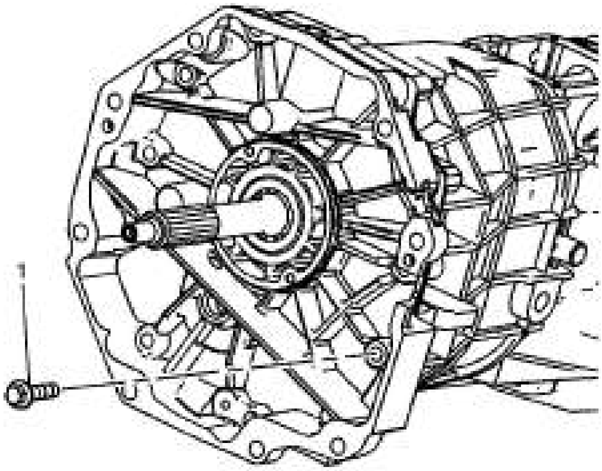
Transmission Case Removal



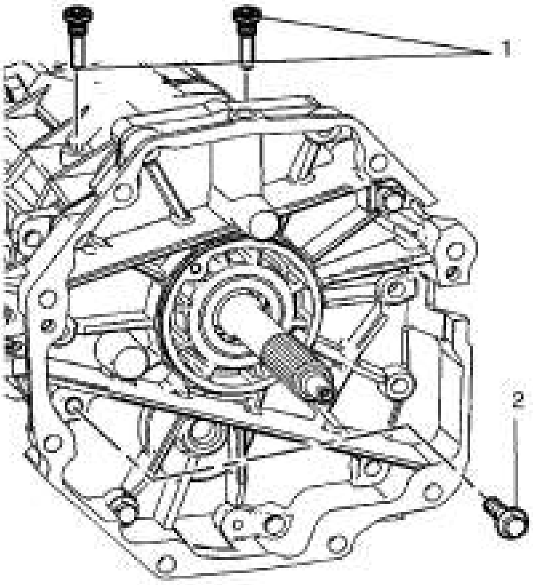
1. Remove the shift detent assembly (1).



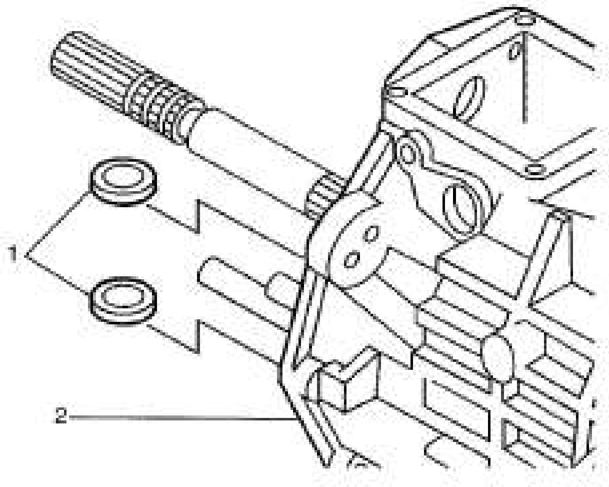
2. Remove the shift detent plug (1), spring (2) and ball (3).



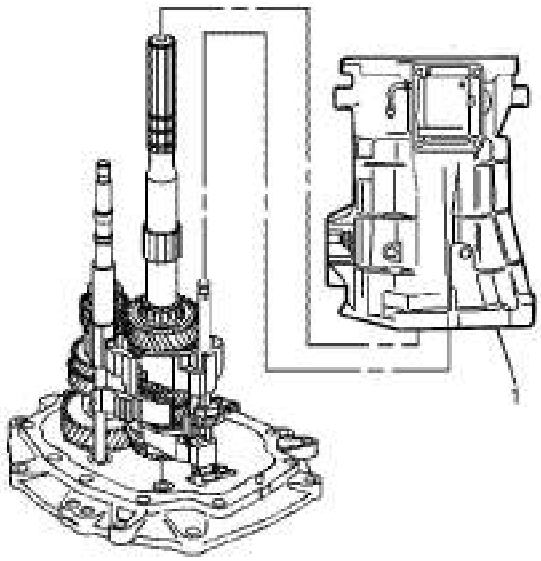
3. Remove 9 of the 11 adapter plate to transmission case bolts (1).
4. Rotate the transmission into the vertical position.



5. Remove the last 2 adapter plate to transmission case bolts (2).
6. Remove the shift lever guide bolts (1).

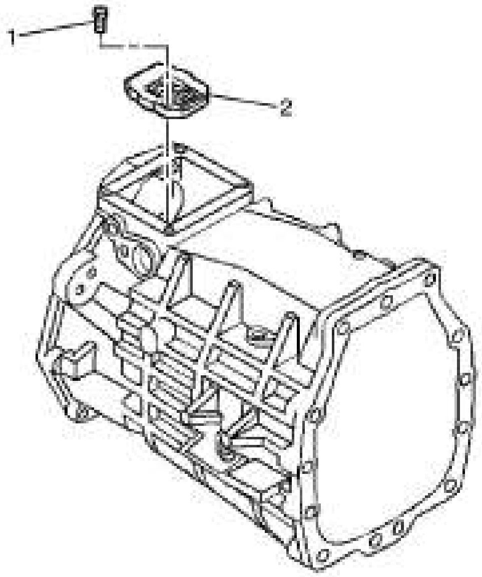


7. Remove the magnets (1) from the transmission case (2).



8. Remove the transmission case and the offset lever together as follows:
   8.1. Slide the transmission case (1) up and off of the gear clusters and the shift shaft components.
   8.2. Hold the offset lever against the guide plate in order to prevent the release of the detent ball and the spring.
   8.3. Remove the offset lever from the transmission case.

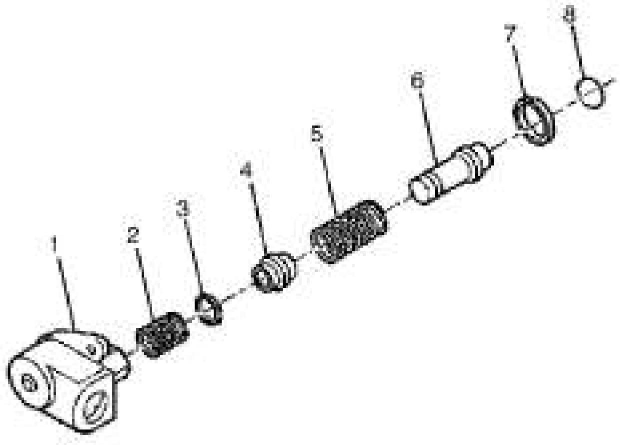
Guide Plate Removal



1. Remove the detent guide plate retaining bolts (1).
2. Remove the detent guide plate (2).

Reverse Lockout Assembly Disassemble

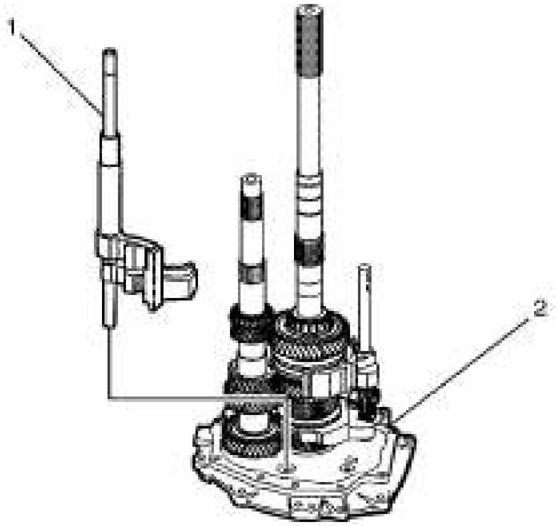
Caution: Refer to General Repair Instructions in the Preface section.



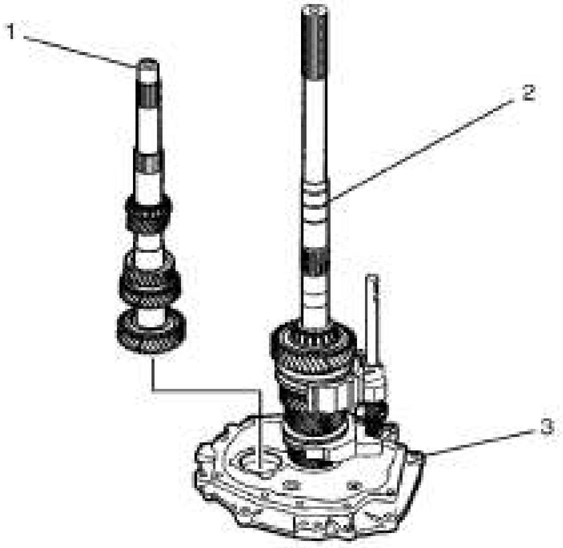
1. Remove the O-ring (1) from the body (8).
2. Remove the retainer ring (2) from the body (8).
3. Remove the reverse lockout inner spring (7).
4. Compress the reverse lockout plunger (3) and the collar (5) in a vise and remove the retainer ring (6).

5. Remove the reverse lockout plunger (3).
6. Remove the reverse lockout outer spring (4).
7. Remove the reverse lockout collar (5).

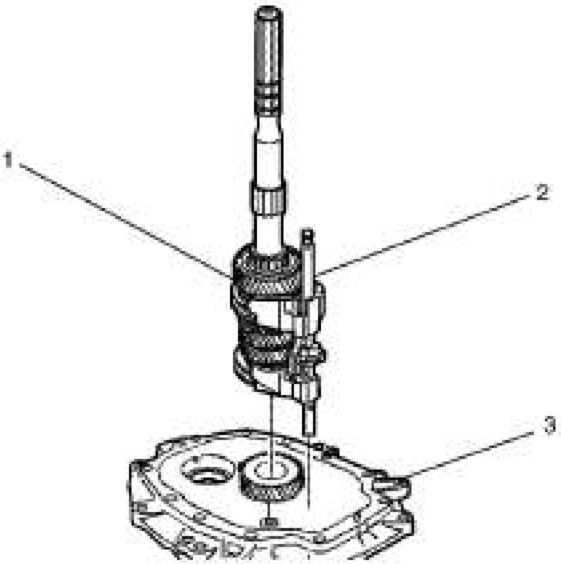
Shift Shaft Assemblies and Gear Cluster Removal



1. Rotate the 5th/6th and the reverse shift shaft levers off the shift interlock plate.
2. Remove the 5th/6th and the reverse shift shaft assembly (1) from the adapter plate (2).



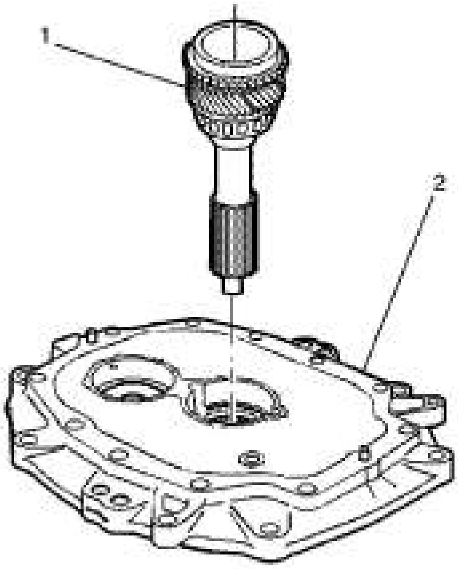
3. Remove the countershaft (1) from the adapter plate (3). Lift up the mainshaft (2) enough in order to remove the countershaft (1).



4. Remove the mainshaft and the shift shaft components as an assembly (1) from the adapter plate.

   Important: When removing the shift shaft be careful not to lose the dowel pin.

5. Remove the shift shaft assembly from the mainshaft.



6. Remove the input shaft (1) from the adapter plate (2).

Manual Transmission Description and Operation

General Information

Manual transmissions are identified by the number of forward gears and the measured distance between the centerline of the output shaft and the counter gear.

The Tremec T56 six speed manual transmission primarily consists of a four piece aluminium alloy construction, comprising a clutch housing bolted to a front adaptor plate, transmission case and extension housing.

The ‘T56’ manual transmission is a fully synchronised unit, including reverse gear, with blocking ring type synchronisers. A triple piece synchroniser assembly is fitted to first and second gears and two piece assemblies are fitted to third, fourth, fifth and sixth gears. Reverse gear is fitted with a single piece blocking ring.

The input shaft, mainshaft and countershaft gears are all supported by taper roller bearings. A parallel roller supports the rear of the mainshaft, while all constant mesh gears have caged needle roller bearings.

During disassembly, the major number of gear train components and shift mechanism remain on the transmission front adaptor plate.

The gear ratios are as follows:

Gear	M10 Ratio (:1)
FIRST	3.01
SECOND	2.07
THIRD	1.43
FOURTH	1.00
FIFTH	0.84
SIXTH	0.57
REVERSE	3.28

Synchroniser Assemblies

Each of the four synchroniser hubs are splined to their respective shafts and secured by a snap ring. All synchromesh blocking rings have a carbon fibre frictional material and are brass, except for 1st and 2nd gears.

The blocking rings used on 1st and 2nd gears are of a double cone construction, with carbon fibre frictional material on each side of the inner member. The purpose of the synchroniser assemblies is to permit clutching to the required gear.

During synchroniser operation, the synchroniser ring is moved into engagement by the appropriate fork, carrying with it, three spring loaded synchroniser inserts, located in slots in the synchroniser hub.

The synchroniser ring, together with the inserts, is moved along the hub, placing a load on the three lugs of the blocking ring.

This initial force is sufficient to seat the blocking ring and start pre-synchronisation because of the friction between the cone on the constant mesh gear and the blocking ring.

At this stage, gear engagement is prevented as long as there is a difference in speed between the mating surfaces of the blocking ring and cone of the constant mesh gear. As the speeds between the blocking ring and the gear cone become synchronised, the teeth on the blocking ring and gear cone line up with the internal splines of the ring, allowing the ring to engage the teeth on the gear being engaged, completing gear selection.

Reverse Gear

The reverse idler gear is in constant mesh with the countershaft gear and the reverse gear, splined to the mainshaft. When reverse gear is engaged, the reverse synchromesh ring engages the reverse constant mesh gear, completing the selection.

Bearing Support

All shafts in the transmission are supported by taper roller bearings, except for a parallel roller bearing at the rear of the mainshaft.

The input shaft gear and countershaft gear extension bearing cups are a sliding fit in their respective housings. Selective shims are located under each of the bearing cups to control bearing pre-load or end float (for the countershaft).

Each of the constant mesh gears is supported by caged needle roller bearings, except for the reverse idler gear that has a twin, caged needle roller bearing running on the reverse idler gear shaft.

Lubrication

Lubrication of all internal components is by splash feed, provided by the rotating countershaft gear assembly.

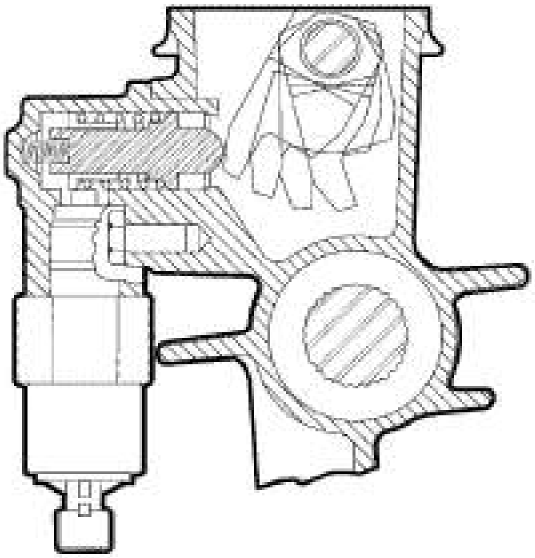
Selector Mechanism

The floor mounted, gearshift control lever operates through a remote lever arrangement onto a single rail mechanism which extends into the transmission rear case. The 1st/2nd, 3rd/4th, 5th/6th and reverse shift shaft rails are all supported at each end, in the adaptor plate, transmission case or extension housing.

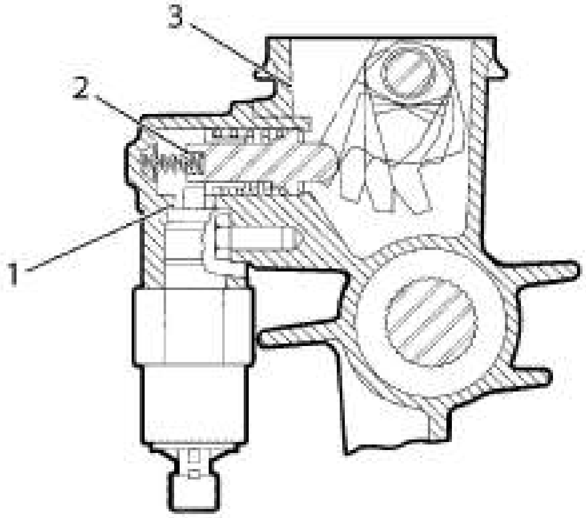
A shift interlock system, prevents engagement of more than one gear at a time. The system consists of a selector pin and interlock plate mounted on the 1st/2nd and 3rd/4th selector shaft rail.

When any gear is selected, the selector pin is aligned with the particular shift fork link or shift lever, with 5th/6th and reverse gears. As this selector pin slides within the interlock plate, only the gear selected can be engaged.

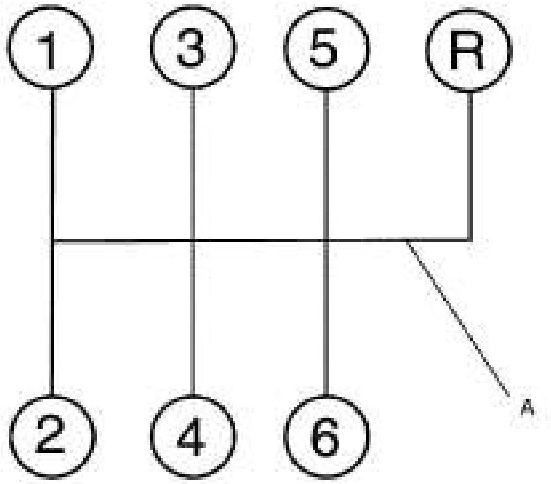
Reverse Lockout



The transmission is also fitted with a reverse lockout solenoid assembly that prevents the selection of reverse gear, above road speeds of 5 km/h (3 mph) or more.



Above road speeds of 5 km/h (3 mph) or more, the Powertrain Control Module (PCM), activates the solenoid plunger (1) which blocks the movement of the spring loaded, reverse lockout plunger (2). When activated, the rear offset lever (3) is blocked from rotating to the reverse selection position.

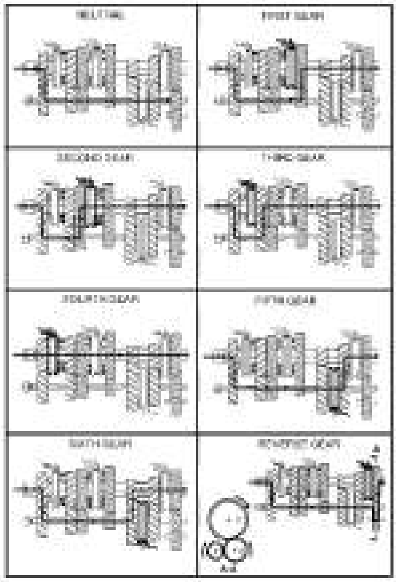


Point (A) of the shift pattern indicates how reverse gear can be inhibited by the reverse lockout solenoid assembly.

Transmission Power Flows

The input shaft drive gear, third, second and first speed gears are in constant mesh with the countershaft gear. The reverse drive gear rotates with the countershaft gear.

Therefore, when the engine is running with the clutch engaged, engine torque is transferred to the input shaft drive gear and through the countershaft gear to the third, second, first speed and reverse gears at all times.



NEUTRAL
FIRST GEAR
SECOND GEAR
THIRD GEAR
FOURTH GEAR
FIFTH GEAR
SIXTH GEAR
REVERSE GEAR
A

Neutral

In neutral, with the clutch engaged, the input shaft drive gear turns the countershaft gear. The countershaft gear turns the constant mesh gears of 3rd, 2nd, 1st and reverse gears because no synchroniser assemblies are engaged. As these constant mesh gears are supported on roller bearings, they will also rotate with the countershaft gear. As the 5th/6th compound gear is splined to the mainshaft, these constant mesh gears will remain stationery while the vehicle is stopped.

First Gear

In first gear, the first/second speed synchroniser ring is moved rearward to engage the first speed gear, which is being turned by the countershaft gear. Because the first/second speed synchroniser hub is splined to the mainshaft, torque is transferred to the mainshaft from the first speed gear through the synchroniser ring and hub, at a speed reduction of 3.01:1.

Second Gear

In second gear, the first/second speed synchroniser ring is moved forward to engage the second speed gear, which is being turned by the countershaft gear. Because the first/second speed synchroniser hub is splined to the mainshaft, torque is transferred to the mainshaft from the second speed gear through the synchroniser ring and hub, at a speed reduction of 2.07:1.

Third Gear

In selecting third gear, the first/second speed synchroniser ring moves to the neutral position and the third/fourth speed synchroniser ring is moved rearward to engage the third speed gear. As this gear is being turned by the countershaft gear, the engagement of the ring with the third speed gear, torque is transferred to the mainshaft because the third/fourth speed synchroniser hub is splined to the mainshaft. The mainshaft the turns at a speed reduction of 1.43:1.

Fourth Gear

In fourth gear, the third/fourth speed synchroniser ring is moved forward to engage the input shaft drive gear. This engagement of the input shaft drive gear with the third/fourth synchroniser ring and hub assembly, transfers torque directly to the mainshaft. While the countershaft gear is still rotating, no torque transfer takes place but the spinning gear continues to lubricate the internal transmission components by the ‘splash’ method. As the mainshaft is effectively joined to the input shaft, the drive is direct with a ratio of 1.00:1.

Fifth Gear

In fifth gear, which is the first of the overdrive ratios , the first/second and third/fourth speed synchroniser rings must be in the neutral position. The fifth/sixth speed synchroniser ring is moved rearward to engage the fifth speed drive gear, supported on the countershaft gear by a caged needle roller bearing. This engagement of the ring with the fifth speed constant mesh gear, allows torque to be transferred from the countershaft gear to the mainshaft, via the splined synchromesh hub and the splined fifth/sixth speed compound driven gear. This speed generates an overdrive ratio of 0.84:1.

Sixth Gear

In sixth gear, the fifth/sixth speed synchroniser ring is moved forward to engage the sixth speed drive gear, supported on the countershaft gear by a caged needle roller bearing. This engagement of the ring with the sixth speed constant mesh gear, allows torque to be transferred from the countershaft gear to the mainshaft, via the splined synchromesh hub and the splined fifth/sixth speed compound driven gear. This speed generates an overdrive ratio of 0.57:1.

Automatic Transmission Shift Lock Control Description and Operation

The automatic transmission park lock control system is a safety device that prevents an inadvertent shift out of PARK when the engine is running. The driver must press the brake pedal before moving the park lever out of the PARK position. The system consists of the following components:

- The automatic transmission park lock solenoid (serviced as the automatic transmission shift lock actuator), located within the floor shift control assembly with vehicles equipped with floor shift.
- The body control module, which controls the voltage supply circuit of the park lock control solenoid.
- The engine control module.

The body control module controls the voltage to the park lock control solenoid through the park lock control solenoid controlled voltage circuit. The following conditions must be met before the body control module will supply voltage to the park lock solenoid:

- The ignition is in the ON position.
- The engine control module sends an input via GMLAN serial data to the body control module indicating the transmission is in the PARK position.
- The body control module determines the brake pedal is applied according the brake pedal position.

Since the park lock control solenoid is permanently grounded, the body control module supplies voltage to the automatic transmission park lock control solenoid, unlocking the park lever allowing the driver to move the park lever out of the PARK position as the solenoid de-energizes. When the brake pedal is not applied, the body control module turns the control voltage output of the park lock control solenoid OFF, energizing the park lock control solenoid. The energized solenoid mechanically locks the park lever in the PARK position.

During remote start operation, the body control module will energize the park lock control circuit, locking the park lever in the PARK position.

Diagnostic Starting Point - Automatic Transmission Shift Lock Control

Begin the system diagnosis with the Diagnostic System Check - Vehicle. The Diagnostic System Check will provide the following information:

- The identification of the control modules which command the system
- The ability of the control modules to communicate through the serial data circuit
- The identification of any stored diagnostic trouble codes (DTCs) and their status

The use of the Diagnostic System Check will identify the correct procedure for diagnosing the system and where the procedure is located.

DTC B2705

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B2705 02: Gearshift Unlock Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Shift Lock Control	B2705 02	1	2	--
Shift Lock Ground	--	1	--	--
1. Shift lever will not move from PARK with the brake pedal pressed. 2. Shift lever will move from PARK without pressing on the brake pedal.				

Circuit/System Description

The body control module (BCM) controls the automatic transmission shift lock control solenoid by providing a battery positive voltage to the solenoid. The BCM utilizes a smart driver to control the voltage supply circuit to the automatic transmission shift lock control solenoid. The smart driver monitors the voltage and current flow of the control circuit.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- The brake pedal is pressed.
- The transmission is in the PARK position.

Conditions for Setting the DTC

The DTC sets if there is a short to ground in the automatic transmission shift lock control solenoid control circuit.

Action Taken When the DTC Sets

The BCM will not attempt to enable the voltage supply circuit of the automatic transmission shift lock control solenoid until the next key cycle.

Conditions for Clearing the DTC

- A current DTC B2705 will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 100 ignition cycles with no current DTC active during the 100 ignition cycles.

Description and Operation

Automatic Transmission Shift Lock Control Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit / System Verification

1. Ignition ON, observe the scan tool BCM Brake Status parameter while pressing and releasing the brake pedal. The parameter should change from ON to OFF when the brake pedal is depressed.
   If the parameter does not change, refer to Stop Lamps Malfunction.
2. Ignition ON, while pressing the brake pedal, move the shift lever out of the PARK position. The shift lever should move out of the PARK position.

Circuit / System Testing

1. Ignition OFF, disconnect the harness connector at the shift lock control solenoid.
2. Ignition OFF, test for less than 10 ohms between the ground circuit terminal 3 and ground.

If greater than the specified range, test the ground circuit for an open/high resistance.

3. Connect a test lamp between the ground circuit terminal 3 and the control circuit terminal 2.
4. Ignition ON, command the BCM BTSI - Park Lock Test ON and OFF with a scan tool. The test lamp should turn ON and OFF when changing between the commanded states.

   If the test lamp is always ON, test the control circuit for short to voltage. If the circuit tests normal, replace the BCM.

   If the test lamp is always OFF, test the control circuit for short to ground or an open/high resistance. If the circuit tests normal, replace the BCM.
5. If all circuits test normal, test or replace the shift lock actuator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Automatic Transmission Shift Lock Control Actuator Replacement
- Control Module References for scan tool information

Symptoms - Automatic Transmission Shift Lock Control

Important: The following steps must be completed before using the symptom tables.

1. Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Automatic Transmission Shift Lock Control Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the automatic transmission shift lock control. Refer to Checking Aftermarket Accessories.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Transmission Control Lever Malfunction

Transmission Control Lever Malfunction

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information
